PANTOLOGIA.

A

NEW CYCLOPÆDIA,

COMPREHENDING

A COMPLETE SERIES OF

Essays, Treatises, and Systems,

ALPHABETICALLY ARRANGED;

WITH A GENERAL DICTIONARY OF

ARTS, SCIENCES, AND WORDS:

THE WHOLE

PRESENTING A DISTINCT SURVEY OF

Human Genius, Learning, and Industry.

ILLUSTRATED WITH

ELEGANT ENGRAVINGS;

THOSE ON NATURAL HISTORY BEING FROM ORIGINAL DRAWINGS BY EDWARDS AND OTHERS, AND BEAUTIFULLY COLOURED AFTER NATURE.

BY JOHN MASON GOOD, ESQ. F.R.S.

MEMBER OF THE AMERICAN PHILOSOPHICAL SOCIETY, AND OF THE LINNEAN SOCIETY OF PHILADELPHIA;

OLINTHUS GREGORY, LL.D.

OF THE ROYAL MILITARY ACADEMY, WOOLWICH, AND HONORARY MEMBER OF THE LITERARY AND PHILOSOPHICAL SOCIETY, NEWCASTLE-UPON-TYNE; AND

MR. NEWTON BOSWORTH,

OF CAMBRIDGE;

ASSISTED BY OTHER GENTLEMEN OF EMINENCE, IN DIFFERENT DEPARTMENTS OF LITERATURE.

VOL. X.

Q — SOY.

LONDON:

PRINTED FOR G. KEARSLEY; J. WALKER; J. STOCKDALE; R. LEA; E. JEFFERY; CROSBY AND CO.; SHERWOOD, NEELY, AND JONES; SUTTABY, EVANCE, AND CO.; J. BLACKLOCK; W. LOWE; J. BOOTH; J. RODWELL; BELL AND BRADFUTE, EDINBURGH; BRASH AND REID, GLASGOW; AND M. KEENE, DUBLIN.

1813.

PANTOLOGIA.

Q.

Q, A consonant, borrowed from the Latin or French, for which the Saxons generally used cp, *cw*; and the sixteenth letter of the alphabet.

The name of this letter is *cue*, from *queue*, French, tail; its form being that of an O with a tail.

The Q has this peculiar to it, that it is always followed by an U, and is, therefore, reckoned among the mutes.

The Q is formed from the Hebrew ק, koph; which most other languages have borrowed; though some of them have rejected it again, particularly the Greeks, who now only retain it as a numeral character, called κοππα επισημον.

In effect, there is that resemblance between the Q and C, in some languages, and the K in others, that many grammarians, in imitation of the Greeks, banish the Q as a superfluous letter. Papias even affirms, that all the Latin words now wrote with a Q, were written among the ancient Romans with a C; but we want better authorities for this. For, though that may hold in many cases, insomuch that some write indifferently *quur*, or *cur*; *cum*, or *quum*; *quotidie*, or *cotidie*, &c. yet does it not thence follow, that they ever wrote *cis*, *cæ*, *cid*, for *quis*, *quæ*, *quid*. What inscriptions authorize such a reading?

Far from this, the ancients sometimes substituted Q for C; and wrote *quojus*, *quoi*; for *cujus*, *cui*, &c.

Varro, however, and some other grammarians, as we are told by Censorinus, &c. would never use the Q. The truth is, its use or disuse seems to have been so little settled, and agreed on, that the poets used the Q or C indifferently, as best suited their measures; it being a rule, that the Q joined the two following vowels into one syllable; and that the C imported them to be divided.

Hence it is, that Lucretius uses *cuiret* for three syllables, in lieu of *quiret*; *acua*, for *aqua*; and that Plautus uses *relicuum*, for *reliquum*; as in *quod dedi, datum non vellum, relicuum non*; where the *cuum* must be two syllables, otherwise the trochaic verse will be lame of a foot

In the French, the sound of the Q and K are so near akin, that some of their nicest authors think the former might be spared. Ramus adds, that, till the establishment of royal professors in the university of Paris, under Francis I. they always used Q in the Latin the same as in the French; pronouncing *kis*, *kalis*, *kantus*, &c. for *quis*, *qualis*, *quantus*. See K.

Some very learned men make Q a double letter, as well as K and X. According to them, Q is evidently a C and U joined together.

It is not enough that the sound is the same, but they see the traces of the CU in the figure of the Q; the V being only laid obliquely, so as to come within the cavity of the C; as C ⊰.

To confirm this, they say the ancients wrote *qi*, *qæ*, *qid*. Though Jos. Scaliger, Littleton, &c. think this no proof of the point; for in Gruter's inscriptions we find not only the Q, but also the C, put for QU; as *Cintus*, *Quintus*; *sicis* for *siquis*, &c. Yet nobody ever imagined the C a double letter.

Q, among the ancients, was a numeral letter, signifying 500; as in the verse,

Q velut A cum D quingentos vult numerare.

A dash over it, as $\overline{Q}$, denoted it to signify five hundred thousand.

Q is also used as an abbreviature in several arts. Q. *pl.* in physicians bills, stand for

quantum placet, or *quantum vis*, as much as you please of a thing; *q. s.* for *quantum sufficit*, or as much as is necessary; *q. v.* for *quantum vis*, as much as you will.

Q. E. D. among mathematicians, signifies *quod erat demonstrandum*, which was to be demonstrated.

Q. E. F. *quod erat faciendum*, which was to be done.

Q. D. is also frequently used, among grammarians, &c. for *quasi dictum*, as if it were said, &c. or as who should say.

Q, in the proper names of the Romans, signifies Quintus, or Quintius. Upon the French coins this letter denotes that they were struck at Perpignan.

QUACHA. See BARB.

To QUACK. *v. a.* (*quacken*, Dutch.) 1. To cry like a duck (*King*). 2. To chatter boastingly; to brag loudly; to talk ostentatiously (*Hudibras*).

QUACK. *s.* (from the verb.) 1. A boasted pretender to arts which he does not understand (*Felton*). 2. A vain boasting pretender to physic; one who proclaims his own medical abilities in public places (*Addison*). 3. An artful tricking practitioner in physic (*Pope*).

QUA'CKERY. *s.* (from *quack.*) Mean or bad acts in physic: also pretensions to any art.

QUA'CKSALVER. *s.* (*quack* and *salve.*) One who brags of medicines or salves; a medicaster; a charlatan (*Burton*).

QUADI, a German nation near the country of the Marcomanni, on the borders of the Danube. They rendered themselves celebrated by their opposition to the Romans, by whom they were often defeated, though not totally subdued.

QUADRA and VANCOUVER ISLAND, an island on the N.W. coast of America, on the W. side of which is Nootka Sound. It was so named by captain Vancouver in compliment to senor Quadra, the Spanish commandant at Nootka. It is about 300 miles in length, and 80 in its greatest breadth.

QUADRAGE'SIMAL. *a.* (*quadragesimal*, French; *quadragesima*, Latin.) Lenten; belonging to lent; used in lent (*Sanderson*).

QUA'DRANGLE. *s.* (*quadratus* and *angulus*, Lat.) A square; a surface with four right angles (*Howel*).

QUADRA'NGULAR. *a.* (from *quadrangle.*) Square; having four right angles (*Woodward*).

QUADRANT, in geometry, is either the quarter or fourth part of a circle, or the fourth part of its circumference; the arch of which, therefore, contains 90 degrees.

QUADRANT also denotes a mathematical instrument, of great use in astronomy and navigation, for taking the altitudes of the sun and stars, as also taking angles in surveying, heights and distances, &c.

This instrument is variously contrived, and furnished with different apparatus, according to the various uses it is intended for; but they have all this in common, that they consist of the quarter of a circle, whose limb or arch is divided into 90°, &c. Some have a plummet suspended from the centre, and are furnished either with plain sights, or a telescope, to look through.

The principal and most useful quadrants, are the common surveying quadrant, the astronomical quadrant, Adams's quadrant, Cole's quadrant, Collins's or Sutton's quadrant, Davis's quadrant, Gunter's quadrant, Hadley's quadrant, the horodictical quadrant, and the sinical quadrant, &c. Of these in their order. See also MURAL QUADRANT.

1. *The Common, or Surveying Quadrant.*—This instrument ABC, fig. 1, pl. 147, is made of brass, or wood, &c.; the limb or arch of which BC is divided into 90°, and each of these farther divided into as many equal parts as the space will allow, either diagonally or otherwise. On one of the radii AC, are fitted two moveable sights; and to the centre is sometimes also annexed a label, or moveable index AD, bearing two other sights; but instead of these last sights, there is sometimes fitted a telescope. Also from the centre hangs a thread with a plummet; and on the under side or face of the instrument is fitted a ball and socket, by means of which it may be put into any position. The general use of it is for taking angles in a vertical plane, comprehended under right lines going from the centre of the instrument, one of which is horizontal, and the other is directed to some visible point. But besides the parts above described, there is often added on the face, near the centre, a kind of compartment EF, called a quadrat, or geometrical square, which is a kind of separate instrument, and is particularly useful in altimetry and longimetry, or heights and distances.

This quadrant may be used in different situations; in each of them the plane of the instrument must be set parallel to that of the eye and the objects whose angular distance is to be taken. Thus, for observing heights or depths, its plane must be disposed vertically, or perpendicular to the horizon; but to take horizontal angles or distances, its plane must be disposed parallel to the horizon.

Again, heights and distances may be taken two ways, viz. by means of the fixed sights and plummet, or by the label; as also, either by the degrees on the limb, or by the quadrat. Thus, fig. 2, pl. 24, shews the manner of taking an angle of elevation with this quadrant; the eye is applied at C, and the instrument turned vertically about the centre A, till the object R be seen through the sights on the radius AC; then the angle of elevation RAH, made with the horizontal line KAH, is equal to the angle BAD, made by the plumb line and the other radius of the quadrant, and the quantity of it is shewn by the degrees in the arch BD cut off by the plumb line AD.

2. *The Astronomical Quadrant*, is a large one, usually made of brass or iron bars; having its limb EF (fig. 3, pl. 147) nicely divided, either diagonally or otherwise, into degrees, minutes, and seconds, if room will permit, and furnished either with two pair of plain sights or two telescopes, one on the side of the quadrant at AB, and the other CD moveable about the centre by means of the screw G. The dented wheels I and H serve to direct the instrument to any object or phenomenon.

The application of this useful instrument, in taking observations of the sun, planets, and fixed stars, is obvious; for being turned horizontally upon its axis, by means of the telescope AB, till the object is seen through the moveable telescope, then the degrees, &c. cut by the index, give the altitude, &c. required.

3. *Cole's Quadrant*, is a very useful instrument, invented by Mr. Benjamin Cole. It consists of six parts, viz. the staff AB (fig. 11, pl. 147); the quadrantal arch DE; three vanes A, B, C; and the vernier FG. The staff is a bar of wood about two feet long, an inch and a quarter broad, and of a sufficient thickness to prevent it from bending or warping. The quadrantal arch is also of wood; and is divided into degrees and third parts of degrees, to a radius of about nine inches; and to its extremities are fitted two radii, which meet in the centre of the quadrant by a pin, about which it easily moves. The sight-vane A is a thin piece of brass, near two inches in height, and one broad, set perpendicularly on the end of the staff A, by means of two screws passing through its foot. In the middle of this vane is drilled a small hole, through which the coincidence or meeting of the horizon and solar spot is to be viewed. The horizon-vane B is about an inch broad, and two inches and a half high, having a slit cut through it of near an inch long, and a quarter of an inch broad; this vane is fixed in the centre-pin of the instrument, in a perpendicular position, by means of two screws passing through its foot, by which its position with respect to the sight-vane is always the same, their angle of inclination being equal to 45 degrees. The shade-vane C is composed of two brass plates. The one, which serves as an arm, is about four inches and a half long, and three-fourths of an inch broad, being pinned at one end to the upper limb of the quadrant by a screw, about which it has a small motion; the other end lies in the arch, and the lower edge of the arm is directed to the middle of the centre-pin; the other plate, which is properly the vane, is about two inches long, being fixed perpendicularly to the other plate, at about half an inch distance from that end next the arch; this vane may be used either by its shade, or by the solar spot cast by a convex lens placed in it. And because the wood work is often subject to warp or twist, therefore this vane may be rectified by means of a screw, so that the warping of the instrument may occasion no error in the observation, which is performed in the following manner:—Set the line G on the vernier against a degree on the upper limb of the quadrant, and turn the screw on the backside of the limb forward or backward, till the hole in the sight-vane, the centre of the glass, and the sunk spot in the horizon-vane, lie in a right line.

To find the sun's altitude by this instrument.—Turn your back to the sun, holding the staff of the instrument with the right hand, so that it be in a vertical plane passing through the sun; apply one eye to the sight-vane, looking through that and the horizon-vane till the horizon be seen; with the left hand slide the quadrantal arch upwards, till the solar spot or shade, cast by the shade-vane, fall directly upon the spot or slit in the horizon-vane; then will that part of the quadrantal arch which is raised above G or S (according as the observation respects either the solar spot or shade) shew the altitude of the sun at that time. But for the meridian altitude, the observation must be continued, and as the sun approaches the meridian, the sea will appear through the horizon-vane, which completes the observation; and the degrees and minutes, counted as before, will give the sun's meridian altitude: or the degrees counted from the lower limb upwards will give the zenith distance.

4. *Adams's Quadrant*, differs only from Cole's quadrant, just described, in having an horizontal vane, with the upper part of the limb lengthened; so that the glass, which casts the solar spot on the horizon-vane, is at the same distance from the horizon-vane as the sight-vane at the end of the index.

5. *Collins's* or *Sutton's Quadrant* (fig. 8, pl. 147.), is a stereographic projection of one quarter of the sphere between the tropics, upon the plane of the ecliptic, the eye being in its north pole; and fitted to the latitude of London. The lines running from right to left, are parallels of altitude; and those crossing them are azimuths. The smaller of the two circles, bounding the projection, is one quarter of the tropic of Capricorn; and the greater is a quarter of the tropic of Cancer. The two ecliptics are drawn from a point on the left edge of the quadrant, with the characters of the signs upon them; and the two horizons are drawn from the same point. The limb is divided both into degrees and time; and by having the sun's altitude, the hour of the day may here be found to a minute. The quadrantal arches next the centre contain the calendar of months; and under them, in another arch, is the sun's declination. On the projection are placed several of the most remarkable fixed stars between the tropics; and the next below the projection is the quadrant and line of shadows.

To find the time of the sun's rising or setting, his amplitude, his azimuth, hour of the day, &c. by this quadrant.—Lay the thread on the day and the month, and bring the bead to the proper ecliptic, either of summer or winter, according to the season, which is called rectifying; then by moving the thread bring the bead to the horizon, in which case the thread will cut the limb in the point of the time of the sun's rising or setting before or after six: and at the same time the bead will cut the horizon in the degrees of the sun's amplitude. Again, observing the sun's altitude with the quadrant, and supposing it found to be 45° on the 5th of May, lay the thread over the 5th of May; then bring the bead to the summer ecliptic, and carry it to the parallel of altitude 45°; in which case the thread will cut the limb at 55° 15′, and the hour will be seen among the hour-lines to be either 41m. past nine in the morning, or 19m. past two in the afternoon.—Lastly, the bead shews among the azimuths the sun's distance from the south 50° 41′.

But note, that if the sun's altitude be less than what it is at six o'clock, the operation must be performed among those parallels above the upper horizon; the bead being rectified to the winter ecliptic.

6. *Davis's Quadrant*, the same as the BACKSTAFF; which see.

7. *Gunner's Quadrant* (fig. 6, pl. 147.), sometimes called the gunner's square, is used for elevating and pointing cannon, mortars, &c. and consists of two branches either of wood or brass, between which is a quadrantal arch divided into 90°, and furnished with a thread and plummet.

The use of this instrument is very easy; for if the longer branch, or bar, be placed in the mouth of the piece, and it be elevated till the plummet cut the degree necessary to hit a proposed object, the thing is done.

Sometimes on the sides of the longer bar are noted the division of diameters and weights of iron balls, as also the bores of pieces.

8. *Gunter's Quadrant*, so called from its inventor Edmund Gunter (fig. 4, pl. 147.), beside the apparatus of other quadrants, has a stereographic pro-

jection of the sphere on the plane of the equinoctial; and also a calendar of the months, next to the divisions of the limb; by which, beside the common purposes of other quadrants, several useful questions in astronomy, &c. are easily resolved.

9. *Hadley's Quadrant* (fig. 7, pl. 147.), so called from its inventor John Hadley, Esq. is now universally used as the best of any for nautical and other observations.

It seems the first idea of this excellent instrument was suggested by Dr. Hooke; for Dr. Sprat, in his History of the Royal Society, p. 246, mentions the invention of a new instrument for taking angles by reflection, by which means the eye at once sees the two objects both as touching the same point, though distant almost to a semicircle; which is of great use for making exact observations at sea. This instrument is described and illustrated by a figure in Hooke's Posthumous works, p. 503. But as it admitted of only one reflection, it would not answer the purpose. The matter, however, was at last effected by sir Isaac Newton, who communicated to Dr. Halley a paper of his own writing, containing the description of an instrument with two reflections, which, soon after the doctor's death, was found among his papers by Mr. Jones, by whom it was communicated to the Royal Society, and it was published in the Philos. Trans. for the year 1742. How it happened that Dr. Halley never mentioned this in his lifetime, is hard to say; but it is very extraordinary; more especially as Mr. Hadley had described, in the Trans. for 1731, his instrument, which is constructed on the same principles. Mr. Hadley, who was well acquainted with sir Isaac Newton, might have heard him say, that Dr. Hooke's proposal could be effected by means of a double reflection; and perhaps in consequence of this hint, he might apply himself, without any previous knowledge of what Newton had actually done, to the construction of his instrument. Mr. Godfrey too, of Pennsylvania, had recourse to a similar expedient; for which reason some gentlemen of that colony have ascribed the invention of this excellent instrument to him. The truth may probably be, that each of these gentlemen discovered the method independent of one another. See also Trans. of the American Society, vol. i. p. 21 Appendix.

This instrument consists of the following particulars:—1. An octant, or the eighth part of a circle, ABC. 2. An index D. 3. The speculum F. 4. Two horizontal glasses, F, G. 5. Two screens, K and K. 6. Two sight-vanes, H and I.

The octant consists of two radii AB, AC, strengthened by the braces L, M, and the arch BC; which, though containing only 45°, is nevertheless divided into 90 primary divisions, each of which stands for degrees, and are numbered 0, 10, 20, 30, &c. to 90; beginning at each end of the arch for the convenience of numbering both ways, either for altitudes or zenith distances: also each degree is subdivided into minutes, by means of a vernier. But the number of these divisions varies with the size of the instrument.

The index D is a flat bar, moveable about the centre of the instrument; and that part of it which slides over the graduated arch BC, is open in the middle, with Vernier's scale on the lower part of it; and underneath is a screw, serving to fasten the index against any division.

The speculum E is a piece of flat glass, quicksilvered on one side, set in a brass box, and placed perpendicular to the plane of the instrument, the middle part of the former coinciding with the centre of the latter: and because the speculum is fixed to the index, the position of it will be altered by the moving of the index along the arch. The rays of an observed object are received on the speculum, and from thence reflected on one of the horizon glasses F or G; which are two small pieces of looking glass placed on one of the limbs, their faces being turned obliquely to the speculum, from which they receive the reflected rays of objects. This glass F has only its lower part silvered, and set in brass-work; the upper part being left transparent to view the horizon. The glass G has in its middle a transparent slit, through which the horizon is to be seen. And because the warping of the materials, and other accidents, may distend them from their true situation, there are three screws passing through their feet, by which they may be easily replaced.

The screens are two pieces of coloured glass, set in two square brass frames K and K, which serve as screens to take off the glare of the sun's rays, which would otherwise be too strong for the eye: the one is tinged much deeper than the other; and as they both move on the same centre, they may be both or either of them used: in the situation they appear in the figure, they serve for the horizon-glass F; but when they are wanted for the horizon-glass G, they must be taken from their present situation, and placed on the quadrant above G.

The sight-vanes are two pins H and I, standing perpendicularly to the plane of the instrument: that at H has one hole in it, opposite to the transparent slit in the horizon-glass G; the other, at I, has two holes in it, the one opposite to the middle of the transparent part of the horizon-glass F, and the other rather lower than the quicksilvered part: this vane has a piece of brass on the back of it, which moves round a centre, and serves to cover either of the holes.

Of the observations.—There are two sorts of observations to be made with this instrument: the one is when the back of the observer is turned towards the object, and therefore called the back observation; the other when the face of the observer is turned towards the object, which is called the fore observation.

To rectify the instrument for the fore observation:—Slacken the screw in the middle of the handle behind the glass F; bring the index close to the button *h*; hold the instrument in a vertical position, with the arch downwards; look through the right hand hole in the vane I, and through the transparent part of the glass F, for the horizon; and if it lie in the same right line with the image of the horizon seen on the silvered part, the glass F is rightly adjusted; but if the two horizontal lines disagree, turn the screw which is at the end of the handle backward or forward, till those lines coincide; then fasten the middle screw of the handle, and the glass is rightly adjusted.

To take the sun's altitude by the fore observation.—Having fixed the screens above the horizon-glass F, and suited them proportionally to the strength of the sun's rays, turn your face towards the sun, holding the instrument with your right hand, by the braces L and M, in a vertical position, with the arch downward; put your eye close to the right hand hole in the vane I, and view the horizon through the transparent part of the horizon-glass F, at the same time moving the index D with the left hand, till the reflex solar spot coincides with

the line of the horizon; then the degrees counted from C, or that end next your body, will give the sun's altitude at that time, observing to add or subtract 16 minutes according as the upper or lower edge of the sun's reflex image is made use of.

But to get the sun's meridian altitude, which is the thing wanted for finding the latitude; the observations must be continued; and as the sun approaches the meridian the index D must be continually moved towards B, to maintain the coincidence between the reflex solar spot and the horizon; and consequently as long as this motion can maintain the same coincidence, the observation must be continued, till the sun has reached the meridian, and begins to descend, when the coincidence will require a retrograde motion of the index, or towards C; and then the observation is finished, and the degrees counted as before will give the sun's meridian altitude, or those from B will give the zenith distance; observing to add the semi-diameter, or 16′, when his lower edge is brought to the horizon; or to subtract 16′, when the horizon and upper edge coincide.

To take the altitude of a star by the fore observation.—Through the vane H, and the transparent slit in the glass G, look directly to the star; and at the same time move the index, till the image of the horizon behind you, being reflected by the great speculum, be seen in the silvered part of G, and meet the star; then will the index shew the degrees of the star's altitude.

To rectify the instrument for the back observation.—Slacken the screw in the middle of the handle, behind the glass G; turn the button *h* on one side, and bring the index as many degrees before o as is equal to double the dip of the horizon at your height above the water; hold the instrument vertical, with the arch downward; look through the hole of the vane H; and if the horizon, seen through the transparent slit in the glass G, coincide with the image of the horizon seen in the silvered part of the same glass, then the glass G is in its proper position; but if not, set it by the handle, and fasten the screw as before.

To take the sun's altitude by the back observation.—Put the stem of the screens K and K into the hole *r*, and in proportion to the strength or faintness of the sun's rays, let either one or both or neither of the frames of those glasses be turned close to the face of the limb; hold the instrument in a vertical position, with the arch downward, by the braces L and M, with the left hand; turn your back to the sun, and put one eye close to the hole in the vane H, observing the horizon through the transparent slit in the horizon-glass G; with the right hand move the index D, till the reflected image of the sun be seen in the silvered part of the glass G, and in a right line with the horizon; swing your body to and fro, and if the observation be well made, the sun's image will be observed to brush the horizon, and the degrees reckoned from C, or that part of the arch farthest from your body, will give the sun's altitude at the time of observation: observing to add 16′ or the sun's semi-diameter if the sun's upper edge be used, and subtract the same for the lower edge.

The direction just given, for taking altitudes at sea, would be sufficient, but for two corrections that are necessary to be made before the altitude can be accurately determined, viz. one on account of the observer's eye being raised above the level of the sea, and the other on account of the refraction of the atmosphere, especially in small altitudes. See DIP and REFRACTION.

10. *Horodictical Quadrant*, a pretty commodious instrument, and is so called from its use in telling the hour of the day. Its construction is as follows:—From the centre of the quadrant C (fig. 5, pl. 147.), whose limb AB is divided into 90°, describe seven concentric circles at any intervals; and to these add the signs of the zodiac, in the order represented in the figure. Then, applying a ruler to the centre C and the limb A B, mark upon the several parallels the degrees corresponding to the altitude of the sun, when in them, for the given hours; connect the points belonging to the same hour with a curve line, to which add the number of the hour. To the radius CA fit a couple of sights, and to the centre of the quadrant C tie a thread with a plummet, and upon the thread a bead to slide.

Now, if the bead be brought to the parallel in which the sun is, and the quadrant be directed to the sun, till a visual ray pass through the sights, the bead will shew the hour. For the plummet, in this situation, cuts all the parallels in the degrees corresponding to the sun's altitude. And since the bead is in the parallel which the sun describes, and because hour-lines pass through the degrees of altitude to which the sun is elevated every hour, therefore the bead must shew the present hour.

11. *Sinical Quadrant*, is one of some use in navigation. It consists of several concentric quadrantal arches, divided into eight equal parts by means of radii, with parallel right lines crossing each other at right angles. Now any one of the arches, as BC (fig. 10, pl. 147.), may represent a quadrant of any great circle of the sphere, but is chiefly used for the horizon or meridian. If then BC be taken for a quadrant of the horizon, either of the sides, as AB, may represent the meridian; and the other side AC, will represent a parallel, or line of east and west; all the other lines, parallel to AB, will be also meridians; and all those parallel to AC, east and west lines, or parallels. Again, the eight spaces into which the arches are divided by the radii, represent the eight points of the compass in a quarter of the horizon; each containing 11° 15′. The arch BC is likewise divided into 90°, and each degree subdivided into 12′, diagonalwise. To the centre is fixed a thread, which, being laid over any degree of the quadrant, serves to divide the horizon.

If the sinical quadrant be taken for a fourth part of the meridian, one side of it AB may be taken for the common radius of the meridian and equator; and then the other AC will be half the axis of the world. The degrees of the circumference BC will represent degrees of latitude; and the parallels to the side AB, assumed from every point of latitude to the axis AC, will be radii of the parallels of latitude, as likewise the cosine of those latitudes.

Hence, suppose it be required to find the degrees of longitude contained in 83 of the lesser leagues in the parallel of 48°: lay the thread over 48° of latitude on the circumference, and count thence the 83 leagues on AB, beginning at A; this will terminate in H, allowing every small interval four leagues. Then tracing out the parallel HE, from the point H to the thread; the part AE of the thread shews that 125 greater or equinoctial leagues make 6° 15′; and therefore that the 83 lesser leagues AH, which make the difference of

longitude of the course, and are equal to the radius of the parallel HE, make 6° 15′ of the said parallel.

When the ship sails upon an oblique course, such course, beside the north and south greater leagues, gives lesser leagues easterly and westerly, to be reduced to degrees of longitude of the equator. But these leagues being made neither on the parallel of departure, nor on that of arrival, but in all the intermediate ones, there must be found a mean proportional parallel between them. To find this, there is on the instrument a scale of cross latitudes. Suppose then it were required to find a mean parallel between the parallels of 40° and 60°; take with the compasses the middle between the 40th and 60th degree on the scale: this middle point will terminate against the 51st degree, which is the mean parallel sought.

The chief use of the sinical quadrant is to form upon it triangles similar to those made by a ship's way with the meridians and parallels; the sides of which triangles are measured by the equal intervals between the concentric quadrants and the lines N and S, E and W: and every fifth line and arch is made deeper than the rest. Now, suppose a ship has sailed 150 leagues north-east by north, or making an angle of 33° 45′ with the north part of the meridian: here are given the course and distance sailed, by which a triangle may be formed on the instrument similar to that made by the ship's course; and hence the unknown parts of the triangle may be found. Thus, supposing the centre A to represent the place of departure; count, by means of the concentric circles along the point the ship sailed on, viz. AD, 150 leagues: then in the triangle AED, similar to that of the ship's course, find AE=difference of latitude, and DE =difference of longitude, which must be reduced according to the parallel of latitude come to.

Sutton's Quadrant. See *Collins's Quadrant.*

12. *Quadrant of Altitude* (fig. 9, pl. 147.), is an appendix to the artificial globe, consisting of a thin slip of brass, the length of a quarter part of one of the great circles of the globe, and graduated. At the end, where the division terminates, is a nut riveted on, and furnished with a screw, by means of which the instrument is fitted on the meridian, and moveable round upon the rivet to all points of the horizon, as represented in the figure referred to.—Its use is to serve as a scale in measuring altitudes, amplitudes, azimuths, &c.

QUADRA'NTAL. *a.* (from *quadrant.*) Included in the fourth part of a circle (*Derham*).

QUADRANTAL TRIANGLE, is a spherical triangle, which has one side equal to a quadrant or quarter part of a circle.

QUADRAT, called also geometrical square, and line of shadows: it is often an additional member on the face of Gunter's and Sutton's quadrants; and is chiefly useful in taking heights or depths.

QUADRAT, in astrology, is the same as quartile, being an aspect of the heavenly bodies when they are distant from each other a quadrant, or 90°, or 3 signs, and is thus marked □.

QUA'DRATE. *a.* (*quadratus*, Latin.) 1. Square; having four equal and parallel sides. 2. Divisible into four equal parts (*Hakewill*). 3. (*quadrans*, Lat.) Suited; applicable (*Harvey*).

QUA'DRATE. *s.* A square; a surface with four equal and parallel sides (*Spenser*).

To QUA'DRATE. *v. n.* (*quadro*, Latin; *quadrer*, French.) To suit; to be accommodated (*Addison*).

QUADRATIC EQUATIONS, in algebra, are those in which the unknown quantity is of two dimensions, or raised to the second power. See EQUATION, and ALGEBRA.

Quadratic equations are either simple, or affected, that is, compound.

A simple quadratic equation, is that which contains the second power only of the unknown quantity, without any other power of it: as $x^2=25$, or $y^2=ab$. And in this case, the value of the unknown quantity is found by barely extracting the square root on both sides of the equation: so in the equations above, it will be $x=\pm 5$, and $y=\pm\sqrt{ab}$; where the sign of the root of the known quantity is to be taken either plus or minus, for either of these may be considered as the sign of the value of the root x, since either of these, when squared, make the same square, $+5^2=25$, and $-5^2=25$ also; and hence the root of every quadratic or square has two values.

Compound or *affected quadratics*, are those which contain both the 1st and 2d powers of the unknown quantity; as $x^2+ax=b$, or $x^{2n}-ax^n=\pm b$, where n may be of any value, and then x^n is to be considered as the root or unknown quantity.

Affected quadratics are usually distinguished into three forms, according to the signs of the terms of the equation:

Thus, 1st form, $x^2+ax=b$,
2d form, $x^2-ax=b$,
3d form, $x^2-ax=-b$.

But the method of extracting the root, or finding the value of the unknown quantity x, is the same in all of them. And that method is usually performed by what is called completing the square, which is done by taking half the coefficient of the 2d term or single power of the unknown quantity, then squaring it, and adding that square to both sides of the equation, which makes the unknown side a complete square. Thus, in the equation $x^2+ax=b$, the coefficient of the 2d term being a, its half is $\frac{1}{2}a$, the square of which is $\frac{1}{4}a^2$, and this added to both sides of the equation, it becomes $x^2+ax+\frac{1}{4}a^2=\frac{1}{4}a^2+b$, the former side of which is now a complete square. The square being thus completed, its root is next to be extracted; in order to which, it is to be observed, that the root on the unknown side consists of two terms, the one of which is always x the square root of the first term of the equation, and the other part is $\frac{1}{2}a$ or half the coefficient of the 2d term: thus then the root of $x^2+ax+\frac{1}{4}a^2$ the first side of the completed equation being $x+\frac{1}{2}a$, and the root of the other side $\frac{1}{4}a^2+b$ being $\pm\sqrt{\frac{1}{4}a^2+b}$, it follows that $x+\frac{1}{2}a=\pm\sqrt{\frac{1}{4}a^2+b}$, and hence, by transposing $\frac{1}{2}a$, it is $x=-\frac{1}{2}a\pm\sqrt{\frac{1}{4}a^2+b}$, the two values of x, or roots of the given equation $x^2+a=b$. And thus is found the root, or value of x, in the three forms of equations above mentioned: thus,

1st form, $x=-\frac{1}{2}a\pm\sqrt{\frac{1}{4}a^2+b}$,
2d form, $x=+\frac{1}{2}a\pm\sqrt{\frac{1}{4}a^2+b}$,
3d form, $x=+\frac{1}{2}a\pm\sqrt{\frac{1}{4}a^2-b}$,

where it is observable that because of the double sign $\pm$ every form of quadratics has two roots. In the first and second forms those roots are one

positive and the other negative, the positive root being the less of the two in the first form, but the greater in the second form; while in the third form the roots are both positive.

It may not be amiss to shew in this place, that if there exist a quantity which substituted for x satisfies the equation of the second degree $x^2 + px = q$, and is, consequently, the value of x, that unknown will also have another value.

Substituting a for x, there would result $a^2 + pa = q$; and since, by hypothesis, a is the value of x, q will necessarily be equal to the quantity $a^2 + pa$: we may therefore write this quantity instead of q in the proposed equation, which will therefore become

$$x^2 + px = a^2 + pa.$$

Transposing all the terms of the second member into the first, it will become

$$x^2 + px - a^2 - pa = 0,$$

which may evidently be written thus,

$$x^2 - a^2 + p(x - a) = 0;$$

and because $x^2 - a^2 = (x + a)(x - a)$, we see at once that the first member is divisible by $x - a$, so as to give an exact quotient $x + a + p$; we shall therefore have

$x^2 + px - q = x^2 - a^2 + p(x - a) = (x - a)(x + a + p)$. Now it is manifest that a product is equal to zero, when either of its factors becomes nothing; we must therefore have

$(x - a)(x + a + p) = 0$, not only when $x = a$, which gives $x - a = 0$, but also when $x + a + p = 0$, whence results $x = -a - p$.

It is therefore proved that if a is one of the values of x, $-a - p$ will necessarily be the other. This result accords with the two values comprised in the formula

$$x = -\tfrac{1}{2}p \pm \sqrt{q + \tfrac{1}{4}p^2};$$

for, by taking one of the roots for a,

$-\frac{1}{2}p + \sqrt{q + \frac{1}{4}p^2}$, for example, we shall find for the other

$$-a - p = \tfrac{1}{2}p - \sqrt{q + \tfrac{1}{4}p^2} - p = -\tfrac{1}{2}p - \sqrt{q + \tfrac{1}{4}p^2},$$

which is obviously the other root comprised in the general form.

We may also see that the equation $x^2 + px = q$, or $x^2 + px - q = 0$, cannot have more than two roots. For, supposing that it could have a third represented by b, we might prove, as above, that $x - b$ must be of the number of the factors of $x^2 + px - q$, or of $(x - a)(x + a + p)$; and we may easily be assured that the terms $x - a$ and $x + a + p$, being prime to each other, or having no common factor, their product cannot have any other than they; thus $-b$ cannot be other than $-a$, or $+a + p$. See, farther, the articles EQUATIONS and ALGEBRA.

QUADRATRIX, or QUADRATIX, in geometry, is a mechanical line, by means of which, right lines are found equal to the circumference of circles, or other curves, and of the parts of the same. Or, more accurately, the quadratrix of a curve, is a transcendental curve described on the same axis, the ordinates of which being given, the quadrature of the correspondent parts in the other curve is likewise given. See CURVE.—Thus, for example, the curve AND (fig. 1, pl. 148), may be called the quadratrix of the parabola AMC, when the area APMA bears some such relation as the following to the absciss AP or ordinate PN, viz.

when APM $=$ PN^2,
or APM $=$ AP $\times$ PN,
or APM $= a \times$ PN,

where a is some given constant quantity.

The most distinguished of these quadratrices are, those of Dinostrates and of Tschirnhausen for the circle, and that of Mr. Perks for the hyperbola.

QUADRATRIX of Dinostrates, is a curve AMD, fig. 2, by which the quadrature of the circle is effected, though not geometrically, but only mechanically. It is so called from its inventor Dinostrates; and the genesis or description of it is as follows:—Divide the quadrantal arc ANB into any number of equal parts, in the points N, n, n, &c.; and also the radius AC into the same number of parts at the points P, p, p, &c. To the points of N, n, n, &c. draw the radii CN, Cn, &c.; and from the points P, p, &c. the parallels to CB, as PM, Pm, &c.: then through all the points of intersection draw the curve AMmD, and it will be the quadratrix of Dinostrates.

Or the same curve may be conceived as described by a continued motion, thus:—Conceive a radius CN to revolve with a uniform motion about the centre C, from the position AC to the position BC; and at the same time a ruler PM always moving uniformly parallel towards CB; the two uniform motions being so regulated that the radius and the ruler shall arrive at the position BC at the same time. For thus the continual intersection M, m, &c. of the revolving radius, and moving ruler, will describe the quadratrix AMm, &c. Hence,

1. *For the equation of the quadratrix.*—Since, from the relation of the uniform motions, it is always, AB : AN : : AC : AP; therefore if AB $= a$, AC $= r$, AP $= x$, and AN $= z$, it will be $a : z : : r : x$, or $ax = rz$, which is the equation of the curve.

Or, if s denote the sine NE of the arc AN, and $y =$ PM the ordinate of the curve AM, its abscissa AP being x; then, by similar triangles, CE : CP : : EN : PM, that is, $\sqrt{r^2 - s^2} : r - x : : s : y$,

and hence $y\sqrt{r^2 - s^2} = r - x \cdot s$, the equation of the curve. And when the relation between AB and AN is given, in terms of that between AC and AP, hence will be expressed the relation between the sine EN and the radius CB, or s will be expressed in terms of r and x; and consequently the equation of the curve will be expressed in terms of r, x, and y only.

2. The base of the quadratrix CD is a third proportional to the quadrant AB and the radius AC or CB; i. e. CD : CB : : CB : AB. Hence the rectification and quadrature of the circle.

3. A quadrantal arc DF described with the centre C and radius CD, will be equal in length to the radius CA or CB.

4. CDF being a quadrant inscribed in the quadratrix AMB, fig. 3, if the base CD be $= 1$; and the circular arc DG $= x$; then in the area CFMD

$$= x - \frac{1}{9}x^3 - \frac{1}{225}x^5 - \frac{2}{6615}x^7, \text{ &c.}$$

QUADRATURE, in geometry, denotes the squaring, or reducing a figure to a square. Thus, the finding of a square, which shall contain just as much surface or area as a circle, an ellipsis, a triangle, &c. is the quadrature of a circle, ellipsis, &c. The quadrature, especially among the ancient mathematicians, was a great postulatum. The quadrature of rectilineal figures is easily found, for it is merely the finding their areas or surfaces, i. e. their squares; for the squares of equal areas are easily found by only extracting the roots of the areas thus found. See GEOMETRY. The quadrature of curvilinear spaces is of more difficult

investigation; and in this respect extremely little was done by the ancients, except the quadrature of the parabola by Archimedes. In 1657, sir Paul Neil, lord Brouncker, and sir Christopher Wren, geometrically demonstrated the equality of some curvilinear spaces to rectilinear spaces; and soon after the like was proved both at home and abroad of other curves, and it was afterwards brought under an analytical calculus; the first specimen of which was given to the public in 1688 by Mercator, in a demonstration of lord Brouncker's quadrature of the hyperbola, by Dr. Wallis's reduction of a fraction into an infinite series of division. Sir Isaac Newton, however, had before discovered a method of attaining the quantity of all quadruple curves analytically by his fluxions before 1668. It is disputed between sir Christopher Wren and Mr. Huygens which of them first discovered the quadrature of any determinate cycloidal space. Mr. Leibnitz afterwards found that of another space; and in 1669 Bernoulli discovered the quadrature of an infinity of cycloidal spaces, both segments and sectors, &c.

The quadrature of curvilinear spaces, as the circle, ellipsis, parabola, &c. makes part of the higher geometry; wherein the doctrine of fluxions is of singular use. We shall give an example or two.

Let ARC (pl. 148, fig. 4.) be a curve of any kind, whose ordinates Rb, CB, are perpendicular to the axis AB. Imagine a right line, bRg, perpendicular to AB, to move parallel to itself from A towards B; and let the velocity thereof, or the fluxion of the absciss, Ab, in any proposed position of that line, be denoted by $\dot{bd}$, then will $\dot{bn}$, the rectangle under bd and the ordinate, bR, express the corresponding fluxion of the generating area, AbR; which fluxion, if A$b=x$, and bR$=y$, will be $y\dot{x}$. From whence, by substituting for y or $\dot{x}$, according to the equation of the curve, and taking the fluent, the area itself, AbR, will become known.

But in order to render this still more plain, we shall give some examples, wherein x, y, z, and u, are all along put to denote the absciss, ordinate, curve-line, and the area respectively, unless where the contrary is expressly specified. Thus, if the area of a right angled triangle be required; put the base AH (fig. 5.)$=a$, the perpendicular HM$=b$, and let AB$=x$, be any portion of the base, considered as a flowing quantity; and let BR$=y$ be the ordinate, or perpendicular corresponding. Then because of the similar triangles, AHM and ABR, we shall have $a : b :: x : y = \frac{bx}{a}$. Whence $y\dot{x}$, the fluxion of the area ABR, is, in this case, equal to $\frac{\dot{bx}x}{a}$; and consequently the fluent thereof, or the area itself, $=\frac{bx^2}{2a}$ which, therefore, when $x=a$, and BR coincides with HM, will become $\frac{ab}{2} = \frac{\text{AH} \times \text{HM}}{2}$ = the area of the whole triangle AHM; as is also demonstrable from the principles of common geometry.

Again, let the curve ARMH (fig. 6.), whose area you would find, be the common parabola; in which case, if AB$=x$, and BR$=y$, and the parameter$=a$; we shall have $y^2=ax$, and $y=a^{\frac{1}{2}}x^{\frac{1}{2}}$: and therefore, $\dot{u}\,(=y\dot{x})=a^{\frac{1}{2}}x^{\frac{1}{2}}\dot{x}$; whence $u=\frac{2}{3}\times a^{\frac{1}{2}}x^{\frac{3}{2}}=\frac{2}{3}$ $a^{\frac{1}{2}}x^{\frac{1}{2}} \times x=\frac{2}{3}yx=\frac{2}{3}\times \text{AB}\times \text{BR}$. Hence a parabola is two-thirds of a rectangle of the same base and altitude.

The same conclusion might have been found more easily in terms of y; for $x=\frac{y^2}{a}$, and $\dot{x}=\frac{2y\dot{y}}{a}$; and consequently $\dot{u}\,(=y\dot{x})=\frac{2y^2\dot{y}}{a}$, whence $u=\frac{2y^3}{3a}=\frac{2y}{3}\times\frac{y^2}{a}=\frac{2y}{3}\times x=\frac{2}{3}\times \text{AB}\times \text{BR}$, as before.

To determine the area of the hyperbolic curve AMRB (fig. 7.), whose equation is $x^m y^n=a^{m+n}$; whence we have $y=a^{\frac{m+n}{n}}\div x^{\frac{m}{n}}=a^{\frac{m+n}{n}}\times x^{\frac{-m}{n}}$; and therefore $\dot{u}\,(=y\dot{x})=a^{\frac{m+n}{n}}\times x^{\frac{m-n}{n}}\dot{x}$, whose fluent is $u=\frac{a^{\frac{m+n}{n}}\times x^{\frac{m-n}{n}}x}{\frac{m+n}{n}\times 1-\frac{m}{n}}=\frac{na^{\frac{m+n}{n}}\times x^{\frac{n-m}{n}}}{n-m}$; which, when $x=0$, will also be $=0$, if n be greater than m; therefore the fluent requires no correction in this case: the area, AMRB, included between the asymptote, AM, and the ordinate BR, being truly defined by $\frac{na^{\frac{m+n}{n}}\times x^{\frac{n-m}{n}}}{n-m}$, as above. But if n be less than m, then the fluent, when $x=0$, will be infinite, because the index $\frac{n-m}{n}$ being negative, 0 becomes a divisor to na^{m+n}; whence the area, AMRB, will also be infinite.

But here, the area, BRH, comprehended between the ordinate, the curve, and the part, BH, of the asymptote, is finite, and will be truly expressed by $\frac{na^{\frac{m+n}{n}}\times x^{\frac{n-m}{n}}}{m-n}$, the same quantity with its signs changed; for the fluxion of the part AMRB, being $a^{\frac{m+n}{n}}\times x^{\frac{-m}{n}}\dot{x}$, that of its supplement BRH must consequently be $-a^{\frac{m+n}{n}}\times x^{\frac{-n}{n}}\dot{x}$, whereof the fluent is $-\frac{a_n^{\frac{m+n}{n}}\times x^{\frac{n-m}{n}}}{1-\frac{m}{n}}=\frac{a^{\frac{m+n}{n}}\times x^{\frac{n-m}{n}}}{m-n}$ = the area, BRH, which wants no correction; because when x is infinite and the area BRH$=0$, the said fluent will also entirely vanish; since the value of $x^{\frac{n-m}{n}}$, which is a divisor to $a^{\frac{m+n}{n}}$, is then infinite.

In spirals CAR, or curves referred to a centre C, fig. 8; put $y=$ any radius CR, $x=$BN the arc of a circle described about the centre C, at any distance CB$=a$, and Cnr another ray indefinitely near CNR: then $\frac{1}{2}$ CN $\cdot$ N$n=\frac{1}{2}a\dot{x}=$CNn, and by

sim. fig. $CN^2 : CR^2$ or $a^2 : y^2 :: CN n : \frac{y^2 \dot{x}}{2a} = CR r$ the fluxion of the area described by the revolving ray CR; then the fluent of this, for any particular case, will be the quadrature of the spiral. So if, for instance, it be Archimedes's spiral, in which $x : y$ in a constant ratio suppose as $m : n$, or $my = nx$, and $y^2 = \frac{n^2 x^2}{m^2}$; hence then $CR r = \frac{y^2 \dot{x}}{2a} = \frac{n^2 x^2 \dot{x}}{2am^2}$ the fluxion of the area; the fluent of which is $\frac{n^2 x^3}{6am^2} = \frac{xy^2}{6a}$ the general quadrature of the spiral of Archimedes.

For a great many more examples consult the treatises on Fluxions, by Simpson, Dealtry, &c.

As to the quadrature of the circle in particular, or the finding a square equal to a given circle, it is a problem that has employed the mathematicians of all ages, but still without the desired success. This depends on the ratio of the diameter to the circumference, which has never yet been determined in precise numbers. Many persons have approached very near this ratio. See CIRCLE.

Strict geometry here failing, mathematicians have had recourse to other means, and particularly to a sort of curves called quadratices: but these being mechanical curves, instead of geometrical ones, or rather transcendental instead of algebraical ones, the problem cannot fairly be effected by them.

Hence recourse has been had to analytics. And the problem has been attempted by three kinds of algebraical calculations. The first of these gives a kind of transcendental quadratures, by equations of indefinite degrees. The second by vulgar numbers, though irrationally such; or by the roots of common equations, which, for the general quadrature, is impossible. The third by means of certain series, exhibiting the quantity of a circle by a progression of terms. See SERIES.

Thus, for example, the diameter of a circle being 1, it has been found that the quadrant, or one-fourth of the circumference, is equal to $\frac{1}{1} - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9}$, &c. making an infinite series of fractions, whose common numerator is 1, and denominators the natural series of odd numbers; and all these terms alternately will be too great, and too little. This series was discovered by Leibnitz and Gregory. And the same series is also the area of the circle.

If the sum of this series could be found, it would give the quadrature of the circle: but this is not yet done; nor is it at all probable that it ever will be done, though the impossibility has never yet been demonstrated, except Mr. Glenie's recent attempt can be called a demonstration.

To this it may be added, that as the same magnitude may be expressed by several different series, possibly the circumference of the circle may be expressed by some other series, whose sum may be found. And there are many other series, by which the quadrant, or area, to the diameter, has been expressed; though it has never been found that any one of them is actually summable. Such as this series, $1 - \frac{1}{6} - \frac{1}{40} - \frac{1}{112}$, &c. invented by Newton.

Other ingenious series have been invented by Halley, Hutton, &c. for which see Dr. Hutton's excellent Mensuration, and the second volume of his Tracts, now printing.

Dr. Halley's method of computing the ratio of the diameter of the circle to its circumference was considered by himself, and other learned mathematicians, as the easiest the problem admits of. And, although, in the course of a century, much easier methods have been discovered, still a celebrated mathematician of our own times has expressed an opinion, that no other aliquot part of the circumference of a circle can be so easily computed by means of its tangent as that which was chosen by Dr. Halley, viz. the arch of 30 degrees. Without taking upon him to determine whether this opinion be just or not, the Rev. John Hellins has shewn how the series by which Dr. Halley computed the ratio of the diameter to the circumference of the circle may be transformed into others of swifter convergency, and which, on account of the successive powers $\frac{1}{10}$ which occur in them, admit of an easy summation. We shall give the memoir in the author's own words.

"1. The proposed transformation is obtained by means of different forms in which the fluents of some fluxions may be expressed; and to proceed with greater clearness, I will here," says Mr. Hellins, "set down the fluxion in a general form, and its fluent, in the two series which are used in the following particular instance, and may be applied with advantage in similar cases.

"2. The fluent of $\frac{x^{m-1}\dot{x}}{1-x^n}$ is $= \frac{x^m}{m} + \frac{x^{m+n}}{m+n} + \frac{x^{m+2n}}{m+2n} + \frac{x^{m+3n}}{m+3n}$, &c. which series, being of the simplest form which the fluent seems to admit, was first discovered, and probably is the most generally useful. But it has also been found, that the fluent of the same fluxion may be expressed in series of other forms, which, though less simple than that above written, yet have their particular advantages. Amongst those other forms of series which the fluent admits of, that which suits my present purpose is $\frac{x^m}{m.1-x^n} - \frac{nx^{m+n}}{m.m+n.\ 1-x^n}\Big|^2 + \frac{n.2n.x^{m+2n}}{m.m+n.m+2n.1-x^n}\Big|^3 - \frac{n.2n.3n.x^{m+3n}}{m.m+n.m+2n.m+3n.1-x^n}\Big|^4 +$ &c. which, to say nothing of other methods, may easily be investigated by the rule given in p. 64, of the third edition of Emerson's Fluxions; or its equality with the former series may be proved by algebra.

"3. On account of the sign — before x^n, in the last series, it may be proper to remark, that its convergency, by a geometrical progression, will not cease till $\frac{x^n}{1-x^n}$ becomes $= 1$, or x becomes $= \sqrt[n]{\frac{1}{2}}$; and that when x is a small quantity, and n a large number, this series will converge almost as swiftly as the former. For instance, if x be $= \sqrt{\frac{1}{2}}$, and $n = 8$, which are the values in the following case, the former series will converge by the quantity $x^n/=\sqrt{\frac{1}{2}}\Big|^8 = \frac{1}{81}$, and this series by the quantity $\frac{x^n}{1-x^n} = \frac{\frac{1}{81}}{1-\frac{1}{81}} = \frac{1}{80}$; where the difference in convergency will be but little, and the divisions by 80 easier than those by 81.

"4. With respect to the indices m and n, as they are here supposed to be affirmative whole numbers, and will be so in the use I am about to make of them, the reader need not be detained with any observations on the cases in which these fluents will fail, when the indices have contrary signs.

"5. It may be proper further to remark, that by putting $\frac{x^n}{1-x^n} = z$, and calling the first, second, third, &c. terms of the series $\frac{x^m}{m.1-x^n} - \frac{nx^{m+n}}{m.m+n.\overline{1-x^n}^2} + \frac{n.2nx^{m+2n}}{m.m+n.m+2n.\overline{1-x^n}^3} +$ &c. A, B, C, &c. respectively, the series will be expressed in the concise and elegant notation of sir Isaac Newton, viz. $\frac{x^m}{m.1-x^n} - \frac{nzA}{m+n} + \frac{2nzB}{m+2n} - \frac{3nzC}{m+3n} +$ &c. which is well adapted to arithmetical calculation.

"6. I come now to the transformation proposed, which will appear very easy, as soon as the common series, expressing the length of an arch in terms of its tangent, is properly arranged.

"If the radius of a circle be 1, and the tangent of an arch of it be called t, it is well known that the length of that arch will be $= t - \frac{t^3}{3} + \frac{t^5}{5} - \frac{t^7}{7} + \frac{t^9}{9} - \frac{t^{11}}{11} +$ &c. Now, if the affirmative terms of this series be written in one line, and the negative ones in another, the arch will be

$$= \begin{cases} t + \frac{t^5}{5} + \frac{t^9}{9} + \frac{t^{13}}{13} + \frac{t^{17}}{17} + \text{&c.} \\ \frac{t^3}{3} + \frac{t^7}{7} + \frac{t^{11}}{11} + \frac{t^{15}}{15} + \frac{t^{19}}{19} + \text{&c.} \end{cases}$$

And if, again, the first, third, fifth, &c. term of each of these series be written in one line, and the second, fourth, sixth, &c. in another, the same arch will be expressed thus:

$$= \begin{cases} + \begin{cases} t + \frac{t^9}{9} + \frac{t^{17}}{17} + \frac{t^{25}}{25} + \frac{t^{33}}{33} + \text{&c.} \\ \frac{t^5}{5} + \frac{t^{13}}{13} + \frac{t^{21}}{21} + \frac{t^{29}}{29} + \frac{t^{37}}{37} + \text{&c.} \end{cases} \\ - \begin{cases} \frac{t^3}{3} + \frac{t^{11}}{11} + \frac{t^{19}}{19} + \frac{t^{27}}{27} + \frac{t^{35}}{35} + \text{&c.} \\ \frac{t^7}{7} + \frac{t^{15}}{15} + \frac{t^{23}}{23} + \frac{t^{31}}{31} + \frac{t^{39}}{39} + \text{&c.} \end{cases} \end{cases}$$

All which series are evidently of the first form in article 2. and therefore their values may be expressed in the second form there given, or more neatly by the Newtonian notation mentioned in article 5. In each of these series the value of n is 8.

And the value of m, $\begin{cases} \text{in the first series, is } 1; \\ \text{in the second series, is } 5; \\ \text{in the third series, is } 3; \\ \text{in the fourth series, is } 7. \end{cases}$

"If now we take $t = \sqrt{\frac{1}{3}}$, the tangent of 30°, which was chosen by Dr. Halley, we shall have the arch of 30°

$$= \begin{cases} + \begin{cases} \frac{1}{\sqrt{3}} \times :1 + \frac{1}{9.81} + \frac{1}{17.81^2} + \frac{1}{25.81^3} + \frac{1}{33.81^4}, \text{ &c.} \\ \frac{1}{9\sqrt{3}} \times :\frac{1}{5} + \frac{1}{13.81} + \frac{1}{21.81^2} + \frac{1}{29.81^3} + \frac{1}{37.81^4}, \text{ &c.} \end{cases} \\ - \begin{cases} \frac{1}{3\sqrt{3}} \times :\frac{1}{3} + \frac{1}{11.81} + \frac{1}{19.81^2} + \frac{1}{27.81^3} + \frac{1}{35.81^4}, \text{ &c.} \\ \frac{1}{27\sqrt{3}} \times :\frac{1}{7} + \frac{1}{15.81} + \frac{1}{23.81^2} + \frac{2}{31.81^3} + \frac{1}{39.81^4}, \text{ &c.} \end{cases} \end{cases}$$

Six times this quantity will be = the semicircumference when radius is 1, and = the whole circumference when the diameter is 1. If therefore we multiply the last series by 6, and write $\sqrt{12}$ for $\frac{6}{\sqrt{3}}$, and express their value in the form given in article 5. we shall have the circumference of a circle whose diameter is 1,

$$= \begin{cases} + \begin{cases} \frac{81\sqrt{12}}{80} - \frac{8A}{9.80} + \frac{16B}{17.80} - \frac{24C}{25.80} + \frac{32D}{33.80}, \text{ &c.} \\ \frac{81\sqrt{12}}{5.9.80} - \frac{8A}{13.80} + \frac{16B}{21.80} - \frac{24C}{29.80} + \frac{32D}{37.80}, \text{ &c.} \end{cases} \\ - \begin{cases} \frac{81\sqrt{12}}{3.3.80} - \frac{8A}{11.80} + \frac{16B}{19.80} - \frac{24C}{27.80} + \frac{32D}{35.80}, \text{ &c.} \\ \frac{81\sqrt{12}}{7.27.80} - \frac{8A}{15.80} + \frac{16B}{23.80} - \frac{24C}{31.80} + \frac{32D}{39.80}, \text{ &c.} \end{cases} \end{cases}$$

"7. All these new series, it is evident, converge somewhat swifter than by the powers of 80. For in the first series, which has the slowest convergency, the coefficients $\frac{8}{9}$, $\frac{16}{17}$, $\frac{24}{25}$, &c. are each of them less than 1; so that its convergency is somewhat swifter than by the powers of 80.

"8. But another advantage of these new series is, that the numerator and denominator of every term except the first, in each of them, is divisible by 8; in consequence of which, the arithmetical operation by them is much facilitated, the division by 80 being exchanged for a division by 10, which is no more than removing the decimal point. These series, then, when the factors which are common to both numerators and denominators are expunged, will stand as follows (each of which still converging somewhat quicker than by the powers of 80), and we shall have the circumference of a circle whose diameter is 1,

$$\frac{\pi}{4} = \left\{ \begin{array}{l} + \left\{ \begin{array}{l} \frac{81\sqrt{12}}{80} - \frac{A}{9.10} + \frac{2B}{17.10} - \frac{3C}{25.10} + \frac{4D}{33.10}, \text{ \&c.} \\ \frac{9\sqrt{12}}{400} - \frac{A}{13.10} + \frac{2B}{21.10} - \frac{3C}{29.10} + \frac{4D}{37.10}, \text{ \&c.} \end{array} \right. \\ - \left\{ \begin{array}{l} \frac{9\sqrt{12}}{80} - \frac{A}{11.10} + \frac{2B}{19.10} - \frac{3C}{27.10} + \frac{4D}{35.10}, \text{ \&c.} \\ \frac{3\sqrt{12}}{7.80} - \frac{A}{15.10} + \frac{2B}{23.10} - \frac{3C}{31.10} + \frac{4D}{39.10}, \text{ \&c.} \end{array} \right. \end{array} \right.$$

"By which series the arithmetical computation will be much more easy than by the original series."

Some curious series for the same purpose have been recently investigated by Mr. Wallace of the Royal Military College, for which we must refer to his ingenious paper on the subject, in the Edinburgh Transactions.

QUADRATURE, in astronomy, that aspect of the moon when she is 90° distant from the sun; or when she is in a middle point of her orbit, between the points of conjunction and opposition, namely, in the first and third quarters. See ASTRONOMY.

QUADRATURE LINES, are two lines placed on Gunter's sector: they are marked with Q. and 5, 6, 7, 8, 9, 10; of which Q. signifies the side of the square, and the other figures the sides of polygons of 5, 6, 7, &c. sides. S, on the same instrument, stands for the semidiameter of a circle, and 90 for a line equal to ninety degrees in circumference.

QUADRATUS. See DEPRESSOR LABII INFERIORIS. It is also the generic name of various other muscles.

QUADRATUS FEMORIS. (*quadratus*, from *quadra*, a square; so called from its supposed shape.) A muscle of the thigh situated on the outside of the pelvis. It is a flat, thin, and fleshy muscle, but not of the shape its name would seem to indicate. It is situated immediately below the gemini. It arises tendinous and fleshy from the external surface and lower edge of the tuberosity of the ischium, and is inserted by short tendinous fibres into a ridge which is seen extending from the basis of the trochanter major to that of the trochanter minor. Its use is to bring the os femoris outwards.

Q. GENÆ. See PLATISMA MYOIDES.

Q. LABII INFERIORIS. See DEPRESSOR LABII INFERIORIS.

Q. LUMBORUM. Quadratus, seu Lumbaris externus of Winslow. A muscle situated within the cavity of the abdomen. This is a small, flat, and oblong muscle, that has gotten the name of quadratus from its shape, which is that of an irregular square. It is situated laterally, at the lower part of the spine. It arises tendinous and fleshy, from about two inches from the posterior part of the spine of the ilium. From this broad origin it ascends obliquely inwards, and is inserted into the transverse processes of the four superior lumbar vertebræ, into the lower edge of the last rib, and, by a small tendon, that passes up under the diaphragm, into the side of the last vertebra of the back. When this muscle acts singly, it draws the loins to one side; when both muscles act, they serve to support the spine, and perhaps to bend it forwards. In laborious respiration, the quadratus lumborum may assist in pulling down the ribs.

Q. MAXILLÆ INFERIORIS. See PLATYSMA MYODES.

Q. RADII. See PRONATOR RADII QUADRATUS.

QUADREL, in building, a kind of artificial stone, so called from its being perfectly square. The quadrels are made of a chalky earth, &c. and dried in the shade for two years. These were formerly in great request among the Italian architects.

QUADRE'NNIAL. *a.* (*quadrennium*, Latin.) 1. Comprising four years. 2. Happening once in four years.

QUA'DRIBLE. *a.* (from *quadro*, Latin.) That may be squared (*Derham*).

QUADRICAPSULAR PERICARP, in botany, having four capsules to a flower: as in rhodiola.

QUADRIDENTATE DOWN, in botany. A four-toothed down. Having four teeth on the edge. As in rudbeckia.

QUADRIFID CALYX, in botany. A four-cleft perianth: as in rhinanthus.—Quadrifidum folium. A four-cleft leaf. Cut into four segments with linear sinuses, and straight margins.

QUADRIGA, in antiquity, a car or chariot drawn by four horses. On the reverses of medals we frequently see the emperor or victory in a quadriga, holding the reins of the horses; whence these coins are, among the curious, called *nummi quadrigati*, and *victoriati*.

QUADRIJUGOUS LEAF, in botany. Pinnate, with four pairs of leaflets.

QUADRILATERAL, or QUADRILATERAL FIGURE, is a figure comprehended by four right lines; and having consequently also four angles, for which reason it is otherwise called a quadrangle.

The general term quadrilateral comprehends these several particular species or figures, viz. the square, parallelogram, rectangle, rhombus, rhomboides, and trapezium.

If the opposite sides be parallel, the quadrilateral is a parallelogram. If the parallelogram have its angles right ones, it is a rectangle; if oblique, it is an oblique one. The rectangle having all its sides equal, becomes a square; and the oblique parallelogram having all its sides equal, is a rhombus, but if only the opposites be equal, it is a rhomboides. All other forms of the quadrilateral are trapeziums, including all the irregular shapes of it.

The sum of all the four angles of any quadrilateral is equal to four right angles. Also, the two opposite angles of a quadrilateral in-

scribed in a circle taken together, are equal to two right angles. And in this case the rectangle of the two diagonals, is equal to the sum of the two rectangles of the opposite sides. For the properties of the particular species of quadrilaterals, see their respective names, SQUARE, RECTANGLE, PARALLELOGRAM, RHOMBUS, RHOMBOIDES, and TRAPEZIUM.

QUADRILA'TERALNESS. *s.* The property of having four rightlined sides.

QUADRILLE. (*quadrillo*, Span. a party of four persons.) A game at cards played by four persons, the number of cards being forty; to effect which the tens, nines, and eights are discarded in each suit from the pack. The deal is made by distributing the cards to each player, three at a time, for any two rounds, and once four a time, beginning with the right-hand player, who is the elder hand.

The stakes, consisting of several equal billets or contracts comprising the counters and fishes, are distributed among the players, who agree upon their value, as also upon the number of tours, which are usually ten. After the trump is named, the right-hand player leads, and if the ombre, either alone or with a friend, win all the tricks, he gains the vole, or if six tricks, the game; but if he get only five tricks he loses by remise, and if only four, loses by codill. The game, consolation, matadores, bastos, and other payments are variously regulated, according as the game is won or lost. The holder of either of the red aces is entitled to a fish for each.

The chief rules are as follows:

1. When you are the ombre, and your friend leads from a mat, play your best trump, and then lead the next best the first opportunity.

2. If you possess all the trumps, keep leading them, except you have other certain winning cards.

3. If all the mats be not revealed by the time you have won six tricks, do not risk playing for the vole.

4. When you are the friend called, and hold only a mat, lead it, but if only a mat guarded by a small trump, lead the small one; though when the ombre is last player, lead the best trump you have.

5. Punto in red, or king of trumps in black, are good cards to lead when they are your best, and should either of them succeed, then play a small trump.

6. When the ombre leads to discover the friend, if you hold king, queen, and knave, put on the knave.

7. Preserve the called suit, whether friend or foe.

8. When playing against a lone hand, never lead a king, unless you have the queen, nor change the suit, nor permit, if possible to prevent it, the ombre to be last player.

9. Call on the strongest suits, except you have a queen guarded, and if elder hand you have a better chance than when middle hand.

10. A good player may succeed with a weaker hand when either elder or younger, better than if middle hand.

The rank of the cards when not trumps.

Clubs and spades.	Hearts and diamonds.
King,	King,
Queen,	Queen,
Knave,	Knave,
Seven,	Ace,
Six,	Deuce,
Five,	Three,
Four,	Four,
Three,	Five,
Deuce.	Six,
	Seven.
In all 9.	In all 10.

The rank and order of the trumps.

Clubs and spades.	Hearts and diamonds.
Spadille, the ace of spades.	Spadille, the ace of spades.
Manille, the deuce of spades, or of clubs.	Manille, the seven of hearts, or of diamonds.
Basto, the ace of clubs.	Basto, the ace of clubs.
	Punto, the ace.
King,	King,
Queen,	Queen,
Knave,	Knave,
Seven,	Deuce,
Six,	Three,
Five,	Four,
Four,	Five,
Three.	Six.
In all 11.	In all 12.

N. B.—Spadille and basto are always trumps; by which the red suits have one trump more than the black.

There are three matadores, viz. spadille, manille, and basto, which force all inferior trumps, but if an ordinary trump be led, you are not obliged to play a matadore; though if spadille be led, and you hold manille or basto unguarded, you must play it; also if manille be led, and you have basto unguarded, that must be played.

1. The first thing, after you have seen your cards, is, to ask leave; to pass; or play *sans prendre*; and if you name a wrong trump, you must abide by it.

2. If all the players pass, he who has spadille is obliged to play (called forced spadille;) but if he do not make three tricks, he is not basted.

3. The player, when he calls a king, ought to have a fair probability of winning three tricks, to prevent being basted.

4. Therefore, such games only are set down as give a fair chance to win by calling a king with directions at the end of each what to lead.

Calculations for those who have made some progress in the game.

1. What are the odds that my partner holds one out of any two cards?

Ans. That he holds one card out of any two certain cards, is about 5 to 4 in his favour; and if you hold one matadore, those odds are in your favour that your partner holds one of the other two, and consequently you may play your game accordingly.

Again, suppose you call a king, having a knave and one small card of another suit in your hand, you have 5 to 4 in your favour that your partner holds either the king or queen of that suit; and consequently you have the odds in your favour to win a trick in the same.

2. What are the odds that my partner holds one out of any three certain cards?

Ans. That he holds one out of any three certain cards, is about 5 to 2 in his favour; and if you have no matadore, but with the assistance of one of them have great odds to win the game; observe, that it is about 5 to 2 that your partner holds one of them, you having none.

This calculation may be applied to many other cases.

Games in red, calling a king.

1. Spadille, manille, two small hearts or diamonds, the queen of clubs, and one small one, and four small cards of the other suit. Lead a small trump.

2. Spadille, manille, two small hearts or diamonds, with the knave and two small clubs, and three small cards of the other suits. Lead a small trump.

3. Spadille, manille, two small hearts or diamonds, three small clubs, and three small cards of the other suits. Lead a small trump.

4. Spadille, punto, king, queen, and one small heart or diamond, three small clubs, the queen, and one spade. Lead punto.

5. Spadille, punto, king, knave, and one small heart or diamond, the knave and two small clubs, and two small spades. Lead punto.

6. Spadille, king, queen, knave, and one small heart or diamond, with the queen, knave, and one small club, and two small spades. Lead the king of trumps.

7. Spadille, three, four, five, and six of hearts or diamonds, king of clubs and one more, queen and two small spades; when you have the lead play a small trump; in the second lead play a spadille.

8. Manille, basto, punto, and two small hearts or diamonds, three small clubs, and the knave and one spade. Lead manille.

9. N. B. Manille, basto, king, and two small hearts or diamonds, queen and one small club, and three small spades. Lead manille.

10. N. B. Manille, basto, queen, and two small hearts or diamonds, queen and two small clubs, knave and one spade. Lead manille.

11. Manille, basto, with the three smallest hearts or diamonds, queen and one small club, knave and two small spades. Play a small trump.

12. N. B. Manille, punto, king, and two small hearts or diamonds, queen knave, and one small club, king, and one small spade. Lead manille.

13. Manille, punto, queen, and two small hearts or diamonds, queen and one small club, king and two small spades. Play a small trump.

14. Manille, punto, and three small hearts or diamonds, knave and one small club, king, queen, and one small spade. Play a small trump.

15. Manille, and the four smallest hearts or diamonds, queen and one small club, king, queen, and one small spade. Play a small trump.

16. N. B. Basto, punto, king, and two small hearts or diamonds, king and queen of clubs, queen and two small spades. Lead basto.

17. N. B. Basto, punto, queen, and two small hearts or diamonds, queen, knave, and one small club, king and queen of spades. Lead basto.

18. N. B. Basto, punto, and three of the smallest hearts or diamonds, king and queen of clubs, queen, knave, and one small spade. Play a small trump.

19. Basto, and the four smallest hearts or diamonds, king and queen of clubs, queen, knave, and one small spade. Play a small trump.

20. N. B. Punto, king, queen, and two small hearts or diamonds, king and queen of clubs, queen, knave, and one small spade. Lead punto.

21. Punto, king, and three small hearts or diamonds, king and queen of clubs, queen, knave and one small spade. Play a small trump.

Games in black, calling a king.

1. Spadille, manille, and two small clubs or spades, the knave and two small hearts, and three small diamonds. Lead a small trump.

2. N. B. Spadille, manille, and two small clubs or spades, queen and two small hearts, and three small diamonds. Lead a small trump.

3. Spadille, manille, and two small clubs or spades, three small hearts, three small diamonds. Lead a small trump.

4. N. B. Spadille, king, queen, and two small clubs or spades, with the queen and one small heart, three small diamonds. Lead the king of trumps.

5. Spadille, king, knave, and two small clubs, queen and two diamonds, two small hearts. Play a small trump.

6. Spadille, queen, and three small clubs or spades, queen and two small hearts, two small diamonds. Play a small trump.

7. Spadille, and the four smallest clubs or spades, king and one small heart, queen and two small diamonds. Play a small trump.

8. Manille, basto, king, and two small clubs or spades, three small hearts, and two small diamonds. Lead manille.

9. Manille, basto, queen, and two small

clubs or spades, three small hearts, queen and one small diamond. Lead manille.

10. Manille, basto, knave, and two small clubs or spades, knave and one heart, three small diamonds. Lead manille.

11. Manille, basto, and the three small clubs or spades, queen, and two small hearts, knave and one small diamond. Lead manille.

12. N. B. Manille, king, queen, and two small clubs or spades, king and one small heart, queen, knave, and one small diamond. Lead manille.

13. N. B. Manille, king, knave, and two small clubs or spades, king and one small heart, queen and two small diamonds. Lead manille.

14. Manille, king, and three small clubs or spades, queen and two small hearts, king and one small diamond. Play a small trump.

15. Manille, and the four smallest clubs or spades, king, queen, and one small heart, two small diamonds. Play a small trump.

16. N. B. Basto, king, queen, and two small clubs or spades, queen and two small hearts, king and one small diamond. Lead basto.

17. N. B. Basto, king, knave, and two small clubs or spades, knave and one heart, king and two small diamonds. Lead basto.

18. N. B. Basto, king, and three small clubs or spades, king and queen of hearts, queen and two small diamonds. Play a small trump.

19. Basto, and four of the smallest clubs or spades, king and queen of hearts, queen, knave and one small diamond. Play a small trump.

20. N. B. King, queen, knave, and two small clubs or spades, king and queen of hearts, knave and two small diamonds. Lead the king of trumps.

21. King, queen, seven, six, and five of clubs or spades, king and queen of hearts, queen, knave, and one small diamond. Lead the king of trumps.

Those cases, both in red and black, which are marked thus (N. B.) are very good games to play, and you have the odds on your side to win those which are not marked.

N. B.—You are to call to your strongest suit, except you have a queen guarded. And if you are elder hand, you have a fairer chance to win the game than if middle, because leading a trump frequently makes your adversaries play against each other.

The following are the laws of the game.

1. The cards are to be dealt to the right hand, by fours and threes, and no otherwise; and the dealer is at liberty to begin by four or three; if in dealing there should come one or more faced cards, there must be a new deal, unless the last card.

2. If there be too many or too few cards in the pack, there must be a new deal.

3. He who deals wrong, is to deal again.

4. He who has asked leave is obliged to play.

5. No one is basted for playing out of turn, but the card played may be called at any time in that deal, provided it do not cause a renounce; or either of the adversaries may demand the partner of him who played out of his turn, or his own partner, to play any suit he thinks fit.

6. The three matadores cannot be forced by an inferior trump, but the superior forces the inferior, when lead by a first player.

7. Whoever names any suit for trumps, must abide by it.

8. If you play with eleven cards, you are basted.

9. If you play *sans prendre*, or have matadores, you are to demand them before the next dealer has finished, otherwise you lose the benefit.

10. Any person naming his trump without asking leave, is obliged to play *sans prendre*, unless he is the younger hand, and all the rest have passed.

11. After the game is won, if the person who won the sixth trick play the seventh card, he is obliged to play for the *vole*.

12. If you have four kings dealt, you are at liberty either to call a queen to one of your kings, except the queen of trumps; or to call one of your kings.

13. If any person separate a card from the rest, he ought to play it, if the adverse party have seen it, unless he plays *sans prendre*.

14. If the king call, or his partner play out of his turn, no *vole* is to be played for.

15. No person is to be basted for a renounce, unless the trick is turned and quitted; and if any person renounce, and be discovered, should the player happen to be basted by such renounce, all the parties are to take up their cards, and play them over again.

16. Forced spadille is not obliged to make three tricks, nor is allowed to play for the *vole*.

17. Whoever undertakes to play the *vole*, has the preference of playing before him who offers to play *sans prendre* only.

18. If all parties agree to it, let the person have the preference of playing who plays for the most tricks, which will prevent small games.

19. The ombre is entitled to know his king called, before he declares for the *vole*.

20. When six tricks are won, he who won the sixth ought to say, I play the *vole*; or, I do not play the *vole*; or, I ask ———, and nothing else.

21. He who wins the *vole*, is to take double the stake played for out of the pool.

22. He who asks leave (if elder hand), may play *sans prendre*, in preference to any of the other players.

23. If you have one or more kings, you may call yourself, but must win six tricks.

24. If you play the king surrendered, he must win six tricks who demands the king of any person.

25. He who has passed once (unless he has spadille) has no right to play afterwards; also

he who has asked is obliged to play, unless somebody else plays *sans prendre*.

26. If the ombre, or his friend, show their cards before they have won six tricks, the adversaries may call their cards as they please.

27. Whoever has only asked leave, cannot play *sans prendre*, unless forced.

28. You are at liberty to look at the tricks when you are to lead, but not otherwise.

29. Whoever undertakes playing for the *vole*, and does not succeed, has a right to the stakes *sans prendre*, and matadores if he has them, having won his game.

30. Any person discovering his game, is not entitled to play for the *vole*.

31. If there happen to be two cards of the same sort, and found out before the deal is ended, the deal is void, but not otherwise.

32. Nobody is to declare how many trumps are played out.

33. He who calls and does not make three tricks, is to be basted alone, unless forced spadille.

Glossary.

Alone. See *Sans Appeller.*

To ask leave; to ask leave to play with a partner by calling a king.

Basto; the ace of clubs, which is always the third trump, and from which the following term is derived.

Baste; a penalty, which consists in paying as many counters as there are down; and is incurred either by renouncing, or by not winning, when you stand the game, which is called making the baste.

Cheville; to be between the eldest hand and the dealer.

Codill; when those who defend the pool make more tricks than they who stand the game, the former are said to win codill, and the latter to lose it.

Consolation; a claim, which is always paid by those who lose to those who win, whether by codill or remise.

Devolve; when he who stands the game does not make a trick.

To do more; is when any player having asked leave, is required by a younger hand either to pass or play alone.

Double. To play double, is to pay the game and the stake double, as well as the consolation, the *sans prendre*, the matadores, and the devolve.

Force. The ombre is said to be forced, when you play a strong trump to weaken him, if he overtrump; he is likewise said to be forced, when he asks leave, and one of the other players, by offering to play *sans prendre*, obliges him to play *sans prendre*, or pass.

Friend; the player who has the king called.

Impasse; when, being in cheville, you play the knave of a suit of which you have the king.

Manille; in black, the deuce of spades, or clubs; in red, the seven of hearts or diamonds; it is always the second trump.

Mark; the fish put down by the dealer.

Matadores or Mats; spadille, manille, and basto, which are the three first trumps. *False matadores* are any sequence of trumps, following the matadores regularly.

Mille; mark of ivory; stands for ten fish.

Ombre; the name given to him who stands the game, either by calling or by playing *sans appeller*, or *sans prendre*.

Party; the duration of the game, according to the number of tours agreed upon.

Pass; a term used when you have not a hand to play.

Ponto or *Punto*; the ace of diamonds, when diamonds are trumps; or of hearts, when these are trumps; and it is then the fourth trump.

Pool. The pool consists of the fishes, which are staked for the deals, or the counters which are put down by the players, or the bastes that go on the game. To defend the pool, is to be against him who stands the game.

Prise; a number of fishes or counters given to each player at the beginning of the party.

Regle; the order observed at the game; it is called, being in regle, when the ombre trumps the return of the king called.

Remise; when they who stand the game do not make more tricks than they who defend the pool; and they then lose by remise.

Renounce; is not to play in the suit led, when you have it: it is also called a renounce, when, not having any of the suit led, you win with a card that is the only one you have of that suit in which you play.

Reprise, the same as party.

Reporte, the same as remise.

Roy rendu, the king surrendered; the method of playing, when the king called is exchanged with the ombre, for which a fish is paid and some other card given by him who is with that to win the game alone.

Spadille; the ace of spades, which is always the first trump. *Forced spadille* is when he who has it is obliged to play; all the other players having passed.

Sans appeller. This imports without calling; and is when you play without calling a king.

Sans prendre, the same as *sans appeller*. *Forced sans prendre* is, when, having asked leave, one of the players offers to play *sans prendre*; in which case you are obliged to play *sans prendre*, or to pass.

Tenace; to wait with two trumps, that you must necessarily make when he that has two others is obliged to lead; such are the two black aces, with regard to manille and punto.

Tours; counters put down by the winners, to mark the number of games played.

Vole; gaining all the tricks either with a friend or alone.

In order to vary this game, some introduce the mediateur, either with or without the favourite suit; the first term signifies a king, which any person may demand, in order to play *sans prendre*, giving in return some other card, and a fish; but if the king be of the fa-

vourite suit, then two fishes are to be paid. The favourite suit is determined by drawing a card at the commencement of the party; and during the whole game, each player, asking leave in that, has a preference before others who have a good hand in a different suit, unless a mediateur is demanded, when it takes the lead; and if in the favourite suit, first; those who play alone, without the mediateur, precede even that, and, when in the favourite, take place of all.

Solitaire quadrille is where it is agreed not to call, but always play *sans prendre*, with or without the mediateur; and if in any deal no one can play alone, then the cards are to be dealt again, and such additions made to the stake as may have been settled.

Solitaire quadrille by three, or tredille, is by throwing out all (except the king of one, and only the six of the other red suit); each person playing on their own account, as at three-handed whist.

QUADRILOBATE LEAF, in botany, a four-lobed leaf. Divided to the middle into four distant parts, with convex margins.

QUADRILOCULAR PERICARP, in botany, a four-celled pericarp: as in euonymus.

QUA'DRIN. *s.* (*quadrinus*, Lat.) A mite; a small piece of money, in value about a farthing (*Bailey*).

QUADRINO'MICAL. *a.* (*quatuor* and *nomen*, Lat.) Consisting of four denominations.

QUADRIPA'RTITE. *a.* (*quatuor* and *partitus*, Lat.) Having four parts; divided into four parts.

QUADRIPA'RTITELY. *ad.* In a quadripartite distribution.

QUADRIPARTITION. *s.* A division by four, or the taking the fourth part of any quantity.

QUADRIPHY'LLOUS. *a.* (*quatuor* and φυλλον.) Having four leaves.

QUADRIRE'ME. *s.* (*quadriremis*, Lat.) A galley with four banks of oars.

QUADRISY'LLABLE. *s.* (*quatuor* and *syllable*.) A word of four syllables.

QUADRIVA'LVES. *s.* (*quatuor* and *valvæ*, Lat.) Doors with four folds.

QUADRI'VIAL. *a.* (*quadrivium*, Latin.) Having four ways meeting in a point.

QUADRUPED. (*quadrupes*, Latin.) In its simplest and most general meaning a four-footed animal. But as such an interpretation must include a prodigious multiplicity of animals of very different habits and structures, as for example not only hoofed and clawed land-animals, but lizards, tortoises, frogs and other amphibious reptiles, and perhaps various kinds of insects, it has been necessary, in the study of natural history, to limit its meaning, in order to be able to apply it to any definite purpose, and hence it has been generally restrained to such animals as have not only four feet, but a hairy body, produce viviparously, and suckle their young.

Thus explained, Aristotle divided quadrupeds into three sections, solid-hoofed, cloven, and digitated. And under this general view quadrupeds continued to be treated till the publication of Mr. Ray's Synopsis Methodica in 1693: in which they are divided into two classes, each of which classes contains several orders, as follows:

The classed consist of,

I. Hoofed.

II. Clawed, or digitate.

The first class is divided into the two orders of,

i. Whole-hoofed.

ii. Divided-hoofed.

i. The *whole-hoofed* are exemplified in the horse, ass, onager or wild ass, mule, zebra, &c. Of this order Aristotle has observed that none of them have horns, or the bones of the foot called talus, and astragalus; and that the males of none of them have any appearance of teats. This last observation, however, is not perfectly correct; for the horse has an appearance of this kind, but in an organ where few people would think of looking for it, for the teat of the male horse is situate on the penis.

ii. *The divided-hoofed* are still further subpartitioned into 1. διχηλα, *bisulcate*; and 2. τετραχηλα, *quadrusulcate*.

1. The *bisulcate* consist of quadrupeds whose hoof is separated into two parts only: of which there are two kinds—

α. Ruminant, or chewers of the cud.

β. Non-ruminant, or that do not chew the cud.

α. Of the ruminant, or cud-chewing kind, we may take examples from the ox, uroch, bison, and buffalo; the sheep, goat, deer, and rabbit.

β. The non-ruminant include the swine tribes, and their numerous varieties, but no others.

2. The *quadrusulcate* consist of quadrupeds whose hoofs are cloven into four sections, all of which seem to be non-ruminant, as the rhinoceros, hippopotamus, tapir, and capybara.

II. The second class, comprising the *clawed*, or *digitate* quadrupeds, is subdivided as follows:

i. Quadrupeds possessing two fissures or toes, but without nails; as the camel kind, which ruminate, and, like other ruminating animals, have complicated stomachs.

ii. Quadrupeds possessing many fissures, whether toes or claws.

1. Undivided, as in the elephant, which is also a ruminant animal.

2. Divided, as in various kinds, as follows.

α. With broad nails and a human shape, as the monkey tribes.

β. With narrower and more pointed nails, as the dog, cat, rabbit, and similar kinds, and which are sub-distinguished by the number and structure of the fore-teeth.

It must be obvious to every one, that though the leading characters are natural, there is no small complexity in the sub-distinctions of this

arrangement. The most striking features, perhaps, are in the possession of a mammary, or suckling organ, and of teeth: for we have already observed that the attribute of four feet belongs certainly to various amphibials, and perhaps to various insects, as well as to quadrupeds properly so called. And hence Linnéus, banishing the term quadruped altogether from the regions of his own system, as too indistinct and indefinite, has made choice of these features as the foundation of this system, employing the term mammalia, mammals, or suckling animals, instead of quadrupeds, for the class; and arranging the orders of which the mammalian class consists, according to the number, structure, and position of the fore-teeth.

Even this system, however, is not without its inconvenience: for the whale tribes, the narwhal, and dolphin, are also mammalian animals, although they differ from all other mammals in structure and habit; being destitute of feet, and proper nostrils, and living constantly in the water.

For this system, however, as for various others upon the same subject, the reader must turn to the articles PHYSIOLOGY and ZOOLOGY.

QUA'DRUPED. *a.* Having four feet (*Watts*).

QUA'DRUPLE. *a.* (*quadruplus*, Latin.) Fourfold; four times told (*Raleigh*).

To QUADRU'PLICATE. *v. a.* (*quadruplico*, Latin.) To double twice; to make fourfold.

QUADRUPLICA'TION. *s.* (from *quadruplicate*.) The taking a thing four times.

QUA'DRUPLY. *ad.* (from *quadruple*.) To a fourfold quantity (*Swift*).

QUÆ'RE. (Latin.) Inquire; seek.

QUÆSTOR. See QUESTOR.

To QUAFF. *v. a.* (from *coëffer*, French, to be drunk.) To drink; to swallow in large draughts (*Shakspeare*).

To QUAFF. *v. n.* To drink luxuriously.

QUA'FFER. *s.* (from *quaff*.) He who quaffs.

To QUA'FFER. *v. a.* To feel out (*Derham*).

QUA'GGY. *a.* Boggy; soft; not solid (*Ainsworth*).

QUA'GMIRE. *s.* (that is, *quakemire*.) A shaking marsh; a bog that trembles under the feet (*More*).

QUAID. *part.* Crushed; dejected; depressed (*Spenser*).

To QUAIL. *v. n.* (*quelen*, Dutch.) 1. To languish; to sink into dejection (*Herbert*). 2. To fade; to decline (*Hakewill*).

To QUAIL. *v. a.* (cpellan, Saxon.) To crush; to quell: not used (*Spenser*).

QUAIL, in ornithology. See TETRAO.

Quails are to be taken by means of the call during their whole wooing time, which lasts from April to August. The proper times for using the call are at sun-rising, at nine o'clock in the morning, at three in the afternoon, and at sun-set; for these are the natural times of the quail's calling. The notes of the cock and hen quail are very different; and the sportsman who expects to succeed in the taking them must be expert in both: for, when the cock calls, the answer is to be made in the hen's note; and when the hen calls, the answer is to be made in the cock's. By this means they will come up to the person, so that he may with great ease throw the net over them and take them. If a cock quail be single, on hearing the hen's note he will immediately come; but if he has a hen already with him, he will not forsake her. Sometimes, though only one quail answers to the call, there will three or four come up; and then it is best to have patience, and not run to take up the first, but stay till they are all entangled, as they will soon be.

The quail is a neat cleanly bird, and will not run much into dirty or wet places: in dewy mornings, they will often fly instead of running to the call; and in this case, it is best to let them go over the net, if it so happens that they fly higher than its top; and the sportsman then changing sides, and calling again, the bird will come back, and then will probably be taken in the net.

The calls are to be made of a small leather purse, about two fingers wide, and four fingers long, and made in the shape of a pear; this is to be stuffed half full of horse-hair, and at the end of it is to be placed a small whistle, made of the bone of a rabbit's leg, or some such other bone: this is to be about two inches long, and the end formed like a flageolet, with a little soft wax. This is to be the end fastened into the purse; the other is to be closed up with the same wax, only that a hole is to be opened with a pin, to make it give a distinct and clear sound. To make this sound, it is to be held full in the palm of the hand, with one of the fingers placed over the top of the wax; then the purse is to be pressed, and the finger is to shake over the middle of it, to modulate the sound it gives into a sort of shake. This is the most useful call; for it imitates the note of the hen-quail, and seldom fails to bring a cock to the net if there be one near the place.

The call that imitates the note of the cock, and is used to bring the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire turned round and curled, and covered with leather; and one end of it must be closed up with a piece of flat wood, about the middle of which there must be a small thread or strap of leather, and at the other end is to be placed the same sort of pipe, made of bone, as is used in the other call. The noise is made by opening and closing the spiral, and gives the same sound that the cock does when he gives the hen a signal that he is near her.

QUA'ILPIPE. *s.* (*quail* and *pipe*.) A pipe with which fowlers allure quails (*Addison*).

QUAINT. *a.* (*coint*, French.) 1. Nice; scrupulously, minutely, superfluously; exact (*Sidney*). 2. Subtile; artful: obsolete (*Cha.*). 3. Neat; pretty; exact (*Shakspeare*). 4. Subtly excogitated; finespun (*Milton*). 5. Affected; foppish (*Swift*).

QUAI'NTLY. *ad.* (from *quaint.*) 1. Nicely; exactly; with petty elegance (*B. Jonson*). 2. Artfully (*Shakspeare*).

QUAI'NTNESS. *s.* (from *quaint.*) Nicety; petty elegance (*Pope*).

To QUAKE. *v. n.* (cpacon, Saxon.) 1. To shake with cold or fear; to tremble (*Sha.*). 2. To shake; not to be solid or firm (*Pope*).

QUAKE. *s.* (from the verb.) A shudder; a tremulous agitation (*Suckling*).

QUAKERS, a religious society, which took its rise in England about the middle of the 17th century, and rapidly found its way into other countries in Europe, and into the English settlements in North America.—Their founder, George Fox, an illiterate shoemaker, made his first appearance as a preacher about the year 1648. The nation was then greatly agitated by religious controversies, and numerous errors arose on the demolition of the ecclesiastical and civil constitution. The character of Fox was harmless, and he appears to have been an honest visionary, though some writers accuse him of making himself equal to Christ. He acquired several followers; and in the year 1650, being brought before two justices in Derbyshire for opposing a minister in the exercise of his duty, one of the magistrates, by way of jeer, gave to them the name of *quakers*; an appellation which has stuck to them ever since, though they themselves adopted, and still retain, the term of *friends*. Robert Barclay and William Penn are the greatest names which this society can boast; the former wrote a masterly apology for their doctrines, to which he prefixed a remarkable address to king Charles II. Penn wrote several books, the chief of which is that entitled, No Cross No Crown, showing that the way to obtain the heavenly crown is by being willing to bear the cross.

These were writers of considerable learning and abilities, to whom may be added Sewell, the historian, who wrote an account of this people, first in Dutch, and afterwards in English. It may also be proper to mention, of later time, Anthony Pruver, who having been brought up (like Fox) in the employment of a shepherd, and a shoemaker, afterwards acquired so much knowledge in the dead languages, as to translate the whole of the Scriptures into English. It must be admitted, however, that the quakers, as a body, have produced few learned or scientific authors; and this reason may be assigned, that they avoid sending their children to public schools, and train them principally to mechanical or commercial employments, prefering the useful to the ornamental in their education. In medicine, nevertheless, the only learned profession which is open to them in Great Britain, they have had many who have attained and adorned the degree of doctor, among whom the learned world will readily recognize the name of Fothergill.

It is somewhat difficult to give an accurate account of their tenets, as they have no standard confession of faith. They have, however, so lately as 1790, published a summary view of their doctrines: from which we learn, in brief, that the friends believe in one eternal God, and in Jesus Christ, his Son, the Messiah and Mediator of the new covenant. They acknowledge the divinity of Christ, who is the wisdom and power of God unto salvation. To Christ alone they give the title of the word of God, and not to the Scriptures, but they highly esteem those sacred writings, in subordination to the spirit, from which they were given forth. They believe that, in order to enable men to put in practice the most excellent precepts of the gospel, every man is endued with a measure of the light, grace, or good spirit of Christ, by which he is enabled to distinguish good from evil, and to correct those corrupt propensities of his nature which mere reason is insufficient to overcome. They believe that the influence of the spirit of Christ is necessary to enable them acceptably to worship; and that to wait for it, when met in silence, is their proper business. They ascribe all true ministry to the same source, the immediate influence of the Holy Spirit. They reject, or disuse, baptism with water and the supper: the former as pertaining, according to John the Baptist's avowal, to a decreasing dispensation, and having been merely typical of spiritual baptism: the latter rite they do not consider as maintaining communion between Christ and his church; which is only obtained by a real participation of his divine nature through faith. As this society lays so much stress on the inward persuasion of the mind, effected by the operation of the light of Christ; and as they believe that lively faith is not at man's command, but is the gift of God in Christ, although nourished by man's obedience to its discoveries; they are so far from requiring of such as request admission among them, or such as are employed in the service of their church, any of those articles or formulas of faith, which are too often the means of inducing an insincere compliance, that they make no use of such forms at all. They say in their summary, "We prefer the judging of men by their fruits, and depending on the aid of him who, by his prophet, hath promised to be a spirit of judgment to him that sitteth in judgment. Without this, there is a danger of receiving numbers into outward communion, without any addition to that spiritual sheepfold, whereof our blessed Lord hath declared himself to be both the door and the shepherd—that is, of such as know his voice, and follow him in the paths of obedience."

In their public worship, all is performed in silence, unless some believe themselves inwardly moved to speak; and, except during the time of prayer by one so moved, the men sit covered at liberty. Their marriages, after due enquiry, are performed by the parties taking each other in a meeting, and the company subscribe as witnesses. Their burials are equally simple; but frequently preaching takes place on both occasions. The quakers believe it wrong for Christians to use such flattering titles to men, as your grace, your excellency, the right honourable, reverend, and the like, to

use compliments, or to adopt, for flattery's sake, the custom of saying the plural you, to one person. Neither do they allow of kneeling or uncovering the head in respect to any man, reserving these gestures for divine worship. They condemn gaiety and superfluity of apparel, public diversions, gaming, sports, and unnecessary frequenting of public-houses. They also disuse those names of the months and days, which, having been given in honour of the false gods or heroes of the heathens, originated in their superstition or flattery; and they believe it forbidden to Christians to swear or to fight on any occasion.

The sobriety of their dress is a good contrast to the ever-varying modes of a degenerate age. Their guarded and decent language, and regular deportment, however uncouth to light and superficial minds, must excite admiration in the liberal and intelligent observer. The excellent manner in which they govern their families and bring up their children in an acquiescence with their restraints and customs, may be recommended as deserving imitation. The quakers have exerted themselves with great zeal in procuring an abolition of the slave trade in this country; and have long ago so far set the example of emancipation in America, that there is scarcely a quaker in that continent possessing a slave. Though they are, as has been mentioned, restrained by their principles from attempting to serve their country in its wars, they have always proved themselves good subjects of the state, and have experienced from the British government many acts of indulgence.

A system of discipline has been established among this people, which has been admired, even by their adversaries; the object of it is, the relief of their poor—the maintenance of good order—the support of their testimonies, which they believe it is their duty to bear to the world—and the help and recovery of such as are overtaken in faults. This discipline is laid down in the rules which their yearly meeting has issued from time to time; and is carried into effect at their monthly meetings, which are composed of members living at a convenient distance, and sometimes of several small congregations for worship. All their monthly meetings in one county (or, in some instances, in two or three adjacent counties) form a quarterly meeting, which has the immediate superintendance of the monthly meetings. The quarterly meetings in their turn are superintended by the yearly meeting. The yearly meeting requires of the quarterly meetings, and these latter of their monthly meetings, answers, at stated times, to certain queries, by which means the circumstances of the inferior meeting is made known to the superintending one. The monthly meetings send representatives to the quarterly meetings, and these, to the yearly meeting. The yearly meeting for Great Britain is held in London in the spring, to which come representatives from the yearly meeting in Ireland. The American continent, on which there are numerous settlements of the Friends, comprises six other yearly meetings, namely, New England, New York, Pennsylvania, Maryland, Virginia, and the Carolinas, &c. These yearly meetings are no otherwise bound to each other than by similarity of principle, and yet (though this similarity is doubtless the cause) no dispute on any point of faith has yet arisen between them; and it is not unusual for ministers of one country to spend much time in travelling in that character in the other, in which the certificates from the meetings to which he belongs at home secure him a reception. These are certificates of concurrence signed in the monthly meeting to which the minister belongs; and if the proposed journey extend beyond the limit of his yearly meeting, it is necessary to have the joint concurrence of his quarterly meeting, and also of his fellow-ministers and elders assembled at their yearly meeting. It may be here remarked, that among the quakers, women, as well as men, fill the station of minister; and, with the before-mentioned concurrence, are often engaged in travelling from place to place.

The quakers have charity schools in some parts of the kingdom; but at Ackworth in Yorkshire they have a large school, under the direction of their yearly meeting, in which about one hundred and eighty boys, and one hundred and seventy girls, are boarded and educated.

This society experienced at its outset violent opposition, and was cruelly persecuted during the times of Cromwell and of Charles II. although the Friends do not impeach the character of either, as being the springs of the persecution. In New England, the government put four of them to death; but farther executions of that sect were stopped by the interference of king Charles. The Friends, however, did not flinch, either in England or America; and as they seem to have borne persecution with as much patience as any people, so, when in their turn they came into power, they never shewed any disposition to persecute others. For William Penn, who founded Pennsylvania, laid down the widest plan of religious liberty that had then been devised, and reserved no privileges for his own society in the government of his province.

For more on the subject of this denomination of christians, the reader may consult Clarkson's Portraiture of Quakerism, and the works of Bevan, one of the society of Friends.

QUALEA, in botany, a genus of the class monandria, order monogynia. Calyx four-parted, corol two-petalled; berry undecided. Two species; forest-trees of Guiana.

QUALIFICA'TION. *s.* (*qualification*, Fr.) 1. That which makes any person or thing fit for any thing (*Swift*). 2. Accomplishment (*Atterbury*). 3. Abatement; diminution (*Raleigh*).

QUALIFICATION, in sporting, an annual fine paid to the legislature to possess the liberty of shooting, hunting, or coursing, upon the receipt of which a certificate of such receipt is

given by the proper officer; or it implies the possession of landed estate to a certain amount, or a manorial deputation from such possessor, the one or the other of which is presupposed upon the payment of the annual fine. This qualification (or exemption from the penalties of former acts during different reigns) till of very late years, consisted in the full and unrestrained possession of one hundred pounds per annum, issuing from freehold land, or estate, and producing that clear annual sum when every other expence was paid: or, the possession of a leasehold estate of one hundred and fifty pounds per annum, in right of self or wife, for the term of ninety-nine years, or any term beyond that period.

The fine is derived from a statute of the present reign which enacts, That every person in Great Britain who shall use any dog, gun, net, or other engine, for the taking or destruction of game, shall take out an annual certificate, from the clerk of the peace for the county in which he resides, and shall pay for such certificate the sum of three pounds three shillings, with one shilling to the clerk for his trouble in making it out.

QUALIFICATION also appertains to the sport of racing upon the turf, and the term is used in a peculiar signification. Plates of 50l. are given at numerous sporting places, to be run for on certain conditions; some by colts and fillies of three years old; some by those of four years old; others of five and six; and, lastly, by horses of all ages and qualifications. The precise meaning of which last expression is, that a horse equal in age to one or more of his competitors, yet superior in other points, must have his powers attempted to be equalized, by so increasing the weight which he is to carry above the standard of the others, that the superiority in speed may still remain doubtful, and an equal hope be indulged of winning the prize for which they are to start. To render such equalizing scale the less liable to objection, it is an usual custom to give notice in the advertisements that a winner of one plate in the present year is to carry 3lb. the winner of two, 5lb. and of three or more 7lb. extra.

To QUA'LIFY. *v. a.* (*qualifier*, French.) 1. To fit for any thing (*Swift*). 2. To furnish with qualifications (*Shakspeare*). 3. To make capable of any employment or privilege: as, he is *qualified* to kill game. 4. To abate; to soften; to diminish (*Raleigh*). 5. To ease; to assuage (*Spenser*). 6. To modify; to regulate (*Brown*).

QUA'LITY. *s.* (*qualitas*, Lat.) 1. Nature relatively considered (*Hooker*). 2. Property; accidental adjunct (*Bentley*). 3. Particular efficacy (*Shakspeare*). 4. Disposition; temper (*Shakspeare*). 5. Virtue or vice (*Dryden*). 6. Accomplishment; qualification (*Clarendon*). 7. Character (*Bacon*). 8. Comparative or relative rank (*Temple*). 9. Rank; superiority of birth or station (*Shakspeare*). 10. Persons of high rank (*Pope*).

QUALITY. (*qualitas.*) That affection of a thing whence it is denominated such; or that which occasions a thing to affect our senses in this or that manner, and gives it this or that denomination. Accordingly quality is said to be an attribute, from which no substance is exempt. See MODE.

Thus, that power in fire, whatever it be, whereby it excites in us the sensation of heat, since it is that whence the fire is denominated hot, is called the quality of fire.

The word quality, *qualitas*, is said to have been first introduced into the Latin by Cicero: till his time the Romans studiously avoided using a term which denoted an abstract; and in lieu thereof only considered the concrete, signified by *quale*. The like is observed of the ancient Greeks, who did not use ποιοτης, but ποιον.

Quality, it is to be observed, is an ambiguous term; and has been applied to some things which ought rather to have been looked upon as states of matter, or assemblages of several qualities; as life, health, beauty, &c.

There are, also, other attributes, as size, shape, motion, and rest, usually reckoned among qualities, which might more conveniently be ranked among the primary modes of the parts of matter; since from these simple attributes all the qualities are derived.

The ancient school-philosophers distinguish quality in the general, which they call metaphysical and predicamental quality, into essential and accidental. The moderns, more usually, divide it into spiritual and corporeal.

Spiritual qualities, or *qualities of the soul*, are affections of the mind, considered as in this or that habitude or disposition. Of these they make two kinds; the one belonging to the understanding, the other to the will: of the former kind are knowledge, opinion, certainty, doubting, &c. Of the latter, are all the moral virtues and vices.

Qualities corporeal or physical, are what we chiefly consider under this denomination, and to which the definition above laid down is accommodated.

Philosophers are divided as to the nature of these qualities, or what they are in the body. The general language of the Peripatetic school is, that they are things distinct from the bodies themselves; and are superadded to them, or flow from their substantial forms: on which principle, they hold qualities to be real, and denominate them accidents; supposing them to be inherent in substances, though not in the relation of parts, but to be sustained thereby as in a subject, and incapable of subsisting without them. In effect, the Thomists define qualities to be accidents following or arising from the form; in the same manner as quality is an accident following or arising from the substance.

The moderns absolutely explode the notion of qualities distinct from the body; and insist, that the powers whereby bodies excite in us the ideas of such qualities are no other than the mechanical affections of the bodies themselves, viz. the figure, magnitude, motion, &c. of the parts whereof they consist.

Sensible qualities are such as are the more immediate object of the senses: as figure, taste, colour, smell, hardness, &c.

Occult qualities, among the ancients, were such as did not admit of a rational solution in their way.

Dr. Keil demonstrates, that every quality which is propagated in orbem, such as light, heat, cold, odour, &c. has its efficacy or intensity either increased, or decreased, in a duplicate ratio of the distances from the centre of radiation inversely. So at double the distance from the earth's centre, or from a luminous or hot body, the weight or light or heat, is but a 4th part; and at 3 times the distance, they are 9 times less, or a 9th part, &c.

QUALM. *s.* (cpealm, Saxon.) A sudden fit of sickness; a sudden seizure of sickly languor (*Calamy*).

QUA'LMISH. *a.* (from *qualm.*) Seized with sickly languor (*Dryden*).

QUAMOCLIT, in botany. See IPOMEA.

QUANDA'RY. *s.* (*qu'en dirai je*, French. *Skinner.*) A doubt; a difficulty.

QUANGA. See CAPRA.

QUANG-PING, a city of China, of the first rank, in the province of Pe-tche-li, 212 miles S.S.E. of Peking. Lon. 114. 30 E. Lat. 36. 47 N.

QUANG-SI, a province of China, bounded on the N. by Koei-tcheou and Hou-quang, W. by Yunnan, and the kingdom of Tonquin, S. by the gulf of Tonquin and the province of Quang-tong, and E. by the same and Houquang. The southern part is a flat country, and well cultivated; but the northern is full of mountains covered with trees, and have mines of gold, silver, copper, and tin. It is watered by several rivers, and produces so much rice, as to supply the inhabitants of Quang-tong for six months in the year. Here is a singular tree, which, instead of pith, contains a soft pulp, that yields a kind of flour; and the bread made of it is said to be exceedingly good. Beside paroquets, hedge-hogs, and the rhinoceros, a prodigious number of wild animals, curious birds, and uncommon insects are found here. Quei-ling is the capital.

QUANG-TONG. See CANTON.

QUA'NTITIVE. *a.* (*quantitivus*, Latin.) Estimable according to quantity (*Digby*).

QUA'NTITY. *s.* (*quantité*, Fr. *quantitas*, Latin.) 1. That property of any thing which may be increased or diminished (*Cheyne*). 2. Any indeterminate weight or measure. 3. Bulk or weight (*Dryden*). 4. A portion; a part (*Shakspeare*). 5. A large portion (*Arbuthnot*). 6. The measure of time in pronouncing a syllable (*Holder*).

QUANTITY, according to the first of the above acceptations, is that property of any thing which may be increased or diminished. This interpretation of the word is certainly just, and for the purposes of common conversation it is sufficiently determinate; but the man of science may expect to find in a work like ours a definition of the thing signified. This, however, cannot be given him. A logical definition consists of the genus under which the thing defined is ranked, and the specific difference (see LOGIC); but quantity is ranked under no genus. In that school where such definitions were most valued, it was considered as one of the ten categories, or general conceptions, under which all the objects of human apprehension were mustered, like soldiers in an army (see CATEGORY and PHILOSOPHY). On this account, even Aristotle himself, who delighted in definitions, and was not easily deterred from a favourite pursuit, could not consistently with his own rules attempt to define quantity. He characterises it, however, in several parts of his works; and particularly in the 15th chapter of the 4th book of his Metaphysics, where he gives the following account of the three first categories: *Ταυτα μεν γαρ, ων μια ἡ ουσια· ὁμοια δ' ων ἡ ποιοτης μια· ισα δε, ων το ποσον εν.* Things are the same, of which the substance is one; similar, of which the quality is one; equal, of which the quantity is one. Again, he tells us that the chief characteristic of quantity is, that it may be denominated equal and unequal.

That any man can become wiser by reading such descriptions as these, none but an idolater of Aristotle will suppose. There is, indeed, no periphrases by which we can explain what is meant by quantity to those who have not previously formed such a notion.—All that can be done by making the attempt is only to settle language, by stating exactly the cases in which we use this word in the greatest conformity to general custom; for there is a laxness or carelessness of expression in the language of most men, and our notions are frequently communicated by speech in a way by no means precise; so that it is often a great chance that the notions excited in the mind of the hearer are not exact counterparts of those in the mind of the speaker.

The understandings of men differ in nothing more remarkably than in their power of abstraction, and of rapidly forming conceptions so general and simple as not to be clogged with distinguishing circumstances, which may be different in different minds while uttering and hearing the same words: and it is of great consequence to a man of scientific habits, either to cultivate, if possible, this talent, or to supersede its use, by studiously forming to himself notions of the most important universals in his own course of contemplation, by careful abstraction of every thing extraneous. His language by this means becomes doubly instructive by its extreme precision; and he will even judge with greater certainty of notions intended to be communicated by the more slovenly language of another person.

We cannot say that there is much ambiguity in the general use of the term quantity: but here, as in all other cases, a love of refinement, of novelty, and frequently of vanity, and the wish of appearing ingenious and original, have made men take advantage of even the small latitude with which the careless use of the word will furnish them, to amuse themselves and the public by giving the appearance of science to empty sounds.

Mathematics is undoubtedly employed in discovering and stating many relations of quantity; and it is in this category alone that any thing is contemplated by the mathematician, whether in geometry, arithmetic, or algebra. Hence mathematics has been called the science of quantity. The simplicity of the object of the mathematician's contemplation, and unparalleled distinctness with which he can perceive its modifica-

tions, have enabled him to erect a body of science, eminent not only for its certainty, but also for the great length to which he can carry his reasonings without danger of error; and the intimate connection which this science has with the arts of life, and the important services which it has performed, have procured it a most respectable place in the circle of the sciences. Ingenious men have availed themselves of this preeminence of mathematics, and have endeavoured to procure respect for their disquisitions on other subjects, by presenting them to the public as branches of mathematical science, and therefore susceptible of that accuracy and certainty, which are its peculiar boast. Our moral affections, our sensations, our intellectual powers, are all susceptible of augmentation and diminution, are conceivable as greater and less when stated together, and are familiarly spoken of as admitting of degrees of comparison. We are perfectly well understood when we say that one pain, heat, grief, kindness, is greater than another; and as this is the distinguishing characteristic of quantity, and as quantity is the subject of mathematical discussion, we suppose that these subjects may be treated mathematically. Accordingly, a very celebrated and excellent philosopher (Dr. F. Hutchinson), has said, among many things of the same kind, that the greatness of a favour is in the direct compound ratio of the service performed and the dignity of the performer, and the inverse ratio of the merit and rank of the receiver; that the value of a character is in the compound ratio of the talents and virtue, &c.; and he has delivered a number of formal propositions on the most interesting questions in morals, couched in this mathematical language, and even expressed by algebraic formulæ. But this is mere play, and conveys no instruction. We understand the words; they convey no absurdity; and in as far as they have a sense, we believe the propositions to be true. But they give no greater precision to our sentiments than the more usual expressions would do. If we attend closely to the meaning of any one of such propositions, we shall find that it only expresses some vague and indistinct notions of degrees of those emotions, sentiments, or qualities, which would be just as well conceived by means of the expressions of ordinary language; and that it is only by a sort of analogy or resemblance that this mathematical language conveys any notions whatever of the subjects.

The object of contemplation to the mathematician is not whatever is susceptible of greater and less, but what is measurable; and mathematics is not the science of magnitude, in its most abstracted and general acceptation, but of magnitude which can be measured. It is, indeed, the science of measure, and whatever is treated in the way of mensuration is treated mathematically. Now, in the discourse of ordinary life and ordinary men, many things are called quantities which we cannot or do not measure. This is the case in the instances already given of the affections of the mind, pleasure, pain, beauty, wisdom, honour, &c. We do not say that they are incapable of measure; but we have not yet been able to measure them, nor do we think of measuring them when we speak rationally and usefully about them. We therefore do not consider them mathematically; nor can we introduce mathematical precision into our discussions of these subjects till we can, and actually do, measure them. Persons who are precise in their expression will even avoid such phrases on these subjects as suppose, or strictly express, such measurement. We should be much embarrassed how to answer the question, how much pain does the tooth-ache give you just now; and how much is it easier since yesterday? Yet the answer (if we had a measure) would be as easy as to the question, how many guineas did you win at cards? or, how much land have you bought? Nay, though we say familiarly, "I know well how much such a misfortune would affect you," and are understood when we say it, it would be awkward language to say, "I know well the quantity of your grief." It is vain, therefore, to expect mathematical precision in our discourse or conceptions of quantities in the most abstracted sense. Such precision is confined to quantity which may be and is measured. It is only trifling with the imagination when we employ mathematical language on subjects which have not this property.

It will therefore be of some service in science to discriminate quantities in this view; to point out what are susceptible of measure and what are not.

What is measure? It is one of these two things: it is either finding out some known magnitude of the thing measured, which we can demonstrate to be equal to it; or to find a known magnitude of it, which being taken so many times shall be equal to it. The geometer measures the contents of a parabolic space when he exhibits a parallelogram of known dimensions, and demonstrates that this parallelogram is equal to the parabolic space. In like manner, he measures the solid contents of an infinitely extended hyperbolic spindle, when he exhibits a cone of known dimensions, and demonstrates that three of these cones are equal to the spindle.

In this process it will be found that he actually subdivides the quantity to be measured into parts of which it consists, and states these parts as actually making up the quantity, specifying each, and assigning its boundaries. He goes on with it, piece by piece, demonstrating the respective equalities as he goes along, till he has exhausted the figure, or considered all its parts.—When he measures by means of a submultiple, as when he shows the surface of a sphere to be equal to four of its great circles, he stops, after having demonstrated the equality of one of these circles, to one part of the surface: then he demonstrates that there are other three parts, each of which is precisely equal to the one he has minutely considered. In this part of the process he expressly assigns the whole surface into its distinct portions, of which he demonstrates the equality.

But there is another kind of geometrical measurement which proceeds on a very different principle. The geometer conceives a certain individual portion of his figure, whether line, angle, surface, or solid, as known in respect to its dimensions. He conceives this to be lifted from its place, and again laid down on the adjoining part of the figure, and that it is equal to the part which it now covers; and therefore that this part together with the first is double of the first: he lifts it again, and lays it down on the next adjoining part, and affirms that this, added to the two former, make up a quantity triple of the first. He goes on in this way, making similar inferences, till he can demonstrate that he has in this man-

ner covered the whole figure by twenty applications, and that his moveable figure will cover no more; and he affirms that the figure is twenty times the part employed.

This mode is precisely similar to the manner of practical measurement in common life: we apply a foot rule successively to two lines, and find that 30 applications exhaust the one, while it requires 35 to exhaust the other. We say, therefore, that the one line is 30 and the other 35 feet long; and that these two lines are to each other in the ratio of 30 to 35. Having measured two shorter lines by a similar application of a stick of an inch long 30 times to the one and 35 times to the other, we say that the ratio of the two first lines is the same with that of the two last. Euclid has taken this method of demonstrating the fourth proposition of the first book of his celebrated elements.

But all this process is a fiction of the mind, and it is the fiction of an impossibility. It is even inconceivable, that is, we cannot in imagination make this application of one figure to another; and we presume to say, that, if the elements of geometry cannot be demonstrated in some other way, the science has not that title to pure, abstract, and infallible knowledge, which is usually allowed it. We cannot suppose one of the triangles lifted and laid on the other, without supposing it something different from a triangle *in abstracto*. The individuality of such a triangle consists solely in its being in the precise place where it is, and in occupying that portion of space. If we could distinctly conceive otherwise, we should perceive that, when we have lifted the triangle from its place, and applied it to the other, it is gone from its former place, and that there is no longer a triangle there. This is inconceivable, and space has always been acknowledged to be immoveable. There is therefore some logical defect in Euclid's demonstration. We apprehend that he is labouring to demonstrate, or rather illustrate, a simple apprehension. This indeed is the utmost that can be done in any demonstration (see METAPHYSICS): but the mode by which he guides the mind to the apprehension of the truth of his fourth proposition is not consistent either with pure mathematics, or with the laws of corporeal nature. The real process as laid down by him, seems to be this. We suppose something different from the abstract triangle; some thing that, in conjunction with other properties, has the property of being triangular, with certain dimensions of two of its sides and the included angle. It has avowedly another property, not essential to, and not contained in, the abstract notion of a triangle, viz. mobility. We also suppose it permanent in shape and dimensions, or that although, during its motion, it does not occupy the same space, it continues, and all its parts, to occupy an equal space. In short, our conception is very mixed, and does not perceptibly differ from our conception of a triangular piece of matter, where the triangle is not the subject, but an adjunct, a quality. And when we suppose the application made, we are not in fact supposing two abstract triangles to coincide. This we cannot do with any thing like distinctness; for our distinct conception now is, not that of two triangles coinciding, but of one triangle being now exactly occupied by that moveable thing which formerly occupied the other. In short, it is a vulgar measurement, restricted by suppositions which are inadmissible in all actual measurements in the present universe, in which no moveable material thing is known to be permanent, either in shape or magnitude.

This is an undeniable consequence of the principle of universal gravitation, and the compressibility of every kind of tangible matter with which we are acquainted. Remove the brass rule but one inch from its place; its gravitation to the earth and to the rest of the universe is immediately changed, and its dimensions change of consequence. A change of temperature will produce a similar effect; and this is attended to and considered in all nice mensurations. We do the best we can to assure ourselves that our rule always occupies a sensibly equal space; and we must be contented with chances of error which we can neither perceive nor remove.

We might (were this a proper place) take notice of some other logical defects in the reasoning of this celebrated proposition: but they are beside our present purpose of explaining the different modes of mathematical measurement, with the view of discovering that circumstance in which they all agree, and which (if the only one) must therefore be the characteristic of mensuration.

We think that the only circumstance in which all modes of mensuration agree, or the only notion that is found in them all, is, that the quantity is conceived as consisting of parts, distinguishable from each other, and separated by assignable boundaries; so that they are at once conceived separately and jointly. We venture to assert that no quantity is directly measured which we cannot conceive in this way, and that such quantities only are the immediate objects of mathematical contemplation, and should be distinguished by a generic name. Let them be called mathematical quantities. Extension, duration, number, and proportion, have this characteristic, and they are the only quantities which have it. Any person will be convinced of the first assertion by attending to his own thoughts when contemplating these notions. He will find that he conceives every one of them as made up of its own parts, which are distinguishable from each other, and have assignable boundaries, and that it is only in consequence of involving this conception that they can be added to or subtracted from each other; that they can be multiplied, divided, and conceived in any proportion to each other.

He may perhaps find considerable difficulty in acquiring perfectly distinct notions of the mensurability, and the accuracy of the modes of mensuration. He will find that the way in which he measures duration is very similar to that in which he measures space or extension. He does not know, or does not attend to, any thing which hinders the brass foot-rule in his hand from continuing to occupy equal spaces during his use of it, in measuring the distance of two bodies. In like manner he selects an event which nature or art can repeat continually, and in which the circumstances which contribute to its accomplishment are invariably the same, or their variations and their effects are insensible. He concludes that it will always occupy an equal portion of time for its accomplishment, or always last an equal time. Then, observing that, during the event whose duration he wishes to measure, this standard event is accomplished $29\frac{1}{2}$ times, and that it is repeated $365\frac{1}{4}$ times during the accomplishment of another event, he affirms that the

durations of these are in the ratio of 29½ to 365¼. It is thus (and with the same logical defect as in the measuring a line by a brass rod) that the astronomer measures the celestial revolutions by means of the rotation of the earth round its axis, or by the vibrations of a pendulum.

We are indebted for most of the preceding observations to Dr. Reid, the celebrated author of the Inquiry into the Human Mind on the Principles of Common Sense, and of the Essays on the Intellectual and Active Powers of Man. He has published a dissertation on this subject in the 45th volume of the Philosophical Transactions, No. 489, which we recommend to our philosophical readers as a performance eminent for precision and acuteness. If we presume to differ from him in any trivial circumstance, it is with that deference and respect which is due to his talents and his worth.

Dr. Reid justly observes, that as nothing has proportion which has not either extension, duration, or number, the characters of mathematical quantity may be restricted to these three. He calls them proper quantities, and all others he calls improper. We believe that, in the utmost precision of the English language, this denomination is very apposite, and that the word quantity, derived from *quantum*, always supposes measurement: but the word is frequently used in cases where its original is not kept in view, and we use other words as synonymous with it, when all mensuration, whether possible or not, is out of our thoughts. According to practice, therefore, the *jus et norma loquendi*, there seems to be no impropriety in giving this name, in our language at least, to whatever can be conceived as great or little. There is no impropriety in saying that the pain occasioned by the stone is greater than that of the tooth-ache; and when we search for the category to which the assertion may be referred, we cannot find any other than quantity. We may be allowed therefore to say, with almost all our scientific countrymen, that every thing is conceivable in respect of quantity which we can think or speak of as greater and less; and that this notion is the characteristic of quantity as a genus, while measurableness is the characteristic of mathematical quantity as a species.

But do we not measure many quantities, and consider them mathematically, which have not this characteristic of being made up of their own distinguishable parts? What else is the employment of the mechanician, when speaking of velocities, forces, attractions, repulsions, magnetic influence, chemical affinity, &c. &c.? Are not these mathematical sciences? And if the precision and certainty of mathematics arise from the nature of their specific object, are not all the claims of the mechanician and physical astronomer ill-founded pretensions? These questions require and deserve a serious answer.

It is most certain that we consider the notions which are expressed by these terms velocity, force, density, and the like, as susceptible of measure, and we consider them mathematically.

Some of these terms are nothing but names for relations of measurable quantity, and only require a little reflection to shew themselves such. Velocity is one of these. It is only a name expressing a relation between the space described by a moving body and the time which elapses during its description. Certain moderate rates of motion are familiar to us. What greatly exceeds this, such as the flight of a bird when compared with our walking, excites our attention, and this excess gets a name. A motion not so rapid as we are familiar with, or as we wish, also gets a name; because in this the excess or defect may interest us. We wish for the flight of the hawk; we chide the tardy pace of our messenger; but it is scientific curiosity which first considers this relation as a separate object of contemplation, and the philosopher must have a name for it. He has not formed a new one, but makes use of a word of common language, whose natural meaning is the combination of a great space with a short time. Having once appropriated it, in his scientific vocabulary, to this very general use, it loses with him its true signification. Tardity would have done just as well, though its true meaning is diametrically opposite; and there is no greater impropriety in saying the tardity of a cannon bullet than in saying the velocity of the hour-hand of a watch. Velocity is a quality or affection of motion, the notion of which includes the notions of space and duration (two mathematical quantities), and no other. It does not therefore express a mathematical quantity itself, but a relation, a combination of two mathematical quantities of different kinds; and as it is measurable in the quantities so combined, its measure must be a unit of its own kind, that is, an unit of space as combined with an unit of time.

Density is another word of the same kind, expressing a combination of space with number. *Densæ arbores* means trees standing at a small distance from each other; and the word is used in the same sense when we say that quicksilver is denser than water. The expression always suggests to the reflecting mind the notions of particles and their distances. We are indeed so habituated to complicated views of things, that we can see remote connections with astonishing rapidity; and a very few circumstances are sufficient for leading forward the mind in a train of investigation. Common discourse is a most wonderful instance of this. It is in this way that we say, that we found by weighing them that inflammable air had not the sixth part of the density of common air. Supposing all matter to consist of equal atoms equally heavy, and knowing that the weight of a bladder of air is the sum of the weights of all the atoms, and also knowing that the vicinity of the atoms is in a certain proportion of the number contained in a given bulk, we affirm that common air is more than six times denser than inflammable air; but this rapid decision is entirely the effect of habit, which makes us familiar with certain groups of conceptions, and we instantaneously distinguish them from others, and thus think and discourse rationally. The Latin language employs the word *frequens* to express both the combination of space and number, and that of time and number.

There are perhaps a few more words which express combinations of mathematical quantities of different kinds; and the corresponding ideas or notions are therefore proper and immediate subjects of mathematical discussion: but there are many words which are expressive of things, or at least of notions, to which this way of considering them will not apply. All those affections or qualities of external bodies, by which they are conceived to act on each other, are of this kind: impulsive force, weight, centripetal

and centrifugal force, magnetical, electrical, chemical attractions and repulsions; in short, all that we consider as the immediate causes of natural phenomena. These we familiarly measure, and consider mathematically.

What was said on this subject in the article PHYSICS will give us clear conceptions of this process of the mind. These forces or causes are not immediate objects of contemplation, and are known only by and in the phenomena which we consider as their effects. The phenomenon is not only the indication of the agency of any cause, and the characteristic of its kind, but the measure of its degree. The necessary circumstances in this train of human thought are, 1st, The notion of the force as something susceptible of augmentation and diminution. 2d, The notion of an inseparable connection of the force with the effect produced, and of every degree of the one with a corresponding degree of the other. From these is formed the notion that the phenomenon or effect is the proper measure of the force or cause. All this is strictly logical.

But when we are considering these subjects mathematically, the immediate objects of our contemplation are not the forces which we are thus treating. It is not their relations which we perceive, and which we combine with such complication of circumstances and certainty of inference as are known in all other sciences: by no means; they are the phenomena only, which are subjects of purely mathematical discussion. They are motions, which involve only the notions of space and time; and when we have finished an accurate mathematical investigation, and make our affirmation concerning the forces, we are certain of its truth, because we suppose the forces to have the proportions and relations, and no other, which we observe in the phenomena. Thus, after having demonstrated, by the geometrical comparison of the lines and angles and surfaces of an ellipse, that the momentary deflection of the moon from the tangent of her orbit is the 3600th part of the simultaneous deflection of a stone from the tangent of its parabolic path; Newton affirms, that the force by which a particle of the moon is retained in her orbit is the 3600th part of the weight of a particle of the stone; and having farther shown, from fact and observation, that these momentary deflections are inversely as the squares of the distances from the centre of the earth, he affirms, that all this is produced by a force which varies its intensity in this manner.

Now all this investigation proceeds on the two suppositions mentioned above, and the measures of the forces are in fact the measures of the phenomena. The whole of physical astronomy, and indeed the whole of mechanical philosophy, might be taught and understood, without ever introducing the word force, or the notion which it is supposed to express: for our mathematical reasonings are really about the phenomena, which are subjects purely mathematical.

The precision, therefore, that we presume to affirm to attend these investigations, arises entirely from the measurable nature of the quantities which are the real objects of our contemplation, and the suitableness and propriety of the measures which we adopt in our comparisons.

Since, then, the phenomena are the immediate subjects of our discussion, and the operating powers are only inferences from the phenomena considered as effects, the quantity ascribed to them must also be an inference from the quantity of the effect, or of some circumstance in the effect. The measure, therefore, of the cause, or natural power or force, cannot be one of its own parts; for the whole and the part are equally unperceived by us. Our measure, therefore, must be a measure of some interesting part, or of the only interesting part of the phenomenon. It is therefore in a manner arbitrary, and depends chiefly on the interest we take in the phenomenon. It must, however, be settled with precision, so that all men in using it may mean the same thing. It must be settled, therefore, by the description of that part or circumstance of the phenomenon which is characteristic of the natural power. This description is the definition of the measure.

Thus Newton assumes as his measure of the centripetal force, the momentary deviation from uniform rectilineal motion. Others, and sometimes Newton himself, assumes the momentary change of velocity, which again is measured by twice this deviation. These measures, being thus selected, are always proper in a mathematical sense; and if strictly adhered to, can never lead us into any paralogism. They may, however, be physically wrong: there may not be that indissoluble connection between the phenomenon and the supposed cause. But this is no mathematical error, nor does it invalidate any of our mathematical inferences: it only makes them useless for explaining the phenomenon by the principle which we adopted; but it prepares a modification of the phenomenon for some more fortunate application of physical principles.

All that can be desired in the definitions or descriptions of these measures is, that they may not deviate from the ordinary use of the terms, because this would always create confusion, and occasion mistakes. Dr. Reid has given an example of an impropriety of this kind, which has been the subject of much debate among the writers on natural philosophy. We mean the measure of the force inherent in a body in motion. Descartes, and all the writers of his time, assumed the velocity produced in a body as the measure of the force which produces it; and observing that a body, in consequence of its being in motion, produces changes in the state or motion of other bodies, and that these changes are in the proportion of the velocity of the changing body, they asserted that there is in a moving body a *vis insita*, an inherent force, and that this is proportional to its velocity; saying that its force is twice or thrice as great, when it moves twice or thrice as fast at one time as at another. But Leibnitz observed, that a body which moves twice as fast, rises four times as high, against the uniform action of gravity; that it penetrates four times as deep into a piece of uniform clay; that it bends four times as many springs, or a spring four times as strong, to the same degree; and produces a great many effects which are four times greater than those produced by a body which has half the initial velocity. If the velocity be triple, quadruple, &c. the effects are nine times, 16 times, &c. greater; and, in short, are proportional, not to the velocity, but to its square. This observation had been made before by Dr. Hooke, who has enumerated a prodigious variety of important cases in which this proportion of effect is observed. Leibnitz, therefore, affirmed, that the force inherent in a moving body is proportional to the square of the velocity.

It is evident that a body, moving with the same velocity, has the same inherent force, whether this be employed to move another body, to bend springs, to rise in opposition to gravity, or to penetrate a mass of soft matter. Therefore these measures, which are so widely different, while each is agreeable to a numerous class of facts, are not measures of this something inherent in the moving body which we call its force, but are the measures of its exertions when modified according to the circumstances of the case; or, to speak still more cautiously and securely, they are the measures of certain classes of phenomena consequent on the action of a moving body. It is in vain, therefore, to attempt to support either of them by a demonstration. The measure itself is nothing but a definition. The Cartesian calls that a double force which produces a double velocity in the body on which it acts. The Leibnitzian calls that a quadruple force which makes a quadruple penetration. The reasonings of both in the demonstration of a proposition in dynamics may be the same, as also the result, though expressed in different numbers.

But the two measures are far from being equally proper: for the Leibnitzian measure obliges us to do continual violence to the common use of words. When two bodies moving in opposite directions meet, strike each other, and stop, all men will say that their forces are equal, because they have the best test of equality which we can devise. Or when two bodies in motion strike the parts of a machine, such as the opposite arms of a lever, and are thus brought completely to rest, we and all men will pronounce their mutual energies by the intervention of the machine to be equal. Now, in all these cases, it is well known that a perfect equality is found in the products of the quantities of matter and velocity. Thus a ball of two pounds, moving with the velocity of four feet in a second, will stop a ball of eight pounds moving with the velocity of one foot per second. But the followers of Leibnitz say, that the force of the first ball is four times that of the second.

All parties are agreed in calling gravity a uniform or invariable accelerating force; and the definition which they give of such a force is, that it always produces the same acceleration, that is, equal accelerations in equal times, and therefore produces augmentations of velocity proportionable to the times in which they are produced. The only effect ascribed to this force, and consequently the only thing which indicates, characterises, and measures it, is the augmentation of velocity. What is this velocity, considered not merely as a mathematical term, but as a phenomenon, as an event, a production by the operation of a natural cause? It cannot be conceived any other way than as a determination to move on for ever at a certain rate, if nothing shall change it. We cannot conceive this very clearly. We feel ourselves forced to animate, as it were, the body, and give it not only a will and intention to move in this manner, but a real exertion of some faculty in consequence of this determination of mind. We are conscious of such a train of operations in ourselves; and the last step of this train is the exertion or energy of some natural faculty, which we, in the utmost propriety of language, call force. By such analogical conception, we suppose a something, an energy, inherent in the moving body; and its only office is the production and continuation of this motion, as in our own case. Scientific curiosity was among our latest wants, and language was formed long before its appearance: as we formed analogical conceptions, we contented ourselves with the words already familiar to us, and to this something we gave the name force, which expressed that energy in ourselves which bears some resemblance (in office at least) to the determination of a body to move on at a certain rate. This sort of allegory pervades the whole of our conceptions of natural operations, and we can hardly think or speak of any operation without a language, which supposes the animation of matter. And, in the present case, there are so many points of resemblance between the effects of our exertions and the operations of nature, that the language is most expressive, and has the strongest appearance of propriety. By exerting our force, we not only move and keep in motion, but we move other bodies. Just so a ball not only moves, but puts other bodies in motion, or penetrates them, &c.—This is the origin of that conception which so forcibly obtrudes itself into our thoughts, that there is inherent in a moving body a force by which it produces changes in other bodies. No such thing appears in the same body if it be not in motion. We therefore conclude, that it is the production of the moving force, whatever that has been. If so, it must be conceived as proportional to its producing cause. Now this force, thus produced or exerted in the moving body, is only another way of conceiving that determination which we call velocity, when it is conceived as a natural event. We can form no other notion of it. The *vis insita*, the determination to move at a certain rate, and the velocity, are one and the same thing, considered in different relations.

Therefore the *vis insita corpori moventi*, the determination to move at a certain rate, and the velocity, should have one and the same measure, or any one of them may be taken for the measure of the other. The velocity being an object of perception, is therefore a proper measure of the inherent force; and the propriety is more evident by the perfect agreement of this use of the words with common language. For we conceive and express the action of gravity as uniform, when we think and say that its effects are proportional to the times of its action. Now all agree, that the velocity produced by gravity is proportional to the time of its action. And thus the measure of force, in reference to its producing cause, perfectly agrees with its measure, independent of this consideration.

But this agreement is totally lost in the Leibnitzian doctrine; for the body which has fallen four times as far, and has sustained the action of gravity twice as long, is said to have four times the force.

The quaintness and continued paradox of expression which this measure of inherent force leads us into, would have quickly exploded it, had it not been that its chief abettors were leagued in a keen and acrimonious warfare with the British mathematicians who supported the claim of sir Isaac Newton to the invention of fluxions. They rejoiced to find in the elegant writings of Huygens a physical principle of great extent, such as this is, which could be set in comparison with some of the wonderful discoveries in Newton's Principia. The fact, that in the action of elastic bodies on each other the product of the masses and the squares of the ve-

locities remain always the same (which they call the *conservatio virium vivarum*) is of almost universal extent; and the knowledge of it enabled them to give ready and elegant solutions of the most abstruse and intricate problems, by which they acquired a great and deserved celebrity. Dr. Robert Hooke, whose observation hardly any thing escaped, was the first (long before Huygens) who remarked, that in all the cases of the gradual production and extinction of motion, the sensible phenomenon is proportional to he square of the produced or extinguished velocity.

John Bernoulli brought all these facts together, and systematised them according to the principle advanced by Huygens in his treatise on the centre of oscillation. He and Daniel Bernoulli gave most beautiful specimens of the prodigious use of this principle for the solution of difficult physical problems in their dissertations on the motion and impulse of fluids, and on the communication of motion. It was however very early objected to them (we think by marquis Poleni), that in the collision of bodies perfectly hard there was no such *conservatio virium vivarum*; and that in this case, the forces must be acknowledged to be proportional to the velocities. The objections were unanswerable.—But John Bernoulli evaded their force, by affirming that there were and could be no bodies perfectly hard. This was the origin of another celebrated doctrine, on which Leibnitz greatly plumed himself, the law of continuity, viz. that nothing is observed to change abruptly, or *per saltum*. But no one will pretend to say that a perfectly hard body is an inconceivable thing; on the contrary, all will allow that softness and compressibility are adjunct ideas, and not in the least necessary to the conception of a particle of matter, nay totally incompatible with our notion of an ultimate atom.

Sir Isaac Newton never could be provoked to engage in this dispute. He always considered it as a wilful abuse of words, and unworthy of his attention. He guarded against all possibility of cavil, by giving the most precise and perspicuous definitions of those measures of forces, and all other quantities which he had occasion to consider, and by carefully adhering to them. And in one proposition of about 20 lines, viz. the 39th of the 1st book of the Principia, he explained every phenomenon adduced in support of the Leibnitzian doctrine, showing them to be immediate consequences of the action of a force measured by the velocity which it produces or extinguishes. There it appears that the heights to which bodies will rise in opposition to the uniform action of gravity are as the squares of the initial velocities: so are the depths to which they will penetrate uniformly resisting matter: so is the number of equal springs which they will bend to the same degree, &c. &c. &c. We have had frequent occasion to mention this proposition as the most extensively useful of all Newton's discoveries. It is this which gives the immediate application of mechanical principles to the explanation of natural phenomena. It is incessantly employed in every problem by the very persons who hold by the other measure of forces, although such conduct is virtually giving up that measure. They all adopt, in every investigation, the two theorems $ft=v$, and $fs=\frac{1}{2}v^2$; both of which suppose an accelerating force f proportional to the velocity v which it produces by its uniform action during the time t, and the theorem $\int fs=v^2$ is the 39th 1. Princip. and is the *conservatio virium vivarum*.

This famous dispute (the only one in the circle of mathematical science) has led us somewhat aside. But we have little more to remark with respect to measurable quantity. We cannot say what varieties of quantity are susceptible of strict measure, or that it is impossible to give accurate measures of every thing susceptible of augmentation and diminution. We affirm, however, with confidence, that pain, pleasure, joy, &c. are not made up of their own parts, which can be contemplated separately: but they may chance to be associated by nature with something that is measurable; and we may one day be able to assign their degrees with as much precision as we now ascertain the degrees of warmth by the expansion of the fluid in the thermometer. But we dare not descant farther upon these topics here. We beg once more to recommend to the particular notice of our mathematical readers, Dr. Reid's admirable essay above-mentioned, either in the 45th volume of the Philosophical Transactions, or in volume ix. p. 559—566, of the new abridgment of the Philosophical Transactions.

QUANTITY is popularly distinguished into *continued* and *discrete*.

QUANTITY, *continued*, or *continuous*, is when the parts are connected together, and is commonly called magnitude. This, again, is of two kinds; either successive, or improper, as time.

QUANTITY, *discrete*, is when the parts whereof it consists exist distinctly, and unconnected together; which makes what we call number or multitude.

QUANTITY *of matter* in any body, is the product of the density into the bulk; or a quantity arising from the joint consideration of its magnitude and density.

As, if a body be twice as dense, and take up twice as much space as another, it will be four times as great.

This quantity of matter is the best discoverable by the absolute weight of bodies. See MATTER.

QUANTITY *of motion*, the product of the mass into the velocity. See MOMENTUM and QUANTITY.

QUANTITY, in grammar, an affection of a syllable, whereby its measure, or the time wherein it is pronounced, is ascertained; or that which determines the syllable to be long or short.

Quantity is also the object of prosody, and distinguishes verse from prose; and the economy and arrangement of quantities, that is, the distribution of long and short syllables, makes what we call the number.

The quantities are used to be distinguished, among grammarians, by the characters ˘, short, as pĕr; and ¯, long, as rōs. There is also a common, variable, or dubious quantity; that is, syllables that are at one time taken for short ones, and at another time for long ones; as the first syllable in *Atlas*, *patres*, &c.

QUANTUM. *s.* (Latin.) The quantity; the amount (*Swift*).

QUANTUM MERUIT, called also an assumpsit, an action upon the case, grounded upon a necessity to pay a man for doing any thing so much as it deserves or merits.

QUANTUM VALEBAT, or an implied assumpsit, is where goods and wares sold are delivered by a tradesman at no certain price, or to be paid for them as much as they are worth in general; then *quantum valebat*, or an action on the case, lies, and the plaintiff is to aver them to be worth so much; so where the law obliges one to furnish another with goods or provisions, as an innkeeper his guests, &c.

QUARANTINE, is a trial which ships must undergo when suspected of a pestilential infection. It may be ordered by the king, with advice of the privy-council, at such times, and under such regulations, as he judges proper. Ships ordered on quarantine must repair to the place appointed, and must continue there during the time prescribed (generally six weeks); and must have no intercourse with the shore, except for necessary provisions, which are conveyed with every possible precaution. When the time is expired, and the goods opened and exposed to the air as directed, if there be no appearance of infection, they are admitted to port.

Ships infected with the pestilence must proceed to St. Helen's Pool, in the Scilly islands, and give notice of their situation to the custom-house officers, and wait till the king's pleasure be known.

Persons giving false information to avoid performing quarantine, or refusing to go to the place appointed, or escaping, also officers appointed to see quarantine performed, deserting their office, neglecting their duty, or giving a false certificate, suffer death as felons.

Goods from Turkey, or the Levant, may not be landed without licence from the king, or certificate that they have been landed and aired at some foreign port. See PLAGUE.

QUARE, in law, a term affixed to the title of several writs: as, 1. Quare ejecit infra terminum, is a writ that lies for a lessee cast out of his farm before his term is expired. 2. Quare impedit, a writ that lies for a person that has purchased an advowson, against him who disturbs him in the right thereof by presenting a clerk to it when the church is vacant. This writ differs from what is called a darrein presentment, because that is brought where a person or his ancestors formerly presented; but this lies for him that is purchaser himself. Yet in both these writs, the plaintiff recovers the presentation and damages; though the title to the advowson is recovered only by a quare impedit. 3. Quare incumbravit, is a writ that lies against a bishop, who, within six months after the vacancy of a benefice, confers it on his clerk, while two others are contesting the right of presentation. 4. Quare non admisit, is a writ that lies where any one has recovered an advowson or presentation, and sending his clerk to be admitted, the bishop refuses to admit him; in which case, the person that has the presentation may have this writ against the bishop. 5. Quare non permittit, is a writ that lies for one who has a right to present for a turn against the proprietary. 6. Quare obstruxit, is a writ that lies from him who, having a right to pass through another's grounds, cannot enjoy the same, because the owner has fenced them up.

QUARLES (Francis), the son of James Quarles, clerk to the board of green cloth, and purveyor to queen Elizabeth, was born in 1592. He was educated at Cambridge; became a member of Lincoln's Inn; and was for some time cup-bearer to the queen of Bohemia, and chronologer to the city of London. It was probably on the ruin of her affairs that he went to Ireland, as secretary to archbishop Usher; but the troubles in that kingdom forcing him to return, and not finding affairs more at peace in England, some disquiets he met with were thought to have hastened his death, which happened in 1644. His works both in prose and verse are numerous, and were formerly in great esteem, particularly his Divine Emblems: but the obsolete quaintness of his style has caused them to fall into neglect, excepting among particular classes of readers. "The memory of Quarles," says Mr. Headly, "has been branded with more than common abuse, and he seems to have been censured merely from the want of being read. If his poetry failed to gain him friends and readers, his piety should at least have secured him peace and good-will. He too often, no doubt, mistook the enthusiasm of devotion for the inspiration of fancy; to mix the waters of Jordan and Helicon in the same cup, was reserved for the hand of Milton; and for him, and him only, to find the bays of Mount Olivet equally verdant with those of Parnassus. Yet, as the effusions of a real poetical mind, however thwarted by untowardness of subject, will be seldom rendered totally abortive, we find in Quarles original imagery, striking sentiment, fertility of expression, and happy combinations; together with a compression of style that merits the observation of the writers of verse. Gross deficiencies of judgment, and the infelicity of his subjects, concurred in ruining him. Perhaps no circumstance whatever can give a more complete idea of Quarles's degradation than a late edition of his Emblems; the following passage is extracted from the preface: 'Mr. Francis Quarles, the author of the Emblems that go under his name, was a man of the most exemplary piety, and had a deep insight into the mysteries of our holy religion. But, for all that, the book itself is written in so old a language, that many parts of it are scarce intelligible in the present age; many of his phrases are so affected, that no person, who has any taste for reading, can peruse them with the least degree of pleasure; many of his expressions are harsh, and sometimes whole lines are included in a parenthesis, by which the mind of the reader is diverted from the principal object. His Latin mottoes under each cut can be of no service to an ordinary reader, because he cannot understand them. In order, therefore, to accommodate the public with an edition of Quarles's Emblems, properly modernised, this work was undertaken.' Such an exhibition

of Quarles is chaining Columbus to an oar, or making John Duke of Marlborough a train-band corporal."

QUA'RREL. *s.* (*querelle*, French.) 1. A breach of concord (*Hammond*). 2. A brawl; a petty fight; a scuffle (*Shakspeare*). 3. A dispute; a contest (*Hooker*). 4. A cause of debate (*Fairfax*). 5. Something that gives a right to mischief, reprisal, or action (*Bacon*). 6. Objection; ill-will (*Felton*). 7. Any one peevish or malicious (*Shakspeare*). 8. (*quadrella*, Italian). An arrow with a square head (*Camden*).

To QUA'RREL. *v. n.* (*querelle*, French.) 1. To debate; to scuffle; to squabble (*Shakspeare*). 2. To fall into variance (*Shakspeare*). 3. To fight; to combat (*Dryden*). 4. To find fault; to pick objections (*Bramhall*).

QUA'RRELLER. *s.* He who quarrels.

QUA'RRELOUS. *a.* (*querelleux*, French.) Petulant; easily provoked to enmity (*Shakspeare*).

QUA'RRELSOME. *a.* (from *quarrel.*) Inclined to brawls; easily irritated; irascible; choleric; petulant (*L'Estrange*).

QUA'RRELSOMELY. *ad.* In a quarrelsome manner; petulantly; cholericly.

QUA'RRELSOMENESS. *s.* (from *quarrelsome.*) Cholericness; petulance.

QUA'RRY. *s.* (*quarré*, Fr.) 1. A square (*Mortimer*). 2. (*quadreau*, French.) An arrow with a square head (*Sandys*). 3. Game flown at by a hawk (*Sandys*). 4. (*quarriere*, *quarrel*, Fr.) A stone mine; a place where they dig stones (*Cleaveland*).

To QUA'RRY. *v. n.* (from the noun.) To prey upon: not in use (*L'Estrange*).

QUA'RRYMAN. *s.* (*quarry* and *man.*) One who digs in a quarry (*Woodward*).

QUART. *s.* (*quart*, French.) 1. The fourth part; a quarter (*Spenser*). 2. The fourth part of a gallon (*Shakspeare*). 3. (*quarte*, French.) The vessel in which strong drink is commonly retailed (*Shakspeare*).

QUARTAN, or FOURTH DAY AGUE. Of this species of ague, as well as the other kinds, there are several varieties noticed by authors. The most frequent of these are, 1. The double quartan, with two paroxysms or fits on the first day, none on the second and third, and two again on the fourth day. 2. The double quartan, with a paroxysm on the first day, another on the second, but none on the third. 3. The triple quartan, with three paroxysms every fourth day. 4. The triple quartan, with a slight paroxysm every day, every fourth paroxysm being similar. See also FEBRIS INTERMITTENS, and NOSOLOGY.

QUARTA'TION. *s.* (from *quartus*, Lat.) A chymical operation (*Boyle*).

QUA'RTER. *s.* (*quart*, *quartier*, Fr.) 1. A fourth part (*Burnet*). 2. A region of the skies, as referred to the seaman's card (*Addison*). 3. A particular region of a town or country. 4. The place where soldiers are lodged or stationed (*Spectator*). 5. Proper station (*Milton*). 6. Remission of life; mercy granted by a conqueror (*Clarendon*). 7. Treatment shown by an enemy (*Collier*). 8. Friendship; amity: not in use (*Shakspeare*). 9. A measure of eight bushels (*Mortimer*). 10. False *quarter* is a cleft or chink in a *quarter* of a horse's hoof from top to bottom.

QUARTER, in heraldry, is applied to the parts or members of the first division of a coat that is quartered or divided into four quarters.

QUARTER OF A POINT, in navigation, is the fourth part of the distance between two cardinal points, which is 2° 48′.

QUARTER OF A SHIP, is that part of a ship's hold which lies between the steerage-room and the transom.

QUARTER-MASTERS, or QUARTEERS, in a ship of war, are officers whose business it is to rummage, stow, and trim, the ship in the hold; to overlook the steward in his delivery of victuals to the cook, and in pumping or drawing out beer, or the like. They are also to keep their watch duly, in conning the ship, or any other duty.

QUARTER-CAST. A horse is said to cast his quarters, when, for any disorder in his coffin, we are obliged to cut one of the quarters off the hoof; and when the hoof is thus cut, it grows and comes on anew.

QUARTER (False), in farriery. See FALSE QUARTER.

To QUA'RTER. *v. a.* (from the noun.) 1. To divide into four parts (*Shakspeare*). 2. To divide; to break by force (*Shakspeare*). 3. To divide into distinct regions (*Dryden*). 4. To station or lodge soldiers (*Dryden*). 5. To lodge; to fix in a temporary dwelling. 6. To diet (*Hudibras*). 7. To bear as an appendage to the hereditary arms (*Peacham*).

QUA'RTERAGE. *s.* (from *quarter*) A quarterly allowance (*Hudibras*).

QUA'RTERDAY. *s.* (*quarter* and *day.*) One of the four days in the year, on which rent or interest is paid (*Addison*).

QUA'RTERDECK. *s.* (*quarter* and *deck.*) The short upper deck.

QUARTERING, in gunnery, is when a piece of ordnance is so traversed that it will shoot on the same line, or on the same point of the compass, as the ship's quarter bears.

QUARTERING, in heraldry, is dividing a coat into four or more quarters, or quarterings, by parting, couping, &c. that is, by perpendicular and horizontal lines, &c.

QUA'RTERLY. *a.* (from *quarter.*) Containing a fourth part (*Holder*).

QUA'RTERLY. *ad.* Once in a quarter of a year.

QUA'RTERN. *s.* A gill, or the fourth part of a pint.

QUARTER SESSIONS. The sessions of the peace is a court of record holden before two or more justices, whereof one is of the quorum, for the execution of the authority given them by the commission of the peace, and certain statutes and acts of parliament. The jus-

tices keep their sessions in every quarter of the year at least, and for three days if need be; to wit, in the first week after the feast of St. Michael, in the first week after the Epiphany, in the first week after Easter, and in the first week after St. Thomas, and oftener if need be.

Any two justices, one whereof is of the quorum, by the words of the commission of the peace, may issue their precept to the sheriff, to summon a session for the general execution of their authority; and such session, holden at any time within that quarter of a year, is a general quarter-session, and the sheriff must summons a jury under their authority.

There are many offences, which, by particular statutes, belong properly to this jurisdiction, and ought to be prosecuted in this court, as the smaller misdemeanors, not amounting to felony, and especially offences relating to the game, highways, alehouses, bastard children, the settlements and provision of the poor, vagrants, servants' wages, apprentices, and popish recusants. Some of these are proceeded upon by indictment, and others in a summary way, by motion and order, which may, for the most part, unless guarded against by any particular statute, be removed into the Court of King's Bench, by certiorari, and be there either quashed or confirmed.

The business done at quarter-sessions is become of the highest importance to the country, and the public are greatly indebted to those magistrates who have sufficient knowledge of law to perform the duties of their office and give their attendance. In Ireland a practising barrister is appointed at each session to assist as chairman. In England this is not generally the case by law, but barristers are chiefly preferred, and the duty to be performed is so multifarious, that it requires no small skill in law, accompanied with much activity and industry, to execute it justly.

QUARTERS, a name given at sea to the several stations where the officers and crew of a ship of war are posted in action.

The number of men appointed to manage the artillery is always in proportion to the nature of the guns, and the number and condition of the ship's crew. They are, in general, as follow, when the ship is well manned, so as to fight both sides at once occasionally:

Pounder	No. of men.
To a 42	15
32	13
24	11
18	9
12	7
9	6
6	5
4	4
3	3

This number, to which is often added a boy to bring powder to every gun, may be occasionally reduced, and the guns nevertheless well managed. The number of men appointed to the small arms on board his majesty's ships and sloops of war, by order of the admiralty, are:

Rate of the ship.	No. of men to the small arms.
1st	150
2d	120
3d of 80 guns	100
— of 70 guns	80
4th of 60 guns	70
4th	60
5th	50
6th	40
Sloops of war	30

The lieutenants are usually stationed to command the different batteries, and direct their efforts against the enemy. The master superintends the movements of the ship, and whatever relates to the sails. The boatswain, and a sufficient number of men, are stationed to repair the damaged rigging; and the gunner and carpenter, wherever necessary, according to their respective offices.

QUARTERS (Close), in a ship, those places where the seamen quarter themselves, in case of boarding, for their own defence, and for clearing the decks, &c.

QUARTERS OF A SADDLE; the pieces of leather made fast to the lower part of the sides of the saddle, and hanging down below the saddle.

QUARTERS, i. e. the fore-quarters and hind-quarters of a horse. The fore-quarters are the shoulders and the fore legs: the hind-quarters are the hips and the legs behind.

QUARTERS OF A HORSE'S FOOT; the sides of the coffin comprehended between the toe and the heel on one side and the other of the foot. The inner-quarters are those opposite to one another, facing from one foot to the other; these are always weaker than the outside quarters, which lie on the external sides of the coffin. A horse is said to have a false quarter when the hoof has a kind of cleft occasioned by a horse's casting his quarter, and getting a new one, for then the horn becomes uneven and also softer than the rest of the hoof; and the foot should be shod with some nicety. But if the cleft be considerable, and take up a fourth of the hoof, the horse is worth little.

QUA'RTERSTAFF. *s.* A staff of defence (*Dryden*).

QUA'RTILE. *s.* An aspect of the planets, when they are three signs or ninety degrees distant from each other (*Harris*).

QUA'RTO. *s.* (*quartus*, Latin) A book in which every sheet, being twice doubled, makes four leaves (*Watts*).

QUARTZUM. Quartz. In mineralogy, a genus of the class earths; order siliceous. Consisting of silica, about six per cent of alumina, and one per cent of carbonat of lime; hard, lightish, brittle, shining internally, breaking into indeterminate fragments with acute margins, more commonly parisitical, found in mountains of all ages, mouldering in the air;

not melting by fire alone, but with soda running into a hard pellucid glass. Twenty-four species.

1. Q. fibrosum. Fibrous quartz. Diaphonous, whitish, fibrous, with the fibres thicker and parallel, of a common form. Found on the Carpathian mountains in Hungary, and near Rabischau in Silesia: exceedingly rare.

2. Q. foveolatum. With the surface uneven by shallow pits of a common form. Found in Hungary, Bohemia, near Freyburg and Schneeburg in Saxony, and in the quarries of Sweden; colour generally whitish, rarely violet, or ochraceous; mostly diaphonous, though sometimes opake; the pits or hollow very numerous and cubic, rarely parallellopiped or triedo-pyramidal, or spherical or tubular.

3. Q. foraminulentum. Perforated with deep, roundish hollows, of a common form. Found near Freyburg in Saxony, and near Schemnitz in Hungary; colour white, greyish or ochraceous; the hollows generally narrow, and sometimes flexuous.

4. Q. erosum. Full of numerous, very minute empty hollows and cavities, of a common form. Found in the mines of Hungary; white, violet, or dull greenish.

5. Q. cellosum. Cellular quartz. Lamellar, with the plates contiguous, placed at various angles with each other and forming cells, of a common form. The cells vary in a great multitude of ways, triangular, polygonal, gyrating, or double. Found in Siberia, Hungary, Bohemia, Saxony. Colour sometimes white, sometimes more or less tinged with oxyd of iron.

6. Q. lamellosum. Lamellar or lamellated quartz. Lamellar, with the plates parallel, of a common form. Found near Schemnitz in Hungary, and in the mines of Bohemia; colour milk-white, white, violet, or brown; rarely yellow and blue: the foliations sometimes very thin and compacted together.

7. Q. cristatum. The surface marked with very fine parallel groves, of a common form. Saxony and Hungary; white, violet, or yellowish-brown.

8. Q. globulozum. Of a more or less rounded form, pellucid: perfectly globular, oval, almond-shaped, kidney-shaped, tuberous. Found detached in the beds or banks of rivers in various parts of Europe, Asia, and Africa; or compacted with other fossils in Hungary, Saxony, &c.—colour generally white.

9. Q. cylindricum. Separating into cylindrical pieces; the cylinders sometimes parallel, sometimes diverging. Found in Hungary, Saxony, and in other parts of the continent; colour white, subopake, with the cylinders thinner or thicker.

10. Q. granulare. Granular quartz. Quartz in grains. Separating into granular fragments. Found commonly in small grains, sometimes detached, sometimes compacted, in Norway, Spain, France, and Saxony; white, variegated, greenish, red, or yellow-brown; the grains sometimes so disposed as to reflect a fine splendour when polished.

11. Q. stillatitium. Stalactitic quartz. Gradually deposited by water impregnated with particles of quartz, and often covering other bodies as with a bark. Bishopric of Cologne, Ireland, Sweden, and Hungary; colour diaphonous, generally white, sometimes yellowish or reddish; and appearing in the form of solid or hollow cones, or in that of roses, cauliflowers, grapes, &c.

12. Q. fragile. Pure quartz. Solid quartz. Of a common form and splintery texture, not falling spontaneously into fragments: in some instances nearly opake, in others diaphonous, milky white. Found almost every where in the fissures of rocks and mountains; sometimes opake, sometimes diaphonous, rarely semipellucid; colour mostly white, oftentimes milky, frequently pale greenish or red.

13. Q. Prasius. Prase. Pellucid agate. Smaragdmatt, Cronst. Leek-green, diaphonous, of a coarse splintery texture. Found in Saxony, in Finland, Siberia, and Bohemia, in irregular masses, or variously crystallized; colour green of various degrees of density, sometimes yellowish or blueish-green; when broken shining, and of a coarse shivery texture, sometimes approaching to the imperfectly small conchoidal; admits a degree of polish, and is frequently numbered among the gems.

14. Q. pingue. Common quartz. Pure quartz. Of a common form, slightly greasy to the touch, approaching to the minutely conchoidal texture, not falling spontaneously into fragments. Pellucid, diaphonous, or coloured. Found distributed in most parts of the globe, frequently in the native oxyds of metals and minerals, sometimes forming whole rocks and sometimes in beds and veins; of various degrees of transparency and colour, but generally white or greyish: spec. grav. from 26,4 to 26,5.

15. Q. tabulare. Of a conchoidal texture, in tabular crystals. Hungary and Saxony: colour generally white, rarely dull-greenish; the tables mostly rhombic, though sometimes three-sided.

16. Q. cubicum. Of a conchoidal texture, in cubic crystals which are frequently hollow within. Faces square or rhombic. Sweden, Hungary, Saxony, Bohemia; generally in aggregate crystals, which seem to have acquired their form from some other crystal which it had enveloped and which had gradually mouldered, leaving a hollow in its place; white, hoary, margaritaceous, or brown-red; pellucid, diaphanous, or nearly opake.

17. Q. octahedricum. Of a conchoidal texture, in a double four-sided pyramid. Found in Saxony; often hollow within: colour the same as quartzum cubicum.

18. Q. triedrum. Of a conchoidal texture, in a simple three-sided pyramid. Found in Sweden and Saxony, in aggregate crystals, which are sometimes hollow; lustre frequently pellucid; colour reddish or white.

19. Q. pyramidale. Of a conchoidal texture, in a single six-sided pyramid transversely striate; the pyramid truncate at top, perfect, or doubled at top or bottom. Found in various parts of England and Scotland, in Switzerland, Hungary, Silesia, Bohemia, and Saxony; more commonly pellucid than opake; colour mostly white, sometimes pale red, yellowish, or yellowish-red; the crystals generally in grains, sometimes resembling a kidney or a gem.

20. Q. Pseudadomas. Of a conchoidal texture, in a double six-sided pyramid, not striate; the pyramid perfect; the margins of the common base truncate, pellucid or opake. Found near Bristol and Buxton, in Cornwall, Derbyshire, and Northampton, and various parts of Europe; colour mostly white, sometimes reddish, or blackish; rarely hollow within; the crystals sometimes detached, sometimes clustered and adhering together in various forms.

21. Q. Crystallus. Rock crystal. Mountain crystal. White, pellucid, of a conchoidal texture, in a six-sided transversely striate prism, the prism varying almost to infinity in different varieties. Found in almost every part of the globe, particularly in alpine situations, and is almost exclusively confined to primitive rocks, especially granite and mica slate; colour various shades of white, brown, red, and yellow, sometimes mixed together; fragments indeterminately angular with very sharp edges; does not lose its transparency in the fire; causes double refraction: spec. gravity from 2,650, to 2,888, contains

Silica - -	93,0
Alumina -	6,0
Lime - -	1,0
	100

Bergman.

22. Q. Pseudogemma. Nitrous fluor. Mountain crystal. Coloured, pellucid, of a conchoidal texture, in a six-sided transversely striate prism: the colour varying in different varieties, blackish, clove-brown, red, fulvous, yellow, leek-green, grass-green, sky-blue, deep-blue. Found chiefly in veins abounding in rock crystal, of various degrees of magnitude and transparency: often sold for gems, but may easily be distinguished by the different form of their crystals, and by their less degree of hardness and lustre: they yield to the file, and like the rock-crystal, when two pieces are rubbed hard together, they emit a phosphorescent light in the dark, and exhale a peculiar empyreumatic odour.

23. Q. Amethystus. Amethyst. Violet-crystal. Violet-blue, varying in texture, form, and degrees of transparency. Found in Mexico, Ceylon, Sweden, Bohemia, Saxony, and other parts of Europe, in veins of primitive rocks, and sometimes in agate balls and kidneys in porphyry; usually violet-blue in various degrees of intensity, sometimes greenish, rarely white; texture conchoidal, fibrous, granular, or splintery; lustre various degrees of transparency to nearly opake; crystals simple six-sided pyramids, or with faces of different sizes the planes of which are smooth; yields to the file, is brittle, and easily frangible; specific gravity 2,750: contains

Silica - -	97,50
Alumina -	0,25
Oxyd of iron with a trace of manganese	0,50
Loss - -	1,75
	100

24. Q. Pseudocrystallus. Rude quartz. Opake, in a six-sided prism terminating at one or both ends in a six-sided pyramid. Found in Hungary, Bohemia, Saxony, Sweden, and Barbary: the crystals sometimes detached, sometimes united; colour, various degrees of white, black, red or variegated.

The size of the crystal varies from small to very large; some of the largest prisms are more than two feet in length, and weigh above 100 pounds. The planes of the prisms are transversely striated, but those of the terminating pyramids are smooth. The crystals are commonly brightly shining, both externally and internally, with a vitreous lustre. Its fracture is conchoidal, passing occasionally into obscurely foliated. The fragments are interminatedly angular, and very sharp-edged. The colourless or slightly coloured varieties are usually transparent, but those that are much loaded with iron-ochre are often only transfluent: when transparent it exhibits a double reflection. Its hardness is superior to that of glass, and it gives vivid sparks when struck against a steel. It is brittle and easily frangible. When two crystals are rubbed together they afford a phosphorescent light, and exhale a peculiar odour. By exposure to the blowpipe this mineral undergoes no change, except that certain of its varieties lose their colour. Even a blow-pipe charged with oxygen gass is wholly incapable, according to Lavoisier, of inducing the least sign of fusion. According to Ehrmann, however, it melts into an enamel; but in this case the quartz was probably heated on charcoal, from which it might acquire potash enough to serve as a flux. Several of the varieties of crystallized quartz are used to seal stones and ornaments of various kinds on account of their hardness, the exquisite polish that they are capable of receiving, and the pleasing tone of their colours.

The most perfectly transparent and colourless is called by the lapidaries rock crystal, and besides being applied to various purposes of ornament, it is cut into spectacle glasses, which from the hardness are not so liable to be scratched as those which are made of flint glass. The reddish-purple or violet-coloured variety is called amethyst, and is occasionally ranked among the gems: it must not however be confounded with the oriental amethyst, which is a true gem, being a variety of corundum. The pearl-gray or pale-blue variety is called false, or

water sapphire. The yellow and smoke-coloured varieties are called false topaz. The green varieties are not unfrequently mistaken for chrysolite.

The largest and most esteemed crystals of quartz come from Madagascar, also from the Alps, from Norway, and Scotland, where they occur lining cavities in granite. Amethyst is commonly found in geodes of agate, and is chiefly procured from Catalonia in Spain, from Bohemia, Saxony, Silesia, and the Palatinate in Germany; from Hungary; from Auvergne in France, and the Uralian mountains near Catharinenburg in Russia. Quartz crystals also occur in most metallic veins both of ancient and recent formation in every kind of rock. There is scarcely any crystallized mineral so liable as quartz to contain foreign substances; sometimes drops of water and bubbles of air may be observed in it, also fibres of amethyst, capillary crystals, of schorl and ruthil, scales of chlorite, and dendritical iron ore, &c.

To QUA'SH. *v. a.* (*quassen*, Dutch.) 1. To crush; to squeeze (*Waller*). 2. To subdue suddenly (*Roscommon*). 3. To annul; to nullify; to make void.

To QUA'SH. *v. n.* To be shaken with a noise.

QUASH. *s.* A pompion (*Ainsworth*).

QUASSIA. (from a slave of the name of Quassi, who first used it with uncommon success in the malignant endemic fevers which frequently prevail at Surinam.) Quassia. In botany, a genus of the class decandria monogynia. Calyx five-leaved; petals five; nectary five-leaved; drupes five, distinct, two-valved, one-seeded, inserted on a fleshy receptacle. Three species.

1. Q. simarouba. Simirouba. A high and bulky tree, common to the woodlands of Jamaica; the trunk of the old trees black and a little furrowed; the bark of the young smooth and grey, interspersed with yellow spots; inner bark white, fibrous, tough, with a slightly bitter taste: branches alternate, spreading; flowers monœcous, panicled, of a beautiful yellow; leaves abruptly pinnate; leaflets alternate, slightly petioled; petiole naked.

The simarouba of the shops is the bark of the branches, for the medical properties of which see SIMAROUBA.

2. Q. amara. Bitter quassia. A tree less tall than the preceding, branchy; wood of a white colour and light; bark thin and grey; leaves unevenly pinnate, entire, elliptic, glabrous; leaflets opposite, sessile; petiole jointed, winged; flowers racemed, hermaphrodite, of a bright red colour. A native of Surinam, and of South America generally.

The root, bark, and wood of this tree are all comprehended in the catalogues of the Materia Medica. Its botanical character was known long before that of the simarouba, as it is noticed in its proper place in the Sp. Plantarum, upon the authority of Dahlberg, when it was thought peculiar to Surinam. Afterwards, Linnéus, in his Materia Medica, referred it to the Nux Americana, foliis alatis bifidis of Commelin.

The roots are perfectly ligneous; they may be medically considered in the same light as the wood, which is now most generally employed, and seems to differ from the bark in being less intensely bitter; the latter is therefore thought to be a more powerful medicine. Quassia has no sensible odour; its taste is that of a pure bitter, more intense and durable than that of almost any other known substance; it imparts its virtues more completely to watery than to spirituous menstrua, and its infusions are not blackened by the addition of martial vitriol. The watery extract is from a sixth to a ninth of the weight of the wood, the spirituous about a twenty-fourth. Quassia, as before observed, derived its name from a negro named Quassi, who employed it with uncommon success as a secret remedy in the malignant endemic fevers which frequently prevailed at Surinam. In consequence of a valuable consideration, this secret was disclosed to Daniel Rolander, a Swede, who brought specimens of the quassia wood to Stockholm, in the year 1756; and, since then, the effects of this drug have been generally tried in Europe, and numerous testimonies of its efficacy published by many respectable authors. Various experiments with quassia have likewise been made, with a view to acertain its antiseptic powers; from which it appears to have considerable influence in retarding the tendency to putrefaction; and this, Professor Murray thinks, cannot be attributed to its sensible qualities, as it possesses no adstringency whatever; nor can it depend upon its bitterness, as gentian is much bitterer, yet less antiseptic. The medicinal virtues ascribed to quassia are those of a tonic, stomachic, antiseptic, and febrifuge. It has been found very effectual in restoring digestion, expelling flatulencies, and removing habitual costiveness, produced from debility of the intestines, and common to a sedentary life. Dr. Lettsom, whose extensive practice gave him an opportunity of trying the effects of quassia in a great number of cases, says "In debility, succeeding febrile diseases, the Peruvian bark is most generally more tonic and salutary than any other vegetable hitherto known; but in hysterical atony, to which the female sex is so prone, the quassia affords more vigour and relief to the system than the other, especially when united with the vitriolum album, and still more with the acid of some absorbent." In dyspepsy arising from hard drinkings, and also in diarrhæas, the doctor has exhibited the quassia with great success. But, with respect to the tonic and febrifuge qualities of quassia, he says, "I by no means subscribe to the Linnéan opinion, where the author declares *ne quidem judice chinchinam longe superat.*" It is very well known, that there are certain peculiarities of the air, and idiosyncrasies of constitution, unfavourable to the exhibition of Peruvian bark, even in the most clear intermissions of fever; and writers have repeatedly noticed it. But this is comparatively very rare. About midsummer 1785, Dr. L. met with several instances of low remittent and nervous fevers,

wherein the bark uniformly aggravated the symptoms, though given in intermissions the most favourable to its success, and wherein quassia, or snake-root, was successfully substituted. In such cases, he mostly observed, that there was great congestion in the hepatic system, and the debility at the same time discouraged copious evacuations. And in many fevers, without evident remissions to warrant the use of the bark, whilst, at the time, increasing debility began to threaten the life of the patient, the Doctor found that quassia, or snake-root, singly or combined, upheld the vital powers, and promoted a critical intermission of fever, by which an opportunity was offered for the bark to effect a cure. It may be given in infusion, or in pills made from the watery extract; the former is generally preferred, in the proportion of three or four drachms of the wood to twelve ounces of water.

3. Q. excelsa, or polygama. Common to the woods of Jamaica; beautiful, tall and stately; a hundred feet high, ten feet in circumference three yards from the ground: trunk straight, smooth, tapering; branches ascending; outside bark smoothish, light grey or ash-colour, from various lichens; bark of the root yellowish; wood yellow, tough, hardish, takes a good polish; leaves unevenly pinnate; leaflets opposite, petioled; petiole naked; flowers polygamous, panicled, small, yellow-green, with a minute calyx; fruit a smooth black drupe, round-shaped, size of a pea.

In taste and medical virtue nearly resembling the last; and very largely employed in Jamaica for the same purposes.

QUA'TERCOUSINS. *s.* Those within the first four degrees of kindred; friends (*Skinner*).

QUATE'RNARY. *s.* (*quaternarius*, Lat.) The number four (*Boyle*).

QUATERNATE LEAVES, in botany. Four-fold leaves. Growing by fours, or coming out four together; as in the stellatæ.

QUATE'RNION. *s.* (*quaternio*, Lat.) The number four (*Holder*).

QUATE'RNITY. *s.* (*quaternus*, Latin.) The number four (*Brown*).

QUA'TRAIN. *s.* (*quatrain*, Fr.) A stanza of four lines rhyming alternately (*Dryden*).

QUATUORVIR, in antiquity, formerly written IIII. VIR, a Roman magistrate, who had three colleagues joined with him in the same administration, and had the care of conducting and settling the colonies sent into the provinces. There were also quatuorviri appointed to inspect and take care of repairs, &c.

QUAVER, in music, a note or measure of time, equal to half a crotchet, or to an eighth part of a semibreve. See MUSIC.

To QUA'VER. *v. n.* (cpean, Sax.) 1. To shake the voice; to speak or sing with a tremulous voice (*Bacon*). 2. To tremble; to vibrate (*Newton*)

QUAY. *s.* (*quai*, Fr.) A key; an artificial bank to the sea or river, on which goods are conveniently unladen.

QUE'ACHY. *a.* Unsolid; unsound; boggy; not in use (*Drayton*).

QUEAN. *s.* (cpean, Saxon.) A worthless woman; generally a strumpet (*Dryden*).

QUE'ASINESS. *s.* (from *queasy*.) The sickness of a nauseated stomach.

QUE'ASY. *a.* (of uncertain etymology.) 1. Sick with nausea (*Donne*). 2. Fastidious; squeamish (*Dryden*). 3. Causing nauseousness (*Shakspeare*).

QUEBEC, a city and the capital of Lower Canada, situate on the N.W. shore of the river St. Lawrence. It is divided into the upper and lower town; the former erected on the summit of a limestone rock, and the latter round the base of the eminence, on the border of the river. The houses in each are of stone, and the fortifications strong, though not regular. The governor resides in a citadel, which covers the town, and is both regular and handsome. The cathedral of the catholics is a plain building, with the spire on one side of its front. The jesuits college, a large edifice, is now converted into a barrack for the troops. The protestant metropolitan church, and a house for the courts of law, are neat edifices built on the site of a monastery destroyed by fire in 1796. The seminary of the catholics and the convent of the Ursulines are spacious buildings, with extensive gardens. On the N. side of the town is an edifice above 500 feet in length, containing the office of ordnance, an armoury, storehouses and workshops, and a public gaol. The river St. Lawrence here narrows suddenly to the breadth of a mile; but hence to the sea it is from four to five leagues broad, and navigable for large men of war. The harbour is safe and commodious, and flanked by two bastions, that are raised 25 feet from the ground, which is the height of the tides at the time of the equinox. This city was erected by the French in 1605. The English reduced it, with all Canada, in 1626; but it was restored in 1632. In 1759, it was again taken by the English, after a battle memorable for the death of general Wolfe, in the moment of victory, and confirmed to them by the peace of 1763. It is 400 miles by the river, from the Atlantic Ocean, and 590 N.W. of Boston. Lon. 69. 48 W. Lat. 46. 55 N. The inhabitants are now computed at more than 15,000.

To QUECK. *v. n.* To shrink; to show pain.

QUEDA, a kingdom in the peninsula of Malacca, tributary to Siam. The principal town, of the same name, is subject to the Dutch. It has a harbour, and is 300 miles N. of the city of Malacca. Lon. 100. 5 E. Lat. 7. 5 N.

QUEDLINGBURG, a town of Upper Saxony, in the principality of Anhalt, with a famous protestant abbey, the abbess of which is a princess of the empire. The inhabitants of the town subsist by brewing, husbandry, and feeding of cattle. It is 10 miles S.E. of Halberstadt. Lon. 11. 34 E. Lat. 52. 1 N.

QUEEN. (*regina*.) A woman who holds the

crown of a realm, singly, and by right of blood.

The word queen is derived from the Saxon *cwen*, *uxor*, the wife of any one, but applied, by way of excellency, to the wife of the king only; whence she was anciently called the king's queen; the West Saxons having no other name for a queen but the king's wife. Asser de Ælfred. rebus, &c. She was also called lady, in Saxon *wlæfdig*; just as *madame*, or *mademoiselle*, are still used in France, for the wife and daughter of the duke of Orleans.

The name queen is also given, by way of courtesy, to her that is married to the king; called, by way of distinction, queen consort. In respect whereof the former is called queen regnant, or regent.

The widow of a king is also called queen, but with the addition of dowager.

In the first sense, queen is, in all construction, the same with king; and has the same power and prerogative, in all respects, that the king has.

The queen consort is inferior, and a person distinct from, and a subject of, the king. In England, though she be a feme covert, yet may she sue, and be sued, in her own name; and may make leases, and grants, &c. as a feme sole.

She has several other prerogatives. Though an alien, she may purchase lands in fee-simple, without either naturalization, or denization; she may present to a benefice; nor is plenarty a bar against her more than against the king. She is also capable of taking a grant from the king, which no other wife can do from her husband; and she may have a separate property in goods as well as lands, and has a right to dispose of them by will. She pays no toll, and shall not be amerced, if she be non-suited in any action; and may not be impleaded till first petitioned.

To conspire her death, or violate her chastity, is high treason. She has an ancient peculiar revenue, called queen-gold; besides a very large dower, with a royal court, and officers, apart.

The queen dowager, as the widow of the king, enjoys most of the privileges belonging to her as queen consort. But it is not high treason to conspire her death, or to violate her chastity; because the succession to the crown is not thereby endangered.

To QUEEN. *v. n.* To play the queen.

QUEEN OF THE MEADOWS, in botany. See SPIRÆA.

QUEEN'S BALM, in botany. See DRACOCEPHALUM.

QUEEN'S GILLIFLOWER, in botany. See HESPERIS.

QUEEN MARGARET, in botany. See ASTER.

QUEEN'S VIOLET, in botany. See HESPERIS.

QUEEN-STOCK GILLIFLOWER, in botany. See CHEIRANTHUS.

QUEEN CHARLOTTE'S CAPE, a promontory of the island of Southern Georgia. Lon. 36. 11 W. Lat. 54. 32 S.

QUEEN CHARLOTTE'S FORELAND, a cape of the island of New Caledonia. Lon. 167. 12 E. Lat. 22. 15 S.

QUEEN CHARLOTTE'S ISLAND, an island in the S. Pacific Ocean, six miles long and one broad, discovered by captain Wallis in 1767. Lon. 138. 4 W. Lat. 19. 18 S.

QUEEN CHARLOTTE'S SOUND, a sound at the N. extremity of the S. island of New Zealand, near Cook's Strait. The country here is not so steep as at Dusky Bay, and the hills near the seaside are in general of an inferior height, but covered with forests equally intricate and impenetrable. The dogs here are of the long-haired sort, with pricked ears, and much resemble the common shepherd's cur, but they are very stupid. Lon. 174. 13 E. Lat. 41. 5 S.

QUEEN'S COUNTY, a shire of Ireland, in the province of Leinster, 30 miles long and 29 broad; bounded on the N. by King's County, on the E. by Kildare, on the S.E. by Catherlough, on the S. by Kilkenny, and on the W. by King's County and Tipperary. It was formerly full of woods and bogs; but is now much improved. It contains 50 parishes, and sends eight members to parliament. Maryborough is the capital.

QUEEN'S FERRY, a borough in Linlithgowshire, seated on the frith of Forth, where it is not more than two miles wide. It is a much frequented ferry, and is nine miles W. of Edinburgh. Lon. 3. 20 W. Lat. 56. 0 N.

QUEENBOROUGH, a borough in Kent, in the isle of Shepey, with a market on Monday and Thursday. It had once a strong castle, the remains of which are still to be seen The chief employment of the inhabitants is oyster-dredging, oysters being here in great plenty, and of a fine flavour. It is 15 miles N.W. of Canterbury, and 45 E. of London. Lon. 0. 48 E. Lat. 51. 26 N.

QUEER. *a.* Odd; strange; original; particular (*Spectator*).

QUEE'RLY. *ad.* Particularly; oddly.

QUEE'RNESS. *s.* (from *queer*.) Oddness; particularity.

QUEEST, a ringdove. See COLUMBA.

QUEICH, a river of Germany, which passes by Landau, and runs into the Rhine, near Germersheim.

QUEI-LING, a city of China, capital of the province of Quang-si. It has its name from a flower called quei, which grows on a tree resembling a laurel, and emits such a sweet odour, that it perfumes the whole country. It stands on a river that runs into the Ta, but with such rapidity as not to be navigable. It is 180 miles N. by W. of Canton, and 587 S. of Peking. Lon. 109. 51 E. Lat. 25. 12 N.

To QUELL. *v. a.* (cpellan, Saxon.) To crush; to subdue: originally, to kill (*Atterbury*).

To QUELL. *v. n.* To die (*Spenser*).

QUELL. *s.* Murder: not in use (*Shakspeare*).

QUE'LLER. *s.* (from *quell.*) One that crushes or subdues (*Milton*).

QUELLINUS (Erasmus), an eminent painter, born at Antwerp in 1607. He was the disciple of Rubens. Several of the churches in his native city are ornamented with the united skill of master and pupil. He died in 1678.

QUELLINUS (John Erasmus) the son and disciple of the above, was born at Antwerp, in 1630. After studying under his father he went to Rome, and then returned to Antwerp, where he was employed in decorating the churches. He died in 1715.

QUE'LQUECHOSE. *s.* (Fr.) A trifle; a kickshaw (*Donne*).

To QUEME. *v. n.* (cpeman, Saxon.) To please.

To QUENCH. *v. a.* 1. To extinguish fire (*Sidney*). 2. To still any passion or commotion (*Shakspeare*). 3. To allay thirst (*South*). 4. To destroy (*Davies*).

To QUENCH. *v. n.* To cool; to grow cool (*Shakspeare*).

QUE'NCHABLE. *a.* (from *quench.*) That may be quenched.

QUE'NCHER. *s.* (from *quench.*) Extinguisher.

QUE'NCHLESS. *a.* (from *quench.*) Unextinguishable (*Crashaw*)

QUENSTEDT (John Andrew), a Lutheran divine, born at Quedlimburgh in 1617. He wrote a work, styled Dialogus de Patriis illustrorum virorum, doctrina et scriptis, comprising the learned men from Adam, to 1600. He died in 1688.

QUENTIN (St.), a strong town of France, in the department of Aisne, with a considerable manufacture of lawns and cambrics. Near this place, in 1557, Philip II. of Spain gained a signal victory over the French, and afterward took the town by storm. In memory of this, he built the Escurial. The town was restored to France in 1559. It is seated on an eminence, on the river Somme, 21 miles S. of Cambray, and 83 N. by E. of Paris. Lon. 3. 29 E. Lat. 49. 50 N.

QUERCI, or QUERCY, a late province of France, bounded on the N. by Limosin, E. by Rouergue and Auvergne, S. by Languedoc, and W. by Perigord. It is fertile in corn, wine, and fruits. It now forms the department of Lot.

QUERCUS. Oak. In botany, a genus of the class monœcia, order polyandria. Male: calyx campanulate, lobed; corolless; stamens from five to ten. Female: calyx campanulate, very entire, rough; corolless; styles from two to five; stigmas three; nut superior, coriaceous, one-seeded. Twenty-seven species scattered over the globe, of which two are indigenous to our own country. The following are cultivated.

1. Q. robur. Common oak. Well known to every man; and proverbially to every Englishman. In woods rises to a very considerable height, but when planted singly is rather a spreading than a lofty tree, sending off horizontally prodigious branches, which considerably divide and subdivide. Trunk covered with a very rugged brown bark; leaves deciduous oblong, broader towards the top, with rather acute sinuses, and obtuse angles; peduncles of the fruit elongated.

There are several varieties from a variation in the leaf, form of the tree, or duration of the foliage.

The English oak is as remarkable for its slowness of growth, and longevity, as for its bulk; the trunk has been often observed to have attained not more than twenty inches, and sometimes not more than fourteen, in the space of fourscore years. In regard to bulk we have an account of an oak belonging to lord Powis, growing in Broomfield wood, near Ludlow in Shropshire, in 1764, the trunk of which measured 68 feet in girth, 23 in length; and which, reckoning 90 feet for the larger branches, contained in the whole 1455 feet of timber, round measure, or 29 load and 5 feet, at 50 feet to a load. The Cowthorp oak, near Wetherby in Yorkshire, lays a claim to being the father of the forest. Dr. Hunter, who, in his edition of Evelyn, has given an engraving of it, says, that within three feet of the surface it measures sixteen yards, and close to the ground twenty-six. In 1776, though in a ruinous condition, it was 85 feet high, and its principal limb extended 16 yards from the bole. The foliage was very thin. If this measurement was taken as the dimensions of the real stem, the size of this tree would be enormous; but like most very large trees, its stem is short, spreading wide at the base, the roots rising above the ground like buttresses to the trunk, which is similar not to a cylinder but to the frustum of a cone. Mr. Marsham says, "I found it in 1768, at four feet, 40 feet 6 inches; at five feet, 36 feet 6 inches; and at six feet, 32 feet 1 inch." In the principal dimensions then, the size of the stem, it is exceeded by the Bentley oak, of which the same writer gives the following account: "In 1759 the oak in Holt forest, near Bentley, was at seven feet, 34 feet. There is a large excrescence at five and six feet that would render the measure unfair. In 1778 this tree was increased half an inch in 10 years. It does not appear to be hollow, but by the trifling increase I conclude it not sound." These dimensions, however, are exceeded by those of the Boddington oak. It grows in a piece of rich grass land, called the old orchard ground, belonging to Boddington manor farm, lying near the turnpike road between Cheltenham and Tewksbury, in the vale of Gloucester. The stem is remarkably collected at the root, the sides of its trunk being much more upright than those of large trees in general; and yet its circumference at the ground is about 20 paces; measuring with a two foot rule, it is

more than 18 yards. At three feet high it is 42 feet, and where smallest, i. e. from five to six feet high, it is 36 feet. At six feet it swells out larger, and forms an enormous head, which has been furnished with huge, and probably extensive, arms. But time and the fury of the wind have robbed it of much of its grandeur, and the greatest extent of arm in 1783 was eight yards from the stem.

In the Gentleman's Magazine for May, 1794, we have an account of an oak tree growing in Penshurst park in Kent, together with an engraving. It is called the bear or bare oak, from being supposed to resemble that which Camden thought gave name to the county of Berkshire. The dimensions of the tree are these.

	Ft.	In.
Girth close to the ground -	35	6
Girth one foot from the ground	27	6
Girth five feet from the ground	24	0
Height taken by shadow -	73	0
Girth of lowest, but not largest limb - - -	6	9

With respect to longevity, Linnéus gives account of an oak 260 years old; but we have had traditions of some in England (how far to be depended upon we know not) that have attained to more than double that age. Mr. Marsham, in a letter to Thomas Beevor, esq. Bath Papers, vol. i. p. 79, makes some very ingenious calculations on the age of trees, and concludes from the increase of the Bentley oak, &c. that the Fortworth chesnut is 1100 years old.

The oak perhaps that stands a chance of being most celebrated in future times is that at Yardley Lodge, which Cowper selected as the name of a didactic poem that every one who reads the little he lived to write must deeply regret he did not live to finish. It appears to have been known for some ages by the name of Judith; and Mr. Hayley suggests that it might have been so denominated from its being planted by the countess Judith, niece to the conqueror, whom he gave in marriage to the English earl Waltheof, with the counties of Northampton and Huntingdon as her dower. This however is suggestion and nothing more, though Cowper relates that there was a tradition in the neighbouring country that it had been an oak in the time of the conqueror, which is carrying its nativity still higher, though at the expence of Mr. Hayley's surmise. Whatever be its age, its girth, though considerable, is much less than several of those already noticed, being not more than 28 feet 5 inches as measured by the poet himself: it is also at this time quite in decay, a pollard and almost hollow. It is thus exquisitely described in the fragment above referred to.

Time made thee what thou wast—king of the woods!
And time hath made thee what thou art—a cave
For owls to roost in! once thy spreading boughs
O'erhung the champaign, and the numerous flock,
That grazed it, stood beneath that ample cope
Uncrowded, yet safe-sheltered from the storm.
No flock frequents thee now: thou hast outliv'd
Thy popularity, and art become
(Unless verse rescue thee awhile) a thing
Forgotten as the foliage of thy youth.
While thus through all the stages thou hast push'd
Of tree-ship—first a seedling hid in grass;
Then twig; then sapling; and, as century roll'd
Slow after century, a giant-bulk
Of girth enormous, with moss-cushion'd root
Upheav'd above the soil, and sides emboss'd
With prominent wens globose—till at the last
The rottenness, which time is charg'd to inflict
On other mighty ones, found also thee.

Besides the grand purposes to which oak-timber is applied in navigation and architecture, and its bark in tanning leather, there are various uses of less consequence to which the different parts of this tree have been referred. The bark is employed in the Highlands to dye yarn of a brown colour, or mixed with copperas, of a black colour. Oak saw-dust is a principal ingredient in dyeing drabs, especially fustians. The acorns of the tree are a good food to fatten swine and turkeys; and after the severe winter of 1709 the poor in France fed by constraint upon acorns themselves. The quercus esculus, however, of the south of Europe produces an acorn which is eaten by the inhabitants as an excellent food, and without any compulsion whatever.

In medicine its adstringent effects were sufficiently known to the ancients, but it is the bark which is now directed for medicinal use by our pharmacopœias. Oak bark manifests to the taste a strong adstringency, accompanied with a moderate bitterness. Like other adstringents, it has been recommended in agues, and for restraining hæmorrhages, alvine fluxes, and other immoderate evacuations. A decoction of it has likewise been advantageously employed as a gargle, and as a fomentation or lotion in *procidentia recti et uteri*. Galls, which, in the warm climate of the East, are found upon the leaves of this tree, are occasioned by a small insect with four wings, called cynips quercus folii, which deposits an egg in the substance of the leaf, by making a small perforation through the under surface. The ball presently begins to grow to a considerable size. Two sorts of galls are distinguished in the shops; one said to be brought from Aleppo, the other from Turkey and the southern parts of Europe. The former are generally of a blueish colour, or of a grayish or black verging to blueness; unequal and warty on the surface; hard to break; and of a close compact texture; the other of a light brownish or whitish colour, smooth, round, easily broken, less compact, and of a much larger size. The two sorts differ only in size and strength, two of the blue galls being supposed equivalent in

this respect to three of the others. Galls appear to be the most powerful of the vegetable adstringents. As a medicine, they are to be considered as applicable to the same indications as the oak-bark, and by possessing a greater degree of adstringent and styptic power, seem to have an advantage over it, and to be better suited for external use. Reduced to fine powder, and made into an ointment, they have been found of great service in hæmorrhoidal affections.

2. Q. phellos. Willow-leaved oak-tree. Grows forty or fifty feet high, with deciduous, lanceolate, very entire leaves, like the willow; whence its specific name. The acorns are sweeter than those of the common oak, and are eaten by the Indians. They afford, by expression, an oil little inferior to oil of almonds. It is a native of North America.

3. Q. prinus. Chesnut-leaved oak. Fifty or sixty feet high; leaves deciduous, ovate-elliptic, pubescent underneath, deeply toothed; teeth very white, obtuse, nearly equal. A native of North America.

4. Q. nigra. Black oak. Thirty or forty feet high; bark discoloured and dark; leaves annual, wedge-form, somewhat hearted, obscurely lobed, the lobes dilated. North America.

5. Q. rubra. Red oak. Sixty feet high; dark-greyish bark; leaves annual, but remaining late in autumn, of a reddish colour, glabrous on both sides, obtusely sinuate; the sinuses divaricate; segments acute with setaceous points. North America.

6. Q. alba. White bark. Thirty or forty feet high; bark whitish; leaves annual, pinnatifid; sinuses narrowed; segments oblong-linear without points. Virginia.

7. Q. esculus. Italian or small prickly-cupped oak-tree. Thirty feet high; bark purplish; leaves pinnatifid; pubescent underneath, with lanceolate acute segments; raments axillary, filiform; acorn oblong; calyx prickly. South of Europe. The acorns often made use of as food.

8. Q. ægilops. Great prickly-cupped oak. Seventy, eighty, or more feet high; trunk very large; head widely ramous; bark whitish. Leaves ovate-oblong, downy underneath, sinuate-trepand, with acute segments; calyx very large, clothed with scales spreading every way. Levant.

9. Q. cerris. Turkey oak. Thirty or forty feet high. Leaves sinuate, pinnatifid, pubescent underneath; with rather acute segments; raments axillary, filiform; calyx beset and rough with prickles. South of Europe.

10. Q. ilex. Ever-green, or holm oak. Forty or fifty feet high; bark smooth; leaves ever-green, lanceolate, or oblong, downy underneath; calyx ciliate; anthers ovate. Three varieties, as follow.

α. Leaves lanceolate, very entire.

β. Leaves lanceolate, serrate.

γ. Leaves oblong, with pungent teeth. A native of the south of Europe.

11. Q. gramuntia. Holly-leaved ever-green oak. Forty or fifty feet high; leaves like those of the holly; anthers roundish. South of France.

12. Q. suber. Cork-tree. Thirty or forty feet high; bark thick, tough, fungous, cleft; leaves evergreen, ovate-oblong, downy underneath, undulate. The common and useful material called cork is the outer bark of the tree, which is not destroyed by being carefully deprived of it; on the contrary a new coating, fit for the same purpose, is completed once in every six or seven years: see the article CORK. South of Europe.

13. Q. coccifera. Scarlet, or kermes oak. Fourteen or fifteen feet high, ramous, and bushy. Leaves ovate, hearted, tooth-spinous, glabrous on both sides, undulate. The branches are covered with small glandular excrescences which are the nidus of the insect called coccus ilicis, and produce the dying substance named kermes or scarlet pastel. See COCCUS and KERMES.

These are all propagated by sowing the seed or acorns. If that of the common oak be made use of, and a small plantation or a subsequent plantation be designed, prepare some beds of fresh earth neither too strong and heavy nor too light and dry. In these beds place the acorns in rows one foot asunder, and about two inches distance in the rows, covering them about two inches thick with the same fresh earth, none being left uncovered so as to entice the vermin, which may in a short time destroy all the seeds. In the spring, when the plants begin to appear, you must carefully clear them from weeds, and if the season proves dry, you should refresh them now and then with a little water. In these beds the plants should remain till the following autumn (observing constantly to keep them clear of weeds), at which time you should prepare a spot of good fresh earth, in size proportionable to the quantity of plants, which should be well trenched and levelled: then towards the middle or latter end of October, you should carefully take up the plants so as not to injure their roots, and plant them out in rows three feet asunder, and eighteen inches distance plant from plant, observing never to suffer the plants to abide long out of the ground, because their roots would dry, and endanger the growth of the plants. When they are planted, you should lay a little mulch upon the surface of the ground near in clumps in parks, &c. but if they are designed for timber, it is by much the better method to sow the acorns in the places where they are to remain; in order to which, you should provide yourself in autumn with a sufficient quantity of acorns, which should be always taken from straight, upright, vigorous growing trees. These should be gathered from under the trees as soon as may be after they are fallen, and if possible in a dry time, laying them in some open room to dry; after which they may be put in a dry sand, and preserved in a dry place till the end of November, when you should prepare the ground for planting them.

QUERCUS MARINA, the sea-oak. In botany, the name of one of the broad-leaved dichotomous sea-fucuses.

QUE'RELE. *s.* (*querela*, Latin; *querelle*, Fr.) A complaint to a court (*Ayliffe*).

QUE'RENT. *s.* (*querens*, Lat.) The complainant; the plaintiff.

QUERENGHI (Anthony), an Italian poet, who wrote in his own language and in Latin, born at Padua in 1546. He was secretary of the sacred college under five popes, and died at Rome in 1633. His Latin poems were printed at Rome in 1629, and the Italian in 1616, both in 8vo.

QUERFURT, a town of Upper Saxony, in Thuringia, capital of a principality of the same name, with a castle. It is situate on the rivulet Wute, surrounded by a ditch, 14 miles N.N.W. of Naumburg. Lon. 11. 50 E. Lat. 51. 23 N.

QUERIA, in botany, a genus of the class triandria, order trigynia. Calyx five-leaved; corolless; capsule one-celled; seed one. Three species; two American, one of Japan.

QUERIMBA, a cluster of small islands on the coast of Mosambique, fertile in fruits and pastures. They are inhabited by the descendants of Portuguese, and so named from the principal one. Lon. 41. 40 E. Lat. 11. 40 S.

QUERIMO'NIOUS. *a.* (*querimonia*, Lat.) Querulous; complaining.

QUERIMO'NIOUSLY. *ad.* Querulously; with complaint (*Denham*).

QUERIMO'NIOUSNESS. *s.* (from *querimonious*.) Complaining temper.

QUE'RIST. *s.* (from *quæro*, Lat.) An inquirer; an asker of questions (*Swift*).

QUERLON (A. G. Meusnier de), a native of Nantes, born in 1702. He published a periodical paper for the province of Britany 22 years, entitled Les petites affiches, and for five years of the same time conducted the Gazette de France, and took a part in the Journal Etranger, and Journal Encyclopedique. He published an edition of Lucretius with notes, and many other works. He died in 1780.

QUERN. *s.* (cpeopn, Saxon.) A handmill.

QUE'RPO. *s.* (corrupted from *cuerpo*, Spanish.) A dress close to the body; a waistcoat (*Dryden*).

QUE'RRY, for *equerry*. *s.* (*ecuyer*, Fr.) A groom belonging to a prince, or one conversant in the king's stables (*Bailey*).

QUE'RULOUS. *a.* (*querulus*, Latin.) Mourning; habitually complaining (*Howel*).

QUE'RULOUSLY. *ad.* In a complaining manner (*Young*).

QUE'RULOUSNESS. *s.* (from *querulous*.) Habit or quality of complaining mournfully.

QUE'RY. *s.* (from *quære*, Latin.) A question; an inquiry to be resolved (*Newton*).

To QUE'RY. *v. a.* (from the noun.) To ask questions (*Pope*).

QUESNAY (Francis), first physician to the king of France, and member of the academy of sciences of Paris, and of the royal society of London. He was born at Ecqueville in 1694, and was the author of a charming poem, called Maison rustique; and some other pieces in the line of his profession. He died in 1774.

QUESNE (Abraham, marquis du), born in Normandy in 1610. He was brought up to the naval service under his father. In 1637 he was at the attack of St. Marguerite, and the year following defeated the Spanish fleet before Cattari. In 1644 he entered into the Swedish service, and distinguished himself greatly against the Danes. In 1647 he returned to France, and was employed as commander of a fleet in the Mediterranean. In 1676 he displayed great skill and bravery against the Dutch fleet under Ruyter. He died at Paris in 1688.

QUESNEL (Pasquier), a priest of the congregation called the oratory, in France, born at Paris in 1634. He occasioned considerable disturbances in the church by his writings in defence of its ancient rights. Having embraced Jansenism, he was obliged to retire to Brussels, where after the death of Arnaud he became the head of his party. Pope Clement XI. issued the famous bull Unigenitus against his Reflections on the New Testament, in which a hundred and one propositions extracted from it were condemned. Quesnel fled to Amsterdam, where he died in 1719. He wrote several other works, and was a man of great learning and piety.

QUESNOY (Francis du), a Flemish sculptor, born at Brussels, and died at Leghorn in 1644. His performances shew great taste and elegance.

QUESNOY, a fortified town of France, in the department of Nord, with an old castle. It was taken by the allies in 1711, and retaken the same year. In 1793, it was taken by the Austrians, and retaken the next year. It is seated in an extensive plain, on the rivulet Ronelle, nine miles S.E. of Valenciennes, and 122 N.E. of Paris. Lon. 3. 40 E. Lat. 50. 15 N.

QUEST. *s.* (*queste*, French.) 1. Search; act of seeking (*Milton*). 2. An empannelled jury (*Shakspeare*). 3. Searchers. Collectively (*Shakspeare*). 4. Inquiry; examination (*Shakspeare*). 5. Request; desire; solicitation.

To QUEST. *v. n.* (*queter*, French.) To go in search.

QUE'STANT. *s.* (from *quester*, French.) Seeker; endeavourer after (*Spenser*).

QUE'STION. *s.* (*question*, French.) 1. Interrogatory; any thing inquired (*Bacon*). 2. Inquiry; disquisition (*Bacon*). 3. A dispute; a subject of debate (*John*). 4. Affair to be examined (*Swift*). 5. Doubt; controversy; dispute (*Tillotson*). 6. Judicial trial (*Hooker*). 7. Examination by torture (*Ayliffe*). 8. State of being the subject of present inquiry (*Hooker*). 9. Endeavour; search: not used (*Shakspeare*).

To QUE'STION. *v. n.* (from the noun.) 1.

To inquire (*Bacon*). 2. To debate by interrogatories (*Shakspeare*).

To QUE'STION. *v. a.* (*questionner*, Fr.) 1. To examine one by questions (*Brown*). 2. To doubt; to be uncertain of (*Prior*). 3. To have no confidence in; to mention as not to be trusted (*South*).

QUE'STIONABLE. *a.* (from *question.*) 1. Doubtful; disputable (*Baker*). 2. Suspicious; liable to suspicion; liable to question (*Shakspeare*).

QUE'STIONARY. *a.* (from *question.*) Inquiring; asking questions (*Pope*).

QUE'STIONABLENESS. *s.* (from *question.*) The quality of being questionable.

QUE'STIONER *s.* (from *question.*) An inquirer.

QUE'STIONLESS. *ad.* (from *question.*) Certainly; without doubt; doubtless (*South*).

QUE'STMAN. QUE'STMONGER. *s.* Starter of lawsuits or prosecutions (*Bacon*).

QUESTOR, or QUÆSTOR, in Roman antiquity, an officer who had the management of the public treasure. The questorship was the first office any person could bear in the commonwealth, and gave a right to sit in the senate. At first there were only two; but afterwards two others were created, to take care of the payment of the armies abroad, of selling the plunder, booty, &c. for which purpose they generally accompanied the consuls in their expeditions; on which account they were called *peregrini*, as the first and principal two were called *urbani*. The number of questors was afterwards greatly increased.

QUE'STRIST. *s.* (from *quest.*) Seeker; pursuer (*Shakspeare*).

QUE'STUARY. *a.* (from *quæstus*, Latin.) Studious of profit (*Brown*).

QUEUE, in heraldry, signifies the tail of a beast: thus, if a lion be borne with a forked tail, he is blazoned double queued.

QUEVEDO DE VILLEGAS (Francisco de), a Spanish author, of Madrid. He possessed great powers of writing in verse as well as prose, on subjects of wit, of morality, and of science. His works were published by Gonzales de Salas, under the title of Parnasso Espagnol, in 3 vols. 4to. His satire was so keen, and so imprudently used, that he rendered d'Olivares, the prime minister, his enemy, and in consequence was imprisoned. He died about 1645.

QUIBERON, a town in France, in the department of Morbihan, with a fort, situate at the extremity of a peninsula, to the N. of Belleisle. In 1795, it was taken by some French regiments in the pay of Great Britian; but owing to the desertion and treachery of some of the soldiers, the republicans soon took it by surprise. It was taken by the English in 1800, but evacuated soon afterward. It is 17 miles S.S.E. of Port Louis.

QUIB. *s.* A sarcasm; a bitter taunt.

QUI'BBLE. *s.* (from *quidlibet*, Latin) A slight cavil; a low conceit depending on the sound of words; a pun (*Watts*).

To QUI'BBLE. *v. n.* (from the noun.) To pun; to play on the sound of words (*L'Estrange*).

QUI'BBLER. *s.* (from *quibble.*) A punster.

QUICK. *a.* (cpic, Saxon.) 1. Living; not dead (*Common Prayer*). 2. Swift; nimble; done with celerity (*Hooker*). 3. Speedy; free from delay (*Milton*). 4. Active; spritely; ready (*Clarendon*).

QUICK. *ad.* Nimbly; speedily; readily (*Drayton*).

QUICK. *s.* 1. A live animal: not in use (*Spenser*). 2. The living flesh; sensible parts (*Sharp*). 3. Living plants (*Mortimer*).

QUICK, in botany. See CRATÆGUS.

QUICK-BEAM-TREE. See SORBUS.

QUICK-GRASS. The triticum repens of Linnéus is sometimes so called. See GRAMEN CANINUM.

QUICK-LIME. See LIME.

QUICK-MATCH. See MATCH.

To QUI'CKEN. *v. a.* (cpiccan, Saxon.) 1. To make alive (*Psalms*). 2. To hasten; to accelerate (*Hayward*). 3. To sharpen; to actuate; to excite (*South*).

To QUI'CKEN. *v. n.* 1. To become alive: as, *a woman* quickens *with child* (*Sandys*). 2. To move with activity (*Pope*).

QUICKEN-TREE. See SORBUS.

QUI'CKENER. *s.* (from *quicken.*) 1. One who makes alive. 2. That which accelerates; that which actuates (*More*).

QUI'CKGRASS. *s.* (*quick* and *grass*; *gramen caninum*, Lat.) Dog-grass.

QUI'CKLIME. *s.* (*calx viva*, Latin; *quick* and *lime.*) Lime unquenched (*Hill*).

QUI'CKLY. *ad.* (from *quick.*) Soon; speedily; without delay (*Shakspeare*).

QUI'CKNESS. *s.* (from *quick.*) 1. Speed; velocity; celerity (*South*). 2. Activity; briskness (*Wotton*). 3. Keen sensibility (*Locke*). 4. Sharpness; pungency (*Dryden*).

QUI'CKSAND. *s.* (*quick* and *sand.*) Moving sand; unsolid ground. See SAND and ARENA.

To QUI'CKSET. *v. a.* (*quick* and *set.*) To plant with living plants (*Tusser*).

QUICKSET-HEDGE, in gardening, denotes all live hedges, of whatever sort of plants they are composed, to distinguish them from dead hedges; but in a more strict sense of the word, it is restrained to those planted with the hawthorn, or cratægus oxycantha; under which name these young plants, or sets, are sold by the nursery-gardeners who raise them for sale. See CRATÆGUS, and HEDGE.

QUI'CKSIGHTED. *a.* (*quick* and *sight.*) Having a sharp sight (*Bentley*).

QUICKSI'GHTEDNESS. *s.* (from *quicksighted*) Sharpness of sight (*Locke*).

QUICKSILVER, a metal of a silvery-white colour, fluid at the usual temperature of the atmosphere. For its mineralogical and chemical properties, see HYDRARGYRUM and MERCURY.

From the facility with which this extraordi-

nary metal evaporates, and combines, not only with other metals, but with almost all other substances, and especially many of the elastic gasses, a considerable degree of injury is occasionally sustained by persons in the vicinity without their being aware of the cause. One of the most striking instances of this sort is the following:

In April, 1810, the Triumph man of war took on board thirty tons of quicksilver, contained in leather bags of 50lbs. each. These bags were picked up on the shore of Cadiz, from the wreck of two Spanish line of battle ships, lost in the storm immediately preceding, at the end of March, the above date. The collected bags were stowed below, in the bread room, after hold, and store-rooms: they were saturated with salt water, and, in about a fortnight, all decayed and burst. In the act of collecting and endeavouring to save the quicksilver in casks, much of it found its way to the recesses of the ship, beyond the possibility of recovery. Some portion, however, was secreted by the men, who amused themselves in various ways with it, as cleaning their spoons, &c.

At this period bilge water had collected in the ship, the stench from which was intolerable; and the carpenter's mate, in the act of sounding the well, was nearly suffocated. The effect of the gass escaping from bilge water is manifested, by its changing every metallic substance in the ship black. But in this instance metals of every kind were coated with quicksilver; and a general affection of the mouth took place among the men and officers, to a severe degree of ptyalism, in upwards of 200 men. The ship was sent to Gibraltar, had all her stores taken out, the hold made clean, and all the quicksilver, that could be reached, removed; but near ten tons were supposed still to remain between the ship's timbers below, which could only be cleared away by docking the ship, and dislodging a plank at the most descending part near the keel. After the process of cleaning the ship, however, had taken place, and a new atmosphere was created, all effects from the quicksilver ceased.

Now from well-established principles, as well as analogies, a very reasonable explanation may be given of this curious effect of the thirty tons of quicksilver, exposed to the action of the bilge water, from rotten leather bags, in a hot climate, and the beginning of summer.

The stinking gass, which was generated, was sulphuretted and perhaps phosphuretted hydrogen gass, mixed with carbonic acid and perhaps other gasses compounded by the putrefaction of animal and vegetable matter. The deadly suffocating effects of which gasses are fully ascertained, unless diluted with a large proportion of fresh air; and the tarnishing of metals, especially of silver, at a great distance, even when mixed with a large proportion of fresh air, is a well known effect of sulphuretted hydrogen.

These last named effects are attributable to the gasses of putrefaction independently of quicksilver. But when the influence of so large a body of this metal is considered, it will be easy to account for the whitening of metals and the salivation or sore mouth of many persons in the ship. The quicksilver would rise united or suspended by the above gasses, or be even evaporated by the heat of the ship, in the common fresh air. This metal so suspended or dissolved is very likely to penetrate the human body, and act upon it like the fumigation with quicksilver; but sulphuretted hydrogen dissolves the metal, and of course would carry it wherever the gass was transmitted.

It should be understood, that the sulphur and phosphorus were furnished probably by the decomposition of sulphuric and phosphoric acids, always present in all kinds of animal matter. The hydrogen gass was furnished chiefly by the decomposition of the water. The carbonic acid was compounded by the union of the charcoal of the animal and vegetable matter with the oxygen (principally) of the water.

The smell therefore resulted from the mixture of sulphuretted and phosphuretted gasses with putrifying matter. If the leathern bags of quicksilver had been kept dry, they would not have putrefied, but probably would have retained the metal, and the above effects would not have happened.

It is owing to this general readiness with which quicksilver unites with other substances, and especially with silver, that the chemist is able by a very easy process to obtain that beautiful ramified crystallization, which is usually denominated *Arbor Dianæ*. In the article subjoined to this term we have given the usual process, which is that of M. Baumé. M. Vitalis of Rouen has attained the same object, by modifying the common method; and this modification admits of our extracting with facility the metallic vegetation from the liquor, and preserving it, without any alteration, out of the vessel in which it has been formed.

The operation is very simple. In the nitric solutions of mercury and silver, both being well saturated and diluted with the quantity of water prescribed by Baumé, he suspended a small knot of fine linen rag doubled up, and containing five or six drachms of very pure mercury.

The metallic solutions soon penetrate to the mercury, which is inclosed in the rag, and we soon see some beautiful spiculæ formed and grouped around the rag, adhering to the nucleus of mercury, which serves as a kind of support to them.

These spiculæ progressively increase in size, and in a short time exceed an inch in length.

When we perceive that the metallic vegetation makes no more progress, the piece of rag with the spiculæ may be withdrawn from the liquor, and by means of a silk thread fastened to the cork of the bottle, the whole may be suspended under a bell glass. The crystals, which are tetrahedrons, may thus be kept as long as wanted.

M. Vitalis has in his own laboratory a crystallization of this description, which has preserved all its original beauty for these two years past.

It may be easily seen, that, in the above pro-

cess, the play of attractions is a little different from the common method as developed by M. Fourcroy in Systemé des Connoissance chimiques.

QUI'CKSILVERED. *a.* (from *quicksilver.*) Overlaid with quicksilver (*Newton*).

QUID PRO QUO, in law, *q. d.* "what for what," denotes the giving one thing of value for another; or the mutual consideration and performance of both parties to a contract.

QUID PRO QUO, or QUI PRO QUO, is also used in physic to express a mistake in the physician's bill, where *quid* is wrote for *quo*, i. e. one thing for another; or of the apothecary in reading *quid* for *quo*, and giving the patient the wrong medicine. Hence the term is in the general extended to all blunders or mistakes committed in medicine, either in the prescription, the preparation, or application of remedies.

QUI'DAM. *s.* (Lat.) Somebody (*Spenser*).

QUI'DDANY. *s.* (*quidden*, Ger. a quince.) Marmalade; confection of quinces made with sugar.

QUI'DDIT. *s.* A subtilty; an equivocation.

QUI'DDITY. *s.* (*quidditas*, low Lat.) 1. Essence; that which is a proper answer to the question, *quid est?* a scholastic term (*Hudibras*). 2. A trifling nicety; a cavil (*Camden*).

QUIEN DE LA NEUFVILLE (James le), an author of Paris, successively an officer in the French guards, an advocate at the bar, and lastly a literary character. His general history of Portugal, 2 vols. 4to. procured his admission into the academy of inscriptions. He afterwards published a treatise on the use of posts among the ancients and moderns, 12mo. which was well received. In 1713 he went with the French ambassador to Portugal, and was rewarded with a pension. Out of gratitude to the monarch, he determined to continue his history of Portugal, which had concluded in 1531, at the death of Emanuel I. but excessive application brought on disease. He died at Lisbon 1728, aged 81, leaving two sons.

QUIEN (Michael de), a French Dominican, published panoplia contra schisma Græcorum, 4to.—nullity of the English ordinations against Courayer—oriens christianus in quatuor patriarchatus digestus, &c. 3 vols. fol—defence of the Hebrew text against Perron, &c. 2 vols. fol. He died at Paris 1733.

QUIE'SCENCE. *s.* (from *quiesco*, Latin.) Rest; repose (*Glanville*).

QUIE'SCENT. *a.* (*quiescens*, Lat.) Resting; not being in motion; not movent; lying at repose (*Holder*).

QUI'ET. *a.* (*quiet*, Fr. *quietus*, Latin.) 1. Still; free from disturbance (*Spenser*). 2. Peaceable; not turbulent (*Peter*). 3. Still; not in motion (*Judges*). 4. Smooth; not ruffled (*Shakspeare*).

QUI'ET. *s.* (*quies*, Latin.) Rest; repose; tranquillity; peace; stillness (*Hughes*).

To QUI'ET. *v. a.* (from the noun.) 1. To calm; to lull; to pacify; to put to rest (*Forbes*). 2. To still (*Locke*).

QUI'ETER. *s.* (from *quiet.*) The person or thing that quiets.

QUI'ETISM. *s.* Tranquillity of mind.

QUIETISTS, a religious sect, famous towards the close of the last century. They were so called from a kind of absolute rest and inaction, which they supposed the soul to be in when arrived at that state of perfection which they called the unitive life; in which state they imagined the soul wholly employed in contemplating its God, to whose influence it was entirely submissive; so that he could turn and drive it where and how he would. In this state, the soul no longer needs prayers, hymns, &c. being laid, as it were, in the bosom and between the arms of its God, in whom it is in a manner swallowed up.

Molinos, a Spanish priest, is the reputed author of quietism; though the illuminati of Spain had certainly taught something like it before. The sentiments of Molinos were contained in a book which he published at Rome in the year 1681, under the title of the Spiritual Guide; for which he was cast into prison in 1685, and where he publicly renounced the errors of which he was accused. This solemn recantation, however, was followed by a sentence of perpetual imprisonment, and he died in prison in the year 1696. Molinus had numerous disciples in Italy, Spain, France, and the Netherlands. One of the principal patrons and propagators of quietism in France was Marie Bouvieres de la Mothe Guyon, a woman of fashion, remarkable for goodness of heart and regularity of manners; but of an unsettled temper, and subject to be drawn away by the seduction of a warm and unbridled fancy. She derived all ideas of religion from the feelings of her own heart, and described its nature to others as she felt it herself. Accordingly, her religious sentiments made a great noise in the year 1687; and they were declared unsound, after accurate investigation, by several men of eminent piety and learning, and professedly confuted in the year 1697, by the celebrated Bossuet. Hence arose a controversy of greater moment between the prelate last mentioned and Fenelon, archbishop of Cambray, who seemed disposed to favour the system of Guyon, and who, in 1697, published a book containing several of her tenets. Fenelon's book, by means of Bossuet, was condemned in the year 1699, by Innocent XII. and the sentence of condemnation was read by Fenelon himself, at Cambray, who exhorted the people to respect and obey the papal decree.

QUI'ETLY. *ad.* (from *quiet.*) 1. Calmly; without violent emotion (*Taylor*). 2. Peaceably; without offence (*Bacon*). 3. At rest; without agitation.

QUI'ETNESS. *s.* (from *quiet.*) 1. Coolness of temper (*Sidney*). 2. Peace; tranquillity (*Hayward*). 3. Stillness; calmness (*Reynolds*).

QUI'ETSOME. *a.* (from *quiet.*) Calm; still; undisturbed: not in use (*Spenser*).

QUI'ETUDE. *s.* (*quietude*, French; from *quiet.*) Rest; repose; tranquillity (*Wotton*).

QUILIMANCY, a seaport of Zanguebar, in the kingdom of Melinda. It belongs to the Portuguese, and stands at the mouth of a river

of the same name, 26 miles S.S.W. of Melinda. Lon. 41. 40 E. Lat. 3. 10 S.

QUILL. *s.* 1. The hard and strong feather of the wing, of which pens are made (*Bacon*). 2. The instrument of writing (*Garth*). 3. Prick or dart of a porcupine (*Arbuthnot*). 4. Reed on which weavers wind their threads (*Spenser*). 5. The instrument with which musicians strike their strings (*Dryden*).

QUILLS, are the large feathers taken out of the end of the wings of geese, ostriches, crows, &c. They are denominated from the order in which they are fixed in the wing; the second and third quills being the best for writing, as they have the largest and roundest barrels. Crow quills are chiefly used for drawing. In order to harden a quill that is soft, thrust the barrel into hot ashes, stirring it till it is soft, and then taking it out, press it almost flat upon your knee with the back of a penknife, and afterwards reduce it to a roundness with your fingers. Another method of hardening quills is by setting water and alum over the fire, and while it is boiling put in a handful of quills, the barrels only, for a minute, and then lay them by. Large quantities of quills are yearly imported in Britain from Germany and Holland. The goodness of quill is judged by the size of the barrels, but particularly by the weight; hence the denomination of quills of fourteen, fifteen, &c. loths; viz. the thousand consisting of twelve hundred quills, weighing fourteen, fifteen, &c. loths. The loth is a German weight, weighing something more than an ounce. Particular attention should be paid, on purchasing quills, that they may not be left-handed, that is, not out of the left wing.

QUILLET (Claudius), a French writer, born in Touraine, 1602. He practised physic for some years; but his views were changed by his interference with the affair of the nuns of Loudun, who were said to be possessed of the devil. He ridiculed the measures pursued there by the intrigues of Richelieu; and in consequence fled to Rome, for fear of persecution. He became, at Rome, secretary to d'Etrées, the French ambassador; and there he wrote his famous poem, called Callipædia, on the art of having fine children, in which he reflected, with satirical severity, on Mazarin. The cardinal, instead of persecuting the author, made him his friend, and gave him an abbey, and Quillet, in gratitude, when he published a second edition, erased the offensive parts, and dedicated it to his noble patron. This well-known poem is divided into four books, and is written in elegant poetry, and contains many beautiful passages, though it abounds in descriptions both indelicate and licentious. The Callipædia has been translated into English by Rowe. He wrote besides two other short Latin poems. He died 1661, aged 59.

QUI'LLET. *s.* (*quidlibet*, Latin.) Subtilty; nicety; fraudulent distinction (*Digby*).

QUILOA, a seaport of Zanguebar, capital of a kingdom of the same name, with a small citadel. This country was first discovered by the Portuguese, in 1498; and it produces abundance of rice, millet, fruits, cattle, and poultry. The inhabitants are Mahometans, partly black and partly tawny. The capital is well built, and stands on an island, at the mouth of the river Coavo. Lon. 40. 9 E. Lat. 8. 35 S.

QUILT. *s.* (*kulckt*, Dutch.) A cover made by stitching one cloth over another with some soft substance between them (*Pope*).

To QUILT. *v. a.* (from the noun.) To stitch one cloth upon another with something soft between them (*Spenser*).

QUILTING, a method of sewing two pieces of silk, linen, or stuff on each other, with wool or cotton between them; by working them all over in the form of chequer or diamond-work, or in flowers. The same name is also given to the stuff so worked.

QUIMPER, a city of France, capital of the department of Finesterre, and a bishop's see. It is seated at the conflux of the Oder and Benaudet, 34 miles S.S.E. of Brest, and 112 W. by S. of Rennes. Lon. 4. 6 W. Lat. 47. 58 N.

QUIMPERLE, a town of France, in the department of Finisterre, seated on the Isotte, 30 miles E.S.E. of Quimper.

QUIN (James), a celebrated performer on the English stage, was born at London in 1693. He was intended for the bar; but preferring Shakspeare to the statutes at large, he, on the death of his father, when it was necessary for him to do something for himself, appeared on the stage at Drury-lane. In 1720, he first displayed his comic powers in the character of Falstaff, and soon after appeared to as great advantage in sir John Brute; but it was upon Booth's quitting the stage that Quin appeared to full advantage, in the part of Cato. He continued a favourite performer until the year 1748, when, on some disgust between him and Rich the manager, he retired to Bath, and only came up annually to act for the benefit of his friend Ryan; until the loss of two front teeth spoiled his utterance for the stage. While Quin continued upon the stage, he constantly kept company with the greatest geniuses of the age. He was well known to Pope and Swift; and the earl of Chesterfield frequently invited him to his table: but there was none for whom he entertained a higher esteem than for the ingenious James Thomson. Mr. Quin's judgment in the English language recommended him to his royal highness Frederick prince of Wales, who appointed him to instruct his children in speaking and reading with a graceful propriety; and Quin being informed of the elegant manner in which his present majesty delivered his first gracious speech from the throne, he cried out in a kind of ecstacy, "Ah—I taught the boy to speak!" Nor did his majesty forget his old tutor; for, soon after his accession to the throne, he gave orders, without any application being made to him, that a genteel pension should be paid to Quin during his life. Mr. Quin, indeed, was not in absolute need of this royal benefaction; for as he was never married, and had none but distant relations, he sunk 2000l. which was half his fortune, in an annuity, for which he obtained 200l. a-year; and with about 2000l. more in the funds, lived in a decent manner

during the latter part of his life at Bath, from whence he carried on a regular correspondence with Garrick, and generally paid a visit to his friends in the metropolis once a year, when he constantly passed a week or two at Garrick's villa at Hampton. He died of a fever in 1766.

QUINARIUS, was a small Roman coin equal to half the denarius, and consequently worth about three-pence three farthings of our money. See MONEY. It was called quinarius, because it contained the value of five asses, in the same manner as the denarius was named from its containing ten.

QUINARY. *a.* (*quinarius*, Lat.) Consisting of five (*Boyle*).

QUINATE LEAF, in botany, a five-fold leaf. Five together in a whorl. As in some of the stellatæ.

QUINAULT (Philip), born at Paris, in 1635. He wrote a comedy called Les Sœurs rivales, at the age of eighteen, and it was performed with great success. Fifteen other pieces of his writing were acted between the years 1654 and 1666. He was appointed to compose an allegorical drama for the marriage of Louis XIV. which was played at the Louvre in 1660. He died in 1688.

QUINCE, in botany. See QUINCE-TREE.

QUINCE-TREE. See PYRUS CYDONIA.

QUINCE (Bastard). See MESPILUS.

To QUINCH. *v, n.* To stir; to flounce as in resentment or pain (*Spenser*).

QUINCHAMALA, in botany, a genus of the class pentandria, order monogynia. Calyx inferior, five-toothed; corol tubular, superior; anthers sessile; seed one. One species, a native of Chili, with alternate leaves and corymbed flowers.

QUINCU'NCIAL. *a.* (from *quincunx.*) Having the form of a quincunx (*Ray*).

QUINCUNX, in Roman antiquity, denotes any thing that consists of five-twelfths of another; but particularly of the as.

QUINCUNX ORDER, in gardening, a plantation of trees, disposed originally in a square; and consisting of five trees, one at each corner, and a fifth in the middle: or a quincunx is the figure of a plantation of trees disposed in several rows both length and breadthwise, in such a manner, that the first tree in the second row commences in the center of the square formed by the two first trees in the first row, and the two first in the third, resembling the figure of the five at cards. This disposition of trees was formerly much more regarded than at present; but is still much used in France, for planting trees to form a grove, and is expressed in the following form:

QUINDECAGON, in geometry, a plain figure with fifteen sides and fifteen angles; which, if the sides be all equal, is termed a regular quindecagon, and irregular when otherwise. The side of a regular quindecagon inscribed in a circle, is equal in power to the half difference between the side of the equilateral triangle and the side of the pentagon, inscribed in the same circle; also the difference of the perpendiculars let fall on both sides, taken together.

QUINDECIM VIR, XV. VIR, a Roman magistrate who had fourteen colleagues joined with him in the same function.

Under Tarquin the Proud, there were first two magistrates erected to take care of the sacrifices to be performed; these were called *duumviri*. Their number at length grew to ten, and then they were called *decemviri*. In the time of Cicero it had reached to fifteen, when they assumed the name of *quindecimviri*: and though their number grew to forty afterwards, yet Servius observes, on the sixth of the Æneid, that their name never after changed, but they still continued to be called *quindecimviri*.

They were the persons who examined the Sybils' books, and were the interpreters thereof; yet they never did this but by express order of the senate, declared by a senatus consultum. They also presided at the sacrifices, and all other extraordinary ceremonies of religion.

QUINQUAGE'SIMA. *s.* (Latin.) *Quinquagesima* Sunday, so called, because it is the fiftieth day before Easter, reckoned by whole numbers; shrove-sunday.

QUINQUA'NGULAR. *a.* (*quinque* and *angulus*, Latin.) Having five corners (*Woodward*).

QUINQUARTI'CULAR. *a.* (*quinque* and *articulus*, Latin.) Consisting of five articles (*Sandys*).

QUINQUATRIA, a festival in honour of Minerva at Rome, so called from the five days devoted to their celebration. The beginning of the celebration was the 18th of March. Scholars at this time obtained holidays, and it was usual for them to offer prayers to Minerva for learning and wisdom, and on their return to school, they presented their master with a gift called Minerval. They were much the same at the Panathenæa of the Greeks.

QUINQUECAPSULAR PERICARP, in botany. Having five capsules to a flower: as in aquilegia.

QUINQUEFID LEAF, in botany. A five-cleft leaf. Cut into five segments, with linear sinuses, and straight margins. Applied to the corol—and to the perianth, in nicotiana.

QUINQUEFO'LIATED. *a.* (*quinque* and *folius*, Lat.) Having five leaves.

QUINQUEFOLIUM. (from *quinque*, five, and *folium*, a leaf; so called because it has five leaves on each foot-stalk.) Cinquefoil or five-leaved grass. See PENTAPHYLLUM.

QUINQUEJUGOUS LEAF, in botany. A pinnate leaf, with five pairs of leaflets.

QUINQUELOBATE LEAF, in botany. A five-lobed leaf. Divided to the middle into five distant parts, with convex margins.

QUINQUELOCULAR PERICARP, in botany. A five-celled pericarp; as in pyrola.

QUINQUENALES LUDI. See ACTIAN GAMES.

QUINQUE'NNIAL. *a.* (*quinquennis*, Lat.) Lasting five years; happening once in five years.

QUINQUEPARTITE LEAF. A five-parted leaf. Divided into five parts almost to the base.—Applied to the perianth, in lithospermum.

QUINQUEVALVE PERICARP. A pericarp of five valves: as in hottonia.

QUINQUINA. See CINCHONA.

QUINSY, a term applied to sore throats generally, and hence embracing the whole family of cynanches if not of angimas.

QUINT. *s.* (*quint*, French.) A set of five (*Hudibras*).

QUI'NTAIN. *s.* (*quintain*, French.) A post with a turning top. See QUINTIN. (*Shakspeare*).

QUI'NTAL. *s.* (*centupondium*, Latin.) A hundred weight to weigh with.

QUINTE'SSENCE. *s.* (*quinta essentia*, Lat.) 1. A fifth being (*Watts*). 2. An extract from any thing, containing all its virtues in a small quantity (*Boyle*).

QUINTESSE'NTIAL. *a.* (from *quintessence*.) Consisting of quintessence (*Hakewill*).

QUINTILE, in astronomy, an aspect of the planets when they are 72 degrees distant from one another, or a fifth part of the zodiac.

QUINTILIANUS (Marcus Fabius), an illustrious rhetorician and critic, born in a Roman province in Spain, under Claudius Cæsar, about A. D. 42. He went to Rome very young, and is supposed to have accompanied Galba when sent by Nero into Spain. Upon the return of Galba to Rome, after Nero's death, Quintilian taught rhetoric at the expence of the government, and with the highest reputation. When he had obtained leave of Domitian to retire, he composed his admirable book called Institutiones Oratoriæ, the completest work which antiquity has left us for forming a perfect orator. Quintilian had pleaded at the bar, and, he says himself, defended queen Berenice in her presence. Quintilian spent the latter part of his life with dignity, but though some imagine he was consul, yet his name is not mentioned in the Fasti consulares. He was, however, preceptor to the grandsons of the emperor Domitian's sister. After betraying a puerile grief on the loss of his first wife, he married again, and had a daughter, to whom the younger Pliny gave a handsome dowry on her marriage. The greatest blemish in the character of this great orator and rhetorician is the excessive adulation which he paid to Domitian; whom he represents as one of the best of men, and to have abounded in moral virtue.

The editio princeps of Quintilian, printed in folio, at Rome, in 1470, is one of the rarest and valuable productions of the 15th century; it is even now doubted whether it was printed by Udal, Gallus, or Lignamine, though the preponderance of opinions is in favour of the latter. Gibson's edition, printed at Oxford in 1693, has been more undervalued than it ought to be. Burman's edition in 2 vols. 4to, published in 1720, is much and deservedly esteemed; as is also the reprint of Burman, at Padua, in 1736, in 2 vols. 8vo. But the most valuable and highly prized is Spalding's edition, published at Leipsic, in octavo, A. D. 1798, 1803, &c. There is a respectable English translation by Guthrie.

QUINTILIANS, a sect of ancient heretics, thus called from their prophetess Quintilia. In this sect the women were admitted to perform the sacerdotal and episcopal functions. They attributed extraordinary gifts to Eve for having first eaten of the tree of knowledge; told great things of Mary the sister of Moses, as having been a prophetess, &c. They added, that Philip the deacon had four daughters, who were all prophetesses, and were of their sect. In these assemblies it was usual to see the virgins entering in white robes, personating prophetesses.

QUINTILLUS (M. Aurelius Claudius), a brother of Claudius, who proclaimed himself emperor, and 17 days after destroyed himself by opening his veins in a bath, when he heard that Aurelian was marching against him: about the 270th year of the Christian era.

QUI'NTIN. *s.* An upright post, on the top of which a cross post turned upon a pin; at one end of the cross post was a broad board, and at the other a heavy sand bag; the play was to ride against the broad end with a lance, and pass by before the sand bag should strike the tilter on the back (*Ben Jonson*).

QUINTINIE (John de la), a French gardener, born at Poictiers in 1626. He was intended for the law, but applying his leisure hours to the study of ancient and modern writers on agriculture he renounced every other pursuit. He read Columella, Varro, Virgil, and others, who had written upon the subject; but he gained new lights by a journey to Rome with his pupil, who was the son of M. Tomboneau, president of the chamber of accounts. On his return home, Tomboneau entirely gave up to him his garden to manage as he pleased; and Quintinie made it so advantageous a theatre of experiment and observation, that his reputation spread all over France, when Louis XIV. made him director general of all his fruit and kitchen gardens. Quintinie died considerably advanced in years, and left a book of directions for the management of gardens.

QUI'NTUPLE. *s.* (*quintuplus.*) Five-fold.

QUINTUS CURTIUS RUFUS, a Latin historian, who flourished, as some suppose, in the reign of Vespasian or Trajan. He has rendered himself known by his history of the reign of Alexander the great. It was divided into ten books, of which the two first, the end of the fifth, and the beginning of the sixth, are lost. The work is admired for its elegance, the purity, and the floridness of the style; it is, however, blamed for great anachronisms, and glaring mistakes in geography and history.

Among the various editors of Quintus Curtius, there is none to whom we are more indebted than to Freinshem, whose first edition, with various readings and copious notes, was

published in 1640. The quarto variorum edition by Snakenburg, published at Leyden in 1724, is much and deservedly esteemed.

QUINZE. (so called from the number of the game.) In cards, a French game, usually played by only two persons, admired for its simplicity and fairness, dependent entirely upon chance, soon decided, and not requiring that attention which most other games on the cards stand in need of; and hence peculiarly calculated for those who are fond of an equal hazard.

It is called quinze from the number fifteen being the game, produced in the following manner.—First let the players shuffle the cards; and when they have cut for deal, which falls to his lot who cuts lowest, the dealer has the privilege to shuffle last. Having thus shuffled, the adversary cuts; after which the dealer gives one card to his adversary, and one to himself. If the adversary does not like his card, he has a right to have as many more given to him, one after the other, the pips of which will make fifteen, or come nearest to it, which are usually given from the top of the pack. For example: if he should have a deuce, and draw a five which make seven, he should go on in hopes of coming nearer to fifteen: if he draws an eight, which make just fifteen, being eldest hand he is sure of winning the game. But if he overdraw himself, and make above fifteen, he loses unless the dealer does the same, in which case it is a drawn game, and the stakes are to be doubled; thus proceeding till one of the party has won the game by standing, on being fifteen, or the nearest to it below that number. At the end of each game the cards are to be put together and shuffled, and the players are to cut for deal, the elder hand having constantly the advantage.

QUINZY. See QUINSY.

QUIP. *s.* A sharp jest; a taunt; a sarcasm (*Milton*).

To QUIP. *v. a.* To rally with bitter sarcasms.

QUIRE. *s.* (*chœur*, French; *choro*, Italian.) 1. A body of singers; a chorus (*Shakspeare*). 2. The part of the church where the service is sung (*Cleaveland*). 3. (*cahier*, Fr.) A bundle of paper consisting of twenty-four sheets.

To QUIRE. *v. n.* (from the noun.) To sing in concert (*Shakspeare*).

QUIRINALIA, festivals in honour of Romulus, sirnamed Quirinus, celebrated on the 13th of the calends of March.

QUIRINALIS, a hill at Rome, originally called Agonius, and Collinus. The name of Quirinalis it obtained from the inhabitants of Cures, who settled there under their king Tatius.

QUIRINUS, a sirname of Mars among the Romans. This name was also given to Romulus when he had been made a god by his superstitious subjects. (*Ovid*).—Also a sirname of the god Janus.—Sulpitius, a Roman consul born at Lanuvium. Though descended of an obscure family, he was raised to the greatest honours by the emperor Augustus.

QUIRISTER. *s.* (from *quire*.) Chorister; one who sings in concert, generally in divine service (*Thomson*).

QUIRITES, a name given to the Roman citizens, because they admitted into their city the Sabines, who inhabited the town of Cures, and who, on that account, were called Quirites. After this union, the two nations were indiscriminately and promiscuously called by that name.

QUIRK. *s.* 1. Quick stroke; sharp fit (*Shakspeare*). 2. Smart taunt (*Shakspeare*). 3. Slight conceit (*Watts*). 4. Subtilty; nicety; artful distinction (*L'Estrange*). 5. Loose light tune (*Pope*).

QUIRPON, an island in the Atlantic ocean, near the N. coast of Newfoundland. Lon. 55. 22 W. Lat. 51. 40 N.

QUISQUALIS, in botany, a genus of the class decandria, order monogynia. Calyx five-cleft, filiform; petals five; drupe five-angled. One species, an Indian shrub, with opposite heart-ovate leaves; spiked flowers.

QUISTELLO, a town of Italy, in the Mantuan, famous for an action between the French and Austrians in 1734, when marshal Broglio was surprised in his bed. It is seated on the Seccia, 15 miles S.E. of Mantua.

To QUIT. *v. a.* part. pass. *quit*; pret. *I quit* or *quitted*. (*quiter*, French.) 1. To discharge an obligation; to make even (*Denham*). 2. To set free (*Taylor*). 3. To carry through; to discharge; to perform (*Daniel*). 4. To clear himself of an affair (*Milton*). 5. To repay; to requite (*Shakspeare*). 6. To vacate obligations (*Ben Jonson*). 7. To pay any obligation; to clear a debt; to be tantamount (*Temple*). 8. To absolve; to acquit (*Fairfax*). 9. To pay (*Fairfax*). 10. To abandon; to forsake (*Ben Jonson*). 11. To resign; to give up (*Prior*).

QUI TAM, in law, is where an action is brought, or an information exhibited against a person on a penal statute, at the suit of the king and the party or informer, when the penalty for breach of the statute is directed to be divided between them; in that case, the informer prosecutes as well for the king as himself.

QUITCHGRASS. *s.* (cpice, Saxon.) Dog-grass (*Mortimer*).

QUITE. *ad.* Completely; perfectly (*Hook.*).

QUITO, an audience of Peru, lying between two chains of the high mountains called the Andes. The lands are generally well cultivated, and there are a great number of towns and villages inhabited by the Spaniards or native Americans. Every village is adorned with a large square, and a church on one side of it. The streets are generally straight, and in the direction of the four cardinal points; and all the roads are laid out in a line, crossing each other, that the aspect of the country has the appearance of a large garden. Although this country is situate on both sides the equator, yet it lies so high, and so near the mountains covered with snow, that the air is very temperate. There are no noxious animals; for the tigers and serpents are below in the forests. Several

districts of this country are occupied almost entirely by Indians; and the city of Quito alone contains between 50 and 60,000 of all the different races. This is the only province in Spanish America that can be called a manufacturing country. Hats, cotton-stuffs, and coarse woollen cloths, are made here in such quantities as to furnish a considerable article for exportation to other parts of Spanish America. This province was under the jurisdiction of the viceroy of Peru, until the present century, when a new viceroyalty was established at St. Fe-de-Bogota, the capital of the new kingdom of Granada; the jurisdiction of which includes the whole of Quito and all the provinces of Terra-Firma.

QUITO, a city of Peru, in an audience of the same name, and a bishop's see. It is seated in a pleasant valley, between high mountains, and on much higher ground than the rest of Peru that is habitable, being 300 yards above the level of the sea. Here are several religious communities, and two colleges, which are a sort of university. It is 820 miles N. of Lima. Lon. 77. 50 W. Lat. 0. 13 S.

QUIT-RENT, in law, a small rent that is payable by the tenants of most manors, whereby the tenant goes quit and free from all other services. Anciently this payment was called white-rent, on account that it was paid in silver coin, and to distinguish it from rent-corn.

QUITS. *interj.* (from *quit.*) An exclamation used when any thing is repaid and the parties become even.

QUITTANCE. *s.* (*quitance*, French.) 1. Discharge from a debt or obligation; an acquittance (*Shaks.*). 2. Recompence; return; repayment (*Shakspeare*).

To QUI'TTANCE. *v. a.* (from the noun.) To repay; to recompence: not used (*Shakspeare*).

QUI'TTER. *s.* A deliverer (*Ainsworth*).

QUITTER, or QUITTOR, in farriery, an ulcer formed between the hair and hoof usually in the inside of a horse's foot. It is generally produced by treads or bruises, sometimes by gravel which, working its way upwards, lodges about the coronet. If only superficial it may be dressed with digestive applications, intermixed with a little red precipitate. When the disease is deeper seated it is sometimes necessary to remove the quarter of the hoof, which after a cure has been accomplished is often attended with a grievous defect; for the new quarter as it grows up is apt to leave a pretty large seam that weakens the foot, which is called a false quarter; and the horse seldom recovers altogether from this imperfection. If the coffin-bone be injured by the matter of the quitter, it will be necessary to cut away still more of the quarter, and to apply the actual cautery or hot iron, pointed pyramidically. The foot, in this case, should be surrounded with a poultice, and dressed with tincture of myrrh and digestive ointment.

QUITTER-BONE. This is the disease of a quitter attacking the coffin-bone as just noticed in the preceding article, and enlarging its spongious texture by inflammation. It must be treated as already mentioned.

QUI'VER. *s.* (*couvrir*, French, *to cover.*) A case or sheath for arrows (*Spenser*).

QUI'VER. *a.* Nimble; active: not used (*Shakspeare*).

To QUI'VER. *v. n.* 1. To quake; to play with a tremulous motion (*Gay*). 2. To shiver; to shudder (*Sidney*).

QUI'VERED. *a.* (from *quiver.*) 1. Furnished with a quiver (*Milton*). 2. Sheathed as in a quiver (*Pope*).

QUIXOS, a province of Peru, in the audience of Quito.

QUIZAMA, a province in the S. part of the kingdom of Angola. It is full of mountains, and badly cultivated, but produces abundance of honey, wax, and salt. The inhabitants are warlike, and have not submitted to the Portuguese.

QUIZINA, a chain of mountains in the kingdom of Fez, 100 miles in length, extending from the desert of Gret to the river Nocor.

To QUOB *v. n.* To move as the embryo does in the womb. A low word.

QUO'DLIBET. *s.* (Latin.) A nice point; a subtilty (*Prior*).

QUODLIBETARIAN. *s.* (*quodlibet*, Latin.) One who talks or disputes on any subject.

QUODLIBETICAL. *a.* (*quodlibet*, Latin.) Not restrained to a particular subject.

QUOIF. *s.* (*coeffe*, French.) 1. Any cap with which the head is covered. See COIF. (*Shakspeare*). 2. The cap of a serjeant at law.

To QUOIF. *v. n.* (*coeffer*, French.) To cap; to dress with a headdress (*Addison*).

QUO'IFFURE. *s.* (*coeffure*, French.) Headdress (*Addison*).

QUOIL. *s.* See COIL.

QUOIN. *s.* (*coin*, Fr.) Corner (*Sandys*).

QUOIN, or COIN, on board a ship, a wedge fastened on the deck close to the breech of the carriage of a gun, to keep it firm up to the ship's side.

QUOIT. *s.* (*coete*, Dutch.) 1. Something thrown to a great distance to a certain point (*Arbuthnot*). 2. The discus of the ancients is sometimes called in English *quoit*, but improperly.

To QUOIT. *v. n.* (from the noun.) To throw quoits; to play at quoits (*Dryden*).

To QUOIT. *v. a.* To throw (*Shakspeare*).

QUO MINUS, is a writ which issues out of the court of exchequer to the king's farmer or debtor, for debt, trespass, &c. Though this writ was formerly granted only to the king's tenants or debtors, the practice now is become general for the plaintiff to surmise, that by the wrong the defendant does him, he is the less able to satisfy his debt to the king, by which means jurisdiction is given to the court of exchequer to determine the cause. This writ is to take the body of the defendant in like manner as the capias in the common pleas, and the writ of latitat in the king's bench.

QUONDAM. (Lat.) Having been formerly.

QUOOK. The pret. of *quake*: obsolete.

QUORUM, a word frequently mentioned in our statutes, and in commissions both of justices of the peace and others. It is thus called from the words of the commission, *quorum* A. B. *unum esse volumus*. For an example, where a commission is directed to seven persons, or to any three of them, whereof A. B. and C. D. are to be two; in this case, they are said to be of the quorum, because the rest cannot proceed without them: so a justice of the peace and quorum is one without whom the rest of the justices in some cases cannot proceed.

QUORUM, also signifies such a number of any officers as is sufficient to do business.

QUOTA. *s.* (*quotus*, Latin.) A share; a proportion as assigned to each (*Addison*).

QUOTATION. *s.* (from *quote.*) 1. The act of quoting; citation. 2. Passage adduced out of an author as evidence or illustration (*Locke*).

To QUOTE. *v. a.* (*quoter*, French.) To cite an author; to adduce the words of another.

QUOTER. *s.* (from *quote.*) Citer; he that quotes (*Atterbury*).

QUOTH. *verb imperfect.* (cpoðan, Saxon.) *Quoth I*, say I or said I; *quoth he*, says he or said he (*Hudibras*).

QUOTIDIAN. *a.* (*quotidien*, French; *quotidianus*, Latin.) Daily; happening every day.

QUOTI'DIAN. *s.* (*febris quotidianâ*, Latin.) A quotidian fever; a fever which returns every day. See FEBRIS INTERMITTENS.

QUOTIENT, in arithmetic, the number resulting from the division of a greater number by a smaller; and which shows how often the smaller is contained in the greater, or how often the divisor is contained in the dividend. The word is formed from the Latin *quoties*; *q. d.* How often is such a number contained in such another? In division, as the divisor is to the dividend, so is unity to the quotient.—Thus the quotient of 12 divided by 3 is 4; which is thus disposed, 3) 12 (4 quotient. See ARITHMETIC.

QUO-WARRANTO, in law, a writ which lies against a person or corporation that usurps any franchise or liberty against the king; as to have a fair, market, or the like, in order to oblige the usurper to shew by what right and title he holds or claims such franchise. This writ also lies for mis-user or none-user of privileges granted. The attorney-general may exhibit a quo-warranto in the crown-office against any particular persons, or bodies politic or corporate, who use any franchise or privilege without having a legal grant or prescription for the same; and a judgment obtained upon it is final, as being a writ of right.

R.

R, A liquid consonant, and the seventeenth letter of the alphabet.

The grammarians hold it a semi-vowel; especially in the Greek, where, in common with the other vowels, it admits an aspirate, &c. though whether the aspirate should be sounded before or after it, is some doubt. We find instances of each.

Thus ῥέδη the Latins wrote *rheda*; and ῥοδον the Ætolians wrote βροδον; and in English words derived from the Greek it is followed by an *h*, as *rhapsody*. The ancient Goths, and Teutones, Littleton observes, always prefixed *h* to *r*. See H.

The sound is formed by a guttural extrusion of the breath, vibrated through the mouth, with a sort of quivering motion of the tongue drawn from the teeth, with the tip a little elevated towards the palate.

The Hebrews allow the *r* the privilege of a guttural; that is, they never double it, which yet is done by the Arabs, Greeks, Latins, &c.

Persius calls the *r*, *litera canina*, because the dogs seem to pronounce it in snarling; yet it should seem to have had a softer sound among the Romans than among us, by its being frequently interposed to prevent the clashing of vowels; as in *rarus*, αραιος, *nurus* from νυος, *murex* from μυαξ, *mus muris* from μυς μυος; and this softness was such as frequently occasioned its being dropt as useless in writing.

Thus, for *Hetrusci* they frequently wrote *Thusci*, and even *Tusci*; and for *sursum*, *rursus*; *prorsus*, *susum*; *rusus*, *prosus*. In effect, there was that agreement between the sound of the *s* and *r*, that as the Romans avoided the doubling of their consonants, it was no wonder they here dropped the *r* in such words; the *s* supplying the place of both. Hence too it came to pass, that what they at first pronounced *asa*, *asena*, *casmen*, was afterwards *ara*, *arena*, *carmen*; and those first named *Fusii* and *Valesii* were afterwards called *Furii* and *Valerii*. Cicero tell us, the *Papirii* were first called *Papisii*; and even fixes the time when the change was made, viz. in the year of Rome 415. Festus adds, that *olera*, *pignora*, *plurima*, were anciently written *olesa*, *pignosa*, *plusima*.

From the same softness of the sound of the *r*, it came to be used indifferently with the *l*, in many words; e. gr. *Latiaris* and *Latialis*, *Palilia* and *Parilia*, &c.

Though the *r* more frequently degenerated into *l*; thus *remures* became changed into *lemures*; *interlego*, *perluceo*, into *intelligo* and *pelluceo*; *frater* into *fratellus*, &c. and the same is sometimes done between *n* and *r*, as *æreus*, and *æneus*, &c.

In the notes of the ancients, *R.* or *RO.* signified *Roma*; *R. C. Romana civitas*; *R. G. C. rei gerendæ causa*; *R. F. E. D. recte factum & dictum*; *R. G. F. regis filius*; *R. P. res publica*, or *Romani principes*; and *R. R. R. F. F. F. res Romana ruet ferro, fame, flamma.*

R was anciently a numeral letter, signifying 80; according to the verse,

Octoginta dabit tibi R, *siquis numerabit.*

When a dash was added at top, as $\overline{R}$, it signified eighty thousand.

The Greek *r*, ῥ, with a small mark over it, signified a hundred; with the same mark under it, it denoted 1000 × 100: thus ῥ, signified 100,000.

In the Hebrew numeration ר denoted 200; and with two horizontal points over it 1000 × 200; thus $\ddot{\text{ר}} = 200{,}000$.

R on the French coins denotes their being struck at Orleans.

R, or ℞, in medicinal prescription, stands for recipe, take: thus, ℞ *magnes. alb.* ℥j. signifies, take a dram of magnesia.

RAAB, a town of Lower Hungary, capital of Javerin, with a castle, and a bishop's see. It is a strong frontier bulwark against the Turks, and has two bridges, one over a double ditch, and another that leads toward Alba Regalis. It is seated at the confluence of the Raab and Rabnitz, not far from the Danube, 55 miles S.E. of Vienna. Lon. 17. 25 E. Lat. 47. 48 N.

RAAJEGUR, a town of Hindoostan Proper, in the province of Malwa, 74 miles N.E. of Ougein, and 214 S.S.W. of Agra. Lon. 76. 56 E. Lat. 24. 2 N.

RABASTEINS, a town of France, in the department of Tarn, with a decayed castle, seated on the Tarn, 18 miles W. by S. of Alby. Lon. 1. 52 E. Lat. 43. 46 N.

RABAT, a seaport of Algiers, in Tremesen, with a castle. It has fine mosques and handsome palaces, and is seated at the mouth of the Burigrig, between Fez and Tangier. Lon. 5. 28 W. Lat. 34. 40 N.

To RA'BATE. *v. n.* (*rabattre*, Fr.) In falconry, to recover a hawk to the fist again (*Ainsworth*).

To RA'BBET. *v. a.* (*rabatre*, French.) To pare down pieces of wood so as to fit one another (*Moxon*).

RA'BBET. *s.* (from the verb.) A joint made

by paring two pieces so that they wrap over one another (*Moxon*).

RABBI, or RABBINS, a title which the Pharisees and doctors of the law among the Jews assumed, and literally signifies masters or excellents. There were several gradations before they arrived at the dignity of a rabbin; which was not conferred till they had acquired the profoundest knowledge of the law and the traditions. It does not, however, appear that there was any fixed age or previous examination necessary; but when a man had distinguished himself by his skill in the written and oral law, and passed through the subordinate degrees, he was saluted a rabbin by the public voice. Among the modern Jews, for near 700 years past, the learned men retain no other title than that of rabbi, or rabbins; they have great respect paid them, have the first places or seats in their synagogues, determine all matters of controversy, and frequently pronounce upon civil affairs; they have even power to excommunicate the disobedient.

RABBINISTS, among the modern Jews, an appellation given to the doctrine of the rabbins concerning traditions, in opposition to the Caraites, who reject all traditions. See CARAITE.

RABBIT, a well-known animal of the hare-kind, with a short tail, and naked ears. In the wild state, the colour of the fur is brown; but, in a tame state, it varies to a black, pied, and quite white; the eyes are of a fine red. (See LEPUS.) In their wild state they inhabit the temperate and hot parts of Europe, and the hottest parts of Asia and Africa. The female, or doe rabbit, goes with young thirty days, and then kindles; and if she take not the buck at once she loses her month, or at least a fortnight, and often kills her young and eats them. In England they begin to breed at a year old, but in some places much sooner; and continue breeding very fast from the time when they begin, four, five, six, or seven times a year being common with them. The female sometimes brings eight young ones at a time. Supposing this to happen regularly for four years, the number of rabbits from a single pair would amount to 1,274,840. By this account we might justly apprehend being overstocked with these animals; but a great number of enemies prevent their increase; not only men, but hawks and beasts of prey making dreadful havock among them. Notwithstanding all these different enemies, however, we are told by Pliny and Strabo, that they once proved such a nuisance to the inhabitants of the Balearic islands, that they were obliged to implore the assistance of a military force from Augustus in order to exterminate them. The does cannot suckle their young till they have been at buck again; this therefore is to be done soon, else there is a fortnight lost of the time for the next brood, and the present brood also probably lost. When the buck goes to the doe, he always first beats and stamps very hard with his feet, and when he has copulated with her he falls backward, and lies, as it were, in a trance; in this state it is easy to take him, but he soon recovers from it. The buck-rabbit, like our boar-cats, will kill the young ones, if he can get at them; and the does in the warrens prevent this, by covering their stocks, or nests, with gravel or earth, which they close so artificially up with the hinder part of their bodies, that it is difficult to find them out. They never suckle the young ones at any other time than early in the morning and late at night, and always for eight or ten days close up the hole at the mouth of the nest, in this careful manner, when they go out. After this they begin to leave a small opening, which they increase by degrees, till at length, when they are about three weeks old, the mouth of the hole is left wholly open, that the young may go out; for they are at that time grown big enough to take care of themselves, and to feed on grass. When the young ones come to the mouth of the hole, and eat such herbs as the mother brings to them, the father seems to know them: he takes them betwixt his paws, smooths their hair, and caresses them with great fondness. Wild rabbits are much inferior in size, and many shades lighter in the colour of their fur, than the hare, to whom they have a natural and an invincible aversion; which, in fact, seems to be mutual, as they are but rarely found in the purlieus of each other. The rabbit, in its wild and uncultivated state, (not part of, or appertaining to a warren,) is thought of but very little intrinsic value, and is killed or taken as a matter of public right, by individuals of every class who happen to find them; not being included in the late acts of parliament for the preservation of the game; although they are mentioned as conies in some of the former records, which, though unrepealed, are seldom resorted to for legal information. Rabbits in a warren are supposed the most prolific and profitable animal of any that contributes to human subsistence: these warrens are common in many parts of the kingdom, but more particularly in Yorkshire, Lincolnshire, Norfolk, Suffolk, and Cambridgeshire, by the three last of which counties the metropolis is supplied for its almost infinite consumption. The scent of a rabbit is exceedingly faint in comparison with that of the hare, fox, or fallow deer; by jumping up suddenly, however, it frequently leads hounds a little astray, but cannot stand long before them.

In consequence of the rapidity with which rabbits breed, they increase so largely in some parks and farms of a woodland country as to become, by their numbers, exceedingly injurious, and an occasional reduction now, as in former times, is found necessary, as a matter of self-defence; in which case rabbit-shooting is a pleasant diversion. This is followed up by the assistance of a brace of spaniels, which being turned into the bushes and hedge-rows, are hardly ever without a rabbit on foot: but it must be a very quick and good shot that proves successful, as their short turns and sudden twists render them a very difficult mark to hit. Warreners, in some parts of the kingdom, are called warren farmers; their premises are of

very great extent, and their rent from three to four and five hundred pounds a year: the rabbits in these warrens are so completely private property, that various acts are still in force for their preservation, and a summary punishment of offenders (before a justice of peace) for any transgression against the statutes in such case made and provided.

RA'BBLE. *s.* (*rabula*, Latin.) A tumultuous crowd; an assembly of low people (*Raleigh*).

RA'BBLEMENT. *s.* (from *rabble.*) Crowd; tumultuous assembly of mean people (*Spenser*).

RABELAIS (Francis), a French writer famous for his facetiousness, was born at Chinon in Touraine, about the year 1483. He was first a Franciscan friar; but quitting his religious habit studied physic at Montpelier, where he took his doctor's degree. It is said, that the chancellor du Pratt having abolished the privileges of the faculty of physic at Montpelier, by a decree of the parliament, Rabelais had the address to make him revoke what he had done; and that those who were made doctors of that university wore Rabelais's robe, which is there held in great veneration. Some time after he came to Rome in quality of physician in ordinary to cardinal John du Bellay, archbishop of Paris. Rabelais is said to have used the freedom to jeer pope Paul III. to his face. He had quitted his religious connections for the sake of leading a life more agreeable to his taste; but renewed them on a second journey to Rome, when he obtained, in 1536, a brief to qualify him for holding ecclesiastical benefices; and, by the interest of his friend cardinal John du Bellay, he was received as a secular canon in the abbey of St. Maur, near Paris. His profound knowledge in physic rendered him doubly useful; he being as ready, and at least as well qualified, to prescribe for the body as for the soul: but as he was a man of wit and humour, many ridiculous things are laid to his charge, of which he was quite innocent. He published several things; but his chief performance is a strange incoherent romance, called the History of Gargantua and Pantagruel, being a satire upon priests, popes, fools, and knaves of all kinds. This work contains a wild, irregular profusion of wit, learning, obscenity, low conceits, and arrant nonsense; hence the shrewdness of his satire, in some places where he is to be understood, gains him credit for those where no meaning is discoverable. Some allusions may undoubtedly have been so temporary and local as to be now quite lost: but it is too much to conclude thus in favour of every unintelligible rhapsody; for we are not without English writers of great talents, whose sportive geniuses have betrayed them into puerilities, no less incoherent at the times of writing than those of Rabelais appear above two centuries after. He died about 1553.

RA'BID. *a.* (*rabidus*, Lat.) Fierce; furious; mad.

RABIES CANINA. See HYDROPHOBIA and LYSSA.

RABIRIUS, (C.) a Roman knight, who lent an immense sum of money to Ptolemy Auletes, king of Egypt. The monarch afterwards not only refused to repay him, but even confined him. Rabirius escaped from Egypt with difficulty, and at his return to Rome he was accused by the senate of having lent money to an African prince, for unlawful purposes. He was ably defended by Cicero, and acquitted with difficulty.—2. A Latin poet in the age of Augustus, who wrote a poem on the victory which the emperor had gained over Antony at Actium. Seneca has compared him to Virgil for elegance and majesty, but Quintilian is not so favourable to his poetry.

RACCOON. In mastiology. See URSUS.

RACE. *s.* (*race*, Fr. from *radico*, Lat.) 1. A family ascending. 2. Family descending (*Milton*) 3. A generation; a collective family (*Shakspeare*). 4. A particular breed (*Milton*). 5. RACE *of ginger*. A root or sprig of ginger. 6. A particular strength or taste of wine. (*Tem.*). 7. (*ras*, Islan.) Contest in running (*Milton*). 8. Course on the feet (*Bacon*). 9. Progress; course (*Milton*). 10. Train; process (*Milton*).

RACE, a trial of speed between men or animals. Races are most commonly run by horses trained for the purpose. See the articles RACE-HORSE, MATCH, &c.

RACE-HORSE, a horse bred for the turf, or, in other words, calculated for speed. See HORSE-RACING. In his chapter on Running Horses and the Turf, Mr. John Lawrence contends for "the necessity, or at least the utility, of a reserve of thorough-bred horses in this country, on the ground, that were the species neglected, and suffered to be indiscriminately blended amongst the whole genus, the English saddle-horse would, in all probability, become retrograde in quality, and in the course of time would degenerate into the round buttock, gummy carcase, and coarse head, of former days." In fact, examples enough of this degeneracy are always to be seen, he says, in the studs of the different breeders; neither is the number of well-shaped half-bred stallions considerable, or even sufficient for the demand of the country. In opposition to the idea which some entertain of the propriety of putting an end to horse-racing by law, "On the course only," says he, "can the worth of this peculiar species of the horse be essayed; and, independent of that object, it is scarcely probable that the breed would be kept distinct, or that any very minute attention would be bestowed upon pedigree. It is well known, that not only have varieties of a genus of animals been often blended and lost by neglect, but even arts and different branches of knowledge have perished in the same way. From the discontinuance of horse-racing, the English thorough-bred horse, the source of almost all that is excellent in the species, might become extinct. Thus the turf is a grand national object, and its votaries are administering, through the medium of their pleasures, to the interest and prosperity of their country."

"The speed and continuance of race-horses must necessarily be affected and governed, in certain degrees, by the weight which they have

to carry; and reasoning upon that position, it will be easily conceived, that if two horses be equally matched in point of speed and strength, and put to their utmost exertion for a considerable distance, the horse which carries the least weight, by even only a single pound, must infallibly have the advantage to a certain degree (however small), and possess the ability of going more swiftly and lasting longer than his antagonist. The swifter the pace, and the longer it is continued, the more in proportion will the horse be affected by the weight he carries. It is said, that, in running four miles, seven pounds make the difference of a distance, or two hundred and forty yards, between horses of equal goodness. Weight is therefore regulated with scientific precision upon the turf, and forms a prime consideration in all sporting transactions. The weights carried by race-horses vary from the maximum twelve stone, fourteen pounds to the stone, to a feather, which means a boy of the lightest weight to be found."

The thorough-bred courser, Mr. Lawrence thinks, in a general point of view, the most useful species of the horse, as being applicable to every purpose; which cannot be asserted of any other species. He defines a thorough-bred horse, or racer, to be originally the produce of Asia or Africa, or of the south of Europe. The chief object in breeding a race-horse, he thinks, ought to be truth and symmetry in the cardinal points.

As to the "integrity of his blood," he observes, "a true racing pedigree, according to the rule of the present time, ought to prove under the hand of the breeder, that the horse has descended from ancestors of genuine racing blood, without the intervention of a single bastard cross. If the pedigree be long, it is common to take it for granted that there is blood sufficient, although there be no mare mentioned in it, which has proved her blood by her having actually raced; but usually all the horses are reputed runners, or brothers of such. The greater number of mares which have raced contained in a pedigree, the surer and more valuable, no doubt, it must be, particularly if the last-mentioned be specified as a reputed racer, or a natural Arabian or Barb. A pedigree of one single descent is held sufficient, when the sire and dam are named as reputed and tried runners: otherwise a short pedigree of three or four descents would not constitute a horse thorough-bred, though it might serve for a hunter.

"It is yet easy to conceive," he adds, "how liable the pedigree of a horse must be both to error and imposition, and that the best proof of true blood must ever consist in performance. Various accidental bastard crosses have occurred in our racing breed, at different periods, chiefly distant ones; and they are frequently easy to distinguish in the figure of the stock, by a critical eye. The far greater part of those horses brought over to this country, under the general appellation of Arabians, have, I believe, never seen Arabia, or else have been of its inferior breed. They are usually purchased in the Levant, Barbary, or the East Indies, by persons totally unacquainted with horses, or at any rate with the peculiar purpose for which such horses are designed; hence a number of inferior and half-bred Arabians have been brought over at a useless expence, to deteriorate instead of amending our racing breed, and to bring Arabian blood into disrepute."

With a view to assist his readers in forming adequate ideas of the phenomena of blood in horses, Mr. Lawrence, in his chapter On running Horses and the Turf, exhibits the following facts, which, he says, rest upon the ground of constant and invariable experience, namely, "Fine and delicate horses, the natives of warm climes, excel in swiftness; the most perfect of these were originally found in Arabia, but they are improvable in their descendants by a more fruitful country; the Arabians tried in England have never proved themselves in any respect equal upon the course to the English racers, the descendants of their blood. Although the general characteristic of thorough blood is speed, yet the true test is not speed, but continuance, since many common or half-bred horses have been known to possess racing speed, but no instance has ever occurred of its continuance in those beyond perhaps half a mile: the powers of continuance increase in proportion to the quantity of blood; thus, three-part bred horses will persevere longer than half-bred, and those got by bred horses out of three-part bred mares will sometimes equal the real racers. Although, amongst horses equally well bred, superior external conformation will generally prevail in the race, yet racing can in no sort be said absolutely to depend on good shape; it depends entirely on blood: for example, take the worst shaped true-bred horse you can find, and the best shaped common horse; let the latter have a fine coat, loose thrapple, high and declined shoulder, length, speed, in fine, all the admired points of the racer (and such common horses are occasionally to be found); let them run four miles, and the bred horse, although out-footed at first, shall always win the race. This principle is so universal, that perhaps it would be altogether impracticable to find a thorough-bred horse in England sufficiently bad, to be beat four miles by the speediest and best common bred hack. All bred horses cannot race, many of the highest blood having neither the gift of speed nor continuance; many are defective in the material points of conformation, as it happens in common horses."

The author cites some curious instances of speed. "The usual trial of speed in the English racing," says he, "is the distance of a single mile; of continuance, stoutness, or bottom, four miles. It has been asserted with confidence, but not proved, that Flying Childers ran a mile over Newmarket in the space of a minute; a velocity so immense, that it turns one's ideas to speed in the abstract, or ubiquity. It has, however, been really performed in a few seconds over a minute; an instance of which, within my present recollection, is that of Firetail and Pumpkin.

"The distance of four miles was ran by Childers, in 1721, carrying nine stone two pounds, in the space of six minutes forty-eight seconds. This wonderful animal leaped ten yards with his rider, upon level ground; and is supposed to have covered, at every stride, a space of twenty-five feet, which is more than forty-nine feet in a second. Bay Malton ran four miles over York, in 1763, in seven minutes forty-three seconds and a half. Eclipse ran the same distance over York, in eight minutes, with twelve stone."

Of those who have pretended, that they were

unable to discriminate between speed and stoutness in a race-horse, Mr. Lawrence satisfactorily enquires, "What is the cause or basis of that superior speed, endurance, and strength, which distinguish the southern horse? Doubtless a peculiar innate quality of body, which some attribute to the dry and elastic air of those countries where he is bred, but which appears to me not altogether satisfactory. The game, or wild animals of northern climes, possess the peculiar qualities of the race-horse, which they lose in a few generations, on being domesticated; their bones becoming soft and spongy, like those of tame animals in general. The race-horse is much stronger than the cart or common horse, weight for weight; his substance being of a more solid texture."

"The training of race-horses (continues he) is now a much more simple and rational process than in former days, and is indeed making a gradual approach to perfection. It was the fashion of old, to stuff horses, under preparation for the course, with many different kinds of baked bread, to load them with an immense burden of clothes, to force them to breathe a suffocating heat within doors, and greatly to overdo them with severe and long continued exercise. Breads have long since been banished the running stables, where the heaviest oats, and the hardest and sweetest hay, are found to answer completely every purpose of nutrition. Race-horses are no longer stifled with heat, like variolous patients under the ancient regimen. The usual length now of the exercise gallop, is from a mile to a mile and a quarter; of the sweat, from four to five miles."

The training of the race-horse must, of necessity, be most regular and efficacious, on account of the superior and sudden exertions required of him. Hence the custom of sweating, either once in ten days, weekly, or still oftener according to the animal's hardness of carcase and proneness to obesity. The method of sweating a race-horse, is to load him with a double or triple quantity of clothes, and to run him four or five miles upon the turf, keeping him in general to a long steady gallop, or his rate, but making occasional bursts of speed. After this operation, the horse is taken within doors, and gradually uncovered, whilst the sweat is scraped from all parts of his body with an edged wooden instrument; when, being rubbed perfectly dry, his accustomed clothing is replaced. Sweating is usually performed in the morning.

Mr. Lawrence next describes the familiar life of the race-horse. His winter, he says, is usually spent in the paddock and loose stable, enjoying himself at his ease, until the period of physic arrives, which must be so fixed, that there be at least an interval of two months between the last dose and the first race: this interval is of course spent in exercise. The author assumes here, with the majority of persons concerned in training, that no race-horse can perform, to the full extent of his natural powers, without having undergone a course of purgatives. The spring and summer are passed in exercise and racing, the horse perhaps travelling to a number of different courses in the country. A racer travels, perhaps, from twenty to twenty-four miles per day; and this, on the hard road, must of course abate his speed, whence arises the advantage of those which have been trained on the spot where they are intended to run. Mr. Lawrence says, he has also been assured by grooms, that a horse, in the midst of the racing season, when a sufficient interval can be spared, is frequently much benefited by a dose of physic. That the practice admits of extremes, the following judicious remarks very fully evince.

"The purging system of the running stables is still liable to solid objections. Grooms always fancy that the body of a horse abounds with noxious humours, which require specific purgation. In their ideas, racing and aloetic or mercurial physic are connected by an indissoluble chain; and these nostrums are supposed to operate by a peculiar innate virtue or charm. All this is of much the same weight with any other nonsense which prescription may have sanctioned. The exhibition of physic in this case bears no more relation to the expulsion of evil humours from the body of a horse, than to the extirpation of corns in his feet: the sole intent is the detrusion of accumulated alvine fæces, in better English, unloading the stuffed bowels, attenuating the blood, and refrigerating or cooling the general habit. Against the best aloes no general objection can possibly lie; it is a cathartic, equally mild, safe, and efficacious; but I know of no possible business a groom can have with mercurials, in the case of physicing merely for condition. In some instances, the neutral salts might be substituted even for aloes, with great advantage; I mean with washy, hot, and irritable horses, which soon part with their flesh. If a person accustomed to the stable forms would not be satisfied that his horse could race, having been purged with Glauber's salts only; let him make the essay with one which he does not intend should run to win.

"It appears to me, that race-horses are invariably over-purged, either by an excess in the number or strength of the doses, or by the use of Barbadoes aloes, or mercury. Such a cause can never fail of the effect of detracting from a horse's speed, and of debilitating him, however it may possibly elongate his stride. The cords and pullies of the machine are deprived of too much of their spring, in which consists both the edge of speed and the grasp of continuance. The exercise also is, I am convinced, even yet too severe and indiscriminate, and our horses are often brought to the post in a condition much below their work. The external signs of this error are, want of cheerfulness, delicate feeding, refusal of water, or greediness of it, loose testicles, and backwardness in recovery of flesh after training. Many a colt, I believe, is tried and rejected, at the same time, seven or ten pounds the worse over the course, for his exercise and physic."

Mr. Lawrence acknowledges the truth of the common observation, "that a horse cannot run fat;" but insists, at the same time, that a very erroneous use is generally made of the maxim. The material question, he says, is, what is the proportion of physic and exercise calculated for such horses? a question which must be left to the discretion of men of sense and experience. If a horse, after three doses of physic, regular gallops, and a week's sweating, still carry a shew of superfluous substance, Mr. Lawrence would even start him under this disadvantage, rather than attempt to break down the texture of the animal with mercurial purges, or work him off his legs and speed, with extra sweats and violent galloping. "How often," says he, "have I

heard of horses, which were before ready to devour the manger, sweated out of their appetite, and then, if time could possibly be allowed, to mend the matter, purged with strong mercurial physic. The universal panacea of purgation is resorted to on all occasions."—"The error is still more gross, to over-train horses of naturally weak stamina and irritable habits; such should always have a due portion of fleshy substance left to support the tremulous and flagging fibres. I suspect the usual routine of exercise is always too severe for these, but from its being general and common to them all, its ill effects are less apparent. There are horses which become bone lean in two or three weeks exercise; I would ask, why continue to sweat such, since they appear to have no fatty substance left to sweat away? Washy horses particularly, I believe, get rid of their internal fat first, and, for the sake of their wind, would it not be better to sweat or rather give them a four-miles moderate gallop, in only their ordinary clothes, without any additional weight? which last, to the amount generally laid on, must debilitate in a very considerable degree. I have seen some of your hot fly-away racers so excessively influenced by nervous affection, that their lives seemed to be one continued state of anxiety and inquietude. These are always found awake to dreadful expectation: the groom touching their body-girth, sets their hearts palpitating; the act of taking down the saddle operates as a cathartic to the imagination, which, from sympathy, is instantaneously followed by visible effects; they well know the sweating day, and the sight of the sweating clothes gives them a fit of the horrors. The secret of training these horses is, I should think, to give them as little work as possible, and that by themselves; to endeavour to render their exercise rather a pleasure than a fatigue and a terror to them; and not to be alarmed at the little extra flesh they may bear, which will surely rather help to carry them through, than retard their course."

The same well-informed writer offers some remarks upon an established doctrine of the stables, that half-bred horses will not stand training: "There is no doubt," he says, "that full-bred cattle are naturally best adapted to such a purpose; but the inability of the half-bred to endure this discipline arises chiefly from its severity, and the want of its proper adaptation to their natural powers. There is comparative speed and stoutness in every variety of the horse; and Bracken has said, that, by proper training, he could enable even a cart-horse to run up to his foot. A remarkable quality in the race-horse is that which is styled, in the language of the turf, running to the whip; it means answering every stroke of the whip with an additional exertion, as long as nature lasts. Horses of this generous kind are termed 'honest,' and 'stout:' but the terms are usually confounded; for many a horse is honest, without being endowed with those constitutional powers necessary to produce stoutness or continuance; and many which possess those in the amplest measure, which they occasionally evince, are yet never to be depended upon. It is dangerous to offend these last with the immoderate use of the whip or spur, and I have known a winning horse stopped instantly by a foul cut under his flanks: I have also known, and indeed ridden horses, honest and stout as the course was long, yet with such indignant stomachs, and such critical skill in their own powers, that being convinced in a race of the impossibility of success, if abused with the whip, they would instantly shorten their stroke; but if nursed, and encouraged with a pull, the use of which every jockey knows, would, although beaten, strain every nerve to the last extremity. It is a strange quality in the true whipped horse, that he seems really to have a penchant for the whip and spur, since he absolutely will not keep to his stroke without the one or other of them, and never takes offence at either."

The earliest instances of horse-racing upon record are the reign of king Charles II. who sent abroad his master of the horse to procure a selection of foreign horses and mares for the establishment of a breeding stud; the mares then brought over were denominated, as many of their produce have been since, royal mares. The principal Arabians, Barbs, and Turks, by which the original breed of Britain is supposed in some respects to have been improved, are as follows. 1. The White Turk, the property of Mr. Place, stud-master to Oliver Cromwell when protector; he was the sire of Wormwood and Commoner. 2. Dodsworth, though foaled in England, a natural Barb, his dam having been imported when in foal during the reign of Charles II. and called a royal mare. 3. The Lister Turk, brought into England by the duke of Berwick from the siege of Buda, in the reign of James II. the sire of Snake, Brisk, Coneyskins, and Piping Peg. 4. Byerly Turk, Captain Byerly's charger in Ireland in king William's wars; he was sire of Sprite, Black-Hearty, Archer, Basto, Grasshopper, the Byerly gelding, and Jigg. 5. Greyhound, got in Barbary, after which both sire and dam were purchased, and brought to England, by Mr. Marshall. He was the sire of Old Othello, Whitefoot, Osmyn, Rake, Sampson, Goliah, Favourite, and Desdemona. 6. D'Arcy White Turk, the sire of Old Hautboy, Grey Royal, and Cannon. 7. D'Arcy Yellow Turk, the sire of Spanker, Brimmer, and the great great grand-dam of Cartouch. 8. The Marshall, or Sellaby Turk, the property of Mr. Marshall's brother, stud-master to king William, queen Anne, and king George I.; he was the sire of some famous runners, but most of them were mares. 9, 10, 11, 12, 13. Curwen's Bay Barb, the Thoulouse Barb, Darley's Arabian, the Belgrade Turk, and the Godolphin Arabian.

Races were formerly decided in much shorter distances than at present, and few colts or fillies were then ever brought to the post till four years old. Plates for three years old are now common at all places of sport from one extremity of the kingdom to the other; and matches with two years old colts and fillies, and even with yearlings, are seen constantly run at Newmarket; and are the very reason why so many of the most valuable are completely ruined, and all their faculties of superior speed destroyed, by the very time they attain the age at which their predecessors first started. Few matches, sweepstakes, or plates, are now decided in a less distance than four miles, where the horses are five and six years old, as this is considered an unerring criterion of distinguishing between, or annexing bottom to speed: many tolerable horses have taken the lead, and kept it for a mile, or even two, that have been nearly distanced in running the four; and to observations of this kind it is

owing that the propagation of Arabian blood in this country has fallen into disrepute. Whether such change may not also have been occasioned by national prejudice in conjunction with public report, may admit of a doubt; since it is universally known, that very many, of the fleetest horses this country ever produced, have been the immediate descendants from an Arabian breed.

The pedigrees of all thorough-bred horses have been so long studied and recorded, by amateurs, that Mr. Weatherby has given in his stud-book the genealogy of above four thousand horses, mares, colts, and fillies, the produce of the last sixty years only (exclusive of numbers of an earlier date), and in which may be traced the precise pedigree of every particular horse, up to the origin of any race or blood upon record.

RACEMA'TION. *s.* (*racemus*, Lat.) Cluster, like that of grapes (*Brown*).

RACEMI'FEROUS. *a.* (*racemus* and *fero*, Lat.) Bearing clusters.

RA'CER. *s.* (from *race.*) Runner; one that contends in speed (*Dorset*).

RACER, in gardening, a name applied to a peculiar sward-cutter; an instrument employed for the purpose of racing out, or cutting through the surface of grass sward and dividing it into proper widths, lengths, and thickness, as turf for lining pleasure-grounds. It is also employed in cutting and straightening the edges of grass verges in the same grounds.

RACHIALGIA. (from ῥαχις, the spine, and αλφυ, pain.) A pain in the spine. It was formerly applied to several species of cholic which induced pain in the back.

RACHIS. (ῥαχις, the back bone.) In botany, the spine. Receptaculum filiforme, flosculos longitudinaliter annectens in spicam. Delin. Pl.—Receptaculum spicæ graminis cui flores insculpti. Regn. Veg.—A filiform receptacle connecting florets longitudinally into a spike: as in panicum crus-corvi and crus galli, lolium, and many other grasses.—It has the name from some resemblance which it bears to the spine, when it is naked or deprived of the florets. Dr. Withering calls it the spike-stalk.

This term is also sometimes used for the principal rib of a leaf.

RACHITIS. (ῥαχιτις; from ῥαχις, the spine of the back; so called because it was supposed to originate in a fault of the spinal marrow.) The rickets. A species of diseases in the class cachexiæ, and order intumescentiæ of Cullen; known by a large head, prominent forehead, protruded sternum, flattened ribs, big belly, and emaciated limbs, with great debility. It is usually confined in its attack between the two periods of nine months and two years of age, seldom appearing sooner than the former, or showing itself for the first time after the latter age. The muscles become flaccid, the head augments, the carotids are distended, the limbs waste away, and their epiphyses increase in bulk. The bones and spine of the back are variously distorted; disinclination to muscular exertion follows: the abdomen swells and grows hard; the stools are frequent and loose; a slow fever succeeds, with cough and difficulty of respiration: atrophy is confirmed, and death ensues. It frequently happens that nature restores the general health, and leaves the limbs distorted.

After death, the liver and spleen have been found enlarged and scirrhous; the mesenteric glands indurated, and the lungs either charged with vomicæ, or adhering to the pleura; the bones soft, the brain flaccid or oppressed with lymph, and the distended bowels loaded most frequently with slime, sometimes with worms.

It is remarkable, that in the kindred disease, which Hoffmann and Sauvage call the atrophy of infants, we have many of the same symptoms and the same appearances nearly after death. "They who perish by this disease," says Hoffmann, "have the mesenteric glands enlarged and scirrhous; the liver and spleen obstructed and increased in size; the intestines are much inflated, and are loaded with black and fœtid matters, and the muscles, more especially of the abdomen, waste away."

RACHORE, or ADONI-RACHORE, a city of the peninsula of Hindustan, capital of a district of the same name, subject to the nizam of the Deccan. It is seated on the south bank of the Kistna, near its confluence with the Tungebadra, 315 miles N. by E. of Seringapatam. Lon. 78. 15 E. Lat. 16. 30 N.

RACINE (John), a French poet born at Ferté-Milon, 1639. He was educated at Port Royal, where he made a rapid progress in Greek and Latin, and showed great fondness for the sublime compositions of Euripides and Sophocles. He afterwards went to Paris, where he celebrated the king's marriage; and so popular was his nymphe de la Seine, on this occasion, that the courtiers were full of his praises, and the monarch settled on him a pension. He, in 1666, produced his Alexandria, and about this time was engaged in a controversy with Nicole, of the Port Royal. In 1668 he produced his Plaideurs, a comedy, and Andromache, a tragedy; and in 1670 appeared Britannicus, Berenice in 1671, Bajazet in 1672, Mithridates in 1673, Iphigenia in 1675, and Phædra in 1677. These were represented with increased applause; but a cabal was raised against the poet, and Pradon, a writer of little capacity, was prevailed upon to produce a Phædra to oppose the noble composition of Racine. This hurt the feelings of the poet, and strongly alive to the violence of persecution, he formed a design of becoming a Carthusian friar. He had formerly worn the ecclesiastical habit at the Port Royal, but his confessor expostulated with him, and prevailed upon him to marry, and thus instead of bidding adieu to the world, to become one of its most useful members. He thus became father of seven children; but soon after determined never to write for the theatre, and he was reconciled to the Port Royal, and all those whom satire or jocularity had made his enemies. In spite, however, of his resolutions,

he was prevailed upon by madame Maintenon to write a sacred tragedy for her young ladies at St. Cyr, and this produced Esther, and afterwards Athalie. He was, in 1673, admitted member of the French academy, and in 1677 he was employed with Boileau to write the history of Lewis XIV.; but the work was never completed. Racine afterwards drew up the history of the Port Royal, 2 vols. 12mo. His excessive sensibility at last proved the cause of his death. He wrote a memorial on the miseries of the poor, which he lent to madame Maintenon, but it fell accidentally into the hands of the king, who expressed his dissatisfaction. Racine heard of the royal displeasure, and was so terrified that he fell into a fever, and the disorder at last proved fatal. He died 1699. A pension was honourably settled by the king on his family. He wrote besides, canticles or hymns, for the use of St. Cyr—letters and epigrams, &c. He has often been compared to Corneille, and Perrault observes, that if Corneille surpassed Racine in heroic sentiments and the grand character of his personages, he was inferior to him in moving the passions, and in purity of language.

Racine (Lewis), son of the poet, received a civil appointment, by Fleury. He died 1763, aged 71. He was himself a poet of considerable merit, and besides poems, wrote reflections on poetry—the life of his father, 2 vols.—a prose translation of Milton's paradise lost, and other works.

RA'CINESS. *s.* (from *racy.*) The quality of being racy.

RACK. *s.* (*racke*, Dutch; from *racken*, to stretch.) 1. An engine to torture (*Taylor*). 2. Torture; extreme pain (*Temple*). 3. Any instrument by which extension is performed (*Wilkins*). 4. A distaff: commonly spoken and written *rock* (*Dryden*). 5. The clouds as they are driven by the wind (*Shakspeare*). 6. (*racca*, Islandic, hinges or joints.) A neck of mutton cut for the table. 7. A grate; the grate on which bacon is laid. 8. A wooden grate in which hay is placed for cattle (*Mort.*). 9. Arrack; a spirituous liquor.

Rack, in a stable, the railed convenience constructed above the manger, for the reception of the hay. It should be so formed, as to have openings at the bottom, for the dust and seeds to pass through: and although it has become of late a practice exceedingly prevalent, to have the rack on one side, instead of in the center of the stall, no good or rational plea can be advanced in justification of such novelty: on the contrary, it compulsively accustoms the horse to stand with his hind-quarters mostly on one side of the stall, by which his bedding is constantly and inevitably deranged almost as soon as it is set fair.

Rack (Edmund), of Ellingham, Norfolk, from a spinning boy, became the menial servant, and afterwards the apprentice of a woollen draper. In 1758, he settled at Bradford, Essex, in business for himself, and afterwards retired to Bath, master of an honourable competency. He here established the agricultural society, to which he became secretary. Though a quaker, he wrote the ruins of an ancient cathedral, a poem—a volume of poems—Mentor's letters—poems and essays, 1781, &c. and died 1787, aged 52.

To Rack. *v. n.* (from the noun.) To stream as clouds before the wind (*Shakspeare*).

To Rack. *v. a.* (from the noun.) 1. To torment by the rack (*Dryden*). 2. To torment; to harass (*Milton*). 3. To harass by exaction (*Spenser*). 4. To screw; to force to performance (*Tillotson*). 5. To stretch; to extend (*Shakspeare*). 6. To defecate; to draw off from the lees (*Bacon*).

Rack-rent. *s.* (*rack* and *rent.*) Rent raised to the uttermost (*Swift*).

Rack-renter. *s.* (*rack* and *renter.*) One who pays the uttermost rent (*Locke*).

RACKERSBURG, a strong town of Austria, in Stiria, with a castle on a mountain. It is seated on an island, formed by the Muehr, 22 miles S.E. of Gratz, and 100 S. of Vienna. Lon. 15. 58 E. Lat. 46. 54 N.

RA'CKET. *s.* 1. An irregular clattering noise (*Shakspeare*). 2. A confused talk, in burlesque language (*Swift*). 3. The instrument with which players strike the ball (*Digby*).

RA'CKING. *s. Racking* pace of a horse is the same as an amble, only that it is a swifter time and a shorter tread (*Farrier's Dict.*).

RACLE (Leonard), an architect, born at Dijon. He joined the Reyssouze to the Saone, built the harbour of Versoix, and in 1786 obtained the prize of the Toulouse academy, by his memoir on the erection of an iron bridge of a single arch of 400 feet span. He was the friend of Voltaire, and built his house at Ferney. He declined the liberal offers of Catharine of Russia, and died at Pont-de-Vaux, 1792. He wrote besides, memoirs on the property of the cycloid—on regulating the course of the Rhone and the Ain, &c.

RACONI, a populous town of Piedmont, which belongs to the prince of Carignano, who has a castle here. It is seated in a plain, on the rivers Grana and Macra, six miles S. of Carignano. Lon. 7. 46 E. Lat. 44. 39 N.

RACOSIS. (ῥακωσις; from ῥακος, a rag.) A ragged excoriation of the relaxed scrotum.

RA'CY. *a.* Strong; flavourous; tasting of the soil (*Cowley*).

RAD. The old pret. of *read* (*Spenser*).

Rad, *red*, and *rod*, differing only in dialect, signify counsel; as Conrad, powerful or skilful in counsel; Ethelred, a noble counsellor (*Gibson*).

RADCLIFFE (Dr. John), an English physician of great eminence in his time, born at Wakefield in Yorkshire in 1650. He was educated at Oxford, and enrolled himself upon the physical line; but it was remarkable that he recommended himself more by his ready wit and vivacity, than by any extraordinary acquisitions in learning. He began to practise at Oxford in 1675; but never paid any regard to established rules, which he censured whenever he thought fit, with great freedom

and acrimony; and as this drew all the old practitioners upon him, he lived in a continual state of hostility with them. Nevertheless, his reputation increased with his experience; so that, before he had been two years in business, his practice was very extensive among persons of high rank. In 1684, he removed to London, and settled in Bow-street, Covent Garden, where in less than a year he got into excellent business.—In 1687 the princess Anne of Denmark made him her physician: yet when her husband and she joined the prince of Orange, Radcliffe, either not choosing to declare himself, or unwilling to favour the measures then in agitation, excused himself from attending them, on the plea of the multitude of his patients. Nevertheless, he was often sent for to king William and other great personages, though he did not incline to be a courtier. He incurred some censure for his treatment of queen Mary, who died of the small-pox; and soon after lost his place about the princess Anne, by his attachment to his bottle. He also totally lost the favour of king William by his uncourtly freedom; for, in 1699, when the king showed him his swollen ancles, while the rest of his body was emaciated, and asked him what he thought of them? "Why truly I would not have your majesty's two legs for your three kingdoms," replied Radcliffe. He continued increasing in business and insolence as long as he lived, continually at war with his brethren the physicians; who considered him in no other light than that of an active ingenious empiric, whom constant practice had at length brought to some degree of skill in his profession. He died in 1714; and, if he never attempted to write any thing himself, has perpetuated his memory by founding a fine library at Oxford, to preserve the writings of other men.

RADDOCK, or REDBREAST. See MOTACILLA.

RADIAL ARTERY. Arteria radialis. A branch of the humeral artery, that runs down the side of the radius.

RADIALIS EXTERNUS BREVIOR. In anatomy. See EXTENSOR CARPI RADIALIS BREVIOR.

R. EXTERNUS LONGIOR. See EXTENSOR CARPI RADIALIS LONGIOR.

R. EXTERNUS PRIMUS. See EXTENSOR CARPI RADIALIS LONGIOR.

R. INTERNUS. See FLEXOR CARPI RADIALIS.

R. SECUNDUS. See EXTENSOR CARPI RADIALIS BREVIOR.

RA'DIANCE. RA'DIANCY. *s.* (*radiare*, Lat.) Sparkling lustre; glitter (*Brown*).

RA'DIANT. *a.* (*radians*, Latin.) Shining; brightly sparkling; emitting rays (*Milton*).

To RA'DIATE. *v. n.* (*radio*, Latin.) To emit rays; to shine; to sparkle (*Boyle*).

RADIATE COROL, or FLOWER. (*radius*, a ray.) Corol radiatus flos. A rayed corolla or flower.—A kind of compound flower, (in the class syngenesia) consisting of a disk, in which the corollets or florets are tubular and regular; and of a ray, in which the florets are irregular. These are most commonly ligulate: as in sunflower, daisy, &c.—Sometimes, however, they also are tubular, but irregular; as in centaurea. And sometimes they are naked, or nearly so: as in artemisia, gnaphalium.

RA'DIATED. *a.* (*radiatus*, Lat.) Adorned with rays (*Addison*).

RADIATO-PATENT, in botany. Radiate-expanding: or, spreading out like rays. Applied to the stigma.

RADIA'TION. *s.* (*radiatio*, Latin.) 1. Beamy lustre; emission of rays (*Bacon*). 2. Emission from a centre every way (*Bacon*).

RA'DICAL. *a.* (*radical*, French.) 1. Primitive; original (*Bentley*). 2. Implanted by nature (*Wilkins*). 3. Serving to origination.

RADICAL VINEGAR, in chemistry. When acetate of copper, reduced to powder, is put into a retort and distilled, there comes over a liquid at first nearly colourless and almost insipid, and afterwards a highly concentrated acid. The distillation is to be continued till the bottom of the retort is red hot. What remains in it then is only a powder of the colour of copper. The acid product, which should be received in a vessel by itself, is tinged green by a little copper which passes along with it; but when distilled over again in a gentle heat, it is obtained perfectly colourless and transparent. The acid thus obtained is exceeding pungent and concentrated. It was formerly distinguished by the names of radical vinegar, and vinegar of Venus; it has since been found to be acetous acid combined with a new dose of oxygen, and is called acetic acid.

RADICA'LITY. *s.* (from *radical.*) Origination (*Brown*).

RA'DICALLY. *ad.* (from *radical.*) Originally; primitively (*Prior*).

RA'DICALNESS. *s.* (from *radical.*) The state of being radical.

RADICANT STEM, in botany. A rooting stem. Altis se affigens radiculis lateralibus.—Radicant leaf. Si folium radices agat. See ROOTING.

RADICATE LEAF, in botany. A rooted leaf. Radiculas demittens e substantia ipsius folii.—Radicate scape, a rooted scape, as in drosera.

To RA'DICATE. *v. a.* (*radicatus*, Latin.) To root; to plant deeply and firmly (*Hammond*).

RADICA'TION. *s.* (from *radicate.*) The act of taking root and fixing deep (*Hammond*).

RA'DICLE. *s.* (*radicule*, Fr.) That part in a seed which forms the root (*Quincy*).

RADICULA. A small root or radicle. A term sometimes applied by anatomists to express the smaller origin of some nerves. The common horse-radish is sometimes thus denominated.

RADIMPOUR, or RADUNPOUR, a town of Hindustan, in the province of Agimere, situate on the Puddar, 175 miles N. of Surat, and 250 S.W. of Agimere. Lon. 71. 48 E. Lat. 23. 58 N.

RADIOLA, in botany, a genus of the class tetrandria, order tretragynia. Calyx many-cleft; petals four; capsule superior, eight-valved, eight-celled; seeds solitary. One species; indigenous to the wet sandy wastes of our own country. It is the linum radiola of Linnæus; but properly separated, and formed into a distinct genus by Dr. E. Smith.

RADISH, in botany. See RAPHANUS.

RADISH (Black Spanish). See RAPHANUS.

RADISH (Horse). See COCHLEARIA.

RADISH (Turnip). See RAPHANUS.

RADIUS, in geometry, the semidiameter of a circle; or a right line drawn from the centre to the circumference.—It is implied in the definition of a circle, and it is apparent from its construction, that all the radii of the same circle are equal.—The radius is sometimes called, in trigonometry, the sinus totus, or whole sine. The length of the radius of any circle, is equal to that of an arc of 57·2957795 degrees of the same circle.

RADIUS, in the higher geometry. *Radius of the evoluta, radius osculi,* called also the *radius of concavity,* and the *radius of curvature,* is the radius of a circle having the same curvature, in a given point of the curve, with that of the curve in that point. See CURVATURE, CURVE, and EVOLUTE.

RADIUS, in optics. See RAY.

RADIUS VECTOR, is used for a right line drawn from the centre of force in any curve in which a body is supposed to move by a centripetal force, to that point of the curve where the body is supposed to be. In the elliptical orbit of a planet, let $a =$ semiaxis major, $ae =$ distance from the centre to the focus, or $e =$ eccentricity to semiaxis major $= 1$, $v =$ true anomaly, and $u =$ eccentric anomaly, then the radius vector r is expressed by either of the following formulæ $r = a\ (1 + e \cos. u)$, or $r = \frac{a\ (1 - e^2)}{1 - e \cos. v}$.

RADIUS. (*radius,* a staff or beam; so called from its resemblance.) This bone has gotten its name from its supposed resemblance to the spoke of a wheel, or to a weaver's beam; and sometimes, from its supporting the hand, it has been called manubrium manus. Like the ulna, it is of a triangular figure, but it differs from that bone, in growing larger as it descends, so that its smaller part answers to the larger part of the ulna, and vice versa. Of its two extremities, the uppermost and smallest is formed into a small rounded head, furnished with cartilage, and hollowed at its summit, for an articulation with the little head at the side of the pulley of the os humeri. The round border of this head, next the ulna, is formed for an articulation with the lesser sygmoid cavity of that bone. This little head of the radius is supported by a neck, at the bottom of which, laterally, is a considerable tuberosity, into the posterior half of which is inserted the posterior tendon of the biceps, while the anterior half is covered with cartilage, and surrounded with a capsular ligament, so as to allow this tendon to slide upon it as upon a pulley. Immediately below this tuberosity, the body of the bone may be said to begin. We find it slightly curved throughout its whole length, by which means a greater space is formed for the lodgment of muscles, and it is enabled to cross the ulna without compressing them. Of the three surfaces, to be distinguished on the body of the bone, the external and internal ones are the broadest and flattest. The anterior surface is narrower and more convex. Of its angles, the external and internal ones are rounded; but the posterior angle, which is turned towards the ulna, is formed into a sharp spine, which serves for the attachment of the interosseous ligament, of which mention is made in the description of the ulna. This strong ligament, which is a little interrupted above and below, serves not only to connect the bones of the fore-arm to each other, but likewise to afford a greater surface for the lodgment of muscles. On the fore part of the bone, and at about one third of its length, from its upper end, we observe a channel for vessels, slanting obliquely upwards. Towards its lower extremity, the radius becomes broader, of an irregular shape, and somewhat flattened, affording three surfaces, of which the posterior one is the smallest; the second, which is a continuation of the internal surface of the body of the bone, is broader and flatter than the first; and the third, which is the broadest of the three, answers to the anterior and external surface of the body of the bone. On this last we observe several sinuosities, covered with a thin layer of cartilage, upon which slide the tendons of several muscles of the wrist and fingers. The lowest part of the bone is formed into an oblong articulating cavity, divided into two by a slight transverse rising. This cavity is formed for an articulation with the bones of the wrist. Towards the anterior and convex surface of the bone, this cavity is defended by a remarkable eminence, called the styloid process of the radius, which is covered with a cartilage that is extended to the lower extremity of the ulna; a ligament is likewise stretched from it to the wrist. Besides this large cavity, the radius has another much smaller one, opposite its styloid process, which is lined with cartilage, and receives the rounded surface of the ulna. The articulation of the radius with the lesser sygmoid cavity of the ulna is strengthened by a circular ligament, which is attached to the two extremities of that cavity, and from thence surrounds the head of the radius. This ligament is narrowest, but thickest at its middle part. But, besides this ligament, which connects the two bones of the fore arm with each other, the ligaments which secure the articulation of the radius with the os humeri are common both to it and to the ulna, and therefore cannot well be understood till both these bones are described. These ligaments are a capsular and two lateral ligaments. The capsular ligament is attached to the anterior and posterior surfaces of the lower extremity of the os humeri, to the upper edges and sides of the cavi-

ties we remarked at the bottom of the pulley and little head, and likewise to some part of the condyles: from thence it is spread over the ulna, to the edges of the greater sygmoid cavity, so as to include in it the end of olecranon and of the coronoid process; and is likewise fixed round the neck of the radius, so as to include the head of that bone within it. The lateral ligaments may be distinguished into external and internal, or according to Winslow, into brachio radialis, and brachio cubitalis. They both descend laterally from the lowest part of each condyle of the os humeri, and, from their fibres spreading wide as they descend, have been compared to a goose's foot. The internal ligament, or brachio cubitalis, which is the longest and thickest of the two, is attached to the coronoid process of the ulna. The external ligament, or brachio radialis, terminates in the circular ligament of the radius. Both these ligaments adhere firmly to the capsular ligament, and to the tendons of some of the adjacent muscles. In considering the articulation of the fore-arm with the os humeri, we find that when both the bones are moved together upon the os humeri, the motion of the ulna upon the pulley allows only of flexion and extension; whereas, when the palm of the hand is turned downwards or upwards, or in other words, in pronation and supination, we see the radius moving upon its axis, and in these motions its head turns upon the little head of the os humeri at the side of the pulley, while its circular edge rolls in the lesser sygmoid cavity of the ulna. At the lower end of the fore-arm the edge of the ulna is received into a superficial cavity at the side of the radius. This articulation, which is surrounded by a loose capsular ligament, concurs with the articulation above, in enabling the radius to turn with great facility upon its axis; and it is chiefly with the assistance of this bone that we are enabled to turn the palm of the hand upwards or downwards, the ulna having but a very inconsiderable share in these motions.

RADIX, or ROOT, is a certain finite expression or function, which, being evolved or expanded according to the rules proper to its form, shall produce a series. That finite expression, or radix, is also the value of the infinite series. So $\frac{1}{3}$ is the radix of ·3333 &c. because $\frac{1}{3}$ being evolved or expanded, by dividing 1 by 3, gives the infinite series ·3333 &c. In like manner, the radix

of $1 - r + r^2 - r^3 + r^4$ &c. is $\frac{1}{1+r}$,

of $1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \frac{1}{16}$ &c is $\frac{1}{1+\frac{1}{2}}$,

of $1 - 1 + 1 - 1 + 1$ &c is $\frac{1}{1+1}$,

of $1 - 2 + 4 - 8 + 16$ &c is $\frac{1}{1+2}$,

of $\frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} + \frac{1}{32}$ &c is $\frac{1}{2+1}$,

of $1 + x + x^2 + x^3 + x^4$ &c is $\frac{1}{1+x}$,

of $1 + 2x + 3x^2 + 4x^3$ &c is $\frac{1}{(1-x)^2}$,

of $1 + \frac{x^2}{2} + \frac{3x^4}{8} + \frac{5x^6}{16}$ &c is $\sqrt{\frac{1}{1-x^2}}$.

See Dr. Hutton's 4to Tracts, vol. i. pa. 9, 31.

RADIX, in botany. (from *radius*, according to some; from *rado*, as others will have it; but more probably from the Greek ῥαδιξ, which however signifies a branch.) Alimentum hauriens, herbamque cum fructificatione producens. Philos. Bot.—Organon nutriens plantam. Delin. Pl.—Descendens, aquosa sorbens, nutriens. Regn. Veg. See ROOT.

RADNOR (New), a borough of Wales, in Radnorshire, with a market on Thursday. It is nominally the county-town, though a small place, and the assizes are held at Presteign. Three miles E. of it is Old Radnor, said to have been the Magoth of Antoninus, but now an insignificant village. New Radnor is seated near the source of the Somergil, at the foot of a hill, on which a castle formerly stood, 24 miles N.W. of Hereford, and 159 W.N.W. of London. Lon. 2. 45 W. Lat. 52. 10 N.

RADNORSHIRE, a county of Wales, 30 miles long and 25 broad; bounded on the E. by Shropshire and Herefordshire, N. by Montgomeryshire, N.W. by Cardiganshire, and S.W. and S. by Brecknockshire. It contains 326,400 acres, is divided into six hundreds, and 52 parishes; has four market-towns; and sends two members to parliament. The number of inhabitants in 1801 was 19,050. Its principal rivers are the Wye and Tend, the former dividing it from Brecknockshire, and the latter from Shropshire. The E. and S. parts are tolerably level and productive of corn. The other parts are rude and mountainous; devoted chiefly to the rearing of cattle and sheep.

RADSTADT, a town of Bavaria, in the duchy of Salzburg, near the source of the Ens, 35 miles E.S.E. of Salzburg. Lon. 13. 26 E. Lat. 47. 18 N.

To RAFF. *v. a.* To sweep; to huddle; to take hastily without distinction (*Carew*).

To RA'FFLE. *v. n.* (*raffler*, to snatch, Fr.) To cast dice for a prize (*Tatler*).

RA'FFLE. *s.* (*raffle*, Fr.) A species of game or lottery, in which many stake a small part of the value of some single thing, in consideration of a chance to gain it (*Arbuthnot*).

RAFNIA, in botany, a genus of the class diadelphia, order decandria. Calyx ringent; the upper lip bifid; lower lip divaricately trifid, with the middle tooth narrower; legume lanceolate, compressed. Fourteen species; all Cape plants except rafnia perfoliata, which is a native of Carolina.

RAFT, a sort of float, formed by an assemblage of various planks or pieces of timbe, fastened together side by side, so as to be cor-

veyed more commodiously to any short distance in a harbour or road than if they were separate. The timber and plank, with which merchant ships are laden, in the different parts of the Baltic, are attached together in this manner, in order to float them off to the shipping.

RAFT. part. pass. of *raff*. Torn; rent (*Spenser*).

RAFTERS, in architecture, are pieces of timber which stand by pairs on the raising-piece, or wall plate, and meet in an angle at the top, forming the roof of a building.

RA'FTERED. *a.* (from *rafter*.) Built with rafters (*Pope*).

RAG. *s.* (hnaccoꝺ, torn, Saxon.) 1. A piece of cloth torn from the rest; a tatter (*Milton*). 2. Any thing rent and tattered; worn out clothes (*Sandys*). 3. A fragment of dress (*Hudibras*).

RAGAMU'FFIN. *s.* A paltry mean fellow.

RAGE. *s.* (*rage*, French.) 1. Violent anger; vehement fury (*Shakspeare*). 2. Vehemence or exacerbation of any thing painful (*Bacon*). 3. Enthusiasm; rapture (*Cowley*). 4. Eagerness; vehemence of mind (*Pope*).

To RAGE. *v n.* (from the noun.) 1. To be in fury; to be heated with excessive anger (*Milton*). 2. To ravage; to exercise fury (*Wal.*). 3. To act with mischievous impetuosity (*Milton*).

RA'GEFUL. *a.* (*rage* and *full*.) Furious; violent (*Hammond*).

RAGG (Rowley). See RAGGSTONE.

RA'GGED. *a.* (from *rag*.) 1. Rent into tatters (*Arbuthnot*). 2. Uneven; consisting of parts almost disunited (*Shakspeare*). 3. Dressed in tatters (*Dryden*). 4. Rugged; not smooth (*L'Estrange*).

RAGGED ROBIN, in botany. See LYCHNIS.

RA'GGEDNESS. *s.* (from *ragged*.) State of being dressed in tatters (*Shakspeare*).

RA'GINGLY. *ad.* (from *raging*.) With vehement fury.

RAGLAND, a village in Monmouthshire, five miles N.E. of Usk. It is famous for its castle, where Charles I. passed much of his time, and lived in a magnificent style. This castle was the last in Cromwell's time, which surrendered to general Fairfax.

RAGMAN, one who deals in rags.

RAGOT, a name given in the old manage, to a horse that has short legs, a broad croup, and a strong thick body. It differs from a goussaut in this, that the latter has more shoulders, and a thicker neck.

RA'GOUT. *s.* (French.) Meat stewed and highly seasoned (*Addison*).

RAGG-STONE, ROWLEY-RAGG, in mineralogy, a variety of trap, or basalt, by Kirwan denominated turilite; of a black colour with numerous white dots and black lamellæ of basaltine, which give it a dark brownish-grey appearance. It is found in large masses, affecting a rhomboidal form, inclosing rounded pebbles of the same substance: it acquires an ochry crust by exposure to the air, and shines internally from a number of minute particles. Heated in the open air it becomes magnetic, and loses about 3 per cent of its weight. It does not redden in the fire, but at 98° melts into a porous black mass, partly porcelane, partly enamel; its fracture is nearly even, and fine-splintery, often inclining to a conchoidal line. It contains

Silica - - - -	475
Alumina - - -	325
Oxyd of iron - - -	200
	1,000.

It is sometimes found composed of trap and crystals of quartz in various parts of England, and has some resemblance to porphyry. This is particularly the case about Newcastle, where the hills contain large beds of it.

RAGULED, in heraldry, differs from *indented*, in that the latter is regular, the former not.

RAGUSA, a town of Sicily, in Val di Noto, near the river Maulo, 18 miles W.N.W. of Noto.

RAGUSA, a city and seaport of Dalmatia, capital of Ragusen, and an archbishop's see. It is two miles in circumference, and strong by situation, having an inaccessible mountain on the land side, and a strong fort on the gulf of Venice. It has a considerable trade with the Turks, and is 66 miles W. of Scutari. Lon. 17. 55 E. Lat. 42. 32 N.

RAGUSEN, a territory of Dalmatia, lying along the coast of the gulf of Venice, about 55 miles long and 20 broad. It was a republic, under the protection of the Turks and Venetians; but now is annexed to Italy. The soil is so barren, that the inhabitants receive the greatest part of their necessaries from the neighbouring islands and Turkish provinces. The Ragusians profess the Roman catholic religion, but the Greek, Armenian, and Turkish persuasions are tolerated for conveniency. Ragusa is the capital.

RAGWORT, in botany. See SENECIO.

RAGWORT (Sea), in botany. See CINERARIA.

RAGWORT (African), in botany. See OTHONNA.

RAIA. Ray. In zoology, a genus of the class pisces, order chondropterigia. Spiracles five on each side, oblique, placed beneath near the neck; head small, pointed, not distinct from the body; mouth beneath, transverse, toothed; body broad, thin, flat. Nineteen species, thus divided into sections.

A. Teeth sharp, comprising the skates and electric ray, or torpedo.

B. Teeth obtuse, comprising the sting-ray and thornbacks.

C. Uncertain, comprising five species, that inhabit the Red Sea, or around the Cape of Good Hope, and which have not yet been sufficiently examined.

All these are inhabitants of the sea only: they keep at the bottom, and in winter cover themselves with mud or sand; they feed on testaceous animals, fishes, or any animal substances they meet with; grow to a large size, sometimes exceeding two hundred pounds weight; the females are the larger, and produce their young alive, only one at a time, though others are successively extruded a few hours after, and these, like the young of the shark, are inclosed in a quadrangular, black, horny shell, the corners of which end in slender incurved points, but not extending into long filaments like those of the shark; eyes half covered with a thin membrane, oblong, placed on the upper part of the head; above these, in the place of nostrils, is a broad sulcus, or groove, divided by a reticulate membrane, consisting of crested folds, and closed with a valve; behind this sulcus are two semilunar orifices; tongue very broad, short, smooth; pectoral fins covered with a thick skin, and surrounding the body; ventral at the base, and connected with the anal; flesh generally eatable; liver large, and producing a great quantity of pure oil.

The following are the chief species.

1. R. batis. Skate. Varied; middle of the back smooth; tail with a single row of spines. Inhabits the European ocean, and is the largest of its genus: body above cinereous, sometimes with a few black lines, beneath white, with waved lines of black dots; round the eyes are numerous small, hooked spines; in the males the fins are full of spines.

Of all the larger fishes the skates are the most numerous; and their numbers are in a great measure owing to their size, and to the protection of those frightful spines which nature has afforded them. There is none of the rapacious tribes, except, perhaps, the cachalot and white shark, that has a swallow sufficiently large to receive them; and even these are, probably, often deterred from their purposes of destruction by the armour with which their prey is covered. Of some the size is such as to defy all the powers of destruction which even the shark himself is known to possess. In England some have been taken upwards of two hundred pounds weight; but even this is far inferior to their enormous bulk in other parts of the world. Near the island of Guadaloupe in the West Indies, a ray was killed, thirteen feet eight inches in breadth, and twenty-five from the snout to the tip of the tail. This last member contributed largely however to so prodigious a dimension; for it was twenty inches broad at its insertion, and tapered to a point, by which it terminated fifteen feet behind the body of the animal.

The fishes of this tribe probably attain a much larger size than that of any individual which has ever yet been examined. It is only the smallest of the kind that approach the shores; the larger continue for ever prowling at the bottom in the unfathomable caverns of the ocean, where they continue perhaps to grow for a century. Hence the utmost bulks of this tribe of rays cannot be ascertained, and some zoologists have supposed them to be the largest inhabitants of the sea. When, however, they surpass the common size, they become too coarse for food; though even in such state the negroes and half-starved savages of America cut them up for this purpose, and esteem their tenderer parts, when salted, as delicious morsels.

These fishes generate in March and April, at which time they swim near the surface of the water, several males pursuing one female. The females cast their purses as the fishermen call it in May, and continue to produce till September: they are very prolific, not less than three hundred eggs having been found in the body of a single female. In October, when their parturition ceases, they are exceedingly poor; after which they improve gradually during the winter and spring, till May, when they are at their highest perfection, and again begin to undergo the same process of increase.

The rays generally frequent those parts of the sea where the bottom is black and muddy, where their voracity leads them indiscriminately to devour every animal which they can surprise: but although their appetite is ravenous and indiscriminate, they become more delicate with regard to a baited hook; they devour below any putrid substance whatever, but if the bait have been taken up and suffered to lie for any time in the open air, they will not touch it: they appear by their manner to perceive the line, and to dread it; but the impulse of their hunger is too great for their caution, and, even though they perceive the danger, if thoroughly hungry, they devour, as if regardless of destruction.

Both English and Dutch carry on the fishing to a considerable extent: the season at which they begin is early in the winter; and the boats in which the fishermen put to sea are of different sizes, according to the distance of the place where they intend to fish. The vessels used in the British Channel, called cobles, are of one ton burden, rowed with three pair of oars, and admirably constructed for encountering a mountain sea. When they go out to fish, every person is provided with three lines; each man's lines are fairly coiled upon a flat oblong piece of wicker-work, the hooks being baited, and placed very regularly in the centre of the coil. Each line is furnished with two hundred and eighty hooks, at the distance of six feet two inches from each other; the hooks are fastened to lines of twisted horse-hair, twenty-seven inches in length.

When fishing, there are always three men in each coble, and consequently nine of these lines are fastened together, and used as one line, extending in length near three miles, and furnished with above two thousand five hundred hooks; an anchor and buoy are fixed at the first end of the line, and another at the end of every other line; in all, four anchors, and four buoys, made of leather or cork.

The line is always laid across the currents; the tides of flood and ebb continue an equal time upon our coast; and, where undisturbed

by winds, run each way about six hours; they are so rapid, that the fishermen can only shoot and haul their lines at the turn of the tide; and, therefore, the lines always remain upon the ground six hours; the same rapidity of tide prevents them from using hand lines, and, therefore, two of the people commonly wrap themselves up in the sail, and sleep, while the other keeps a strict look out, for fear of being run down by ships, and to observe the weather; for storms often rise so suddenly, that it is sometimes with extreme difficulty they escape to the shore, though they leave the lines behind them.

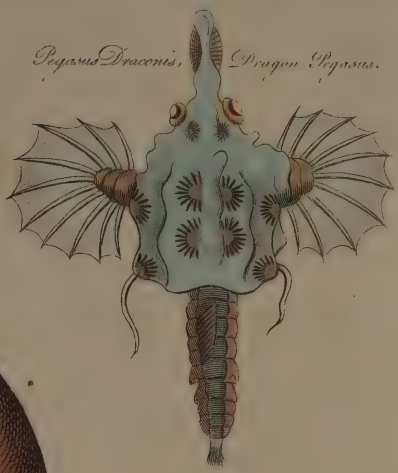
Such is the account which M. Pennant gives of the manner in which the taking of these fish is conducted in the channel; but there are annually larger vessels, of twenty-five tons burden, that repair at the time of Lent to the Dogger Bank, where they fish for turbot, cod, ling, and skates indiscriminately, and where the business is carried on in a more expeditious manner, for as the fishermen have no occasion to wait the returns of the tide, each takes along with him twice the number of lines, which he continues to bait, haul, and shoot, without interruption.

But this method of fishing, operose as it may seem, and this extent of line, though it runs three miles along the bottom, is trifling when compared to the exertions made in the Mediterranean by the Italian fishers: there they go to sea in a tartan, a vessel much larger than ours; and bait a line of no less than twenty miles long, with above ten thousand hooks. This line is called the parisina; and the mode of fishing is named pielago. A piece of tackle of such enormous length, it is impossible to haul and shoot in the same space with the English lines: it remains for a considerable period in the sea, and cannot be taken up in less than twenty-four hours. By this apparatus, they not only take rays, but sharks and other large fishes; some of them above a thousand pounds weight. When a fish of this magnitude is found at the line, the men are provided with an harpoon to dispatch them before they are brought on board.

2. R. oxyrinchus. Sharp-nosed skate. Varied; middle of the back with ten spinous tubercles.

Willoughby describes this species, which he examined at Rome in 1664. They are frequently taken on the British coasts; and are distinguished from the former by their long, narrow, and sharp-pointed snout, not unlike the end of a spontoon. The mouth is very large, and furnished with a number of small sharp teeth, bending inwards: the tail is thick, and terminates in two small fins. The whole fish seven feet long.

This is supposed to be the bos of the ancient naturalists, a fish they describe as of an enormous size. Oppian gives an account of its fondness for human flesh, and the method it takes of destroying men, by overlaying them, and keeping them down with its vast weight till they are drowned. Other writers give the same relation, and confirm the character of these anthropophagi. In the south they are so well known, that the persons employed in the pearl fishing have learned from the fatal experience of many of their own body how much they ought to be guarded against. These unhappy divers are sometimes surrounded, and wrapped round by the fins of the manta, for so this animal is by the pearl-fishers called, till they are suffocated: the negroes, therefore, take care never to go down without a sharp knife to defend themselves against so terrible an enemy.



3. R. torpedo. Torpedo, or electric ray. Body entirely smooth, flat. This species inhabits our own and the Mediterranean seas, and grows to a large size, some weighing not less than eighty pounds, though the usual weight is not more than twenty: its colour is a dirty clay; the head and body are round, and but indistinctly separated; the latter extremely thin, and attenuated towards the edges. Behind the eyes are two wide foramina, which Willoughby supposes are intended for conveying sound: they are beset with six cutaneous fingers on their inner circumference, and communicate with the mouth.

The torpedo can live only twenty-four hours out of the sea, and but little longer if put into fresh water; it inhabits those places where the bottom is sandy, and buries itself superficially by flinging the sand over its back with a vibration it gives to its extremities. It is in this concealed situation that the torpedo astonishes the unwary passenger, who inadvertently treads upon it, by the exertion of a faculty perhaps the most extraordinary in nature.

The narcotic power of this animal has been taken notice of in all ages; the instant the fish is touched it benumbs the arm, and sometimes the whole body of him who touches it. The same effect is produced even when it is touched with a stick, or trodden upon by a person who has his shoes on. Oppian stretches the matter probably too far, when he alleges that it will benumb the fisherman through the whole length of the line and the rod.

The shock given by this animal most nearly resembles that of an electrical machine; it is sudden, tingling, and painful. It is thus described by Kempfer: "The instant I touched it with my hand I felt a terrible numbness in my arm, as far up as the shoulder. Those who touch it with the foot are seized with a stronger palpitation than those who apply the hand to it. This numbness bears no resemblance to that which we feel when the vein has been a long time pressed, and the foot is said to be asleep; it rather appears like a sudden vapour, which, passing through the pores in an instant, penetrates into the very spring of life, whence it diffuses itself over the whole body, and at the same time gives real pain; the nerves are so affected, that the person struck imagines all the bones of his body, particularly those of the limb that received the blow, are driven out of joint; all this is accompanied with an universal tremor, a sickness

of the stomach, a general convulsion, and a total suspension of the faculties of the mind: in short, such is the pain, that all the force of our promises and authority could not prevail upon a seaman to undergo the shock a second time."

The aura which the torpedo discharges, and which produces effects so violent and instantaneous upon the human frame, is sufficiently proved to be electric; but by what means the animal so readily secretes it no naturalist has been able to explain. Great, however, as its powers are when the animal is in vigour, they are impaired as he declines in strength, and totally cease when he expires; they impart no noxious qualities to the fish, when used as food; for the French, who find it plentifully on their coasts, very commonly dress and eat it.

This narcotic power is serviceable to the animal in two important respects; as a means of defence against voracious fishes, and as a method of procuring subsistence from among the smaller tribes; for the former, when electrified, are deprived of all possibility of seizing their prey; and the latter, after having unwarily approached the torpedo, and received the shock, are incapable of making their escape.

The food of the torpedo is surmullets and plaise; the former are so swift, that it is impossible for the torpedo to take them by pursuit: and as this fish has been found in its stomach, it justifies Pliny's account of the manner in which this animal secures its prey. The torpedo is taken at Torbay, off Pembroke, and at Waterford in Ireland; it is caught like other flat fish, with the trawl, and is commonly found in water forty fathom deep, in company with other rays.

4. R. pastinaca. Sting-ray, or fire-flare. Body smooth; tail with a long sharp spine, serrate on the fore part, and another on the back. Two other varieties, one with two spines, both serrate on the fore-part; the other with the body spotted.

Were we to credit all the marvellous accounts which the ancient naturalists have given of the venom lodged in the armour of this fish, we would unavoidably dread it, as an animal still more formidable than the torpedo. The weapon in which nature is said to have lodged this poison grows like a spine from the tail; it is about five inches long, and about four inches behind the body. According to the fables of Pliny, the venom is so potent as to affect even the inanimate creation. Trees that are struck with it instantly lose their verdure, and rocks themselves are incapable of resisting this powerful virus. It was with the spine of the trygon, or fire-flare, that the enchantress Circe armed her son; and with this irresistible weapon he, unintentionally, became the murderer of his father Ulysses.

Succeeding naturalists finding the taste for the marvellous had decreased in their age, have been obliged to give the history of this fish a greater degree of verisimilitude, by curtailing it of its powers against inanimate nature, and contenting themselves with making it formidable only to fishermen. Their opinion has been sanctioned by Linnéus, who ascribes poisonous qualities to no less than three different fishes; the ray-sting, the torpedo, and the tetrodon lineatus. It may be justly doubted, however, whether any fish has a spine charged with actual poison; as far as the ray-sting is concerned, we know that this is not the case: the spine is merely its weapon of offence; with this it is capable of giving a very severe wound, and which being commonly inflicted on the tendinous parts of the body, and by those who are constantly working in cold water, is sometimes dangerous, and difficult of cure.

It is hence a very formidable weapon: and there is reason to believe, that in early times, before the use of iron, the spears and darts of barbarians were often headed with this bone, instead of that metal. The arrows of many of the South American tribes are still pointed with the spine of this fish, which from its hardness and sharpness produces often a fatal wound.

The fire-flare, formidable as it has been deemed, is never rejected by the fisherman when found in his tackle; he commonly cuts away the tail, and exposes it for sale, deprived of this instrument of mischief. This species never grows to the size of the preceding; the most common weigh about eight or ten pounds, and are about two or three feet from the snout to the end of the tail; the nose is very sharp at the point, but short; the mouth small, and provided with granulated teeth; the eyes protuberant; irids of an oblong shape, and golden colour. The whole body of the animal is smooth, flat below, but rounded above, and more elevated in the middle than any of the other rays.

The fire-flare casts its spine, and renews it annually; and that it may at no time be without a proper instrument of defence, it is sometimes seen with the new one growing up, before the old one drops off.

5. R. clavata. Thornback. Body spinous; teeth tuberculate; across the belly a strong semilunar cartilage; rhomboidal; broader, however, than long, and distinguished from all the other species of the ray by its spines, which consist of three rows upon the back, and five upon the tail, all pointing towards its end. Mouth is small; between the nose and the eyes a few spines; and others are scattered without any order upon the pectoral fins.

The colour of the upper part of the body is cinereous, marked with streaks of black, and the skin rough, with small tubercles like shagreen. The belly is white. It begins to generate in the month of June, and continues production till September; its young, as long they are incapable of breeding, are called maids; these are good eating at all times of the year, but the old only begin to be in season in the month of November.

The fishes of this species are found in great plenty, and make a considerable article in our fish markets. They are fond of devouring herring, mackrel, and eels; but their common

food is the different kinds of ground fish; crustaceous animals, such as the crab and lobster, have been also found in their stomachs. See Nat. Hist. Pl. CLXIX.

RAJA, the title of the Indian black princes, the remains of those who ruled there before the Moguls. Some of the rajas are said to preserve their independency, especially in the mountainous parts; but most of them pay an annual tribute to the Mogul. The Indians call them rai; the Persians, raian, in the plural; and our travellers rajas, or ragias.

RAJAMUNDRY, a town of Hindustan, capital of one of the five Circars. The principal riches consists in teak timber. It is seated on the Godavery, 35 miles from its mouth, and 170 S.W. of Cicacole. Lon. 81. 57 E. Lat. 17. 0 N.

RAJANA, in botany, a genus of the class dicœcia, order hexandria. Calyx six-parted; corolless. Female; styles three; fruit inferior, roundish, with an oblique wing. Seven species; climbing plants of East or West Indies, or South America.

RAJEMAL, a town of Hindustan, in Bengal, formerly a place of great trade, but now in a ruinous state. It is seated on the W. bank of the Ganges, 68 miles N.N.W. of Moorshedabad. Lon. 87. 50 E. Lat. 25. 0 N.

RAIL. *s.* (*riegel*, German.) 1. A cross beam fixed at the ends in two upright posts (*Moxon*). 2. A series of posts connected with beams, by which any thing is enclosed (*Bacon*). 3. A kind of bird. See RALLUS. 4. A woman's upper garment.

To RAIL. *v. a.* (from the noun.) 1. To enclose with rails (*Addison*). 2. To range in a line (*Bacon*).

To RAIL. *v. n.* (*railler*, Fr.) To use insolent and reproachful language; to speak to, or to mention in opprobrious terms (*Shakspeare*).

RAI'LER. *s.* (from *rail.*) One who insults or defames by opprobrious language (*South*).

RAI'LLERY. *s.* (*raillerie*, French.) Slight satire; satirical merriment (*Ben Jonson*).

RAILROAD, a modern contrivance for facilitating the conveyance of heavy goods. It consists simply of smooth bars of iron posited horizontally in two rows parallel to each other, at a convenient distance to receive the opposite wheels of a carriage: the road on which the horse draws lying between the two parallel rows or ranges of bars. The wheels of the carriages are usually so constructed with a groove running round them, as to apply freely to the respective rails, without a possibility of their slipping off. Sometimes this is effected by an elevation on the exterior side of the rails, the wheels being flat. In either case, the rails and wheels having tolerably smooth surfaces, admit of motion at a much less expence of animal force than on the common roads of this country. One horse will draw more by means of a rail-road than six could upon a common turnpike-road.

Heavy loads are not moved quite so easily upon rail-roads as in canals; but as the former are constructed at much less expence than the latter, they are very advantageously employed instead of them in various parts of Great Britain.

Mr. Charles Le Caan, of Llanelly, has lately improved the construction of tram-plates. He fastens them together by means of a tenon and mortise, each having a correspondent bevel, so that the head of each plate confines the end of the next succeeding one. These plates rest upon stone blocks or sleepers, placed at the distance of three feet from each other, into which they are fixed by means of perpendicular or beveled plugs cast in the head of each plate; those in the stop plates only being of the former kind. The blocks or sleepers on which the plates rest should by no means weigh less than 120lbs. each, and in some kinds of ground even heavier than this. Besides the advantage of having a more perfect rail-road, and several others, Mr. Le Caan estimates a saving of about 50l. per mile, by adopting this mode of construction.

Mr. Le Caan's method of fixing the plates, in which his principal improvement consists, appears to be well calculated to remove several of the disadvantages attending this operation, in the most approved constructions previously in use.

The plates used in the Surry rail-way have a counter-sunk rectangular notch in each end; and when joined together end-ways, these notches form a square hole, through which an iron spike, having its head fitted to the counter-sunk part, is driven into an oak plug inserted for that purpose in the stones upon which the ends of the plates rest; and thus confines their adjoining extremities in the proper places. In Mr. Woodhouse's patent for a new method of forming a cast-iron rail, described in the third volume of the Repertory of Arts, Second Series, the plates are to be fastened upon similar bearings by means of wrought-iron screws or cutter-bolts. And we are persuaded that, after attentively comparing these three different methods together, the reader will feel no hesitation in preferring Mr. Le Caan's plan. A very ingenious method of forming an iron rail-way, by means of elliptic rails, was invented by Mr. Benjamin Wyatt, and is described at page 285, vol. iii. of the Repertory, Second Series.

RAI'LMENT. *s.* Vesture; vestment; clothes; dress; garment (*Sidney*).

To RAIN. *v. n.* (renian, Saxon; *regenen*, Dutch.) 1. To fall in drops from the clouds (*Locke*). 2. To fall as rain (*Milton*). 3. *It* RAINS. The water falls from the clouds (*Shakspeare*).

To RAIN. *v. a.* To pour down as rain (*Shakspeare*).

RAIN, water that descends from the atmosphere in the form of drops of a considerable size. Rain is apparently a precipitated cloud; as clouds are nothing but vapours raised from moisture, waters, &c. By this circumstance it is distinguished from dew and fog: in the former of

which the drops are so small that they are quite invisible; and in the latter, though their size be larger, they seem to have very little more specific gravity than the atmosphere itself, and may therefore be reckoned hollow spherules rather than drops.

It is universally agreed, that rain is produced by the water previously absorbed by the heat of the sun, or otherwise, from the terraqueous globe, into the atmosphere, as vapours, or vesiculæ. These vesiculæ, being specifically lighter than the atmosphere, are buoyed up by it, till they arrive at a region where the air is in a just balance with them; and there they float, till by some new agent they are converted into clouds, and thence either into rain, snow, hail, mist, or the like.

But the agent in this formation of the clouds into rain, and even of the vapours into clouds, has been much controverted. Most philosophers will have it, that the cold, which constantly occupies the superior regions of the air, chills and condenses the vesiculæ, at their arrival from a warmer quarter; congregates them together, and occasions several of them to coalesce into little masses: and thus their quantity of matter increasing in a higher proportion than their surface, they become an overload to the thin air, and so descend in rain.

Dr. Derham accounts for the precipitation, hence; that the vesiculæ being full of air, when they meet with a colder air than that they contain, this is contracted into a less space: and consequently the watery shell or case becomes thicker, so as to become heavier than the air, &c.

But this separation cannot be ascribed to cold, since rain often takes place in very warm weather. And though we should suppose the condensation owing to the cold of the higher regions, yet there is a remarkable fact which will not allow us to have recourse to this supposition: for it is certain that the drops of rain increase in size considerably as they descend. On the top of a hill for instance, they will be small and inconsiderable, forming only a drizzling shower; but half way down the hill it is much more considerable; and at the bottom the drops will be very large, descending in an impetuous rain. Which shews that the atmosphere condenses the vapours as well where it is warm as where it is cold.

Others allow the cold only a part in the action, and bring in the winds as sharers with it: alleging, that a wind blowing against a cloud will drive its vesiculæ upon one another, by which means several of them, coalescing as before, will be enabled to descend; and that the effect will be still more considerable, if two opposite winds blow together towards the same place: they add, that clouds already formed, happening to be aggregated by fresh accessions of vapour continually ascending, may thence be enabled to descend.

Yet the grand cause, according to Rohault, is still behind. This author conceives it to be the heat of the air, which, after continuing for some time near the earth, is at length carried up on high by a wind, and there thawing the snowy villi or flocks of the half frozen vesiculæ, it reduces them into drops; which, coalescing, descend, and have their dissolution perfected in their progress through the lower and warmer stages of the atmosphere.

Others, as Dr. Clarke, &c. ascribe this descent of the clouds rather to an alteration of the atmosphere than of the vesiculæ; and suppose it to arise from a diminution of the spring or elastic force of the air. This elasticity, which depends chiefly or wholly on the dry terrene exhalations, being weakened, the atmosphere sinks under its burden; and the clouds fall, on the common principle of precipitation.

Now the small vesiculæ, by these or any other causes being once upon the descent, will continue to descend notwithstanding the increase of resistance they every moment meet with in their progress through still denser and denser parts of the atmosphere. For as they all tend toward the same point, viz. the centre of the earth, the farther they fall, the more coalitions will they make; and the more coalitions, the more matter will there be under the same surface; the surface only increasing as the squares, but the solidity as the cubes of the diameters: and the more matter under the same surface, the less friction or resistance there will be to the same matter.

Thus then, if the causes of rain happen to act early enough to precipitate the ascending vesiculæ, before they are arrived at any considerable height, the coalitions being few in so short a descent, the drops will be proportionably small; thus forming what is called dew. If the vapours prove more copious, and rise a little higher, there is produced a mist or fog. A little higher still, and they produce a small rain, &c. If they neither meet with cold nor wind enough to condense or dissipate them, they form a heavy, thick, dark sky, which lasts sometimes several days, or even weeks.

But later writers on this part of philosophical science have, with greater shew of truth, considered rain as an electrical phenomenon. Signior Beccaria reckons rain, hail, and snow, among the effects of a moderate electricity in the atmosphere. Clouds that bring rain, he thinks, are produced in the same manner as thunder clouds, only by a moderate electricity. He describes them at large; and the resemblance which all their phenomena bear to those of thunder clouds is very striking. He notes several circumstances attending rain without lightning, which render it probable that it is produced by the same cause as when it is accompanied with lightning. Light has been seen among the clouds by night in rainy weather; and even by day rainy clouds are sometimes seen to have a brightness evidently independent of the sun. The uniformity with which the clouds are spread, and with which the rain falls, he thinks are evidences of an uniform cause like that of electricity. The intensity also of electricity in his apparatus, usually corresponded very nearly to the quantity of rain that fell in the same time. Sometimes all the phenomena of thunder, lightning, hail, rain, snow, and wind, have been observed at one time; which shews the connection they all have with some common cause. Signior Beccaria therefore supposes that, previous to rain, a quantity of electric matter escapes out of the earth, in some place where it is redundant; and in its ascent to the higher regions of the air, collects and conducts into its path a great quantity of vapours. The same cause, that collects, will condense them more and more; till, in the places of the nearest intervals, they come almost into contact, so as to form small drops; which, uniting with others as they fall, come down in rain.

The rain will be heavier in proportion as the electricity is more vigorous, and the cloud approaches more nearly to a thunder cloud. He imitated the appearance of clouds that bring rain by insulating himself between the rubber and conductor of his electrical machine; and with one hand dropping colophonia into a spoon fastened to the conductor, and holding a burning coal, while his other hand communicated with the rubber. In these circumstances the smoke spread along his arm, and, by degrees, all over his body, till it came to the other hand that communicated with the rubber. The lower surface of this smoke was every where parallel to his clothes, and the upper surface was swelled and arched like clouds replete with thunder and rain. In this manner, he supposes, the clouds that bring rain diffuse themselves from over those parts of the earth which abound with electric fire, to those parts that are exhausted of it; and by letting fall their rain, restore the equilibrium between them. Signior Beccaria also thought, that the electricity communicated to the air, which both receives and parts with it slowly, would account for the retention of vapours in a clear sky; for small disjointed clouds, not dispersed into rain; for the smaller and lighter clouds in the higher regions of the air, which are but little affected by electricity; and also for the darker, heavy, and sluggish clouds in the lower regions, which retain more of it. He even imagined, that some alteration in the weight of the air might be made by this electricity of it: the phenomena of rain, he thought, favoured the supposition, that the electric matter in the air did, in some measure, lessen its pressure: for when the electric matter is actually in the air, collecting and condensing the vapours, the barometer is lowest. When the communication is made between the earth and the clouds by the rain, the quicksilver begins to rise; the electric matter, which supported part of the pressure, being discharged. Lettere dell Elettricismo. Priestley's Hist. &c. of Electricity, vol. i.

As to the general quantity of rain that falls, and its proportion in several places at the same time, and in the same place at several times, we have many observations, journals, &c. in the memoirs of the French academy, the Philos. Trans. &c. Some of these results are as below.

At Upminster, annually.		At Paris, annually.	
1700	19 inches .03	21 inches	.37
1701	18 .69	27	.77
1702	20 .38	17	.45
1703	23 .99	18	.51
1704	15 .80	21	.20
1705	16 .93	14	.82

From the Meteorological Journal of the Royal Society, kept by order of the president and council, it appears that the whole quantity of rain at London, in each of the years specified below, was as follows, viz.

	Inches.
1774	26 .328
1775	24 .083
1776	20 .354
1777	25 .371
1778	20 .772
1779	26 .785
1780	17 .313

The quantity of rain in the four following years at London was,

	Inches.
In 1789	21 .976
1790	16 .052
1791	15 .310
1792	19 .489

Proportion of the Rain of the several Seasons to one another.

1708	Depth at Pisa. Inch.	Depth at Upmins. Inch.	Depth at Zurich. Inch.	1708	Depth at Pisa. Inch.	Depth at Upmins. Inch.	Depth at Zurich. Inch.
Jan.	6 .41	2 .88	1 .64	July	0 .00	1 .11	3 .50
Feb.	3 .28	0 .46	1 .65	August	2 .27	2 .94	3 .15
March	2 .65	2 .03	1 .51	Sept.	7 .21	1 .46	3 .02
April	1 .25	0 .96	4 .69	Oct.	5 .33	0 .23	2 .44

Half Year	21 .82	10 .67	17. 31	Half Year	14 .94	8 .57	15 .35

In Dr. Clarke's and Mr. Blanchard's, of Nottingham, meteorological table for 1808, it appears that of the thirteen places enumerated where the observations were continued for the whole of the period, the greatest quantity of rain fell at Kendal, in Westmoreland, and was 43.34 inches, and the least at London, which is stated at 22.98 inches. At Chichester, Bristol, Chatsworth, Manchester, Lancaster, Dalton, and Kendal, the greatest quantity of rain fell in Oct. and was respectively 6.41, 5.26, 3.98, 5.32, 7.08, 6.53, and 7.25 inches. At London the greatest quantity fell in September, and was 4.18 inches. At West Bridgford, near Nottingham, in January, 2.85 inches. At Horncastle, in December, 4.10 inches. Ferriby and Kingston-upon-Hull, December, 5.01 inches. Heath, near Wakefield, March, 3.49 inches. Edinburgh, August, 7.51: the greatest quantity that fell at any of the above places in the space of one month. Also the annual quantity at Dalton was 39.99; at Chichester, 36.62; Lancaster, 32.48; Bristol, 32.08; Heath, 29.99; Edinburgh, 29.34; Chatsworth, 28.81; Manchester, 27.09; Ferriby, 26.95; Horncastle, 24.32; West Bridgford, 23.22; and to Cheltenham, for the first six months, 12.50 inches.

At Nottingham the number of fair days was 237, and of days on which rain fell 128.

In the year 1809, the same gentlemen's tables shew, that of the eleven places specified, the greatest annual quantity of rain fell at Dalton,

in Lancashire, and is stated at 50.36 inches. The least quantity was at West Bridgford, in Nottinghamshire, and was 17.55 inches. The greatest monthly quantity at Chichester and Chatsworth was in January; at the former it was 8.44, and at the latter 5·22 inches. At Chichester there was none in March; and at Chatsworth the least quantity fell in October, and was 0.28: the total at the two places being 38·07 and 29·91 inches. At London the greatest and least quantities were in July and October; the former was 3.58 and the latter 0·22: the annual quantity was 24·95. The greatest quantities at Horncastle, Ferriby, near Kingston-upon-Hull, Heath, near Wakefield, Yorkshire, Lancaster, Dalton, Bridgford, and Nottingham, fell in August: and were respectively 4·53, 5·88, 4·61, 6·12, 7·25, 3·75, and 4·50. The least quantities at the following places were, at Horncastle, in October, 0·75 inches; at Ferriby, in May, 0·45; Heath, Manchester, Lancaster, and Dalton, in March, 0·43, 0·35, 0.53, and 1·13, respectively; Nottingham, October, 0·31. The total quantities were, at Horncastle, 28·38; Ferriby, 27.97; Heath, 31·65; Manchester, 29·10; Lancaster, 41.73; Nottingham, 23·01. At Nottingham this year, the number of fair days was 234, and of days on which rain fell 131. On the 19th of April snow fell to the depth of a foot!

RAIN-GUAGE. See PLUVIAMETER.

RAIN, a fortified town of Bavaria, seated on the Acha, near the Lech and the Danube, 12 miles W. of Neuburg.

RAIN, or OLD RAIN, a town of Scotland, in Aberdeenshire, near the river Ury, 23 miles NW. of Aberdeen.

RAIN-LAKE, a lake of N. America, lying E. of Lake of the Woods, and W. of Lake Superior. It is nearly 100 miles long, and in no part more than 20 wide.

RAINBOW, *Iris*, or simply the *bow*, is a meteor in form of a party-coloured arch, or semicircle, exhibited in a rainy sky, opposite to the sun, by the refraction and reflection of his rays in the drops of falling rain. There is also a secondary, or fainter bow, usually seen investing the former at some distance. Among naturalists, we also read of lunar rainbows, marine rainbows, &c.

This beautiful phenomenon has engaged the attention of all ages. By some nations it hath been deified; though the more sensible part always looked upon it as a natural appearance, and endeavoured, however imperfectly, to account for it. The observations of the ancients and philosophers of the middle ages concerning the rainbow were such as could not have escaped the notice of the most illiterate husbandmen who gazed at the sky; and their various hypotheses deserve no notice. It was a considerable time even after the dawn of true philosophy in this western part of the world, before we find any discovery of importance on this subject. Maurolycus was the first who pretended to have measured the diameters of the two rainbows with much exactness; and he reports, that he found that of the inner bow to be 45 degrees, and that of the outer bow 56; from which Descartes takes occasion to observe how little we can depend upon the observations of those who were not acquainted with the cause of the appearances.

One Clichtovæus (the same, it is probable, who distinguished himself by his opposition to Luther, and who died in 1543) had maintained, that the second bow is the image of the first, as he thought was evident from the inverted order of the colours. For, said he, when we look into the water, all the images that we see reflected by it are inverted with respect to the objects themselves; the tops of the trees, for instance, that stand near the brink, appearing lower than the roots.

That the rainbow is opposite to the sun had always been observed. It was, therefore, natural to imagine, that the colours of it were produced by some kind of reflection of the rays of light from drops of rain, or vapour. The regular order of the colours was another circumstance that could not have escaped the notice of any person. But, notwithstanding mere reflection had in no other case been observed to produce colours, and it could not but have been observed that refraction is frequently attended with that phenomenon, yet no person seems to have thought of having recourse to a proper refraction in this case, before one Fletcher of Breslau, who, in a treatise which he published in 1571, endeavoured to account for the colours of the rainbow by means of a double refraction and one reflection. But he imagined that a ray of light, after entering a drop of rain, and suffering a refraction both at its entrance and exit, was afterwards reflected from another drop, before it reached the eye of the spectator. He seems to have overlooked the reflection at the farther side of the drop, or to have imagined that all the bendings of the light within the drop would not make a sufficient curvature to bring the ray of the sun to the eye of the spectator. That he should think of two refractions, was the necessary consequence of his supposing that the ray entered the drop at all. This supposition, therefore, was all the light that he threw upon the subject. B. Porta supposed that the rainbow is produced by the refraction of light in the whole body of rain or vapour, but not in the separate drops.

After all, it was a man whom no writers allow to have had any pretensions to philosophy that hit upon this curious discovery. This was Antonio De Dominis, bishop of Spalatro, whose treatise De Radiis Visus et Lucis was published by J. Bartolus in 1611. He first advanced, that the double refraction of Fletcher, with an intervening reflection, was sufficient to produce the colours of the bow, and also to bring the rays that formed them to the eye of the spectator, without any subsequent reflection. He distinctly describes the progress of a ray of light entering the upper part of the drop, where it suffers one refraction, and after being thereby thrown upon the back part of the inner surface, is from thence reflected to the lower part of the drop; at which place undergoing a second refraction, it is thereby bent, so as to come directly to the eye. To verify this hypothesis, this person (no philosopher as he was) proceeded in a very sensible and philosophical manner. For he procured a small globe of solid glass, and viewing it when it was exposed to the rays of the sun, in the same manner in which he had supposed that the drops of rain were situated with respect to them, he actually observed the same colours which he had seen in the true rainbow, and in the same order.

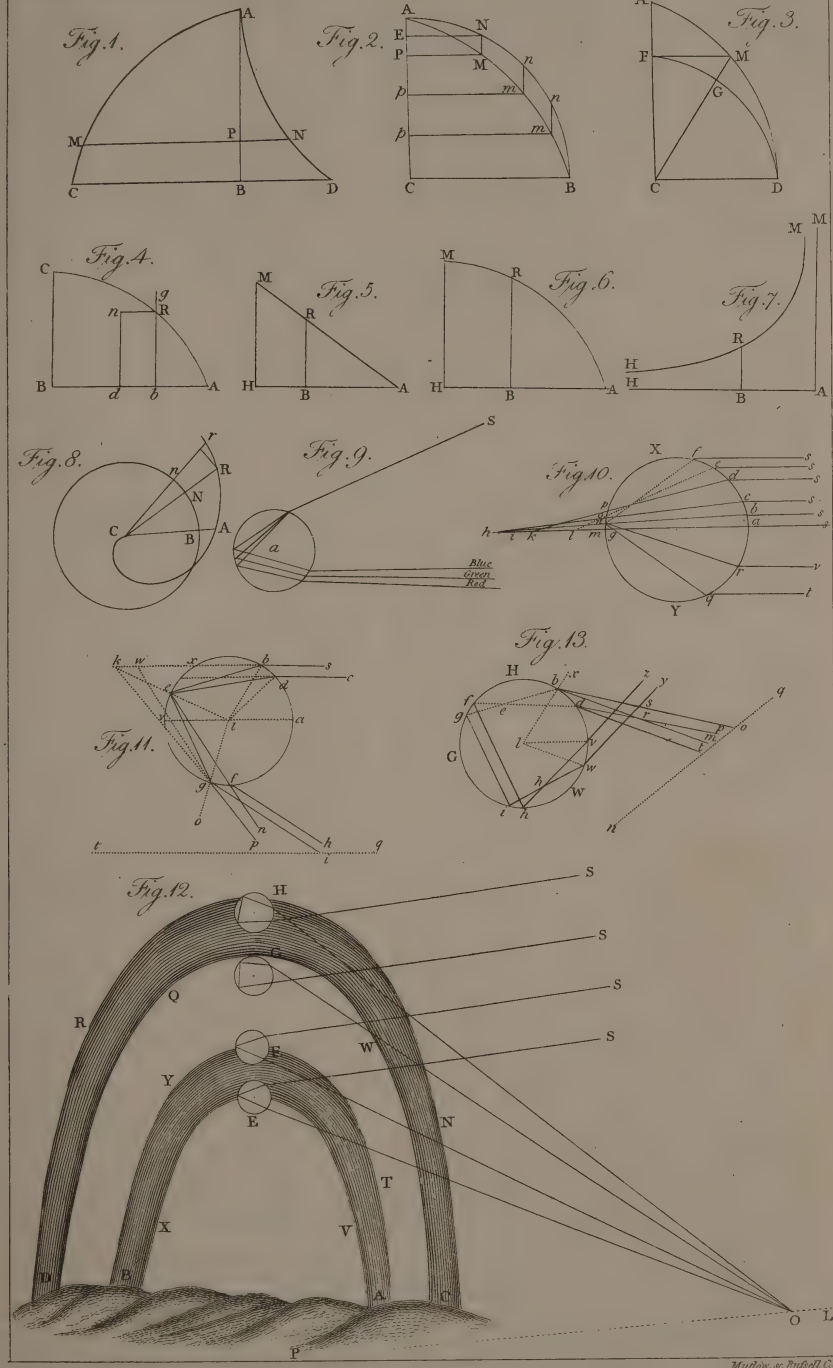
Thus the circumstances in which the colours of the rainbow were formed, and the progress of a ray of light through a drop of water, were clearly understood; but philosophers were a long

time at a loss when they endeavoured to assign reasons for all the particular colours, and for the order of them. Indeed nothing but the doctrine of the different refrangibility of the rays of light, which was a discovery reserved for the great sir Isaac Newton, could furnish a complete solution of this difficulty. De Dominis supposed that the red rays were those which had traversed the least space in the inside of a drop of water, and therefore retained more of their native force, and consequently, striking the eye more briskly, gave it a stronger sensation; that the green and blue colours were produced by those rays, the force of which had been, in some measure, obtunded in passing through a greater body of water; and that all the intermediate colours were composed (according to the hypothesis which generally prevailed at that time) of a mixture of these three primary ones. That the different colours were caused by some difference in the impulse of light upon the eye, and the greater or less impression that was thereby made upon it, was an opinion which had been adopted by many persons, who had ventured to depart from the authority of Aristotle.

Afterwards the same De Dominis observed, that all the rays of the same colour must leave the drop of water in a part similarly situated with respect to the eye, in order that each of the colours may appear in a circle, the centre of which is a point of the heavens, in a line drawn from the sun through the eye of the spectator. The red rays, he observed, must issue from the drop nearest to the bottom of it, in order that the circle of red may be the outermost, and therefore the most elevated in the bow.

Notwithstanding De Dominis conceived so justly of the manner in which the inner rainbow is formed, he was far from having as just an idea of the cause of the exterior bow. This he endeavoured to explain in the very same manner in which he had done the interior, viz. by one reflection of the light within the drop, preceded and followed by a refraction; supposing only that the rays which formed the exterior bow were returned to the eye by a part of the drop lower than that which transmitted the red of the interior bow. He also supposed that the rays which formed one of the bows came from the superior part of the sun's disk, and those which formed the other from the inferior part of it. He did not consider, that upon those principles the two bows ought to have been contiguous; or rather, that an indefinite number of bows would have had their colours all intermixed; which would have been no bow at all.

When sir Isaac Newton discovered the different refrangibility of the rays of light, he immediately applied his new theory of light and colours to the phenomena of the rainbow, taking this remarkable object of philosophical enquiry where De Dominis and Descartes, for want of this knowledge, were obliged to leave their investigations imperfect. For they could give no good reason why the bow should be coloured, and much less could they give any satisfactory account of the order in which the colours appear.



If different particles of light had not different degrees of refrangibility, on which the colours depend, the rainbow, besides being much narrower than it is, would be colourless; but the different refrangibility of differently coloured rays being admitted, the reason is obvious, both why the bow should be coloured, and also why the colours should appear in the order in which they are observed. Let a (pl. 148, fig. 9.) be a drop of water, and S a pencil of light; which, on its leaving the drop of water, reaches the eye of the spectator. This ray, at its entrance into the drop, begins to be decomposed into its proper colours; and upon leaving the drop, after one reflection and a second refraction, it is farther decomposed into as many small differently-coloured pencils as there are primitive colours in the light. Three of them only are drawn in this figure, of which the blue is the most, and the red the least refracted.

The doctrine of the different refrangibility of light enables us to give a reason for the size of a bow of each particular colour. Newton, having found that the sines of refraction of the most refrangible and least refrangible rays, in passing from rain-water into air, are in the proportion of 185 to 182, when the sine of incidence is 138, calculated the size of the bow; and he found, that if the sun was only a physical point, without sensible magnitude, the breadth of the inner bow would be two degrees; and if to this 30′ was added for the apparent diameter of the sun, the whole breadth would be $2\frac{1}{2}$ degrees. But as the outermost colours, especially the violet, are extremely faint, the breadth of the bow will not in reality appear to exceed two degrees. He finds, by the same principles, that the breadth of the exterior bow, if it was every where equally vivid, would be 4° 20′. But in this case there is a greater deduction to be made, on account of the faintness of the light of the exterior bow; so that, in fact, it will not appear to be more than three degrees broad.

The principal phenomena of the rainbow are all explained on sir Isaac Newton's principles, in the following propositions:

When the rays of the sun fall upon a drop of rain and enter into it, some of them, after one reflection and two refractions, may come to the eye of a spectator who has his back towards the sun, and his face towards the drop.

If XY (fig. 10.) is a drop of rain, and the sun shines upon it in any lines sf, sd, sa, &c. most of the rays will enter into the drop; some few of them only will be reflected from the first surface; those rays which are reflected from thence do not come under our present consideration, because they are never refracted at all. The greatest part of the rays then enter the drop, and those passing on to the second surface, will most of them be transmitted through the drop; but neither do those rays which are thus transmitted fall under our present consideration, since they are not reflected. For the rays, which are described in the proposition, are such as are twice refracted and once reflected. However, at the second surface, or hinder part of the drop, at pg, some few rays will be reflected, whilst the rest are transmitted: those rays proceed in some such lines as nr, nq; and coming out of the drop in the lines rv, qt, may fall upon the eye of a spectator, who is placed anywhere in those lines, with his face towards the drop, and consequently with his back towards the sun, which is supposed to shine upon the drop in the lines sf, sd, sa, &c. These rays are twice refracted and once reflected; they are refracted when they pass out of the air into the drop; they are reflected from the second surface, and are refracted again when they pass out of the drop into the air.

Muddw. sc. Russell Co.

London, Published by Sherwood & Co. Paternoster Row, July 1, 1832.

When rays of light reflected from a drop of rain come to the eye, those are called effectual which are able to excite a sensation.

When rays of light come out of a drop of rain, they will not be effectual, unless they are parallel and contiguous.

There are but few rays that can come to the eye at all: for since the greatest part of those rays which enter the drop XY (fig. 10.) between X and *a*, pass out of the drop through the hinder surface *p g*; only few are reflected from thence, and come out through the nearer surface between *a* and *y*. Now, such rays as emerge, or come out of the drop, between *a* and Y, will be ineffectual, unless they are parallel to one another, as *r v* and *q t* are; because such rays as come out diverging from one another will be so far asunder when they come to the eye, that all of them cannot enter the pupil; and the very few that can enter it will not be sufficient to excite any sensation. But even rays, which are parallel, as *r v*, *q t*, will not be effectual, unless there are several of them contiguous or very near to one another. The two rays *r v* and *q t* alone will not be perceived, though both of them enter the eye; for so very few rays are not sufficient to excite a sensation.

When rays of light come out of a drop of rain after one reflection, those will be effectual which are reflected from the same point, and which entered the drop near to one another.

Any rays, as *s b* and *c d* (pl. 148, fig. 11.), when they have passed out of the air into a drop of water, will be refracted towards the perpendiculars *b l d l*; and as the ray *s b* falls farther from the axis *a v* than the ray *c d*, *s b* will be more refracted than *c d*; so that these rays, though parallel to one another at their incidence, may describe the lines *b e* and *d e* after refraction, and be both of them reflected from one and the same point *e*. Now all rays which are thus reflected from one and the same point, when they have described the lines *e f*, *e g*, and after reflection emerge at *f* and *g*, will be so refracted, when they pass out of the drop into the air, as to describe the lines *f h*, *g i*, parallel to one another. If these rays were to return from *e* in the lines *e b*, *e d*, and were to emerge at *b* and *d*, they would be refracted into the lines of their incidence *b s*, *d c*. But if these rays, instead of being returned in the lines *e b*, *e d*, are reflected from the same point *e* in the lines *e g*, *e f*, the lines of reflection *e g* and *e f* will be inclined both to one another, and to the surface of the drop; just as much as the lines *e b* and *e d* are. First *e b* and *e g* make just the same angle with the surface of the drop: for the angle *b e x*, which *e b* makes with the surface of the drop, is the complement of incidence, and the angle *g e v*, which *e g* makes with the surface, is the complement of reflection; and these two are equal to one another. In the same manner we might prove, that *e d* and *e f* make equal angles with the surface of the drop. Secondly, the angle *b e d* is equal to the angle *f e g*; or the reflected rays *e g*, *e f*, and the incident rays *b e*, *d e*, are equally inclined to each other. For the angle of incidence *b e l* is equal to the angle of reflection *g e l*, and the angle of incidence *d e l* is equal to the angle of reflection *f e l*; consequently the difference between the angles of incidence is equal to the difference between the angles of reflection, or $b e l - d e l = g e l - f e l$, or $b e d = g e f$. Since therefore either the lines *e g*, *e f*, or the lines *e b*, *e d*, are equally inclined both to one another and to the surface of the drop, the rays will be refracted in the same manner, whether they were to return in the lines *e b*, *e d*, or are reflected in the lines *e g*, *e f*. But if they were to return in the lines *e b*, *e d*, the refraction, when they emerge at *b* and *d*, would make them parallel. Therefore, if they are reflected from one and the same point *e* in the lines *e g*, *e f*, the refraction, when they emerge at *g* and *f*, will likewise make them parallel.

But though such rays as are reflected from the same point in the hinder part of a drop of rain are parallel to one another when they emerge, and so have one condition that is requisite towards making them effectual, yet there is another condition necessary; for rays, that are effectual, must be contiguous as well as parallel. And though rays, which enter the drop in different places, may be parallel when they emerge, those only will be contiguous which enter it nearly at the same place.

Let XY (fig. 10.) be a drop of rain, *a g* the axis or diameter of the drop, and *s u* a ray of light that comes from the sun and enters the drop at the point *a*. This ray *s a*, because it is perpendicular to both the surfaces, will pass straight through the drop in the line *a g h* without being refracted; but any collateral rays, such as those that fall about *s b*, as they pass through the drop, will be made to converge to their axis, and passing out at *n* will meet the axis at *k*: rays which fall farther from the axis than *s b*, such as those which fall about *s c*, will likewise be made to converge; but then their focus will be nearer to the drop than *k*. Suppose therefore *i* to be the focus to which the rays that fall about *s c* will converge, any ray, *s c*, when it has described the line *c o* within the drop, and is tending to the focus *i*, will pass out of the drop at the point *o*. The rays that fall upon the drop about *s d*, more remote still from the axis, will converge to a focus still nearer than *i*, as suppose at *k*. These rays therefore go out of the drop at *p*. The rays, that fall still more remote from the axis, as *s e*, will converge to a focus nearer than *k*, as suppose at *l*; and the ray *s e*, when it has described the line *e o* within the drop, and is tending to *l*, will pass out at the point *o*. The rays that fall still more remote from the axis will converge to a focus still nearer. Thus the ray *s f* will, after refraction, converge to a focus at *m*, which is nearer than *l*; and having described the line *f n* within the drop, it will pass out to the point *n*. Now here we may observe, that as any rays *s b*, or *s c* fall farther above the axis *s a*, the points *n*, or *o*, where they pass out behind the drop, will be farther above *g*; or that, as the incident ray rises from the axis *s a*, the arc *g n o* increases, till we come to some ray *s d*, which passes out of the drop at *p*; and this is the highest point where any ray that falls upon the quadrant or quarter *a x* can pass out: for any rays *s e*, or *s f*, that fall higher than *s d*, will not pass out in any point above *p*, but at the points *o* or *n*, which are below it. Consequently, though the arc *g n o p* increases, whilst the distance of the incident ray from the axis *s a* increases, till we come to the ray *s d*; yet afterwards, the higher the ray falls above the axis *s a*, this arc *p o n g* will decrease.

We have hitherto spoken of the points on the

hinder part of the drop, where the rays pass out of it; but this was for the sake of determining the points from whence those rays are reflected, which do not pass out behind the drop. For, in explaining the rainbow, we have no farther reason to consider those rays which go through the drop; since they can never come to the eye of a spectator placed any where in the lines $r v$ or $q t$ with his face towards the drop. Now, as there are many rays which pass out of the drop between g and p, so some few rays will be reflected from thence; and consequently the several points between g and p, which are the points where some of the rays pass out of the drop, are likewise the points of reflection for the rest which do not pass out. Therefore, in respect of those rays which are reflected, we may call $g p$ the arc of reflection; and may say, that this arc of reflection increases, as the distance of the incident ray from the axis $s a$ increases, till we come to the ray $s d$; the arc of reflection is $g n$ for the ray $s b$, it is $g o$ for the ray $s c$; and $g p$ for the ray $s d$. But after this, as the distance of the incident ray from the axis $s a$ increases, the arc of reflection decreases; for $o g$ less than $p g$ is the arc of reflection for the ray $s e$, and $n g$ is the arc of reflection for the ray $s f$.

From hence it is obvious, that some one ray, which falls above $s d$, may be reflected from the same point with some other ray which falls below $s d$. Thus, for instance, the ray $s b$ will be reflected from the point n, and the ray $s f$ will be reflected from the same point; and consequently, when the reflected rays $n r$, $n q$, are refracted as they pass out of the drop at r and q, they will be parallel, by what has been shewn in the former part of this proposition. But since the intermediate rays, which enter the drop between $s f$ and $s b$, are not reflected from the same point n, these two rays alone will be the parallel to one another when they come out of the drop, and the intermediate rays will not be parallel to them. And consequently, these rays $r v$, $q t$, though they are parallel after they emerge at r and q, will not be contiguous, and for that reason will not be effectual; the ray $s d$ is reflected from p, which has been shewn to be the limit of the arc of reflection; such rays as fall just above $s d$, and just below $s d$, will be reflected from nearly the same point p, as appears from what has been already shewn. These rays therefore will be parallel, because they are reflected from the same point p; and they will likewise be contiguous, because they all of them enter the drop at one and the same place very near to d. Consequently, such rays as enter the drop at d, and are reflected from p the limit of the arc of reflection, will be effectual; since, when they emerge at the fore part of the drop between a and y, they will be both parallel and contiguous.

If we can make out hereafter that the rainbow is produced by the rays of the sun which are thus reflected from drops of rain as they fall whilst the sun shines upon them, this proposition may serve to shew us, that this appearance is not produced by any rays that fall upon any part, and are reflected from any part of those drops: since this appearance cannot be produced by any rays but those which are effectual; and effectual rays must always enter each drop at one certain place in the fore-part of it, and must likewise be reflected from one certain place in the hinder surface.

When rays that are effectual emerge from a drop of rain after one reflection and two refractions, those which are most refrangible will, at their emersion, make a less angle with the incident rays than those do which are least refrangible; and by this means the rays of different colours will be separated from one another.

Let $f h$ and $g i$ (pl. 148, fig. 11.) be effectual violet rays emerging from the drop at $f g$; and $f n$, $g p$, effectual red rays emerging from the same drop at the same place. Now, though all the violet rays are parallel to one another, because they are supposed effectual, and though all the red rays are likewise parallel to one another for the same reason; yet the violet rays will not be parallel to the red rays. These rays, as they have different colours, and different degrees of refrangibility, will diverge from one another; any violet ray $g i$, which emerges at g, will diverge from any red ray $g p$, which emerges at the same place. Now, both the violet ray $g i$, and the red ray $g p$, as they pass out of the drop of water into the air, will be refracted from the perpendicular $l o$. But the violet ray is more refrangible than the red one; and for that reason $g i$, or the refracted violet ray, will make a greater angle with the perpendicular than $g p$ the refracted red ray; or the angle $i g o$ will be greater than the angle $p g o$. Suppose the incident ray $s b$ to be continued in the direction $s k$, and the violet ray $i g$ to be continued backward in the direction $i k$, till it meets the incident ray at k. Suppose likewise the red ray $p g$ to be continued backwards in the same manner, till it meets the incident ray at w. The angle $i k s$ is that which the violet ray, or most refrangible ray at its emersion, makes with the incident ray; and the angle $p w s$ is that which the red ray, or least refrangible ray at its emersion, makes with the incident ray. The angle $i k s$ is less than the angle $p w s$. For, in the triangle, $g w k$, $g w s$, or $p w s$, is the external angle at the base, and $g w k$ or $i k s$ is one of the internal opposite angles; and either internal opposite angle is less than the external angle at the base. (Euc. b. 1. prop. 16.) What has been shewn to be true of the rays $g i$ and $g p$ might be shewn in the same manner of the rays $f h$ and $f n$, or of any other rays that emerge respectively parallel to $g i$ and $g p$. But all the effectual violet rays are parallel to $g i$, and all the effectual red rays are parallel to $g p$. Therefore the effectual violet rays at their emersion make a less angle with the incident ones than the effectual red ones. And for the same reason, in all the other sorts of rays, those which are most refrangible, at their emersion from a drop of rain after one reflection, will make a less angle with the incident rays, than those do which are less refrangible.

Or otherwise: when the rays $g i$ and $g p$ emerge at the same point g, as they both come out of water into air, and consequently are refracted from the perpendicular, instead of going straight forwards in the line $e g$ continued, they will both be turned round upon the point g, from the perpendicular $g o$. Now it is easy to conceive, that either of these lines might be turned in this manner upon the point g as upon a centre, till they became parallel to $s b$ the incident ray. But if either of these lines or rays were refracted so much from $g o$ as to become parallel to $s b$, the ray so much refracted would, after emersion, make no angle with $s k$, because it would be pa-

rallel to it. And consequently that ray which is most turned round upon the point g, or that ray which is most refrangible, will, after emersion, be nearest parallel to the incident ray, or will make the least angle with it. The same may be proved of all other rays emerging parallel to gi and gp respectively, or of all effectual rays; those which are most refrangible will, after emersion, make a less angle with the incident rays than those do which are least refrangible.

But since the effectual rays of different colours make different angles with sk at their emersion, they will be separated from one another: so that if the eye was placed in the beam $fghi$, it would receive only rays of one colour from the drop $xagv$; and if it was placed in the beam $fgnp$, it would receive only rays of some other colour.

The angle swp, which the least refrangible or red rays make with the incident ones when they emerge so as to be effectual, is found by calculation to be 42 degrees two minutes. And the angle ski, which the most refrangible rays make with the incident ones when they emerge so as to be effectual, is found to be 40 degrees 17 minutes. The rays which have the intermediate degrees of refrangibility, make with the incident ones intermediate angles beween 42 degrees two minutes, and 40 degrees 17 minutes.

If a line is supposed to be drawn from the centre of the sun through the eye of the spectator, the angle which any effectual ray, after two refractions and one reflection, makes with the incident ray, will be equal to the angle which it makes with that line.

Let the eye of the spectator be at i (pl. 148, fig. 11.), and let qt be the line supposed to be drawn from the centre of the sun through the eye of the spectator; the angle git, which any effectual ray makes with this line, will be equal to the angle iks, which the same ray makes with the incident ray sb or sk. If sb is a ray coming from the centre of the sun, then, since qt is supposed to be drawn from the same point, these two lines, upon account of the remoteness of the point from whence they are drawn, may be looked upon as parallel to one another. But the right line ki crossing these two parallel lines will make the alternate angles equal. (Euc. b. 1. prop. 29.) Therefore kit or git is equal to ski.

When the sun shines upon the drops of rain as they are falling, the rays that come from those drops to the eye of a spectator, after one reflection and two refractions, produce the primary rainbow.

If the sun shines upon the rain as it falls, there are commonly seen two bows, as AFB, CHD, (fig. 12.); or if the cloud and rain does not reach over that whole side of the sky where the bows appear, then only a part of one or of both bows is seen in that place where the rain falls. Of these two bows, the innermost AFB is the more vivid of the two, and this is called the primary bow. The outer part TFY of the primary bow is red, the inner part VEX is violet; the intermediate parts, reckoning from the red to the violet, are orange, yellow, green, blue, and indigo. Suppose the spectator's eye to be at O, and let LOP be an imaginary line drawn from the centre of the sun through the eye of the spectator: if a beam of light S coming from the sun falls upon any drop F; and the rays that emerge at F in the line FO, so as to be effectual, make an angle FOP of 42° 2′ with the line LP; then these effectual rays make an angle of 42° 2′ with the incident rays, by the preceding proposition, and consequently these rays will be red, so that the drop F will appear red. All the other rays, which emerge at F, and would be effectual if they fell upon the eye, are refracted more than the red ones, and consequently will pass above the eye. If a beam of light S falls upon the drop E; and the rays that emerge at E in the line EO, so as to be effectual, make an angle EOP of 40° 17′ with the line LP; then these effectual rays make likewise an angle of 40° 17′ with the incident rays, and the drop E will appear of a violet colour. All the other rays, which emerge at E, and would be effectual if they came to the eye, are refracted less than the violet ones, and therefore pass below the eye. The intermediate drops between F and E will, for the same reasons, be of the intermediate colours.

Thus we have shewn why a set of drops from F to E, as they are falling, should appear of the primary colours, red, orange, yellow, green, blue, indigo, and violet. It is not necessary that the several drops, which produce these colours, should all of them fall at exactly the same distance from the eye. The angle FOP, for instance, is the same whether the distance of the drop from the eye is OF, or whether it is in any other part of the line OF something nearer to the eye. And whilst the angle FOP is the same, the angle made by the emerging and incident rays, and consequently the colour of the drop, will be the same. This is equally true of any other drop. So that, although in the figure, the drops F and E are represented as falling perpendicularly one under the other, yet this is not necessary in order to produce the bow.

But the coloured line FE, which we have already accounted for, is only the breadth of the bow. It still remains to be shown, why not only the drop F should appear red, but why all the other drops quite from A to B in the arc ATFYB should appear of the same colour. Now it is evident, that wherever a drop of rain is placed, if the angle which the effectual rays make with the line LP is equal to the angle FOP, that is, if the angle which the effectual rays make with the incident rays is 42° 2′, any of those drops will be red, for the same reason that the drop F is of this colour.

If FOP was to turn round upon the line OP, so that one end of this line should always be at the eye, and the other be at P opposite to the sun; such a motion of this figure would be like that of a pair of compasses turning round upon one of the legs OP with the opening FOP. In this revolution the drop F would describe a circle, P would be the centre, and ATFYB would be an arc in this circle. Now since, in this motion of the line and drop OF, the angle made by FO with OP, that is, the angle FOP continues the same; if the sun was to shine upon this drop as it revolves, the effectual rays would make the same angle with the incident rays, in whatever part of the arc ATFYB the drop was to be. Therefore, whether the drop is at A, or at T, or at Y, or at B, or wherever else it is in this whole arc, it would appear red, as it does at F. The drops of rain, as they fall, are not indeed turned round in this manner: but then, as innumerable of them are falling at once in right lines from the cloud, whilst one drop is

at F, there will be others at Y, at T, at B, at A, and in every other part of the arc ATFYB: and all these drops will be red for the same reason that the drop F would have been red, if it had been in the same place. Therefore, when the sun shines upon the rain as it falls, there will be a red arc ATFYB opposite to the sun. In the same manner, because the drop E is violet, we might prove that any other drop, which, whilst it is falling, is in any part of the arc AVEXB, will be violet; and consequently, at the same time that the red arc ATFYB appears, there will likewise be a violet arc AVEXB below or within it. FE is the distance between these two coloured arcs; and from what has been said, it follows, that the intermediate space between these two arcs will be filled up with arcs of the intermediate colours, orange, yellow, blue, green, and indigo. All these coloured arcs together make up the primary rainbow.

The primary rainbow is never a greater arc than a semicircle.

Since the line LOP is drawn from the sun through the eye of the spectator, and since P (pl. 148. fig. 10.) is the centre of the rainbow; it follows, that the centre of the rainbow is always opposite to the sun. The angle FOP is an angle of 42° 2′, as was observed, or F the highest part of the bow is 42° 2′ from P the centre of it. If the sun is more than 42° 2′ high, P the centre of the rainbow, which is opposite to the sun, will be more than 42° 2′ below the horizon; and consequently F the top of the bow, which is only 42° 2′ from P, will be below the horizon; that is, when the sun is more than 42° 2′ high, no primary rainbow will be seen. If the sun is something less than 42° 2′ high, then P will be something less than 42° 2′ below the horizon; and consequently F, which is only 42° 2′ from P, will be just above the horizon; that is, a small part of the bow at this height of the sun will appear close to the ground opposite to the sun. If the sun is 20° high, then P will be 20° below the horizon; and F, the top of the bow, being 42° 2′ from P, will be 22° 2′ above the horizon; therefore, at this height of the sun, the bow will be an arc of a circle whose centre is below the horizon; and consequently that arc of the circle which is above the horizon, or the bow, will be less than a semi-circle. If the sun is in the horizon, then P, the centre of the bow, will be in the opposite part of the horizon; F, the top of the bow, will be 42° 2′ above the horizon; and the bow itself, because the horizon passes through the centre of it, will be a semicircle. More than a semi-circle can never appear; because, if the bow was more than a semicircle, P the centre of it must be above the horizon; but P is always opposite to the sun, therefore P cannot be above the horizon, unless the sun is below it; and when the sun is set, or is below the horizon, it cannot shine upon the drops of rain as they fall; and consequently when the sun is below the horizon, no bow at all can be seen.

When the rays of the sun fall upon a drop of rain, some of them, after two reflections and two refractions, may come to the eye of a spectator, who has his back towards the sun and his face towards the drop.

If HGW (fig. 13.) is a drop of rain, and parallel rays coming from the sun, as $z v$, $y w$, fall upon the lower part of it, they will be refracted towards the perpendiculars $v l$, $w l$, as they enter into it, and will describe some such lines as $v h$, $w i$. At k and i great part of these rays will pass out of the drop; but some of them will be reflected from thence in the lines $h f$, $i g$. At f and g again, great part of the rays that were reflected thither will pass out of the drop. But these rays will not come to the eye of a spectator at o. However, here again all the rays will not pass out; but some few will be reflected from f and g, in some such lines as $f d$, $g b$; and these, when they emerge out of the drop of water into the air at b and d, will be refracted from the perpendiculars, and, describing the lines $d t$, $b o$, may come to the eye of the spectator who has his back towards the sun and his face towards the drop.

Those rays, which are parallel to one another after they have been once refracted and once reflected in a drop of rain, will be effectual when they emerge after two refractions and two reflections.

No rays can be effectual, unless they are contiguous and parallel. From what was said, it appears, that when rays come out of a drop of rain contiguous to one another, either after one or after two reflections, they must enter the drop nearly at one and the same place. And if such rays as are contiguous are parallel after the first reflection, they will emerge parallel, and therefore will be effectual. Let $z v$ and $y w$ be contiguous rays which come from the sun, and are parallel to one another when they fall upon the lower part of the drop, suppose these rays to be refracted at v and w, and to be reflected at h and i; if they are parallel to one another, as $h f$, $g i$, after this first reflection, then, after they are reflected a second time from f and g, and refracted a second time as they emerge at d and b, they will go out of the drop parallel to one another in the lines $d t$ and $b o$, and will therefore be effectual.

The rays $z v$, $y w$, are refracted towards the perpendiculars $v l$, $w l$, when they enter the drop, and will be made to converge. As these rays are very oblique, their focus will not be far from the surface $v w$. If this focus is at k, the rays, after they have passed the focus, will diverge from thence in the directions $k h$, $k i$; and if $k i$ is the principal focal distance of the concave reflecting surface $h i$, the reflected rays $h f$, $i g$, will be parallel. These rays $e f$, $i g$, are reflected again from the concave surface $f g$, and will meet in a focus at e, so that $g e$ will be the principal focal distance of this reflecting surface $f g$. And because $h i$ and $f g$ are parts of the same sphere, the principal focal distances $g e$ and $k i$ will be equal to one another. When the rays have passed the focus e, they will diverge from thence in the lines $e d$, $e b$: and we are to show, that when they emerge at d and b, and are refracted there, they will become parallel.

Now if the rays $v k$, $w k$, when they have met at k, were to be turned back again in the directions $k v$, $k w$, and were to emerge at v and w, they would be refracted into the lines of their incidence, $v z$, $w y$, and therefore would be parallel. But since $g e$ is equal to $i k$, as has already been shown, the rays $e d$, $e b$, that diverge from e, fall in the same manner upon the drop at d and b, as the rays $k v$, $k w$, would fall upon it at v and w; and $e d$, $e b$, are just as much inclined to

the refracting surface $d\,h$, as $k\,v$, $k\,w$, would be to the surface $v\,w$. From hence it follows, that the rays $e\,d$, $e\,b$, emerging at d and b, will be refracted in the same manner, and will have the same direction in respect of one another, as $k\,v$, $k\,w$, would have. But $k\,v$ and $k\,w$ would be parallel after refraction. Therefore $e\,d$ and $e\,b$ will emerge in lines $d\,p$, $b\,o$, so as to be parallel to one another, and consequently so as to be effectual.

When rays that are effectual emerge from a drop of rain after two reflections and two refractions, those which are most refrangible will at their emersion make a greater angle with the incident rays than those do which are least refrangible; and by this means the rays of different colours will be separated from one another.

If rays of different colours, which are differently refrangible, emerge at any point b (Pl. 148, fig. 13.), these rays will not be all of them equally refracted from the perpendicular. Thus, if $b\,o$ is a red ray, which is of all others the least refrangible, and $b\,m$ is a violet ray, which is of all others the most refrangible; when these two rays emerge at b, the violet ray will be refracted more from the perpendicular $b\,x$ than the red ray, and the refracted angle $x\,b\,m$ will be greater than the refracted angle $x\,b\,o$. From hence it follows, that these two rays after emersion, will diverge from one another. In like manner, the rays that emerge at d will diverge from one another; a red ray will emerge in the line $d\,p$, a violet ray in the line $d\,t$. So that though all the effectual red rays of the beam $b\,d\,m\,t$ are parallel to one another, and all the effectual red rays of the beam $b\,d\,o\,p$ are likewise parallel to one another, yet the violet rays will not be parallel to the red ones, but the violet beam will diverge from the red beam. Thus the rays of different colours will be separated from one another.

This will appear farther, if we consider what the proposition affirms: that any violet or most refrangible ray will make a greater angle with the incident rays, than any red or least refrangible ray makes with the same incident rays. Thus, if $y\,w$ is an incident ray, $b\,m$ a violet ray emerging from the point b, and $b\,o$ a red ray emerging from the same point; the angle which the violet ray makes with the incident one is $y\,r\,m$, and that which the red ray makes with it is $y\,s\,o$. Now $y\,r\,m$ is a greater angle than $y\,s\,o$. For in the triangle $b\,r\,s$ the internal angle $b\,r\,s$ is less than $b\,s\,y$ the external angle at the base. (Eucl. b. 1. prop. 16.) But $y\,r\,m$ is the complement of $b\,r\,s$ or of $b\,r\,y$ to two right ones, and $y\,s\,o$ is the complement of $b\,s\,y$ to two right ones. Therefore, since $b\,r\,y$ is less than $b\,s\,y$, the complement of $b\,r\,y$ to two right angles will be greater than the complement of $b\,s\,y$, to two right angles; or $y\,r\,m$, will be greater than $y\,s\,o$.

Or otherwise: both the rays $b\,o$ and $b\,m$, when they are refracted in passing out of the drop at b, are turned round upon the point b from the perpendicular $b\,x$. Now either of these lines $b\,o$ or $b\,m$ might be turned round in this manner, till it made a right angle with $y\,w$. Consequently, that ray which is most turned round upon b, or which is most refracted, will make an angle with $y\,w$ that will be nearer to a right one than that ray makes with it which is least turned round upon b, or which is least refracted. Therefore that ray which is most refracted will make a greater angle with the incident ray than that which is least refracted.

But since the emerging rays, as they are differently refrangible, make different angles with the same incident ray $y\,w$, the refraction which they suffer at emersion will separate them from one another.

The angle $y\,r\,m$, which the most refrangible or violet rays make with the incident ones, is found by calculation to be 54° 7′; and the angle $y\,s\,o$, which the least refrangible or red rays make with the incident ones, is found to be 50° 57′: the angles, which the rays of the intermediate colours, indigo, blue, green, yellow, and orange, make with the incident rays, are intermediate angles between 54° 7′ and 50° 57′.

If a line is supposed to be drawn from the centre of the sun through the eye of the spectator; the angle which, after two refractions and two reflections, any effectual ray makes with the incident ray, will be equal to the angle which it makes with that line.

If $y\,w$ (fig. 13.) is an incident ray, $b\,o$ an effectual ray, and $q\,n$ a line drawn from the centre of the sun through o the eye of the spectator; the angle $y\,s\,o$, which the effectual ray makes with the incident ray, is equal to $s\,o\,n$ the angle which the same effectual ray makes with the line $q\,n$. For $y\,w$ and $q\,n$, considered as drawn from the centre of the sun, are parallel; $b\,o$ crosses them, and consequently makes the alternate angles $y\,s\,o$, $s\,o\,n$, equal to one another. Eucl. b. i. prop. 29.

When the sun shines upon the drops of rain as they are falling, the rays that come from these drops to the eye of a spectator, after two reflections and two refractions, produce the secondary rainbow.

The secondary rainbow is the outermost CHD, fig. 12. When the sun shines upon a drop of rain H; and the rays HO, which emerge at H so as to be effectual, make an angle HOP of 54° 7′ with LOP a line drawn from the sun through the eye of the spectator; the same effectual rays will make likewise an angle of 54° 7′ with the incident rays S, and the rays which emerge at this angle are violet ones, by what was observed above. Therefore, if the spectator's eye is at O, none but violet rays will enter it: for as all the other rays make a less angle with OP, they will fall above the spectator's eye. In like manner, if the effectual rays that emerge from the drop G make an angle of 50° 57′ with the line OP, they will likewise make the same angle with the incident rays S; and consequently, from the drop G to the spectator's eye at O, no rays will come but red ones; for all the other rays, making a greater angle with the line OP, will fall below the eye at O. For the same reason, the rays emerging from the intermediate drops between H and G, and coming to the spectator's eye at O, will emerge at intermediate angles, and therefore will have the intermediate colours. Thus, if there are seven drops from H to G inclusively, their colours will be violet, indigo, blue, green, yellow, orange, and red. This coloured line is the breadth of the secondary rainbow.

Now, if HOP was to turn round upon the line

OP, like a pair of compasses upon one of the legs OP with the opening HOP, it is plain from the supposition, that, in such a revolution of the drop H, the angle HOP would be the same, and consequently the emerging rays would make the same angle with the incident ones. But in such a revolution the drop would describe a circle of which P would be the centre, and CNHRD an arc. Consequently, since, when the drop is at N, or at R, or any where else in that arc, the emerging rays make the same angle with the incident ones as when the drop is at H, the colour of the drop will be the same to an eye placed at O, whether the drop is at N, or at H, or at R, or any where else in that arc. Now, though the drop does not thus turn round as it falls, and does not pass through the several parts of this arc, yet, since there are drops of rain falling every where at the same time, when one drop is at H, there will be another at R, another at N, and others in all parts of the arc; and these drops will all of them be violet-coloured, for the same reson that the drop H would have been of this colour if it had been in any of those places. In like manner, as the drop G is red when it is at G, it would likewise be red in any part of the arc CWGQD; and so will any other drop, when, as it is falling, it comes to any part of that arc. Thus, as the sun shines upon the rain whilst it falls, there will be two arcs produced, a violet-coloured one CNHRD, and a red one CWGQD; and for the same reasons the intermediate space between these two arcs will be filled up with arcs of the intermediate colours. All these arcs together make up the secondary rainbow.

The colours of the secondary rainbow are fainter than those of the primary rainbow; and are ranged in the contrary order.

The primary rainbow is produced by such rays as have been only once reflected; the secondary rainbow is produced by such rays as have been twice reflected. But at every reflection some rays pass out of the drop of rain without being reflected; so that the oftener the rays are reflected, the fewer of them are left. Therefore the colours of the secondary bow are produced by fewer rays, and consequently will be fainter than the colours of the primary bow.

In the primary bow reckoning from the outside of it, the colours are ranged in this order; red, orange, yellow, green, blue, indigo, violet. In the secondary bow, reckoning from the outside, the colours are violet, indigo, blue, green, yellow, orange, red. So that the red, which is the outermost or highest colour in the primary bow, is the innermost or lowest colour in the secondary one.

Now the violet rays, when they emerge so as to be effectual after one reflection, make a less angle with the incident rays than the red ones; consequently the violet rays make a less angle with the lines OP (Pl. 148, fig. 12.) than the red ones. But, in the primary rainbow, the rays are only once reflected, and the angle which the effectual rays make with OP is the distance of the coloured drop from P the centre of the bow. Therefore the violet drops, or violet arc, in the primary bow, will be nearer to the centre of the bow than the red drops or red arc; that is, the innermost colour in the primary bow will be violet, and the outermost colour will be red. And, for the same reason, through the whole primary bow, every colour will be nearer to the centre P, as the rays of that colour are more refrangible.

But the violet rays, when they emerge so as to be effectual after two reflections, make a greater angle with the incident rays than the red ones; consequently the violet rays will make a greater angle with the line OP, than the red ones. But in the secondary rainbow the rays are twice reflected, and the angle which effectual rays make with OP is the distance of the coloured drop from P the centre of the bow. Therefore the violet drops or violet arc in the secondary bow will be farther from the centre of the bow than the red drops or red arc; that is, the outermost colour in the secondary bow will be violet, and the innermost colour will be red. And, for the same reason, through the whole secondary bow, every colour will be further from the centre P, as the rays of that colour are more refrangible.

RA'INDEER. *s.* (hpanan, Saxon; *rangifer*, Latin.) A deer with large horns, which, in the northern regions, draws sledges through the snow.

RAI'NINESS. *s.* (from *rainy*.) The state of being showery.

RAI'N-WATER. *s.* Water not taken from springs, but falling from the clouds (*Mortimer*).

RAI'NY. *a.* (from *rain*.) Showery; wet (*Shakspeare*).

To RAISE. *v. a.* (*reiser*, Danish.) 1. To lift; to heave (*Pope*). 2. To set upright: as, *he* raised *a mast*. 3. To erect; to build up (*Joshua*). 4. To exalt to a state more great or illustrious (*Bacon*). 5. To amplify; to enlarge (*Shakspeare*). 6. To increase in current value (*Temple*). 7. To elevate; to exalt (*Pr.*). 8. To advance; to promote; to prefer (*Clar.*). 9. To excite; to put in action (*Milton*). 10. To excite to war or tumult (*Shakspeare*). 11. To rouse; to stir up (*Job*). 12. To give beginning of importance to: as, *he* raised *the family*. 13. To bring into being (*Milton*). 14. To call into view from the state of separate spirits (*Sandys*). 15. To bring from death to life (*Romans*). 16. To occasion; to begin (*Brown*). 17. To set up; to utter loudly (*Dryden*). 18. To collect; to obtain a certain sum (*Gay*). 19. To collect; to assemble; to levy (*Milton*). 20. To give rise to (*Milton*). 21. To procure to be bred or propagated: as, *he* raised *sheep*. 22. *To* RAISE *paste*. To form paste into pies without a dish (*Spectator*).

RAI'SER. *s.* (from *raise*.) He that raises (*Taylor*).

RAISINS, grapes prepared by suffering them to remain on the vine till they are perfectly ripe, and then drying them in the sun, or by the heat of an oven. The difference between raisins dried in the sun and those dried in ovens, is very obvious: the former are sweet and pleasant, but the latter have a latent acidity with the sweetness that renders them much less agreeable.

The common way of drying grapes for raisins,

is to tie two or three bunches of them together while yet on the vine, and dip them into a hot lixivium of wood-ashes, with a little of the oil of olives in it. This disposes them to shrink and wrinkle; and after this they are left on the vine three or four days separated on sticks in an horizontal situation, and then dried in the sun at leisure, after being cut from the tree. The finest and best raisins are those called in some places Damascus and Jube raisins; which are distinguished from the others by their size and figure: they are flat and wrinkled on the surface, soft and juicy within, and near an inch long; and, when fresh and growing on the bunch, are of the size and shape of a large olive.

The raisins of the sun, and jar-raisins, are all dried by the heat of the sun; and these are the sorts used in medicine. However, all the kinds have much the same virtues: they are all nutritive and balsamic; they are allowed to be attenuant, are said to be good in nephritic complaints, and are an ingredient in pectoral decoctions: in which cases, as also in all others where astringency is not required of them, they should have the stones carefully taken out.

RAISIN-WINE. See WINE.

RAISIN (Market), a town in Lincolnshire, with a market on Thursday, situate near the source of the Ancholm, 16 miles N.E. of Lincoln, and 147 N. of London.

RAKE. *s.* (race, Saxon; *racche*, Dutch.) 1. An instrument with teeth, by which the ground is divided, or light bodies are gathered up (*Dryden*). 2. (*rekel*, Dutch, a worthless cur dog.) A loose, disorderly, vitious, wild, gay, thoughtless fellow; a man addicted to pleasure (*Pope*).

To RAKE. *v. a.* (from the noun.) 1. To gather with a rake (*May*). 2. To clear with a rake (*Thomson*). 3. To draw together by violence (*Hooker*). 4. To scour; to search with eager and vehement diligence (*Swift*). 5. To heap together and cover (*Suckling*).

To RAKE. *v. n.* 1. To search; to grope (*South*). 2. To pass with violence (*Sidney*).

RAKE OF A SHIP, is all that part of her hull which hangs over both ends of her keel. That which is before is called the fore rake, or rake forward, and that part which is at the setting on of the stern-post is called the rake aft, or afterward.

RAKE, in farriery. A horse is said to rake, when, having been strained, he goes lame, and drags one of his fore legs in a semicircle, which is most apparent when he trots.

RAKE OF COLTS. See RAG.

RA'KEHELL. *s.* (*rake* and *hell.*) A wild, worthless, dissolute, debauched, sorry fellow (*Spenser*).

RA'KEHELLY. *a.* (from *rakehell.*) Wild; dissolute (*Ben Jonson*).

RA'KER. *s.* (from *rake.*) One that rakes.

RA'KISH. *a.* (from *rake.*) Loose; lewd; dissolute (*Clarissa*).

RALEIGH (Sir Walter), an illustrious Englishman, born at Hayes, Devonshire, 1552. He was for some time at Oriel college, Oxford, and in 1569 he accompanied the volunteers whom Elizabeth sent to France to support the protestants. Though afterwards he resided in the Middle Temple he paid no attention to the law; but in 1578 embarked for the Netherlands against the Spaniards, and the next year he went with his half-brother sir Humphrey Gilbert on an expedition to discover North America. In 1580, he engaged in the wars of Ireland, and was one of the commissioners for the government of Munster. On his return to England, he became a favourite of the court by his polite attention to the queen. Walking among her attendants, he extricated her from a dirty part of the road which she was afraid to cross, by spreading his new plush cloak on the ground, over which she gently trod and passed clean. This courtesy gained him the queen's favour, and he gradually rose to places of distinction. In 1583, he sailed again with his brother Gilbert in an expedition to Newfoundland, and soon after he obtained letters patent, and sailed to America, where he discovered Wigandacoa, which was called Virginia, in honour of his virgin mistress, and in this country he afterwards in a second and third voyage settled flourishing colonies. He had been chosen into parliament for Devonshire in 1584, and knighted, and he was now appointed seneschal of Cornwall, and warden of the Stannaries. A fourth and a fifth expedition were fitted out to Virginia; and if he had done no other service to the nation, his recommendation of tobacco, which he first introduced into the country from Virginia, would in a commercial point of view have procured him high distinction. In 1588, his courage was displayed against the Spanish armada, to the destruction of which he ably contributed, and the following year he was employed in the restoration of Antonio, the expelled king of Portugal. In 1592, he was in the expedition sent to attack the Spaniards at Panama, and on his return he became an active speaker in the house of commons; but he incurred the displeasure of the clergy, by accepting the grant of the manor of Sherborne, which formerly belonged to the see of Salisbury. Though called an atheist, it appears, however, that he was a zealous asserter of God and of his providence. In 1593, he offended the queen by an amour with one of her maids of honour, daughter of sir Nicolas Throgmorton; but after being imprisoned for several months he made due reparation for his violation of decorum, by marrying the lady. He engaged in 1595, in the conquest of Guiana in South America, and after storming the city of St. Joseph, and taking the Spanish governor prisoner, he returned to England. He went afterwards against Cadiz, and then opposed Essex, and contributed to the defeat of his treasonable designs; but on the death of the queen his happiness was at an end. On the accession of James, he was stripped of his honors, and tried and condemned for

high treason, on charges not only frivolous but arbitrary. Though reprieved he remained several years a prisoner in the Tower, while his estates were lavished on Car, the royal favourite. During his long captivity, which was soothed by the attentions of his wife, he wrote some valuable works, among which is his history of the world. In 1616, after a confinement of nearly 13 years, he was permitted to leave his prison, and James, as if pretending first to discover his merits, sent him to explore the golden mines of Guiana. The affair proved unfortunate, sir Walter lost his eldest son, who was killed by the Spaniards, and after destroying the town, he returned home to meet the most cruel treatment. Incensed at his conduct, the Spaniards complained by Gundomar, their ambassador, and James ordered Raleigh to be seized. Though no blame could attach to him, the king ordered his execution on his former attainder In vain the unfortunate man pleaded in his defence, and asserted that his life could not be taken away in consequence of a sentence passed 15 years before, and which had been revoked, since in his late expedition the king had granted him power of life and death over his crew. Nothing, however, availed, the pusillanimous James either to please the Spaniards, or to gratify his own enmity, disgracefully assented to his death. He was beheaded in Old Palace Yard, 29th Oct. 1618, and suffered with magnanimity. His body was interred in St. Margaret's Westminster, but his head was preserved several years in his family. Sir Walter must be pronounced one of the greatest characters of these times. His perseverance in making discoveries first inspired the nation with that ardour after maritime distinction, which has since not only increased its commerce and prosperity, but raised its glory to the most exalted rank. He was distinguished not only as a bold navigator, and a valiant leader, but as an able negociator; and as a man of letters his works, composed in the obscurity of a dungeon, on subjects of history, politics, geography, and philosophy, as well as some respectable poetical pieces, will transmit his name with honour to the most distant posterity. His son Carew, who was born in the Tower, was author of some sonnets, of a defence of his father, &c. He was governor of Jersey in 1659, and died in 1666. (*Lempriere*).

RALLUS. Rail. In zoology, a genus of the class aves, order grallæ. Bill tnickish at the base, attenuated on the back towards the tip, compressed, a little incurved, pointed; tongue rough at the tip; body compressed; tail short; feet four-toed, cleft. Thirty-one species; scattered over the globe, three common to our own country. The following are chiefly worthy of notice:

1. R. crex. Crake. Land rail. Wings reddish-rusty; bill and legs brown-ash; irids hazel; feathers of the body reddish-brown the upper ones black in the middle; chin very pale; belly whitish-yellow. Inhabits sedgy places of Europe and Asia; nine and a half inches long; migrates; runs swiftly along the grass, but flies slowly with its long feet hanging down; feeds on seeds and insects; and grows prodigiously fat: its note is harsh, resembling the words *crek, crek*, whence its specific name; lays from twelve to sixteen eggs in the dry grass of a dirty white colour, with a few yellow spots; flesh very excellent. They are found singly and but rarely in different parts of England, in the months of July, August, and September, in the standing corn and clover, but principally in the latter; where, when found, they are prejudicial to pointers, by their incessantly running, while the dog continues drawing on a quick walk till his patience being quite exhausted, the pointer is induced to play the spaniel, and make a springing effort before they can be forced to take wing; after which they are easily brought down from the heaviness of their flight. There are two other varieties from variation of colour in the East and West Indies.

2. R. aquaticus. Brook-ouzel. Water-rail. Wings grey, spotted with brown; flanks spotted with white; bill orange beneath; blackreddish at the base; irids red; feathers of the upper part of the body olive-brown and black in the middle, the lower ones cinereous, those of the lower part of the belly and vent edged with rufous; quill-feathers dusky; lower tail-coverts white; tail-feathers short, black, the two middle ones at the tip, the rest edged with ferruginous; legs dusky red. Inhabits watery places in Europe and Asia, and found in our own country; twelve inches long; hides itself among the sedges; runs and swims with celerity, but flies heavily with its legs hanging down; eggs yellowish with dusky brown spots.

3. R. porzana. Spotted gallinule. Two middle tail-feathers edged with white; bill and legs pale olive; irids hazel; head brown, spotted with black; neck above and flanks brown-ash with small white spots; back and wing-coverts olive with black stripes, and near the edges of the feathers with white spots, the greater with white stripes and lines; cheeks, chin, and throat, pale grey, with brown spots; breast brown with white spots; belly varied with cinereous and white; vent ochre yellow. Inhabits Europe and North America, and found in our own country; frequents the sides of small streams, hiding itself among the bushes: nine inches long.

To RA'LLY. *v. a.* (*rallier*, French.) 1. To put di-ordered or dispersed forces into order (*Atterbury*). 2. (*railler*, French.) To treat with slight contempt; to treat with satirical merriment (*Addison*).

To RA'LLY. *v. n.* 1. To come together in a hurry (*Tillotson*). 2. To come again into order (*Dryden*). 3. To exercise satirical merriment.

RALPH (James), a miscellaneous writer, originally a school-master at Philadelphia. He came to London in the beginning of the second George's reign. His Night, a poem, and some theatrical pieces, were received with applause.

His History of England possesses merit, and some of his political pamphlets for a time enjoyed popularity. He died of the gout 1762 at Chiswick. He was one of the heroes of the Dunciad.

RAM, in zoology. See OVIS.

RAM (Battering), in antiquity, a military engine, used to batter down the walls of besieged places. See BATTERING RAM.

RAM'S HEAD, in a ship, is a great block belonging to the fore and main haulyards. It has three shives in it, in which the haulyards are put; and in a hole at the end are reeved the ties.

To RAM. *v. a.* 1. To drive with violence, as with a battering ram (*Bacon*). 2. To fill with any thing driven hard together (*Hayward*).

RA'MAGE. *s.* (from *ramus*, Lat.) Branches of trees.

RAMAH (anc. geog), a town of Benjamin, near Gibea, (Judges), called Rama of Saul (1 Sam. xxii.), six miles from Jerusalem to the north; memorable for the story of the Levite and his concubine; taken and fortified by Baasa, king of Israel, in order to annoy the kingdom of Judah. This Rama is mentioned Isa. x. Jer. xxxi. and Matth. ii. and is to be distinguished from Rama of Samuel, 1 Sam. xix. called also Ramatha, 1 Sam. i. 19. and Ramathaim Zophim, ibid. i. 1. which lay a great way to the west, towards Joppa, near Lydda, 1. Maccab. ii. the birth-place of Samuel; adjoining to the mountains of Ephraim, and the place of his residence, 1 Sam. xv. &c. (Josephus). Called Ramula in the lower age, (Gul. Tyrius). There is here a convent of the Fathers of the Holy Land, inhabited only by Portuguese, Spaniards, and Italians. The streets are narrow, and the houses contemptible; but there are many fine ruins of Christian churches and other buildings, which show what it has been formerly. It is 20 miles W. by N. of Jerusalem. Lon. 34. 55 E. Lat. 32. 0 N.

RAMANAD, a town of Hindustan, in the Carnatic, 54 miles S.W. of Madura, and 88 S. of Tanjore. Lon. 78. 56 W. Lat. 9. 20 N.

RAMANANCOR, an island of Asia, lying toward Cape Comorin. It is 23 miles in circumference; is very sandy, and has only a few villages and a temple. Lon. 79. 45 E. Lat. 9. 25 N.

RAMAZZINI (Bernardin), an Italian physician, born at Carpi, near Modena, in 1633. He studied at Parma, and took there his doctor's degree. In 1682 he became professor of physic at Modena, which office he filled with great credit eighteen years, and then removed to Padua, and in 1708 he was appointed rector of the college. He died in 1714. His works were published at London in 1716, 4to.

To RA'MBLE. *v. n.* (*rammelen*, Dutch.) To rove loosely and irregularly; to wander (*Locke*).

RA'MBLE. *s.* (from the verb.) Wandering; irregular excursion (*Swift*).

RA'MBLER. *s.* Rover; wanderer (*L'Estrange*).

RA'MBOOZE. RA'MBUSE. *s.* A drink made of wine, ale, eggs, and sugar (*Bailey*).

RAMBOUILLET, a town of France, in the department of Seine and Oise. Here was a palace, in which Francis I. died, in 1547, and Lewis XVI. made it a magnificent royal residence; but it was demolished in 1793, by order of the national convention. It is 27 miles S.W. of Paris.

RAMEAU (John Philip), a musician, born at Dijon 1683. He at first travelled with a strolling company, and afterwards was organist of Clermont cathedral in Auvergne. He, studying the principles of his art, produced his treatise on harmony, and his new system of music. In 1750 he published his famous demonstration of the principles of harmony, in which he makes the whole depend on a single and clear principle, the fundamental base, and for this excellent work he has been deservedly called the Newton of that science. He was manager of the opera at Paris, and composer to Lewis XV. who raised him to the rank of nobility. He died at Paris 1764. He was a man of exemplary character, a good husband, and a benevolent neighbour. As a theorist, he is deservedly admired by Handel.

RAMEHEAD, a promontory of Cornwall, S.W. of Plymouth, at the entrance of Plymouth Sound. On its summit is a chapel, (a sea mark) belonging to the village of Rame. Lon. 4. 20 W. Lat. 50. 18 N.

RAMENT, RAMENTUM, in botany. (a radendo, q. rasura.) A small particle of any thing; as gold-dust, saw-dust, or little chips, &c. Applied by Linnéus to the small loose scales that are frequently found on the stems of vegetables.

RAMENTA. The little slips, shreds, or filings of any thing. Raments as above.

RAMERA, a town of France, in the department of Aube, seated on the Aube, 18 miles N.E. of Troyes. Lon. 4. 30 E. Lat. 48. 32 N.

RAMEX. (dim. of *ramus*, a branch, from its protruding like a branch). An hernia.

RAMIFICATION. *s.* (*ramification*, Fr.) 1. A division or separation into branches; the act of branching out (*Hale*). 2. Small branches (*Arbuthnot*).

To RA'MIFY. *v. a.* (*ramifier*, Fr.) To separate into branches (*Boyle*).

To RA'MIFY. *v. n.* To be parted into branches (*Arbuthnot*).

RAMILLIES, a town of Austrian Brabant, remarkable for the great victory obtained by the duke of Marlborough, over the French, on Whitsunday 1706. It is ten miles N. of Namur, and 24 S.E. of Brussels. Lon. 4. 50 E. Lat. 50. 39 N.

RAMLA, a town of Palestine, the ancient Arimathea, now in a ruinous state; it is, however, the residence of a Turkish aga, who has about 200 troops under him. Here is a manufacture of soap, which is sen into all parts o

Egypt. It is 18 miles N.W. of Jerusalem. Lon. 35. 15 E. Lat. 32. 8 N.

RAMMEKENS, a seaport of the island of Walcheren, in the Dutch province of Zealand. It was one of the towns put into the hands of the English, as a security for a loan in the reign of queen Elizabeth. It is four miles S. of Middleburg. Lon. 3. 40 E. Lat. 51. 29 N.

RAMMELSBERG, a lofty, steep, and extensive mountain of Germany, in that part of the Hartz Forest which lies within the principality of Grubenhagen. On this mountain are 12 silver mines; and at the foot of it is seated the city of Goslar.

RA'MMER. *s.* (from *ram.*) 1. An instrument with which any thing is driven hard (*Moxon*). 2. The stick with which the charge is forced into the gun (*Wiseman*).

RA'MMISH. *a.* (from *ram.*) Strong scented.

RA'MOUS. *a.* (from *ramus*, Latin.) Branchy; consisting of branches (*Newton*).

To RAMP. *v. n.* (*ramper*, French.) 1. To leap with violence (*Spenser*). 2. To climb as a plant (*Ray*).

RAMP. *s.* (from the verb.) Leap; spring (*Milton*).

RAMPA'LLIAN. *s.* A mean wretch (*Shakspeare*).

RA'MPANCY. *s.* (from *rampant.*) Prevalence; exuberance (*South*).

RA'MPANT. *a.* (*rampant*, French.) Exuberant; overgrowing restraint (*South*).

RAMPANT, in heraldry, a term applied to a lion, leopard, or other beast that stands on its hind legs, and rears up his fore-feet in the posture of climbing, showing only half his face, as one eye, &c. It is different from saliant, in which the beast seems springing forward, as if making a sally.

RAMPART, in fortification, is an elevation of earth round a place capable of resisting the cannon of an enemy; and formed into bastions, curtins, &c.

To RA'MPART. *To* RA'MPIRE. *v. a.* (from the noun.) To fortify with ramparts (*Hayward*).

RAMPHASTOS. Toucan. In zoology, a genus of the class aves, order picæ. Bill enormous, empty, convex, serrate at the edges; each mandible incurvate at the tip; nostrils behind the base of the bill, long, narrow: tongue feathered at the edges; feet in most species gressorial.

The bill of the toucan has a most grotesque appearance, and has something of the shape of a mask, with a large and long nose, constructed to surprise and frighten children. Nature, wherever we can trace her object, has certainly formed nothing in vain; and hence it becomes us to believe that it is only because we cannot trace her in the present instance, that we do not perceive the object of this apparent deformity. We are nevertheless too apt to reason from our own limited powers alone; and in providing such an enormous beak for a bird of such moderate size, we regret the apparent waste in nature; and our regret is increased on finding, that this disproportionate instrument, instead of being, as it seems to us, of any service to the bird, cramps it in every operation. It is of no use in seizing, cutting, or dividing its food, which the animal is obliged to gobble up in entire lumps, without grinding or breaking. It is still less a weapon of defence, or a counterpoise in flying: on the contrary, it gives the bird a tottering motion that threatens to bring it to the ground, at the time it wishes to rise in the air.

Neither has nature been contented with admitting only one apparent deformity into the structure of this part of her offspring: the prodigal bill of the toucan incloses a tongue apparently as useless and extraordinary. It is not fleshy nor cartilaginous, like that of other birds, but exactly resembles a feather shut up in a large case.

The feathers of the toucan are greatly admired by the Brasilians; they make them up into articles of dress, and wear them only on extraordinary occasions. The feathers of the throat are of a bright and lively orange, and in request in Europe for making muffs. Notwithstanding the deformity of his bill and his tongue, the toucan wears a splendid dress: this circumstance, with his other peculiarities, have procured him the honour of being placed among the constellations of the south.

From the singular conformation of the tongue of these birds one would imagine that they are mute: they make, however, a considerable noise; their long repetition of a hissing sound is often heard at a great distance. The savages attribute great healing virtues to this extraordinary tongue: and employ it as a medicine in almost every disease. The nostrils of this class of birds are almost imperceptible, being concealed among the feathers upon the base of the beak, in most kinds; though in others, discernible upon the naked rostrum. The feet resemble those of the parrot tribe, having two toes before and two behind, but of a disproportionate length. The legs of the toucan are bare of feathers, but covered with scales that feel soft to the touch. These birds are spread over all the warm climates of America; and, being very sensible to cold, never quit them. They remove at different seasons, after ripe fruit, but are rather wanderers than migratory birds. They delight in marshy grounds, and feed principally upon the fruit of the palm tree. They swallow their food whole, their large beak being of no service in breaking it.

Though the toucan perches on the tops of very tall trees, his flight is heavy, and executed seemingly with great effort. Although he is continually in motion, yet his large beak gives him a grave and serious aspect.

The whole of this genus build in the holes of trees, that have been scooped out by the woodpecker: they lay only two eggs. When taken young they are easily tamed; and can be even brought to hatch their eggs within a house. When in their natural state no bird defends its young better: they sit in their cavity, placing

their large rostrum at the entrance; and should the monkey, or any other plunderer approach, he generally meets with such a reception, as prevents him from returning. The hole at which these birds enter is commonly so small, that their large bill nearly fills it; by this means they are more effectually guarded against birds, serpents, and other assailants. There are seventeen species of this genus. The two following are chiefly entitled to our attention:

1. R. tucanus. Yellow-breasted toucan. Blackish; abdominal band, vent and rump yellow; cheeks, chin, and neck orange; legs and claws lead-colour. Inhabits South America: nineteen inches long. Feeds upon pepper, as do several other species of the genus. The natives of Cayenne glue the skin and feathers of the neck of the bird upon their cheeks by way of ornament.

2. R. viridis, Grigri, or green toucan. Green; belly yellow; rump red. Inhabits with the last; fourteen inches long: and, like the last, fond of moist grounds, and plantations of palm trees. The head, throat, and neck are black; the back, wings, and tail, of a dark green, while the breast and belly are yellow. The bill is not of the same monstrous enormity with that of the toucan, being only about four inches and an half in length.

RAMPION, esculent, in botany. See CAMPANULA.

The root of this plant, which is fleshy, is cultivated both in France and in our own country as a salad. It it the rapunculus of Tournefort; the whole plant is full of a milky juice: the root biennial, spindle-shaped, sometimes branching; the skin upright, angular, two feet high, hairy towards the base, smooth above; branches alternate, short, upright; the segments of the calyx are awl-shaped, or setaceous, twice as long as the germ, with a small tooth on each side of the base; the flowers are upright; the corol blueish purple, sometimes very pale purple or whitish; each segment marked with three lines; the nectary fringed. It grows wild in England and France; and flowers in June, July, and August. Among us it is found in its native state in the fallow fields.

RAMSAY, a seaport of the Isle of Man, situate on a large bay, on the N.E. coast, 10 miles N. of Douglas. Lon. 4. 26 W. Lat. 54. 18 N.

RAMSAY (Andrew Michael), a Scotch writer, born at Ayre, in 1686. He studied at Edinburgh, where he became tutor to the son of the earl of Weems. After this he went to Holland to consult the theologians there on religion, but remained in as doubtful a state as before; at length he was converted from deism, by the illustrious Fenelon, in 1709. Through the friendship of this amiable prelate he was made governor to the duke de Charteau Thierry, afterwards prince de Turenne, and a knight of the order of St. Lazarus. He died in 1743 at St. Germain en laye, while in the office of intendant to the duke de Bouillon. He was the author of the travels of Cyrus, and other works.

RAMSAY (Allan), the Scots pastoral poet, was a barber in Edinburgh in the early part of the last century. His taste in poetry, however, has justly raised him to a degree of fame that may in some measure be considered as a recompence for the frowns of fortune. His songs are in universal esteem; as is also the only dramatic performance attributed to him, viz. Patie and Roger, or The Gentle Shepherd, a Scots pastoral. He died in 1763; and was father to the ingenious Mr. Ramsay, a celebrated painter of the present age, and who has likewise distinguished himself by some well-written tracts on various branches of polite literature, particularly the Investigator.

RAMSDEN (Jesse), of Halifax, Yorkshire, was son of a clothier. In 1751, he came to London, to be an engraver, and then applied himself to the making of mathematical instruments. His improvements in the theodolite, the barometer, Hadley's quadrant, and other mathematical and optical instruments were very important to science; and he acquired no little celebrity from his astronomical apparatus, quadrants, &c. He was the inventor of a very ingenious apparatus for dividing mathematical instruments, for which he received 615l. from the Board of Longitude. A description of this contrivance is given under the words RAMSDEN'S *Machine*, in the 2d vol. of Gregory's Mechanics.

RAMSEY, a town in Huntingdonshire, with a market on Saturday. It is seated in the fens, near the meres of Ramsey and Whitlesey; and had formerly a rich and celebrated abbey. It is 12 miles N.E. of Huntingdon, and 69 N. of London. Lon. 0. 19 W. Lat. 52. 26 N.

RAMSEY, an island on the coast of Pembrokeshire, two miles long and one and a half broad. Near it is a group of dangerous rocks, frequented in the breeding season by vast multitudes of sea-fowl, and known by the name of the Bishop and his Clerks. This island is four miles W. of St. David's, and 17 N.W. of Milford Haven. Lon. 5. 20 W. Lat. 51. 55 N.

RAMSGATE, a seaport in Kent, in the isle of Thanet, where two very fine stone piers have been built, for the security of ships, the harbour being near the Downs, between the N. and S. Foreland. Ramsgate has some trade to the Baltic, and is frequented as a bathing-place. It is four miles S. of Margate, 10 E.N.E. of Canterbury, and 73 E.S.E. of London. Lon. 1. 30 E. Lat. 51. 22 N.

RAMSONS, in botany. See ALLIUM.

RAMULE, in botany. (*ramulus*, a branchlet, little branch, or twig.) A subdivision of the branch.

RAMUS, in botany, a branch. Pars caulis. A subdivision of the stem.

RAMUS (Peter), was one of the most famous professors of the 16th century. He was born in Picardy in 1515. A thirst for learning prompted him to go to Paris when very young,

and he was admitted a servant in the college of Navarre. Spending the day in waiting on his masters, and the greatest part of the night in study, he made such surprising progress, that, when he took his master of arts degree, he offered to maintain a quite opposite doctrine to that of Aristotle. This raised him many enemies; and the two first books he published, Institutiones Dialecticæ, and Aristotelicæ Animadversiones, occasioned great disturbances in the university of Paris: and the opposition against him was not a little heightened by his deserting the Romish religion, and professing that of the Reformed.

Ramus also bore a part in a very singular dispute. About the year 1550, the royal professors corrected among other abuses, that which had crept into the pronunciation of the Latin tongue. Some of the clergy followed this regulation; but the Sorbonnists were much offended at it as an innovation, and defended the old pronunciation with great zeal. Things at length were carried so far, that a minister, who had a good living, was very ill treated by them; and caused to be ejected from his benefice for having pronounced *quisquis, quanquam*, according to the new way, instead of *kiskis, kankam*, according to the old. The minister applied to the parliament; and the royal professors, with Ramus among them, fearing he would fall a victim to the credit and authority of the faculty of divines, for presuming to pronounce the Latin tongue according to their regulations, thought it incumbent on them to assist him. Accordingly, they went to the court of justice, and represented in such strong terms the indignity of the prosecution, that the minister was cleared, and every person had the liberty of pronouncing as he pleased.

Ramus was bred up in the Catholic religion, but, as before observed, afterwards deserted it. He began to discover his new principles by removing the images from the chapel of his college of Presle, in 1552. Hereupon such a prosecution was raised against him by the Religionists, as well as Aristotelians, that he was driven out of his professsorship, and obliged to conceal himself. For that purpose, with the king's leave he went to Fontainbleau; where, by the help of books in the king's library, he prosecuted geometrical and astronomical studies. As soon as his enemies found out his retreat, they renewed their persecutions; and he was forced to conceal himself in several other places. In the mean time, his curious and excellent collection of books in the college of Presle was plundered: but after a peace was concluded in 1563, between Charles the 9th and the Protestants, he again took possession of his employment, and maintained himself in it with vigour, and was particularly zealous in promoting the study of the mathematics.

This continued till the second civil war in 1567, when he was forced to leave Paris and shelter himself among the Hugonots, in whose army he was at the battle of St. Denys. Peace having been concluded some months after, he was restored to his professorship; but, foreseeing that the war would soon break out again, he did not care to venture himself in a fresh storm, and therefore obtained the king's leave to visit the universities of Germany. He accordingly undertook this journey in 1568, and received great honours wherever he came. He returned to France, after the third war in 1571; and lost his life miserably, in the massacre of St. Bartholomew's day, 1572, at 57 years of age. It was said that he was concealed in a granary during the tumult; but discovered and dragged out by some peripatetic doctors who hated him; these, after stripping him of all his money under pretence of preserving his life, gave him up to the assassins, who, after cutting his throat and giving him many wounds, threw him out of the window; and his bowels gushing out inthe fall, some Aristotelian scholars, encouraged by their masters, spread them about the streets; then dragged his body in a most ignominious manner, and threw it into the river.

Ramus was a great orator, a man of universal llearning, and endowed with very fine quaities. He was sober, temperate, and chaste. He ate but little, and that of boiled meat; and drank no wine till the latter part of his life, when it was prescribed by the physicians. He lay upon straw; rose early, and studied hard all day; and led a single life with the utmost purity. He was zealous for the protestant religion, but at the same time a little obstinate, and given to contradiction. The protestant ministers did not love him much, for he made himself a kind of head of a party, to change the discipline of the protestant churches: his design was to introduce a democratical government in the church, but this design was traversed, and defeated in a national synod. His sect flourished however for some time afterwards, spreading pretty much in Scotland and England, and still more in Germany.

He published a great many books; but mathematics was chiefly obliged to him. Of this kind, his writings were principally these following:

1. Scholarum Mathematicarum libri 31.

2. Arithmeticæ libri duo.—Algebræ libri duo.—Geometriæ libri 27.

These were greatly enlarged and explained by Schoner, and published in two volumes 4to. There were several editions of them.—The Geometry, which is chiefly practical, was translated into English by William Bedwell, and published in 4to. at London, 1636.

Ramus's merit in his opposition to Aristotle, and his firmness in undermining his authority, is unquestionably great. But it has been doubted, and with much reason, whether he was equally successful in his attempts after a new logical institute. We have the following general outline of his plan in Dr. Enfield's History of Philosophy. "Considering dialectics as the art of deducing conclusions from pre-

mises, he endeavours to improve this art by uniting it with that of rhetoric. Of the several branches of rhetoric, he considers invention and disposition as belonging equally to logic. Making Cicero his chief guide, he divides his treatise on dialectics into two parts, the first of which treats of the invention of arguments, the second of judgments. Arguments he derives not only from what the Aristotelians call middle terms, but from any kind of proposition, which, connected with another, may serve to prove any assertion. Of these he enumerates various kinds. Judgments he divides into axioms, or self-evident propositions, and *dianoëa*, or deductions by means of a series of arguments. Both these he divides into various classes; and illustrates the whole by examples from the ancient orators and poets.

"In the logic of Ramus many things are borrowed from Aristotle, and only appear under new names; and many others are derived from other Grecian sources, particularly from the dialogues of Plato, and the logic of the Stoics. The author has the merit of turning the art of reasoning from the futile speculations of the schools to forensic and common use; but his plan is defective in confining the whole dialectic art to the single object of disputation, and in omitting many things which respect the general culture of the understanding and the investigation of truth. Notwithstanding the defects of his system, we cannot, however, subscribe to the severe censure which has been passed upon Ramus by lord Bacon and others; for much is, we think, due to him for having with so much firmness and perseverance asserted the natural freedom of the human understanding. The logic of Ramus obtained great authority in the schools of Germany, Great Britain, Holland and France; and long and violent contests arose between his followers and those of the Stagyrite, till his fame vanished before that of Descartes."

RAN. The preterit of *run*.

RAN, in the old English writers, means open or public robbery, so manifest as not to be denied. *Ran dicitur aperta rapina quæ negari non potest.* Lamb 125. Leg. Canut. cap. 58. Hence it is now commonly said of one who takes the goods of another injuriously and violently, that he has taken all he could *rap* and *ran*.

RANA. Frog. Toad. In zoology, a genus of the class amphibia, order reptilia. Body four-footed, naked; generally tailless; hind legs longer than the fore. This genus differs from the lacerta, in having a shorter body, broader, thicker head, and in general no tail. They feed on insects, are full grown the fourth year, and seldom live, excepting under particular circumstances, beyond the twelfth; fore-feet mostly cleft, four-toed; hind-feet palmate, five-toed, all without claws; are very salacious, adhering to the female for days, and even weeks; the tadpole is excluded from the egg, without feet, but with a tail resembling a fish's, which drops off as the legs are protruded; while tadpoles these animals have also a sort of gills and subsidiary lungs, and many a small tube on the lower lip by which they can affix themselves to other bodies; or near the left eye a vesicle from which they discharge water. In breeding time the fore-thumb of the male is warty. Toads are filthy in their aspect, and live in damp, obscure, dark places, and crawl out only by night; their eggs are in a long, connected chain. Frogs are more active, more about by day, and lay their eggs in a confused mass. The genus is thus subdivided:

A. Toads. Body warty, puffed up; legs shorter.

B. Frogs. Body more oblong, smooth; legs longer.

C. Hind-feet very long; claws lenticulate.

There are thirty-six species; chiefly natives of Europe and America: four common to our own country. The following are the principal:

1. R. pipa. Surinam toad. Toes of the fore-feet unarmed, four-cleft; of the hind-feet clawed, palmate; head flat, broad, short; beak spatula-shaped; eyes very small and remote; neck very short, wrinkled; body orbicular, flat, black-bay, with a hard cartilaginous skin; fore-toes round, hind very long. Inhabits the waters of Guiana, and is eaten by the natives. In this extraordinary animal the male, after the exclusion of the eggs, collects the mass together and smears it over the back of the female with its paws, where they are received into cellules upon the back, impregnated by the male and closed up: after some time, (about three months), the perfect young are extruded from these hollow tubercles on the back of the female, without gills, and, at first, without tails; the tails are produced soon after, and when the animal is perfected, drop off.

2. R. musica. Musical toad. Shoulders gibbous, dotted; body varied with lurid and brown; fore-feet cleft; hind-feet subpalmate, five-toed, with hardly any claws. Inhabits fresh waters in Surinam; larger than the common toad: in the evening and during the whole night makes a musical kind of croaking.

3. R. bufo. Common toad. Body lurid, brown. Three other varieties.

β. Body olive: an unequal yellowish red band down the side.

γ. Body with confluent green spots and warts on the spots of the same colour, those of the intervals red; the spaces between bicoloured.

δ. Much less in size.

Inhabits the woods and shady damp places of Europe; lives during spring and summer in shallow stagnant water; in winter in muddy places, and not unfrequently in holes of its own digging, feeds by night on various insects: is so tenacious of life that it has been found alive inclosed in rocks and in the center of stone walls, in which places it must have existed for nearly half a century: is domesticated by the natives of Ucrania; and has been once or twice domesticated in our own country, and found to

live upwards of forty years. It is devoured by the eagle and hawk tribes. Its slimy and frothy discharge secreted on being disturbed does not appear to be poisonous to man or any of the larger animals, although the smaller lizards are said on biting toads to be paralytic for some time afterwards. The common toad may, upon the whole, be regarded as an animal perfectly innoxious.

4. R. rubeta. Natter jack. Vent obtuse; a yellow line on the back; body beneath spotted with black; body above dirty yellow, clouded with brown and covered with porous pimples of unequal sizes. Inhabits dry sandy places of Europe; appears in the evening, especially after showers, and is the species which has been supposed to have been rained down; is of quicker motion than the last: two and a quarter inches long, one and a quarter broad.

5. R. rombina. Laughing toad. Belly orange, spotted with sky-blue. Three other varieties.

6. Belly black, with clear white spots and points.

γ. Brown; with white spots; sides and round the joints red.

δ. With a very loud sonorous voice.

Inhabits fenny places in Germany and Helvetia; leaps like a frog; emits a clear sound like a man laughing; resembles the common toad, but is small, black, and everywhere rough; with dots on the upper part and variegated beneath, with a transverse wrinkle under the neck.

6. R. cornuta. Horned toad. Eye-lids horned; head large, rounded before; mouth excessively large; eye-lids soft, mucronate, trifid at the point, the eyes seated in the middle; body greenish-brown, with broad, longitudinal whitish stripes on the back; legs transversely fasciate with brown; when full grown the back, thighs, and vent are spiny. Inhabits Virginia and Surinam: of all animals this appears to be the most hideous and deformed.

7. R. ridibunda. Jocular toad. Body brown; spotted above with cinereous; dorsal line yellow or greenish; beneath smooth, whitish; haunches brown, spotted with milk-white. Found in great numbers near the rivers which empty themselves into the Caspian sea; never ventures on dry land; is very large, and oftenweighs more than half a pound: resembles the common frog, but broader and shorter: its voice in the evening is like a man laughing.

8. R. variabilis. Changeable toad. Colour variable; back and sides gibbous; warts yellowish in the centre, very small on the middle of the back, and larger on the most prominent part of the flanks. Inhabits shady places in lower Germany; above two inches long; in its manners holds an intermediate rank between the toad and frog, when full awake the body is white with green spots; in the heat of the sun entirely cinereous; when asleep the spots only are cinereous; and when torpid the body is flesh-colour.

9 R. pipiens. Clamorous frog. Green; with numerous ocellate spots, surrounded with a yellowish ring: ears, in the living animal, of a shining golden colour; region of the arms wrinkled. Inhabits running waters in North America; from the mouth to the end of the feet from five to six inches long; during the spring, and especially by night, or on the approach of a storm makes a continually clamorous noise; takes prodigious leaps.

10. R. temporaria. Common frog. Back flattish, subangular. Another variety, above dirty olive, with large warty spots, the head above plain, beneath whitish; twice the size of the common frog. The first inhabits Europe, the second Persia. This species lives during spring in the water among toads, in summer on land, at which time it is silent; feeds on various insects; and is the prey of ducks and cranes; croaks when in muddy ditches. The second in its croaking at night makes a noise like an angry man.

11. R. esculenta. Esculent frog. Body angular; back transversely gibbous; belly marginate. Inhabits the fens and waters of Europe: the male makes a continual croaking in an evening, especially before rain, with the angles of the mouth distended in a globular form: when irritated will pursue and destroy a pike. It is a voracious animal, and will frequently seize on young birds of various kinds, mice, and even ducklings, swallowing them whole.

12. R. paradoxica. Paradoxical frog. Thighs obliquely streaked behind; body pale yellow with ochre-colour spots: fore-feet four-toed, not webbed; hind-feet five-toed, palmate, with the rudiments of a sixth. Inhabits South America. The tail of this animal in the tadpole state is very large, fleshy, two-edged, and has given rise to the opinion that it gradually became a fish, and afterwards changed to a frog: but like the rest of its tribe it gradually drops its branchial fins and tail, and thus arrives at its perfect frog-state.

13. R. arborea. Tree-frog. Body green; beneath whitish, granulate; feet cleft; on each side a yellow curved line. Five or six other varieties, chiefly from variety of colour. Inhabits Europe and America; lives under the foliage of trees, and adheres strongly to the leaves by means of a mucus upon its orbicular flattened claws; feeds on insects; frequently changes its colours; the male in breeding time has an orbicular gular pouch, at which season and before storms it is much inflated. See Nat. Hist. pl. CLXXI.

RANAI, one of the Sandwich islands, in the N. Pacific Ocean, lying S.W. of the passage between Mowee and Morotoi, about three leagues from each. The S. part is high and craggy; but the other parts have a better aspect, and are well inhabited. It produces very few plantains and bread fruit trees, but abounds in yams, sweet potatoes, and taro.

RANATRA, in the entomology of Fabricius a tribe of the hemipterous genus NEPA, which see.

RANC or RANS (John), a painter, born

Rana.

R. Paradoxica or Paradoxical Frog.

R. Cornuta or Horned Toad.

London, Published by Sherwood & Cº Paternoster Row, July 1ˢᵗ 1812.

at Montpelier in 1674, died at Madrid 1735. He was a scholar of Rigaud, whose niece he espoused. He obtained great reputation by his talent for portrait painting; and was received in the academy of painting in 1703, and appointed in 1724 first painter to the king of Spain.

To RANCH. *v. a.* (from *wrench.*) To sprain; to injure with violent contortion (*Garth*).

RA'NCID. *a.* (*rancidus*, Latin.) Strong scented (*Arbuthnot*).

RANCID. Oily substances are said to have become rancid when by keeping they acquire a strong offensive smell, and altered taste. For the cause and means of correction, see BUTTER.

RANCIDITY. Oils of all kinds contain a certain portion of acid, which, from the term *sebum*, which is Latin for fat, is, in modern chemistry, denominated sebacic acid. This acid is so ultimately united with oily base, and especially in butter, fat, and other fixed oils, that none of its properties are discoverable when fresh. But when, by a sufficient degree of heat, a decomposition has taken place, the acid is extricated, the properties of the fixed oil are changed, and it becomes sharp and irritating. The same effect takes place, moreover, when fat or other fixed oil has been for some time exposed to the atmosphere; in which case a partial decomposition ensues, a small portion of the acid is set at liberty, the colour becomes brownish or yellowish, and the taste and smell are sharpish and disagreeable: this property of the fixed oils is denominated rancidity: and during its existence these oils evince a difference in their chemical powers; for alcohol that, in their mild state, had no effect upon them, now dissolves the rancid part, though it still leaves the rest untouched. De Machy, a Parisian chemist, has therefore very properly observed, that by means of washing in alkohol fat may be deprived of all its rancid part, and have the rest of it rendered sweet. Pœrner purposes, as a more economical plan, to deprive it of this rancidity by mixing and boiling it with fresh spring water, to skim it, and repeat the operation. Macquer proposes to add a little calcareous earth or alkali to the water, the better to absorb the rancid acid, and afterwards carries off, by edulcoration with a large quantity of pure water, all the saline or soapy matter that may have been formed.

From such observations Morveau has no doubt that the developed acid puts the oil, now no longer a perfect fat, into a state of soap; since otherwise it could not be extracted by water alone, whilst the properties of the unchanged fat would to a certain point be altered. Fourcroy is of opinion, that this change in fat arises from the fermentation of a peculiar animal mucilage, of which fat always retains a certain portion intimately combined with it, and that the rancidity proceeds from the escape of fixed air. On this supposition the addition of fixed air must correct the rancid property; and Siessert informs us, this was actually accomplished by mixing sweet fruits or honey with rancid oils, so as to occasion a fermentation and production of fixed air, by which means their proper gass is restored to them. Rozier and Œttinger have confirmed this observation, and have even corrected and meliorated fat, and rendered it sweeter and firmer byputting apples or other fruits into the pot in which it was melted. Rozier even recommends a sponge to be dipped in a mixture of alum and chalk, and to be placed at the bottom of the oil-vessel, by which means the acid of the alum will extricate the fixed air from the chalk which will mix with the oil. Morveau himself, indeed, is not far from admitting a kind of fermentation in fat: that is, a more or less sensible motion, determined by the affinities of the air and the heat, producing new combinations. In short, he thinks it very probable that oils change in the manner acids do: that a new portion of the acidifying principle unites to them in the same way, which last is proved from the experiments of Hasse; and Scheele precisely says that the air is diminished by oils which become resinous.

Morveau, however, confesses that much is wanting to conciliate this theory with all the phænomena. For he observes, 1st, that it supposes an animalization in fat which is opposed by facts. 2dly. Recent fat, distilled in close vessels, undergoes a change perfectly analogous; some developed acid is in like manner formed; and hence it must be acknowledged that the acidifying principle pre-existed in the fat; that it was there in sufficient quantity instantly to produce the change which the access of air occasions in a length of time; or it must be said with the celebrated Scheele, that the vital air may proceed here from the decomposition of the matter of heat. Fat is also soluble in alcohol, after it has been precipitated from soap by means of acids.

It would be of use to examine what influence the sweet saccharine matter which Scheele found in oils has upon their rancidity. It is said that if fat or butter be boiled with half the weight of litharge in water to the consistence of an ointment, the water becomes sweet, and by evaporation may be converted into a syrup. This syrup is pure, and contains nothing but saccharine matter if the oil be mild, but if rancid, a little of the litharge, which however may be precipitated by vitriolic acid. By a stronger heat an inflammable vapour arises; and in order to be forced over it requires the boiling heat of oil of vitriol. In this state it is found partly undecomposed, having its sweet taste while the other part is empyreumatic, and is converted into a brown oil with a smell of alcohol; a light spongy coal remains, containing the calx of lead.

RA'NCIDNESS. RANCI'DITY. *s.* (from *rancid.*) Strong scent, as of old oil.

RA'NCOROUS. *a.* (from *rancour.*) Malignant; malicious; spiteful in the utmost degree (*Shakspeare*).

RA'NCOUR. *s.* (*rancoeur*, old French.) 1. Inveterate malignity; malice; steadfast impla-

ability; standing hate (*Spenser*). 2. Virulence; corruption (*Shakspeare*).

RAND. *s.* (*rand*, Dutch.) Border; seam.

RANDALSTOWN, a borough of Ireland, in the county of Antrim, four miles W.N.W. of Antrim.

RANDERADT, a town of Westphalia, in the duchy of Juliers, 10 miles N.W. of Juliers. Lon. 6. 30 E. Lat. 51. 5 N.

RANDIA, in botany. See GARDENIA.

RA'NDOM. *s.* (*randon*, Fr.) Want of direction; want of rule or method; chance; hazard; roving motion (*Milton*).

RA'NDOM. *a.* Done by chance; roving without direction (*Dryden*).

RANDOM-SHOT, is a shot discharged with the axis of the gun elevated above the horizontal or point-blank direction.

RANDOM, of a shot, also sometimes means the range of it, or the distance to which it goes at the first graze, or where it strikes the ground. See RANGE.

RANG. The preterit of *ring*.

To RANGE. *v. a.* (*ranger*, French.) 1. To place in order; to put in ranks (*Clarendon*). 2. To rove over (*Gay*).

To RANGE. *v. n.* 1. To rove at large (*Milton*). 2. To be placed in order (*Shakspeare*). 3. To lie in a particular direction (*Drayton*).

RANGE. *s.* (*rangée*, French.) 1. A rank; any thing placed in a line (*Newton*). 2. A class; an order (*Hale*). 3. Excursion; wandering (*South*). 4. Room for excursion (*Addison*). 5. Compass taken in by any thing excursive, extended, or ranked in order (*Pope*). 6. Step of a ladder (*Clarendon*). 7. A kitchen grate (*Spenser*).

RANGE, in gunnery, sometimes means the path a shot flies in. But more usually,

Range now means the distance to which the shot flies when it strikes the ground or other object, called also the amplitude of the shot. But range is the term in present use.

Were it not for the resistance of the air, the greatest range, on a horizontal plane, would be when the shot is discharged at an angle of 45° above the horizon; and all other ranges would be the less, the more the angle of elevation is above or below 45°; but so as that at equal distances above and below 45°, the two rangers are equal to each other. See GUNNERY and PROJECTILES.

RA'NGER. *s.* (from *range*.) 1. One that ranges; a rover; a robber (*Spenser*). 2. A dog that beats the ground (*Gay*). 3. An officer who tends the game of a forest.

RANGAMATTY, a town of Hindustan, capital of a circar in Bengal. It has a celebrated pagoda, and stands near the Burrampooter, on the confines of Assam and Bootan, 170 miles N.E. of Moorshedabad. Lon. 90. 8 E. Lat. 26. 10 N.

RANGOON, a seaport of Pegu, and the principal mart for teak timber, in the Birman empire. It was founded by Alompro, king of Birmah, in 1755; and is the residence of a governor, who lives within the fort. Here is a custom-house built of brick, but the wharfs and dwelling-houses are all constructed of wood. In its neighbourhood are numerous convents, and two miles N. of the town, on a rocky eminence, is a very grand temple, which is a splendid object at the distance of many miles. Rangoon is seated on the most eastern branch of the Irrawaddy (which hence to the sea is called the Rangoon or Syriam river) 18 miles N. of its mouth, and 60 S. of Pegu. Lon. 96. 10 E. Lat 26. 48 N.

RANINE ARTERY. Arteria ranina. Sublingual artery. The second branch of the external carotid.

RANK. *a.* (nanc, Saxon.) 1. High-growing; strong; luxuriant (*Spenser*). 2. Fruitful; bearing strong plants (*Sandys*). 3. (*rancidus*, Latin.) Strong scented; rancid (*Shakspeare*). 4. High tasted; strong in quality (*Ray*). 5. Rampant; highgrown (*Shakspeare*) 6. Gross; coarse (*Swift*). 7. The iron of a plane is set *rank*, when its edge stands so flat below the sole of the plane, that it will take off a thick shaving (*Moxon*).

RANK. *s.* (*range*, French.) 1. Line of men placed abreast (*Shakspeare*). 2. A row (*Milton*). 3. Range of subordination (*Locke*). 4. Class; order (*Atterbury*). 5. Degree of dignity or excellence (*Addison*). 6. Dignity; high place: as, *he is a man of* rank.

To RANK. *v. a.* (*ranger*, French.) 1. To place abreast (*Milton*). 2. To range in any particular class (*Shakspeare*). 3. To arrange methodically (*Milton*).

To RANK. *v. n.* To be ranged; to be placed (*Tate*).

RANK and PRECEDENCE, in the army and navy, are as follow:

RANK (Engineers'). Chief, as colonel; director, as lieutenant-colonel; sub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as captain-lieutenant; sub-engineer, as lieutenant; practitioner engineer, as ensign.

RANK (Navy). Admiral, or commander in chief of his majesty's fleet, has the rank of a field-marshal; admirals with their flags on the main-top-mast-head, rank with generals of horse and foot; vice-admirals, with lieutenant-generals; rear-admirals, as major-generals; commodores, with broad pendants, as brigadier-generals; captains of post-ships, after three-years from the date of their first commission, as colonels; other captains, as commanding post-ships, as lieutenant-colonels; captains, not taking post, as majors; lieutenants, as captains.

RANK between the Army, Navy, and Governors.

ARMY.	NAVY.	GOVERNORS.
General in chief	Admiral in chief	Commander in chief of the forces in America
Generals of horse	Admiral with a flag at the main-top-mast	Captain-general of provinces
Lieutenant-generals	Vice-admirals	Lieutenant-generals of provinces
Major-generals	Rear-admirals	Lieutenant-governors and presidents
Colonels	Post-captains of 3 years	Lieutenant-governors not commanding
Lieutenant-colonels	Post-captains	Governors of charter colonies
Majors	Captains	Deputy-governors
Captains	Lieutenants	Established by the king, 1760

To RA'NKLE. *v. n.* (from *rank.*) To fester; to breed corruption; to be inflamed in body or mind (*Sandys*).

RA'NKLY. *ad.* (from *rank.*) Coarsely; grossly (*Shakspeare*).

RA'NKNESS. *s.* (from *rank.*) Exuberance; superfluity of growth (*Shakspeare*).

RA'NNY. *s.* The shrewmouse (*Brown*).

RANNEQUIN (N.), an engineer of Liege, 1648, known for the machine of Marly which raised water to the top of a hill 502 feet above its level, with such power that not less than 5258 tons are forced up every 24 hours. He died 1708.

RANNOCH (Loch), a lake of Scotland, in the N. part of Perthshire, 11 miles in length. It receives the waters of Loch Ericht, from the N. and communicates with Loch Tumel on the E. and Loch Lidoch on the W. On its S. side is a forest of birch and pine.

RANS (Bertrand de), of Rheims, after living as a hermit in the forest of Parthenay and Tournay, imposed himself in 1226 upon the credulity of the people as the emperor Baldwin I. of Constantinople, who about 20 years before had been defeated by the Bulgarians, and put to death. Though the daughter of Baldwin discovered his artifice, the imposture prevailed, and Rans was acknowledged by the Flemish as lawful sovereign. At last the usurper was seized, and, confessing his guilt, was hanged at Lisle.

To RA'NSACK. *v. a.* (pan, Saxon, and *saka*, Swedish, to search for or seize.) 1. To plunder; to pillage (*Dryden*). 2. To search narrowly (*Woodward*). 3. To violate; to deflour (*Spenser*).

RANS DES VACHES. An air of much celebrity among the Swiss; and performed by their young herdsmen on the bag-pipe, while they watch their flocks on the mountains.

RA'NSOME. *s.* (*rançon*, Fr.) Price paid for redemption from captivity or punishment (*Tillotson*).

To RA'NSOME. *v. a.* (*rançonner*, Fr.) To redeem from captivity or punishment (*Milton*).

RA'NSOMELESS. *a.* (from *ransome.*) Free from ransome (*Shakspeare*).

RA'NSOMER. *s.* (from *ransome.*) One that redeems.

To RANT. *v. n.* (*randen*, Dutch.) To rave in violent or high sounding language (*Shakspeare*).

RANT. *s.* (from the verb.) High sounding language (*Granville*).

RANTAMPOUR, a town and fortress of Hindustan, capital of a circar of the same name, in the country of Agimere. It is 96 miles E. of Agimere, and 105 W.S.W. of Agra. Lon. 76. 57 E. Lat. 26. 35 N.

RA'NTER. *s.* (from *rant.*) A ranting fellow.

RA'NTIPOLE. *a.* Wild; roving; rakish.

To RA'NTIPOLE. *v. n.* To run about wildly. A low word (*Arbuthnot*).

RANTZAN (Josias), of Holstein, left the Danish service for the French, and was made marshal by Lewis XIII. He lost an eye 1636 at Dole, and afterwards an arm, a leg, and one of his ears. In 1645 he became a protestant, and died five years after in prison. He is known as the active instrument by whom the protestant religion was established in Denmark.

RANULA. (from *rana*, a frog; so called from its resemblance to a frog, or because it makes the patient croak like a frog.) An inflammatory or indolent tumour under the tongue. These tumours are of various sizes and degrees of consistence, seated on either side of the frænum. Children, as well as adults, are sometimes affected with tumors of this kind; in the former they impede the action of sucking; in the latter, of mastication, and even speech. The contents of them are various; in some, they resemble the saliva, in others, the glairy matter found in the cells of swelled joints. Sometimes, it is said that a fatty matter has been found in them; but from the nature and structure of the parts, we are

sure that this can seldom happen; and in by far the greatest number of cases we find that the contents resemble the saliva itself. This, indeed, might naturally be expected, for the cause of these tumours is universally to be looked for in an obstruction of the salivary ducts. Obstructions here may arise from a cold, inflammation, violent fits of the tooth-ach, attended with swelling in the inside of the mouth; and in not a few cases we find the ducts obstructed by a stony matter, seemingly separated from the saliva, as the calculous matter is from the urine; but where inflammation has been the cause, we always find matter mixed with the other contents of the tumor. As these tumors are not usually attended with much pain, they are sometimes neglected, till they burst of themselves, which they commonly do when arrived at the bulk of a large nut. As they were produced originally from an obstruction in the salivary duct, and this obstruction cannot be removed by the bursting of the tumour, it thence happens that they leave an ulcer extremely difficult to heal, nay, which cannot be healed at all till the cause is removed.

RANUNCULUS. Crow-foot; butter-cups; butter-flower. In botany, a genus of the class polyandria, order polygynia. Calyx five-leaved; petals from five to eight with a melliferous pore on the inside of the claw of each; seeds naked. Fifty-nine species, scattered over the globe; fifteen indigenous to our own country. The following are the chief.

1. R. Asiaticus. Persian crow-foot; garden ranunculus. Upright, branched stem, pubescent, round; leaves ternate and twice ternate; leaflets trifid, cut; stem branched towards the bottom; flowers terminal, with the stem naked for a considerable length below them: varies much in size and colour; the petals frequently of different colours on the two surfaces: appear in May, may be protracted in the shade for a month; seeds ripe in July. A native of Asia and the Levant. The varieties are exceedingly numerous, and partitioned into two sections, the old Turkey, and the Persian; the varieties of the latter amounting to many hundreds, and much richer and more beautiful than those of the preceding.

2. R. aconiti folius. Aconite-leaved crow-foot or ranunculus. A very handsome plant; three or four feet high, and branchy; stem hollow; leaves five-lobed, toothed, with the lobes pointed; the middle lobes three-cleft; upper floral leaves in finger-like, sessile, lanceolate divisions; flower white, terminal on each branch. A native of the Alps.

3. R. repens. Creeping crow-foot. Perennial root with numerous whitish fibres; stems several from one root, a foot long, beset with numerous hairs, throwing out long creeping runners; leaves compound, uppermost very entire; flowering stems erect, branched, leafy, generally supporting two flowers. Flowers in June. Found wild in our own meadows. There is a variety cultivated in the gardens with double flowers.

4. R. amplexicaulis. Embracing-leaved crow-foot. Leaves partly surround the stalk at their base, whence the trivial name; of a grayer or more glaucous hue than most of the other species; which, joined to the delicate whiteness of the flower, gives it a peculiar grace, in the midst of other hardy herbaceous plants. A native of the Appenines and Pyrennees. Flowers in April and May.

5. R. acris. Upright meadow crow-foot. Root perennial, tuberose, with many long simple white fibres; stem upright, two feet high, round, hollow, hairy, not very leafy, branchy at top; calyx spreading; peduncles round; leaves three-parted, in many segments; the upper linear. Found wild in our own meadows; flowers in June and July.

There is a variety with double flowers, chiefly cultivated in the gardens, and known by the name of yellow bachelor's buttons.

This, and some other species of ranunculus, have, for medical purposes, been chiefly employed externally as a vesicatory, and are said to have the advantage of a common blistering plaster, in producing a quicker effect, and never causing strangury; but, on the other hand, it has been observed, that the ranunculus is less certain in its operation, and that it sometimes occasions ulcers, which prove very troublesome and difficult to heal. Therefore their use seems to be applicable only to certain fixed pains, and such complaints as require a long continued topical stimulus or discharge from the part, in the way of an issue, which, in various cases, has been found to be a powerful remedy.

On being chewed, they corrode the tongue; and, if taken into the stomach, bring on all the deleterious effects of an acrid poison. The corrosive acrimony which this family of plants possesses was not unknown to the ancients, as appears from the writings of Dioscorides; but its nature and extent had never been investigated by experiments, before those instituted by C. Krapf, at Vienna, by which we learn, that the most virulent of the Linnéan species of ranunculus are the bulbosus, sceleratus, acris, arvensis, thora, and illyricus.

The effects of these were tried either upon himself or upon dogs, and show, that the acrimony of the different species is often confined to certain parts of the plant, manifesting itself either in the roots, stalks, leaves, flowers, or buds; the expressed juice, extract, decoction, and infusion of the plants were also subjected to experiments. In addition to these species mentioned by Krapf, we may also notice the ranunculus fammula, and especially the ranunculus alpestris, which, according to Haller, is the most acrid of this genus. Mr. Curtis observes, that even pulling up the ranunculus acris, the common meadow species, which possesses the active principle of this tribe in a very considerable degree throughout the whole herb, and carrying it to some little distance, excited a considerable inflammation in the palm of the hand in which it was held. It is necessary to remark, that the acrimonious quality of these plants is not of a fixed nature; for it may

be completely dissipated by heat; and the plant, on being thoroughly dried, becomes perfectly bland. Krapf attempted to counteract this venomous acrimony of the ranunculus by means of various other vegetables, none of which was found to answer the purpose, though he thought that the juice of sorrel, and that of unripe currants, had some effect in this way; yet these were much less availing than water; while vinegar, honey, sugar, wine, spirit, mineral acids, oil of tartar, p. d. and other sapid substances, manifestly rendered the acrimony more corrosive. It may be also noticed, that the virulency of most of the plants of this genus depends much upon the situation in which they grow, and is greatly diminished in the cultivated plant. The ranunculus acris is more generally known in the pharmacopœias by the name of ranunculus pratensis.

6. R. flammula. Leaves ovate-lanceolate, petioled; stem declining. This species also forms an article in some pharmacopœias under the specific name of FLAMMULA, which see. It grows wild in the wet marshes of our own country.

7. R. ficaria. Pile-wort. Found wild in our hedges; and known for its medical properties in the dispensatories under the name of CHELEDONIUM MINUS, which see.

8. R. sceleratus. Water-crow-foot. Found in marshy places in our own country and other parts of Europe, and employed in the dispensaries under the name of ranunculus palustris. Its leaves are so extremely acrid that the beggars in Switzerland are said, by rubbing their legs with them, to produce a very fetid and acrimonious ulceration.

The first sort and its varieties may be readily increased by offsets taken from the roots, and new varieties may be raised from the seeds. The roots should be planted early in the spring; February, if the weather be fine, is the best month.

For the second sort the seeds should be made use of in preference to any other method; and they should be collected from the best plants of the semi-double kinds, and be sown in flat pans or boxes filled with light rich earth in August.

The other species may be easily propagated by roots, which should be slipped or parted in autumn when the plants have done flowering, or in the spring before they begin to shoot.

RANUNCULUS ALBUS. The name given in the pharmacopœias to the ANEMONE NEMEROSA, which see. The bruised leaves and flowers are said to cure tinea capitis applied to the part. It is said that the Kamschadales poison their arrows with the juice of its root.

RANUNCULUS GLOBE. See TROLLIUS.

To RAP. *v. n.* (hpæppan, Saxon.) 1. To strike with a quick smart blow (*Prior*). 2. *To* RAP *out*. To utter with hasty violence (*Addison*).

To RAP. *v. a.* (from *rapio extra se*, Latin.) 1. To affect with rapture; to strike with ecstacy: to hurry out of himself (*Pope*). 2. To snatch away (*Milton*). 3. To seize by violence (*Drayton*). 4. To exchange; to truck. A low word.

To RAP *and rend*. To seize by violence. See RAN.

RAP. *s.* (from the verb.) A quick smart blow (*Arbuthnot*).

RAPA'CIOUS. *a.* (*rapace*, French; *rapax*, Lat.) Given to plunder; seizing by violence (*Pope*).

RAPA'CIOUSLY. *ad.* (from *rapacious*.) By rapine; by violent robbery.

RAPA'CIOUSNESS. *s.* (from *rapacious*.) The quality of being rapacious.

RAPA'CITY. *s.* (*rapacité*, Fr. *rapacitas*, Latin.) Addictedness to plunder; exercise of plunder; ravenousness (*Sprat*).

RAPE. *s.* (*raptus*, Lat.) 1. Violent defloration of chastity (*Shakspeare*). 2. Privation; act of taking away (*Chapman*.) 3. Something snatched away (*Sandys*). 4. Fruit plucked from the cluster (*Ray*).

RAPE OF WOMEN, is where a man has carnal knowledge of a woman by force, and against her will, which is by our law a capital felony, and subjects the offender to the punishment of death, which is never remitted. By 18 Elizabeth, c. 7, if any person shall, unlawfully and carnally, know and abuse any woman child under the age of ten years, whether with her consent or against it, he shall be punished as for a rape. And it is not a sufficient excuse in the ravisher to prove that she is a common strumpet; for she is still under the protection of the law, and may not be forced. Nor is the offence of a rape mitigated, by showing that the woman at last yielded to the violence, if such her consent were forced by fear of death or duress; nor is it any excuse that she consented after the fact.

The civilians make another kind of rape, called rape of subordination or seduction; which is seducing a maid either to uncleanness or marriage, and that by gentle means, provided there is a considerable disparity in the age and circumstances of the parties.

RAPE is also a name given to a division of a county, and sometimes means the same as a hundred, and at other times signifies a division consisting of several hundreds; thus Sussex is divided into six rapes, every one of which, besides its hundreds, has a castle, a river, and a forest, belonging to it. The like parts in other counties are called tithings, lathes, or wapentakes.

RAPE, in botany, a species of BRASSICA, which see.

RAPHAEL (Sanzio), an illustrious painter, born at Urbino 1483. His father was a painter, and under him and Perugino he cultivated his talents, after which he visited Siena and Florence, to see the works of Leonardo da Vinci, and Michael Angelo. By studying the best masters he rose to eminence, and merited the appellation of the divine. He also excelled as an architect, and was employed by Leo X. in the building of St. Peter's at Rome, and he enjoyed also the esteem of Francis I. of France,

and of other princes. He unfortunately was too much given to licentious pleasures, which at last hurried him to an untimely grave 1520. He was buried in the Rotunda at Rome. He surpassed, says a connoisseur, all modern painters, because he possessed more of the excellent parts of painting, and above all he possessed the graces in so advantageous a manner, that he has never since been equalled by any other. For an account of his celebrated cartoons, see CARTOONS.

RAPHANIA. (from *raphanus*, the radish or sharlock; because the disease is said to be produced by eating the seeds of that plant.) A genus of diseases in the class neuroses and order spasmi of Cullen; characterized by a spasmodic contraction of the joints, with convulsive motions, and a most violent pain returning at various periods. It begins with cold chills and lassitude, pain in the head, anxiety about the præcordia. These symptoms are followed by spasmodic twitchings in the tendons of the fingers and of the feet, discernible to the eye, heat, fever, stupor, delirium, sense of suffocation, aphonia, and horrid convulsions of the limbs. After these, vomiting and diarrhœa come on, with a discharge of worms. About the eleventh or the twentieth day copious sweats succeed, or purple exanthemata, or tabes, or rigidity of all the joints.

RAPHANUS. Radish. In botany, a genus of the class tetradynamia, order siliquosa. Silique cylindrical, swelling at the seeds, somewhat jointed; glands two between the shorter stamens and the pistil, and two between the longer stamens and the calyx; calyx closed. Eight species, scattered over the globe; of which one is a native of our own country. We shall notice two.

1. R. sativus. Common garden radish. Leaves lyrate; siliques cylindrical, swelling into knobs, two-celled. A native of China. Three varieties, as follow.

α. Common radish; root long.

β. Turnip-rooted radish; root orbicular, white.

γ. Black Spanish radish; root orbicular, black.

These are raised from seeds by different sowings from the end of October till April or May: they should have a light fine mould, and the more early sowings be made on borders, under warm walls, or in similar places, and in frames covered by glasses.

2. R. raphanistrum. Leaves lyrate; siliques cylindrical, jointed, smooth, one-celled. Found wild in our corn fields.

RAPHANUS RUSTICANUS. (ραφανος, παρα το ραδιως φαινεσθαι, from its quick growth.) Armoracia. Horse-radish. The plant which affords this root is the cochlearia armoracia; foliis radicalibus lanceolatis crenatis, caulinis incisis of Linnéus; class tetradynamia, order siliculosa. Horse-radish has long been received into the materia medica, is also well known at our tables. It affects the organs both of taste and smell with a quick penetrating pungency; nevertheless it contains in certain vessels a sweet juice, which sometimes exudes in little drops upon the surface. Its pungent matter is of a very volatile kind, being totally dissipated in drying, and carried off in evaporation, or distillation by water, and rectified as the pungency exhales, the sweet matter of the root becomes more sensible, though this also is, in a great measure, dissipated or destroyed. It impregnates both water and spirit, by infusion or by distillation, very richly with its active matters. In distillation with water it yields a small quantity of essential oil, exceedingly penetrating and pungent.

Dr. Cullen has mentioned every thing necessary to be known respecting the medicinal virtues of horse-radish, we shall therefore transcribe all that the ingenious professor has written on this subject. "The root of this only is employed; and it affords one of the most acrid substances of this order (*siliquosæ*), and therefore proves a powerful stimulant, whether externally or internally employed. Externally, it readily inflames the skin, and proves a rubefacient that may be employed with advantage in palsy and rheumatism; and, if its application be long continued, it produces blisters. Taken internally, Dr. Cullen says it may be so managed as to relieve hoarseness, by acting on the fauces. Received into the stomach, it stimulates this, and promotes digestion; and therefore is properly employed as a condiment with our animal food. If it be infused in water, and a portion of this infusion be taken with a large draught of warm water, it readily proves emetic, and may either be employed by itself to excite vomiting, or to assist the operation of other emetics. Infused in water, and taken into the stomach, it proves stimulant to the nervous system, and is thereby useful in palsy; and, if employed in large quantity, it proves heating to the whole body; and hereby it proves often useful in chronic rheumatism, whether arising from scurvy or other causes. Bergius has given us a particular method of exhibiting this root, which is, by cutting it down, without bruising, into small pieces, and these, if swallowed without chewing, may be taken down in large quantities, to that of a table-spoonful. And the author alleges, that, in this way, taken in the morning for a month together, this root has been extremely useful in arthritic cases; which, however, were probably of the rheumatic kind. It would seem, in this manner employed, analogous to the use of unbruised mustard seed; it gives out in the stomach its subtle volatile parts, that stimulate considerably without inflaming. "The matter of horse-radish, like the same matter of the other siliquose plants carried into the blood-vessels, passes readily into the kidnies, and proves a powerful diuretic, and is therefore useful in dropsy". See ARMORACIA.

RAPHE. (ραφη, a suture.) In anatomy. The rough eminence which divides the scrotum, as it were, in two. It proceeds from the root of the penis inferiorly towards the perinæum.

RAPHE CEREBRI. The longitudinal emi-

nence of the corpus callosum of the brain is so called, because it appears somewhat like a suture.

RAPHIDIA, in zoology, a genus of the class insecta, order neuroptera. Mouth with a curved, toothed, horny mandible; thorax long, cylindrical; stemmata three; wings deflected; antennas filiform, as long as the thorax, the anterior part elongated and cylindrical; feelers four, very short, filiform; tail of the female terminated by a large recurved bristle. Two species only, one with immaculate wings, the other having wings with a brown marginal spot, perhaps merely a variety of the first. Both inhabit Europe, and are found in the woods of our own country: they prey on other insects.

RAPHOE, a town of Ireland, in the county of Donegal, and a bishop's see. The cathedral serves as a parish church. It is 11 miles S.W. of Londonderry, and 21 N.E. of Donegal.

RA'PID. *a.* (*rapide*, Fr.) Quick; swift (*Dryden*).

RAPI'DITY. *s.* (*rapidité*, Fr.) Celerity; velocity; swiftness (*Addison*).

RA'PIDLY. *ad.* (from *rapid.*) Swiftly; with quick motion.

RA'PIDNESS. *s.* (from *rapid.*) Celerity; swiftness.

RA'PIER. *s.* (*rapiere*, Fr.) A small sword used only in thrusting (*Pope*).

RA'PIER-FISH. *s.* The swordfish (*Grew*).

RAPIN (Renatus), a learned jesuit, born at Tours, 1621. He wrote Latin with great elegance, and his poem on gardens, in four books, has been translated into English by Evelyn, and also by Gardiner. His treatises on polite literature were translated from the French into English, by B. Kennet, 2 vols. 8vo. They contain well written comparisons between Demosthenes and Cicero on eloquence, between Homer and Virgil, and are intended to restore good taste, in France. He died at Paris 1687.

RAPIN DE THOYRAS (Paul de), a Frenchman, known as an eminent historian, born at Castres, Languedoc, 1661. He studied at Puylaurens and Saumur, and applied himself to the law, which he abandoned for the profession of arms, but on the revocation of the edict of Nantes, he left France, for England, in 1686. After a short stay in London, he went to Holland, where he enlisted in a company of French volunteers. He accompanied William III. into England, and served in the army in Ireland, at the battle of the Boyne, and the siege of Limerick, where he was wounded. In 1693, he was tutor to lord Portland's son, with a pension of 100l. from the king, and the promise of greater patronage, which he never received. In 1707 he retired to Wezel in the duchy of Cleves, devoted for 17 years to the completion of his history of England. His health suffered by his application, and the attack of a fever carried him to his grave after a week's illness, 1725. He wrote in French, 1. A Dissertation on the Whigs and Tories. 2. His History of England, printed at the Hague in 1726 and 1727, in 9 vols. 4to, and reprinted at Trevoux in 1728, in 10 vols. 4to. This last edition is more complete than that of the Hague. It has been translated into English, and improved with notes, by the Rev. Mr. Tindal, in 2 vols. folio. This performance, though the work of a foreigner, is deservedly esteemed as the fullest and most impartial collection of English political transactions extant. The readers of wit and vivacity, however, may be apt to complain of him for being sometimes rather tedious and dull.

RA'PINE. *s.* (*rapina*, Lat.) 1. The act of plundering (*King Charles*). 2. Violence; force (*Milton*).

RAPPAHANNOC, a river of Virginia, which rises in the mountains, called the Blue Ridge, and flows by Falmouth, Fredericsburg, Portroyal, Leeds, Tappahannoc, and Urbanna, into Chesapeak bay.

RAPPER, *s.* (from *rap.*) One who strikes.

RAPPERSCHWEIL, a town of Swisserland, in the canton of Zurich, seated on a neck of land that advances into the lake of Zurich, over which is a wooden bridge, 1850 feet long. It is 18 miles S.E. of Zurich, and 20 N.W. of Glaris.

RA'PPORT. *s.* (*rappat*, Fr.) Relation; reference: not used (*Temple*)

To RAPT. *v. n.* To ravish; to put in ecstacy.

RAPT. *s.* (from *rap.*) A trance; an ecstacy.

RA'PTURE. *s.* 1. Violent seizure (*Chapman*). 2. Ecstacy; transport; violence of any pleasing passion (*Addison*). 3. Rapidity; haste (*Milton*).

RA'PTURED. *a.* (from *rapture.*) Ravished; transported. A bad word (*Thomson*).

RA'PTUROUS. *a.* (from *rapture*). Ecstatic; transporting (*Collier*).

RAPUNCULUS. (*ranunculus*, dim. of *rapa*, the turnip.) The wild turnip.

RAPUNCULUS VIRGINIANUS. The name given by Morrison to the blue cardinal flower. See LOBELIA.

RAPUS. Rapa. Napus. Napus dulcis. Garden or sweet navew. French turnip. Brassica rapa of Linnéus. The seeds of this plant are sometimes used medicinally. They possess similar virtues to those of mustard. See SINAPI.

RARE. *a.* (*rarus*, Latin.) 1. Scarce; uncommon (*Shakspeare*). 2. Excellent; incomparable; valuable to a degree seldom found (*Cowley*). 3. Thinly scattered (*Milton*). 4. Thin; subtile; not dense (*Newton*). 5. Raw; not fully subdued by the fire (*Dryden*).

RA'REESHOW. *s.* (*rare* and *show.*) A show carried in a box (*Gay*).

RAREFACTION, *rarefactio*, in physics, the act whereby a body is rendered rare; that is, is brought to possess more room, or appear under a larger bulk, without accession of any new matter.

Rarefaction is opposed to condensation.

Our more accurate writers restrain rarefaction to that expansion of a mass into a larger

bulk, which is effected by means of heat. All expansion from other causes they call dilatation.

It is by rarefaction that gunpowder takes effect; and to the same principle also we owe eolipiles, thermometers, &c. The degree to which air is rarefiable exceeds all imagination; perhaps indeed its degree of expansion is absolutely beyond all limits. Upon the rarefaction of the air is founded the method of measuring altitudes by the barometer; in all cases of which the rarity of the air is found to be inversely as the force that compresses it, or inversely as the weight of all the air above it at any place.

The open air, in which we breathe, says sir Isaac Newton, is 8 or 900 times lighter than water, and by consequence 8 or 900 times rarer. And since the air is compressed by the weight of the incumbent atmosphere, and the density of the air is proportionable to the compressing force, it follows by computation, that at the height of about seven English miles from the earth, the air is four times rarer than at the surface of the earth; and at the height of 14 miles, it is 16 times rarer than at the surface of the earth; and at the height of 21, 28, or 35 miles, it is respectively 64, 256, or 1024 times rarer, or thereabouts; and at the height of 70, 140, and 210 miles, it is about 1,000,000, 1,000,000,000,000, or 1,000,000,000,000,000,000, &c.

Mr. Cotes has found, from experiments made with a thermometer, that linseed-oil is rarefied in the proportion of 40 to 39 in the heat of the human body; in that of to 15 to 14, in that degree of heat wherein water is made to boil; in the proportion of 15 to 13, in that degree of heat wherein melted tin begins to harden; and finally, in the proportion of 23 to 20, in that degree wherein melted tin arrives at a perfect solidity. The same author discovered, that the rarefaction of the air, in the same degree of heat, is ten times greater than that of the linseed-oil; and the rarefaction of the oil, about fifteen times greater than that of the spirit of wine.

RA'REFIABLE. *a.* (from *rarefy.*) Admitting rarefaction.

To RA'REFY. *v. a.* (*rarefier*, Fr.) To make thin: contrary to *condense* (*Thomson*).

To RA'REFY. *v. n.* To become thin (*Dryden*).

RA'RELY. *ad.* (from *rare.*) 1. Seldom; not often; not frequently (*Fell*). 2. Finely; nicely; accurately (*Shakspeare*).

RA'RENESS. *s.* (from *rare.*) 1. Uncommonness; state of happening seldom; infrequency (*Dryden*). 2. Value arising from scarcity (*Bacon*). 3. Thinness; tenuity.

RA'RITY. *s.* (*rarité*, Fr. *raritus*, Latin.) 1. Uncommonness; infrequency (*Spectator*). 2. Any thing valued for its scarcity (*Shakspeare*). 3. Thinness; subtilty: the contrary to *density* (*Bentley*).

RA'SCAL. *s.* (narcal, Saxon, a lean beast.) A mean fellow; a scoundrel (*Dryden*).

RASCA'LION. *s.* (from *rascal.*) One of the lowest people (*Hudibras*).

RASCA'LITY. *s.* (from *rascal.*) The low mean people (*South*).

RA'SCALLY. *a.* (from *rascal.*) Mean; worthless (*Swift*).

To RASE. *v. a.* (*raser*, Fr. *rasus*, Latin.) 1. To skim; to strike on the surface (*South*). 2. To overthrow; to destroy; to root up (*Milton*). 3. To blot out by rasure; to erase (*Milton*).

RASH. *a.* (*rasch*, Dutch.) Hasty; violent; precipitate; acting without caution (*Asch.*).

RASH. (*Exanthema.*) A family of diseases characterised by red patches on the skin, variously figured; in general confluent, and diffused irregularly over the body, leaving interstices of a natural colour. Portions of the cuticle are often elevated in a rash, but the elevations are not acuminated. The eruption is usually accompanied with a general disorder of the constitution, and terminates in a few days, by cuticular exfoliations. See MEDICINE.

RA'SHER. *s.* A thin slice of bacon (*Sh.*).

RA'SHLY. *ad.* (from *rash*). Hastily; violently; without due consideration (*Smith*).

RA'SHNESS. *s.* (from *rash.*) Foolish contempt of danger; precipitation (*Dryden*).

RASOR. See RAZOR.

RASOR-BILL. See ALCA.

RASOR-FISH. See SOLEN.

To RASP. *v. a.* (*raspen*, Dutch.) To rub to powder with a very rough file (*Moxon*).

RASP. *s.* (from the verb.) A large rough file, commonly used to wear away wood (*Moxon*).

RA'SPATORY. *s.* (*raspatoir*, French.) A chirurgeon's rasp (*Wiseman*).

RASPBERRY, in botany. See RUBUS.

RASPENBURG, a town of Upper Saxony, in Thuringia, near which are some medicinal springs, and the ruins of the once celebrated castle of Rasseburg. It is situate on the river Lossa, on the ridge of mountains called Finne, 15 miles N.N.E. of Weimar.

RASTADT, a town of Suabia, in the margravate of Baden, with a noble castle. In 1714, a treaty was concluded here between the French and Austrians; and in 1796, the former defeated the latter near this place. It is seated on the Merg, near the Rhine, five miles N.E. of Baden, and 24 S.W. of Philipsburg.

RASTAL (John), a printer born in London, was educated at Oxford. He wrote a description of Europe, Asia, and Africa, in the form of a drama, with cuts—and also canones astrologici—dialogues concerning purgatory—rules of a good life—Anglorum regum chronicum—apology against John Fyrth, &c. He died 1536. His son William was one of the justices of the king's bench under Mary, and published a chronological table from the conqueror—the chartuary 1580—terms of the English law, &c.

RA'SURE. *s.* (*rasura*, Latin.) 1. The act of scraping or shaving. 2. A mark in a writing where something has been rubbed out (*Ayliffe*).

RAT, in mastiology. See MUS.

To smell a RAT. To be put on the watch by suspicion; to suspect danger (*Hudibras*).

RA'TABLE. *a.* (from *rate.*) Set at a certain value (*Camden*).

RA'TABLY. *ad.* Proportionably (*Raleigh*).

RATAFIA, a fine spirituous liquor, prepared from the kernels, &c. of several kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruising the cherries, and putting them into a vessel wherein brandy has been long kept; then adding to them the kernels of cherries, with strawberries, sugar, cinnamon, white pepper, nutmegs, cloves; and to twenty pound of cherries, ten quarts of brandy. The vessel is left open ten or twelve days, and then stopped close for two months before it be tapped.

Ratafia of apricots is prepared two ways; viz. either by boiling the apricots in white wine, adding to the liquor an equal quantity of brandy, with sugar, cinnamon, mace, and the kernels of apricots; infusing the whole for eight or ten days; then straining the liquor, and putting it up for use: or else by infusing the apricots, cut in pieces, in brandy, for a day or two; passing it through a straining-bag, and then putting in the usual ingredients.

RATA'N. *s.* An Indian cane.

RATCH. *s.* In clockwork, a sort of wheel which serves to lift up the detents every hour, and thereby make the clock strike (*Bailey*).

RATE. *s.* (*ratus*, Latin.) 1. A price fixed on any thing (*Dryden*). 2. Allowance settled (*Addison*). 3. Degree; comparative height or value (*Shakspeare*). 4. Quantity assignable (*Shakspeare*). 5. That which sets value; principle on which value is set (*Atterbury*). 6. Manner of doing any thing; degree to which any thing is done (*Clarendon*). 7. Tax imposed by the parish (*Prior*).

To RATE. *v. n.* (from the noun.) 1. To value at a certain price (*Boyle*). 2. (*reita*, Islandic.) To chide hastily and vehemently (*South*).

To RATE. *v. n.* To make an estimate (*Kettlewell*).

RATE OF A SHIP OF WAR, is its order, degree, or distinction, as to magnitude, burden, &c. The rate is usually accounted by the length and breadth of the gun-deck, the number of tons, and the number of men and guns the vessel carries. Of these there are six rates. A first rate man of war has its gun-deck from 159 to 174 feet in length, and from 44 to 50 feet broad; it contains from 1313 to 1882 tons, has from 706 to 800 men, and carries from 96 to 100 or 110 guns. Second rate ships have their gun-decks from 153 to 165 feet long, and from 41 to 46 feet broad; they contain from 1086 to 1482 tons, and carry from 524 to 640 men, and from 84 to 90 guns. Third rates have their gun-decks from 140 to 158 feet in length, from 37 to 42 feet broad; they contain from 871 to 1262 tons; carry from 389 to 476 men, and from 64 to 80 guns. Fourth rates are in length on the gun-decks from 118 to 146 feet, and from 29 to 38 broad; they contain from 448 to 915 tons; carry from 226 to 346 men, and from 48 to 60 guns. Fifth rates have their gun-decks from 100 to 120 feet long, and from 24 to 31 broad; they contain from 259 to 542 tons, and carry from 145 to 190 men, and from 26 to 44 guns. Sixth rates have their gun-decks from 87 to 95 feet long, and from 22 to 25 feet broad; they contain from 152 to 256 tons, carry from 50 to 110 men, and from 16 to 24 guns.

It is to be observed, that the new-built ships are much larger, as well as better, than the old ones of the same rate; whence they double numbers all along; the larger of which express the proportions of the new-built ships, as the less those of the old ones.

Nothing more evidently manifests the great improvement of the marine art, and the degree of perfection to which it has arrived in Britain, than the facility of managing our first rates; which were formerly esteemed incapable of government, unless in the most favourable weather of the summer. Ships of the second rate, and those of the third, which have three decks, carry their sails remarkably well, and labour very little at sea. They are excellent in a general action, or in cannonading a fortress. Those of the third rate, which have two tiers, are fit for the line of battle, to lead the convoys and squadrons of ships of war in action, and in general to suit the different exigencies of the naval service. The fourth rates may be employed on the same occasions as the third rates, and may be also destined amongst the foreign colonies, or on expeditions of great distance; since these vessels are usually excellent for keeping and sustaining the sea. Vessels of the fifth rate are too weak to suffer the shock of a line of battle; but they may be destined to lead the convoys of merchant ships, to protect the commerce in the colonies, to cruize in different stations, to accompany squadrons, or be sent express with necessary intelligence and orders. The same may be observed of the sixth rates. The frigates, which mount from 28 to 38 guns upon one deck, with the quarter-deck, are extremely proper for cruizing against privateers, or for short expeditions, being light, long, and usually excellent sailers.

RATEEN, or RATTEN, in commerce, a thick woollen stuff, quilled, woven on a loom with four treddles, like serges and other stuffs that have the whale or quilling. There are some rateens dressed and prepared like cloths; others left simply in the hair, and others where the hair or knap is frized. Rateens are chiefly manufactured in France, Holland, and Italy, and are mostly used in linings. The frize is a sort of coarse rateen, and the drugget is a rateen half linen half woollen.

RATH. *s.* A hill (*Spenser*).

RATH. *a.* (nað, Saxon, quickly.) Early; coming before the time: out of use (*May*).

RA'THER. *ad.* 1. More willingly; with better liking (*Common Prayer*). 2. Preferably to the other; with better reason (*Locke*). 3. In a greater degree than otherwise (*Dryden*).

4. More properly (*Shakspeare*). 5. Especially (*Shakspeare.*) 6. *To have* RATHER. To desire in preference (*Rogers*).

RATIBOR, a town of Silesia, capital of a principality of the same name, with a castle. The cathedral and town-house are worthy of notice. It is seated on the Oder, in a country fertile in corn and fruits, 15 miles N.E. of Troppau, and 85 S.S.E. of Breslau. Lon. 18. 13 E. Lat. 50 1 N.

RATIFICATION. *s.* (from *ratify.*) The act of ratifying; confirmation.

RATIFIER. *s.* (from *ratify.*) The person or thing that ratifies (*Shakspeare*).

To RATIFY. *v. a.* (*ratum facio*, Latin.) To confirm; to settle; to establish (*Dryden*).

RATIO, according to Euclid, is the habitude or relation of two magnitudes of the same kind in respect of quantity. So the ratio of 2 to 1 is double, that of 3 to 1 triple, &c. Several mathematicians have found fault with Euclid's definition of a ratio, and others have as much defended it, especially Dr. Barrow, in his Mathematical Lectures, with great skill and learning.

Ratio is sometimes confounded with proportion, but very improperly, as being quite different things; for proportion is the similitude or equality or identity of two ratios. So the ratio of 6 to 2 is the same as that of 3 to 1, and the ratio of 15 to 5 is that of 3 to 1 also; and therefore the ratio of 6 to 2 is similar or equal or the same with that of 15 to 5, which constitutes proportion, which is thus expressed, 6 is to 2 as 15 to 5, or thus, 6 : 2 :: 15 : 5, which means the same thing. So that ratio exists between two terms, but proportion between two ratios or four terms.

The two quantities that are compared, are called the terms of the ratio, as 6 and 2; the first of these 6 being called the antecedent, and the latter 2 the consequent. Also the index or exponent of the ratio, is the quotient of the two terms: so the index of the ratio of 6 to 2 is $\frac{6}{2}$ or 3, and which is therefore called a triple ratio.

Wolfius distinguishes ratios into *rational* and *irrational.*

Rational ratio is that which can be expressed between two rational numbers; as the ratio of 6 to 2, or of $6\sqrt{3}$ to $2\sqrt{3}$, 3 to 1. And,

Irrational ratio is that which cannot be expressed by that of one rational number to another; as the ratio of $\sqrt{6}$ to $\sqrt{2}$, or of $\sqrt{3}$ to root $\sqrt{1}$, that is $\sqrt{3}$ to 1, which cannot be expressed in rational numbers.

When the two terms of a ratio are equal, the ratio is said to be that of equality; as of 3 to 3, whose index is 1, denoting the single or equal ratio. But when the terms are not equal, as of 6 to 2, it is a ratio of inequality.

Farther, when the antecedent is the greater term, as in 6 to 2, it is said to be the ratio of greater inequality: but when the antecedent is the less term, as in the ratio of 2 to 6, it is said to be the ratio of less inequality. In the former case, if the less term be an aliquot part of the greater, the ratio of greater inequality is said to be *multiplex* or *multiple*; and the ratio of the less inequality, *sub-multiple.* Particularly in the first case, if the exponent of the ratio be 2, as in 6 to 3, the ratio is called *duple* or *double*; if 3, as in 6 to 2, it is *triple*; and so on. In the second case, if the ratio be $\frac{1}{2}$, as in 3 to 6, the ratio is called *subduple*; if $\frac{1}{3}$, as in 2 to 6, it is *subtriple*; and so on.

If the greater term contain the less once, and one aliquot part of the same over, the ratio of the greater inequality is called *superparticular*, and the ratio of the less *subsuperparticular.* Particularly, in the first case, if the exponent be $\frac{3}{2}$ or $1\frac{1}{2}$, it is called *sesquialterate*; if $\frac{4}{3}$ or $1\frac{1}{3}$, *sesquitertial*; &c. In the other case, if the exponent be $\frac{2}{3}$, the ratio is called *subsesquialterate*; if $\frac{3}{4}$, it is *subsesquitertial.*

When the greater term contains the less once and several aliquot parts over, the ratio of the greater inequality is called *superpartiens*, and that of the less inequality is *subsuperpartiens.* Particularly in the former case, if the exponent be $\frac{5}{3}$ or $1\frac{2}{3}$, the ratio is called *superbipartiens tertius*; if the exponent be $\frac{7}{4}$ or $1\frac{3}{4}$, *supertripartiens quartas*; if $1\frac{1}{7}$ or $1\frac{4}{7}$ *superquadripartiens septimas*; &c. In the latter case, if the exponent be the reciprocals of the former, or $\frac{3}{5}$, the ratio is called *supsuperbipartiens tertias*; if $\frac{4}{7}$, *subsupertripartiens quartas*; if $\frac{7}{11}$ *subsuperquadripartiens septimas*; &c.

When the greater term contains the less several times, and some one part over, the ratio of the greater inequality is called *multiplex superparticular*; and the ratio of the less inequality is called *submultiplex subsuperparticular.* Particularly in the former case, if the exponent be $\frac{5}{2}$ or $2\frac{1}{2}$, the ratio is called *dupla sesquialtera*; if $\frac{13}{4}$ or $3\frac{1}{4}$, *tripla sesquiquarta*, &c. In the latter case, if the exponent be $\frac{2}{5}$, the ratio is called *subdupla subsesquialtera*; if $\frac{4}{13}$, *subtripla subsesquiquarta*, &c. Lastly, when the greater term contains the less several times, and several aliquot parts over; the ratio of the greater inequality is called *multiplex superpartiens*; that of the less inequality, *submultiplex subsuperpartiens.* Particularly in the former case, if the exponent be $\frac{8}{3}$ or $2\frac{2}{3}$, the ratio is called *dupla superbipartiens tertias*; if $\frac{25}{7}$ or $3\frac{4}{7}$, *tripla superbiquadripartiens septimas*; &c. In the latter case, if the exponent be $\frac{3}{8}$, the ratio is called *subdupla subsuperbipartiens tertias*; if $\frac{7}{25}$, *subtripla subsuperquadripartiens septimas*; &c.

These are the various denominations of rational ratios, names which are very necessary to the reading of the ancient authors; though they occur but rarely among the modern writers, who use instead of them the smallest numeral terms of the ratios; such 2 to 1 for duple, and 3 to 2 for sesquialterate, &c.

Compound ratio, is that which is made up of two or more other ratios, viz. by multiplying the exponents together, and so producing the compound ratio of the product of all the antecedents to the product of all the consequents.

Thus the compound ratio of 5 to 3,
and 7 to 4,
is the ratio of.....35 to 12.

Particularly if a ratio be compounded of two equal ratios, it is called the duplicate ratio; if of three equal ratios, the triplicate ratio; if of four equal ratios, the quadruplicate ratio; and so on, according to the powers of the exponents, for all multiplicate ratios. So the several multiplicate ratios of

the simple ratio of - 3 to 2, are thus, viz.
the duplicate ratio - 9 : 4,
the triplicate ratio - 27 : 8,
the quadruplicate ratio 81 : 16, &c.

Properties of ratios. Some of the more remarkable properties of ratios are as follow:

1. The like multiples, or the like parts, of the terms of a ratio, have the same ratio as the terms themselves. So a ; b, and na : nb, and $\frac{a}{n} : \frac{b}{n}$ are all the same ratio.

2. If to, or from, the terms of any ratio, be added or subtracted either their like parts, or their like multiples, the sums or remainders will still have the same ratio. So $a : b$, and $a \pm na : b \pm nb$, and $a \pm \frac{a}{n} : b \pm \frac{b}{n}$ are all the same ratio.

3. When there are several quantities in the same continued ratio, a, b, c, d, e, &c. whatever ratio the first has to the 2d,
the 1st to the 3d has the duplicate of that ratio,
the 1st to the 4th has the triplicate of that ratio,
the 1st to the 5th has the quadruplicate of it, and so on. Thus, the terms of the continued ratio being $1, r, r^2, r^3, r^4, r^5$, &c. where each term has to the following one the ratio of 1 to r, the ratio of the 1st to the 2d; then $1 : r^2$ is the duplicate, $1 : r^3$ the triplicate, $1 : r^4$ the quadruplicate, and so on, according to the powers of $1 : r$.

For other properties, see PROPORTION.

To approximate to a ratio in smaller terms. See Hutton's Dictionary, article RATIO.

The doctrine of ratios and proportions, as delivered by Euclid, in the fifth book of his Elements, is considered by most persons as very obscure and objectionable, particularly the definition of proportionality; and several ingenious gentlemen have endeavoured to elucidate that subject. Among these, the Rev. Dr. Abram Robertson, of Christ-church college, Oxford, Savilian professor of astronomy in that university, printed a neat little paper there in 1789, being a demonstration of that definition, in seven propositions, the substance of which is as follows. He first premises this advertisement:

"As demonstrations depending upon proportionality pervade every branch of mathematical science, it is a matter of the highest importance to establish it upon clear and indisputable principles. Most mathematicians, both ancient and modern, have been of opinion that Euclid has fallen short of his usual perspicuity in this particular. Some have questioned the truth of the definition upon which he has founded it, and almost all who have admitted its truth and validity have objected to it as a definition. The author of the following propositions ranks himself amongst objectors of the last-mentioned description. He thinks that Euclid must have founded the definition in question upon the reasoning contained in the first six demonstrations here given, or upon a similar train of thinking; and in his opinion a definition ought to be as simple, or as free from a multiplicity of conditions, as the subject will admit."

He then lays down these four definitions:

"1. Ratio is the relation which one magnitude has to another, of the same kind, with respect to quantity.

"2. If the first of four magnitudes be exactly as great when compared to the second, as the third is when compared to the fourth, the first is said to have to the second the same ratio that the third has to the fourth.

"3. If the first of four magnitudes be greater, when compared to the second, than the third is when compared to the fourth, the first is said to have to the second a greater ratio than the third has to the fourth.

"4. If the first of four magnitudes be less, when compared to the second, than the third is when compared to the fourth, the first is said to have to the second a less ratio than the third has to the fourth."

Dr. Robertson then delivers the propositions, which are the following:

"*Prop.* 1. If the first of four magnitudes have to the second, the same ratio which the third has to the fourth; then if the first be equal to the second, the third is equal to the fourth; if greater, greater; if less, less.

"*Prop.* 2. If the first of four magnitudes be to the second as the third to the fourth, and if any equimultiples whatever of the first and third be taken, and also any equimultiples of the second and fourth; the multiple of the first will be to the multiple of the second as the multiple of the third to the multiple of the fourth.

"*Prop.* 3. If the first of four magnitudes be to the second as the third to the fourth, and if any like aliquot parts whatever be taken of the first and third, and any like aliquot parts whatever of the second and fourth, the part of the first will be to the part of the second as the part of the third to the part of the fourth.

"*Prop.* 4. If the first of four magnitudes be to the second as the third to the fourth, and if any equimultiples whatever be taken of the first and third, and any whatever of the second and fourth; if the multiple of the first be equal to the multiple of the second, the multiple of the third will be equal to the multiple of the fourth; if greater, greater; if less, less.

"*Prop.* 5. If the first of four magnitudes be to the second as the third is to a magnitude less than the fourth, then it is possible to take certain equimultiples of the first and third, and certain equimultiples of the second and fourth,

such, that the multiple of the first shall be greater than the multiple of the second, but the multiple of the third not greater than the multiple of the fourth.

"*Prop.* 6. If the first of four magnitudes be to the second as the third is to a magnitude greater than the fourth, then certain equimultiples can be taken of the first and third, and certain equimultiples of the second and fourth, such, that the multiple of the first shall be less than the multiple of the second, but the multiple of the third not less than the multiple of the fourth.

"*Prop.* 7. If any equimultiples whatever be taken of the first and third of four magnitudes, and any equimultiples whatever of the second and fourth; and if when the multiple of the first is less than that of the second, the multiple of the third is also less than that of the fourth; or if when the multiple of the first is equal to that of the second, the multiple of the third is also equal to that of the fourth; or if when the multiple of the first is greater than that of the second, the multiple of the third is also greater than that of the fourth: then, the first of the four magnitudes shall be to the second as the third to the fourth."

To RATIO'CINATE. *v. n.* (*ratiocinor*, Lat.) To reason; to argue.

RATIOCINA'TION. *s.* (*ratiocinatio*, Lat.) The act of reasoning; the act of deducing consequences from premises (*Brown*).

RATIOCINA'TIVE. *a.* (from *ratiocinate*,) Argumentative; advancing by process of discourse (*Hale*).

RA'TIONAL. *a.* (*rationalis*, Latin.) 1. Having the power of reasoning (*Law*). 2. Agreeable to reason (*Glanville*). 3. Wise; judicious: as, *a* rational *man*.

RATIONAL, in arithmetic, &c. the quality of numbers, fractions, quantities, &c. when they can be expressed by common numbers; in contradistinction to irrational or surd ones, which cannot be expressed in common numbers.

RATIONA'LE. *s.* (from *ratio*, Latin.) A detail with reasons (*Sparrow*).

RA'TIONALIST. *s.* (from *rational*.) One who proceeds in his disquisitions and practice wholly upon reason (*Bacon*).

RATIONA'LITY. *s.* (from *rational*.) 1. The power of reasoning (*Gov. of the Tongue*). 2. Reasonableness (*Brown*).

RA'TIONALLY. *ad.* (from *rational*.) Reasonably; with reason (*South*).

RA'TIONALNESS. *s.* (from *rational*.) The state of being rational.

RATISBON, or REGENSBURG, a strong city of Bavaria, lately imperial, and an episcopal see, but now the capital of the principality of Ratisbon, and the see of an archbishop, transferred from Mentz to this place in 1798. The abbey of St. Emmeran contains the relics of St. Denys, a valuable library, and a fine collection of mathematical instruments. The townhouse is magnificent, and in its hall the general diets of the empire used to meet. The inhabitants, in general, are protestants, and about 24,000. Ratisbon has a great trade in salt, for which it is a depot, and sends large quantities of corn and wood to Vienna. It has an ancient bridge, of 15 arches, over the Danube, and stands on the S. side of that river, at the influx of the Regem, 62 miles N. by E. of Munich, and 195 W. by N. of Vienna. Lon. 12, 6 E. Lat. 48. 58 N.

RATLINES, or, as the sailors call them, ratlins, those lines which make the ladder steps to go up the shrouds and puttocks, hence called the ratlins of the shrouds.

RATOATH, a borough of Ireland, in the county of Meath, 12 miles E. of Trim, and 12 N.W. of Dublin.

RATOLFZEL, a strong town of Suabia, on that part of the lake of Constance called Boden see. It belongs to the house of Austria, and is 12 miles W. of the city of Constance.

RATSBANE. See ARSENIC.

RAT-TAILS, excrescences which creep from the pastern to the middle of the shank of a horse; so called from their resemblance to a rat's tail. Some are moist; others dry: the former may be treated as in the cure of the grease; and the latter with mercurial ointment.

RATTLE (Red), in botany. See PEDICULARIS.

RATTLE (Yellow), in botany. See RHINANTHUS.

To RA'TTLE. *v. n.* (*ratelen*, Dutch.) 1. To make a quick sharp noise with frequent repetitions and collisions of bodies not very sonorous (*Hayward*). 2. To speak eagerly and noisily (*Swift*).

To RA'TTLE. *v. a.* 1. To move any thing so as to make a rattle or noise (*Dryden*). 2. To stun with a noise; to drive with a noise (*Shakspeare*). 3. To scold; to rail at with clamour (*Arbuthnot*).

RA'TTLE. *s.* (from the verb.) 1. A quick noise nimbly repeated (*Prior*). 2. Empty and loud talk (*Hakewill*). 3. An instrument, which agitated makes a clattering noise (*Raleigh*).

RA'TTLEHEADED. *a.* (*rattle* and *head*.) Giddy; not steady.

RATTLESNAKE. See CROTALUS.

RATTLESNAKE-ROOT. See SENECA and POLYGALA.

RATTLING, among farriers, a term used of a horse when a noise is produced by the air entering between the prepuce and the penis, in trotting.

RATZEBURG, a fortified town of Lower Saxony, capital of a principality of the same name, subject to the duke of Mecklinburg-Strelitz. The town is seated on an island, in the midst of a lake, 30 miles in circumference. The buildings are of brick, and almost every house is shaded with a tree. From the lake of Ratzeburg issues the river Waknitz, which joins the Trave near Lubec. Ratzeburg is noted for its excellent beer, and is 14 miles S. by E. of Lubec, and 22 S. of Lauenburg. Lon. 10. 52 E. Lat. 53. 43 N.

To RA'VAGE. *v. a.* (*ravager*, Fr.) To lay

waste; to sack; to ransack; to spoil; to pillage; to plunder (*Addison*).

RA'VAGE. *s.* (*ravage*, French.) Spoil; ruin; waste (*Dryden*).

RA'VAGER. *s.* (from *ravage*.) Plunderer; spoiler (*Swift*).

RAUCEDO. (from *raucus*, hoarse.) Raucitas. Hoarseness. It is always symptomatic of some other disease.

RAUCITAS. (from *raucus*, hoarse.) In medicine. Hoarseness.

To RAVE. *v. n.* (*reven*, Dutch; *rêver*, Fr.) 1. To be delirious; to talk irrationally (*Smith*). 2. To burst out into furious exclamations as if mad (*Sandys*). 3. To be unreasonably fond (*Locke*).

To RA'VEL. *v. a.* (*ravelin*, Dutch.) 1. To entangle; to entwist one with another; to make intricate; to involve (*Waller*). 2. To unweave; to unknit (*Shakspeare*). 3. To hurry over in confusion (*Digby*).

To RA'VEL. *v. n.* 1. To fall into perplexity or confusion (*Milton*). 2. To work in perplexity; to busy himself with intricacies (*Decay of Piety*).

RAVELIN, in fortification, was anciently a flat bastion, placed in the middle of a curtin; but now a detached work composed only of two faces, which make a saliant angle, without any flanks, and raised before the curtin on the counterscarp of the place. A ravelin is a triangular work, resembling the point of a bastion with the flanks cut off. See FORTIFICATION.

Its use before a curtin is, to cover the opposite flanks of the two next bastions. It is used also to cover a bridge or a gate, and is always placed without the moat. There are also double ravelins that serve to cover each other; they are said to be double when they are joined by a curtin.

RA'VEN, in ornithology. See CORNUS.

To RA'VEN. *v. a.* (ræfian, Sax. to rob.) To devour with great eagerness and rapacity.

To RA'VEN. *v. n.* To prey with rapacity (*Luke*).

RAVENGLASS, a seaport in Cumberland, with a market on Saturday. It stands on an inlet of the Irish sea, between the Mite and Esk, which, with the Irt, run into this inlet, and form a good harbour; but the adjacent country furnishing little for exportation, its chief trade is in oysters. Two miles from the town, on the S. side of the Esk, are ruins of three miles in circumference, called the city of Barnscar, of which no historical documents appear to exist. Ravenglass is 16 miles S.S.E. of Whitehaven, and 279 N.N.W. of London. Lon. 3. 30 W. Lat. 54. 22 N.

RAVENNA, a city of Italy, on the Adriatic, celebrated under the Roman emperors for its capacious harbour, which could contain 250 ships, and for being for some time the seat of the western empire. It was founded by a colony of Thessalians, or, according to others, of Sabines. It is now an archbishop's see, with several colleges, a great number of religious houses, and a ruinous citadel. It had a very flourishing trade, but has greatly suffered since the sea has withdrawn two miles from it. It is now chiefly noted for the excellent wine produced in its neighbourhood. Theodoric king of the Goths resided here, and afterward the exarchs of the Greek emperors. In the sixth century, when there were three popes at the same time, one lived at Ravenna. The mausoleum of Theodoric is still to be seen, and is remarkable for being covered by a single stone, 28 feet in diameter, and 15 thick. Ravenna is seated near the river Mantone, 37 miles S.E. of Ferrara, and 162 N. of Rome. Lon. 12. 5 E. Lat. 44. 25 N.

RA'VENOUS. *a.* (from *raven*.) Furiously voracious; hungry to rage (*Shakspeare*).

RA'VENOUSLY. *ad.* With raging voracity.

RA'VENOUSNESS. *s.* (from *ravenous*.) Rage for prey; furious voracity (*Hale*).

RAVENSBERG, a county of Westphalia, lying S. of the bishoprics of Minden and Osnaburgh. It is so called from a castle of the same name, and is subject to the king of Prussia. Hereford is the capital.

RAVENSBURG, a free imperial town of Suabia. The public structures are handsome, and the inhabitants are partly protestants, and partly papists. It is seated on the Cheuss, 15 miles N. by W. of Lindau. Lon. 9. 40 E. Lat. 47. 59 N.

RAVENSTEIN, a town of Dutch Brabant, capital of a county of the same name, with an ancient and strong castle. It belongs to the elector palatinate, but has a Dutch garrison. It is seated on the Maese, 10 miles S.W. of Nimeguen. Lon. 5. 35 E. Lat. 51. 46. N.

RAVET. See SCARABÆUS.

RAUGHT. The old pret. and part. pass. of *reach*.

RAVILLIAC (Francis), a native of Angoulême, where he practised as an attorney, and afterwards kept a school. The leaguers inspired him with an aversion to Henry IV. and he believed it lawful to kill all those who put the catholic religion in danger, or made war against the pope. He assassinated the king in his coach the 14th of May, 1610, and was drawn in quarters at the Place de Grêve, the 27th of the same month.

RA'VIN. *s.* (from *raven*.) 1. Prey; food gotten by violence (*Milton*.) 2. Rapine; rapaciousness (*Ray*).

RAVINE. (*ravine*, Fr.) A hollow or channel scooped out by a torrent or flood.

RA'VINGLY. *ad.* (from *rave*.) With frenzy; with distraction (*Sidney*).

To RA'VISH. *v. a.* (*ravir*, Fr.) 1. To deflour by force (*Shakspeare*). 2. To take away by violence (*Shakspeare*). 3. To delight to rapture; to transport (*Cant.*).

RA'VISHER. *s.* (*ravisseur*, French.) 1. He that embraces a woman by violence (*Taylor*). 2. One who takes any thing by violence.

RA'VISHMENT. *s.* (*ravissement*, French.) 1. Violation; forcible constupration (*Taylor*). 2. Transport; rapture; ecstacy; pleasing violence on the mind (*Milton*).

RAVITZ, a town of Poland, in the palatinate of Posnania, with a considerable manufacture of cloth, 24 miles S. of Posen.

RAUSCHENBERG, a town of Germany, in the principality of Hesse, four miles N. of Marpurg, and 32 S.S.W. of Cassel. Lon. 8. 46 E. Lat. 50. 33 N.

RAUWOLF (Leonard), a physician and botanist of Augsburg, who, to accomplish himself in this latter science, travelled through Syria, Arabia, and America. He published an account of his travels, which was translated and printed in England in 1693. Being persecuted for his religious opinions, he retired to Linton, where he died in 1606. His Flora Orientalis was printed at Leyden in 1755.

RAUWOLFIA, in botany, a genus of the class pentandria, order monogynia. Corol twisted; berry succulent, two-seeded. Four species, trees or shrubs of South America. The two following are cultivated.

1. R. nitida. Shining Rauwolfia. A small tree, glabrous all over, upright, full of a white glutinous milk; leaves in fours, lanceolate, pointed, glabrous, shining; flowers terminal, small, scentless, of a white hue; fruit fleshy, milky. Flowers from June to September.

2. R. carescens. Hoary Rauwolfia. An upright shrub eight feet high, the whole of it milky; leaves in fours, oblong-ovate, pointed, pubescent; flowers terminal, axillary, reddish, scentless. A native of the Caribbees.

These may be increased by seeds or berries, which should be sown in pots filled with light mould in the autumn or spring, plunging them in a mild hot-bed. They may likewise be raised by layers or cuttings.

RAW. *a.* (hneap, Saxon; *rouw*, Dutch.) 1. Not subdued by the fire (*Spenser*). 2. Not covered with the skin (*Shakspeare*). 3. Sore (*Spenser*). 4. Immature; unripe; not concocted. 5. Unseasoned; unripe in skill (*Raleigh*). 6. New (*Shakspeare*). 7. Bleak; chill (*Spenser*). 8. Not decocted (*Bacon*).

RA'WBONED. *a.* (*raw* and *bone*.) Having bones scarcely covered with flesh (*L'Estrange*).

RA'WHEAD. *s.* (*raw* and *head*.) The name of a spectre (*Dryden*).

RAWLEGH. See RALEIGH.

R'AWLY. *ad.* (from *raw*.) 1. In a raw manner. 2. Unskilfully; without experience. 3. Newly (*Shakspeare*).

RA'WNESS. *s.* (from *raw*.) 1. State of being raw (*Bacon*). 2. Unskilfulness (*Hakewill*). 3. Hasty manner (*Shakspeare*).

RAY (John), a celebrated botanist, was the son of Mr. Roger Ray, a blacksmith, and was born at Black Notly in Essex in 1628. He received the first rudiments of learning at the grammar-school at Braintree; and in 1644 was admitted into Catharine-hall in Cambridge, from whence he afterwards removed to Trinity-college in that university. He took the degree of master of arts, and became at length a senior fellow of the college. In 1651 he was Greek lecturer of his college; two years after mathematical reader, and in 1665 humanity reader. He devoted himself particularly to botany and the universal history of nature, and in 1660 published a catalogue of the Cambridge plants. To enlarge his knowledge of plants he travelled over England, Wales, and Scotland, accompanied by his pupil Mr. Willoughby, and sir Philip Skipton, and Mr. P. Courthope. At the restoration he took orders, but two years after he resigned, as he refused to subscribe. In 1663, he spent three years on the continent, with his pupil, of which he published on account in 1673. In 1672 he lost his friend Willoughby, and the following year he married the daughter of Mr. Oakley of Launton, Oxon, though nearly 24 years younger than himself. After superintending for some time the education of his friend Mr. Willoughby's children at Middleton hall, he removed to Sutton Colfield, and then to Falborne hall, Essex, and in 1679 settled in his native place, where he died 1705. As a botanist, Ray has acquired great celebrity, and his writings are held in high estimation. To strong benevolence of heart he added great humility of mind and modesty of manners. The best of his works are the wisdom of God manifested in the works of the creation, 8vo.—three discourses on the primitive chaos, the creation, deluge, and conflagration of the world, 8vo.—synopsis methodica animalium, quadrupedum, avium, et pisciun—Rauwolf's travels into the East translated, 8vo.—persuasive to a holy life, 8vo.—collection of English proverbs, often reprinted, 8vo.—catalogue of English plants—nomenclator classicus—observations, topographical, moral, &c. in foreign countries—discourse on seeds, and the differences of plants—methodus plantarum nova—historia plantarum generalis—fasciculus stirpium Britanicarum—synopsis methodica, &c. He also assisted Mr. Willoughby in his history of birds, fishes, &c.

RAY (Benjamin), was born at Spalding, Lincolnshire, and educated there and at St. John's college, Cambridge. When in orders he became curate of Surfleet, and of Cowbitt, and wrote an account of a water spout, observed in Deeping-fen, &c. and died at Spalding, 1760.

RAY, in geometry, the same as RADIUS.

RAY, in optics, a beam or line of light, propagated from a radiant point, through any medium.

If the parts of a ray of light lie all in a straight line between the radiant point and the eye, the ray is said to be direct: the laws and properties of which make the subject of optics.—If any of them be turned out of that direction, or bent in their passage, the ray is said to be refracted.—If it strike on the surface of any body, and be thrown off again, it is said to be reflected.—In each case, the ray, as it falls either directly on the eye, or on the point of reflection, or of refraction, is said to be incident.

Again, if several rays be propagated from the radiant object equidistantly from one another, they are called parallel rays. If they come inclining towards each other, they are called con-

verging rays. And if they go continually receding from each other, they are called diverging rays.

It is from the different circumstances of rays, that the several kinds of bodies are distinguished in optics. A body, for example, that diffuses its own light, or emits rays of its own, is called a radiating or lucid or luminous body. If it only reflect rays which it receives from another, it is called an illuminated body. If it only transmit rays, it is called a transparent or translucent body. If it intercept the rays, or refuse them passage, it is called an opaque body.

It is by means of rays reflected from the several points of illuminated objects to the eye, that they become visible, and that vision is performed; whence such rays are called visual rays.

The rays of light are not homogeneous, or similar, but differ in all the properties we know of; viz. refrangibility, reflexibility, and colour. It is probably from the different refrangibility that the other differences have their rise; at least it appears that those rays which agree or differ in this, do so in all the rest. It is not however to be understood that the property or effect called colour, exists in the rays of light themselves; but from the different sensations the differently disposed rays excite in us, we call them red rays, yellow rays, &c. Each beam of light however, as it comes from the sun, seems to be compounded of all the sorts of rays mixed together; and it is only by splitting or separating the parts of it, that these different sorts become observable; and this is done by transmitting the beam through a glass prism, which refracting it in the passage, and the parts that excite the different colours having different degrees of refrangibility, they are thus separated from one another, and exhibited each apart, and appearing of the different colours.

Beside refrangibility, and the other properties of the rays of light already ascertained by observation and experiment, sir I. Newton suspects they may have many more; particularly a power of being inflected or bent by the action of distant bodies; and those rays which differ in refrangibility, he conceives likewise to differ in flexibility.

These rays he suspects may be very small bodies emitted from shining substances. Such bodies may have all the conditions of light: and there is that action and reaction between transparent bodies and light, which very much resembles the attractive force between other bodies. Nothing more is required for the production of all the various colours, and all the degrees of refrangibility, but that the rays of light be bodies of different sizes; the least of which may make violet the weakest and darkest of the colours, and be the most easily diverted by refracting surfaces from its rectilinear course; and the rest, as they are larger and larger, may make the stronger and more lucid colours, blue, green, yellow, and red. See COLOUR, LIGHT, REFRACTION, REFLECTION, INFLECTION, CONVERGING, DIVERGING, &c. &c.

Among other qualities of rays it has been found by experiment that there is a very great difference in the heating power of different rays from the sun.

It appears from the experiments of Dr. Herschel, that this heating power increases from the middle of the spectrum to the red ray, and is greatest beyond it, where the rays are invisible. Hence it is inferred that the rays of light and caloric nearly accompany each other, and that the latter are in different proportions in the different coloured rays. They are easily separated from each other, as when the sun's rays are transmitted through a transparent body, the rays of light pass on seemingly undiminished, but the rays of caloric are intercepted. When the sun's rays are directed to an opaque body, the rays of light are reflected, and the rays of caloric are absorbed and retained. This is the case with the light of the moon, which, however much it be concentrated, gives no indication of being accompanied with heat. It has also been shown that the different rays of light produce different chemical effects on the metallic salts and oxyds. These effects increase on the opposite direction of the spectrum, from the heating power of the rays. From the middle of the spectrum, towards the violet end, they become more powerful, and produce the greatest effect beyond the visible rays. From these discoveries it appears that the solar rays are of three kinds: 1. Rays which produce heat: 2. Rays which produce colour; and, 3. Rays which deprive metallic substances of their oxygen. The first set of rays is in greatest abundance, or are most powerful towards the red end of the spectrum, and are least refracted. The second set, or those which illuminate objects, are most powerful in the middle of the spectrum. And the third set produce the greatest effect towards the violet end, where the rays are most refracted. The solar rays pass through transparent bodies without increasing their temperature. The atmosphere, for instance, receives no increase of temperature by transmitting the sun's rays, till these rays are reflected from other bodies, or are communicated to it by bodies which have absorbed them. This is also proved by the sun's rays being transmitted through convex lenses, producing a high degree of temperature when they are concentrated, but giving no increase of temperature to the glass itself. By this method the heat which proceeds from the sun can be greatly increased. Indeed, the intensity of temperature produced in this way is equal to that of the hottest furnace. This is done, either by reflecting the sun's rays from a concave polished mirror, or by concentrating or collecting them by the refractive power of convex lenses, and directing the rays thus concentrated on the combustible body.

RAYS (Reflected), those rays of light which are reflected, or thrown back again, from the surfaces of bodies upon which they strike. It is found that, in all the rays of light, the

angle of reflection is equal to the angle of incidence.

Rays (Refracted), are those rays of light, which are bent or broken, in passing out of one medium into another.

Rays (Pencil of), a number of rays issued from a point of an object, and diverging in the form of a cone.

Ray (Principal), in perspective, is the perpendicular distance between the eye and the vertical plane or table, as some call it.

Ray of curvature. See Radius of curvature.

Ray, in ichthyology. See Raia.

Ray. Radius. In botany, the outer part or circumference of a compound radiate flower; or radiated discous flower, as it is called by others.

To Ray. *v. a.* (*rayer*, Fr.) To streak; to mark in long lines (*Shakspeare*).

Ray, for *array* (*Spenser*).

RAYNAL (William Francis), a French historian, born at St. Genies, in Rouergue, 1718. He entered among the jesuits, but his love of liberty was too great for the confinement of a cloister, and he left the society in 1748, and settled at Paris. He wrote literary anecdotes, 3 vols. and memoirs of Ninon de l'Enclos, and was engaged in the Mercure de France; but as he had greater partiality for commercial occupations, he devoted himself more closely to the subject, and in 1770, published his history philosophical and political of the establishment, and of the commerce of the Europeans in the East and West Indies. This work was received with general approbation; but while the style and the language were admired, his calculations were discovered to be erroneous. To correct, therefore, a composition which embraced so many concerns, he travelled over France, Holland, and England, in pursuit of information. His reputation was such, that in England, the speaker of the commons observing him among the spectators, suspended the business of the house, till he had seen the historian placed in a more commodious seat. On his return he published a new edition of his work at Geneva, in 10 vols. 8vo. but his severe language against governments drew upon him the censure of the parliament of Paris, and not only his history was burnt, but his person was ordered to be seized. He was, however, allowed sufficient time to escape, and he went into Germany, and received protection from the king of Prussia, and from the empress of Russia, though he had spoken of them with sarcastic indifference. In 1788 he returned to Paris, and viewing the progress of the constituent assembly, in the destruction of whatever was venerable in France, he, in 1791, boldly addressed a letter to that body, and in firm language censured their proceedings. This appeal to the sense of the legislators was ridiculed; but it proved too prophetic of the calamities which followed. Displeased with the capital, the philosopher retired to Passy, where he expired, 1796, aged 84. Though the favourite of great men, he died in poverty, and the only property he left was an assignat of 50 livres, worth not three pence in ready money. He is to be censured for his opinions, often licentious and sceptical, yet his writings possess vigour, clearness, and elegance, and exhibit the nervous powers of an ardent imagination, and the striking features of a rapid invention. He published besides, an history of the Stadtholderate, 2 vols.—history of the English parliament, 2 vols. 12mo.—historical anecdotes from the age of Charles V. 3 vols. 12mo.—history of the divorce of Henry VIII.—historical memoirs of Europe—history of the revolutions of the English American colonies, 2 vols. It is said, that he had written an history of the revocation of the edict of Nantes, which he partly destroyed during the reign of Robespierre

RAZE. *s.* (*rayz*, a root, Spanish.) A root of ginger (*Shakspeare*).

To Raze. *v. a.* (*raser*, Fr. *rasus*, Lat.) 1. To overthrow; to ruin; to subvert (*Shakspeare*). 2. To efface (*Milton*). 3. To extirpate (*Shakspeare*).

RA'ZOR. *s.* (*rasor*, Latin.) A knife with a thick blade and fine edge used in shaving (*Dryden*).

RA'ZORABLE. *a.* (from *razor*.) Fit to be shaved: not in use (*Shakspeare*).

RAZOR-SHEATH, in helminthology. See Solem.

RA'ZURE. *s.* (*rasure*, Fr.) Act of erasing (*Shakspeare*).

RE. An inseparable particle used by the Latins, and borrowed by us to denote iteration or backward action: as, *return*, to come back; *repercussion*, the act of driving back.

Re, in music, the syllable applied by Guido to the second note of his hexachords. In the natural hexachord it is expressed by the letter D.

REA'CCESS. *s.* (*re* and *access*.) Visit renewed (*Hakewill*).

To REACH. *v a.* (pæcan, Saxon.) 1. To touch with the hand extended (*Congreve*). 2. To arrive at; to attain any thing distant; to strike from a distance (*Milton*). 3. To fetch from some place distant, and give (*Esdras*). 4. To bring forward from a distant place (*Job*). 5. To hold out; to stretch forth (*Hooker*). 6. To attain; to gain; to obtain (*Cheyne*). 7. To transfer (*Rowe*). 8. To penetrate to (*Locke*). 9. To be adequate to (*Locke*). 10. To extend to (*Addison*). 11. To extend; to spread abroad (*Milton*). 12. To take in the hand (*Milton*).

To Reach. *v. n.* 1. To be extended (*Boyle*). 2. To be extended far (*Shakspeare*). 3. To penetrate (*Addison*). 4. To make efforts to attain (*Locke*).

Reach. *s.* (from the verb.) 1. Act of touching or seizing by extension of the hand. 2. Power of reaching or taking in the hand (*Locke*). 3. Power of attainment or management (*Locke*). 4. Power; limit of faculties (*Addison*). 5. Contrivance; artful scheme; deep thought (*Hayward*). 6. A fetch; an artifice to attain some distant advantage (*Bacon*).

7. Tendency to distant consequences (*Shakspeare*). 8. Extent (*Milton*).

To REA'CT. *v. a.* (*re* and *act.*) To return the impulse or impression (*Arbuthnot*).

REA'CTION. *s.* (*reaction*, Fr.) The reciprocation of any impulse or force impressed, made by the body on which such impression is made: *action* and *reaction* are equal. See AXIOMS.

READ. *s.* (næd, Saxon.) Obsolete. 1. Counsel (*Sternhold*). 2. Saying; saw (*Spenser*).

To READ. *v. a.* pret. *read*, part. pass. *read.* (næd, Saxon.) 1. To peruse any thing written (*Pope*). 2. To discover by characters or marks (*Spenser*). 3. To learn by observation (*Shakspeare*). 4. To know fully (*Shakspeare*).

To READ. *v. n.* 1. To perform the act of perusing writing (*Deuteronomy*). 2. To be studious in books (*Taylor*). 3. To know by reading (*Swift*).

READ. *particip. a.* (from *read*; the verb *read* is pronounced *reed*; the preterit and participle *red.*) Skilful by reading (*Dryden*).

READ (Alexander), an eminent Scotch physician, celebrated for his anatomical works. He was created a doctor of physic at Oxford by royal mandate in 1602, and he was also a fellow of the college of physicians.

READE'PTION. *s.* (*re* and *adeptus*, Lat.) Recovery; act of regaining (*Bacon*).

REA'DER. *s.* (from *read.*) 1. One that peruses any thing written (*Ben Jonson*). 2. One studious in books (*Dryden*). 3. One whose office is to read prayers in churches (*Swift*).

REA'DERSHIP. *s.* (from *reader.*) The office of reading prayers (*Swift*).

REA'DILY. *ad.* (from *ready.*) Expeditely; with little hinderance or delay (*South*).

REA'DINESS. *s.* (from *ready.*) 1. Expeditiveness; promptitude (*South*). 2. The state of being ready or fit for any thing (*Clarendon*). 3. Facility; freedom from hinderance or obstruction (*Holder*). 4. State of being willing or prepared (*Addison*).

REA'DING. *s.* (from *read.*) 1. Study in books; perusal of books (*Watts*). 2. A lecture; a prelection. 3. Public recital (*Hooker*). 4. Variation of copies (*Arbuthnot*).

READING, the art of delivering written language with propriety, force, and elegance.

"We must not judge so unfavourably of eloquence or good reading (says the illustrious Fenelon), as to reckon it only a frivolous art, that a declaimer uses to impose upon the weak imagination of the multitude, and to serve his own ends. It is a very serious art, designed to instruct people; to suppress their passions, and reform their manners; to support the laws, direct public councils, and to make men good and happy."

Reason and experience demonstrate, that delivery in reading ought to be less animated than in interested speaking. In every exercise of the faculty of speech, and those expressions of countenance and gesture, with which it is generally attended, we may be considered to be always in one of the two following situations: First, delivering our bosom sentiments on circumstances which relate to ourselves or others, or, secondly, repeating something that was spoken on a certain occasion for the amusement or information of an auditor. Now, if we observe the deliveries natural to these two situations, we shall find that the first may be accompanied with every degree of expression which can manifest itself in us, from the lowest of sympathy to the most violent and energetic of the superior passions; while the latter, from the speaker's chief business being to repeat what he heard with accuracy, discovers only a faint imitation of those signs of the emotions which we suppose agitated him from whom the words were first borrowed.—The use and necessity of this difference of manner is evident; and if we are attentive to these natural signs of expression, we shall find them conforming with the greatest nicety to the slightest and most minute movements of the breast.

This repetition of another's words might be supposed to pass through the mouth of a second or third person; and in these cases, since they were not ear and eye witness of him who first spoke them, their manner of delivery would want the advantage necessarily arising from an immediate idea of the original one; hence, on this account, this would be a still less lively representation than that of the first repeater. But as, from a daily observation of every variety of speech and its associated signs of emotion, mankind soon become pretty well acquainted with them, and this in different degrees, according to their discernment, sensibility, &c. experience shows us that these latter repeaters (as we call them) might conceive and use a manner of delivery which, though less characteristic perhaps, would on the whole be no way inferior to the first, as to the common natural expression proper for their situation. It appears, therefore, that repeaters of every degree may be esteemed upon a level as to animation, and that our twofold distinction above contains accurately enough the whole variety of ordinary delivery;—we say ordinary, because

There is another very peculiar kind of delivery sometimes used in the person of a repeater, of which it will in this place be necessary to take some notice. What we mean here is mimicry; an accomplishment which, when perfectly and properly displayed, never fails of yielding a high degree of pleasure. But since this pleasure chiefly results from the principle of imitation respecting manner, and not from the purport of the matter communicated; since, comparatively speaking, it is only attainable by few persons, and practised only on particular occasions;—on these accounts it must be refused a place among the modes of useful delivery taught us by general nature, and esteemed a qualification purely anomalous.

These distinctions with regard to a speaker's situation of mind premised, let us see to which

of them an author and his reader may most properly be referred, and how they are circumstanced with regard to one another.

The matter of all books is, either what the author says in his own person, or an acknowledged recital of the words of others: hence an author may be esteemed both an original speaker and a repeater, according as what he writes is of the first or second kind. Now a reader must be supposed either actually to personate the author, or one whose office is barely to communicate what he has said to an auditor. But in the first of these suppositions he would, in the delivery of what is the author's own, evidently commence mimic; which being, as above observed, a character not acknowledged by general nature in this department, ought to be rejected as generally improper. The other supposition therefore must be accounted right; and then, as to the whole matter of the book, the reader is found to be exactly in the situation of a repeater, save that he takes what he delivers from the page before him instead of his memory. It follows then, in proof of our initial proposition, that if we are directed by nature and propriety, the manner of our delivery in reading ought to be inferior in warmth and energy to what we should use, were the language before us the spontaneous effusions of our own hearts in the circumstances of those out of whose mouths it is supposed to proceed.

Evident as the purport of this reasoning is, it has not so much as been glanced at by the writers on the subject we have now entered upon, or any of its kindred ones; which has occasioned a manifest want of accuracy in several of their rules and observations. Among the rest, this precept has been long reverberated from author to author as a perfect standard for propriety in reading—"Deliver yourselves in the same manner you would do, were the matter your own original sentiments uttered directly from the heart." As all kinds of delivery must have many things in common, the rule will in many articles be undoubtedly right; but, from what has been said above, it must be as certainly faulty in respect to several others; as it is certain nature never confounds by like signs two things so very different, as a copy and an original, an emanation darted immediately from the sun, and its weaker appearance in the lunar reflection.

The several observations which tend to perfect the art of reading, relate to proper loudness of voice, distinctness, slowness, propriety of pronunciation, emphasis, tones, pauses, and mode of reading verse. See the various articles: and for a complete and very judicious disquisition on the subject, consult the Introduction to Lindley Murray's English Reader.

READINGS, in criticism. Various readings, *variæ lectiones*, are the different manners of reading the text of authors in ancient manuscripts; where a diversity has arisen from the corruption of time, or the ignorance of copyists.

A great part of the business of the critic lies in settling the readings, by confronting the various readings of the several manuscripts, and considering the agreement of the words and sense.

READING, a borough and the county-town of Berkshire, with a market on Saturday, and three churches. It has the ruins of a rich abbey, built by Henry I. who was interred here in 1133; and, in 1787, in digging the foundation for a house of correction, the remains of that prince were found in a vault, in a leaden coffin. Reading is governed by a mayor, and sends two members to parliament. Its chief trade is in malt. It contains nearly 10,000 inhabitants, is seated on the Kennet, near its confluence with the Thames, 26 miles S.S.E. of Oxford, and 39 W. of London. Lon. 0. 52 W. Lat. 51. 28 N.

READING, the capital of the county of Berks, in Pennsylvania, seated on the Schynkill, 46 miles N.W. of Philadelphia. Lon. 75. 54. W. Lat. 40. 22 N.

READMI'SSION. *s.* (*re* and *admission.*) The act of admitting again (*Arbuthnot*).

To READMI'T. *v. n.* (*re* and *admit.*) To let in again (*Milton*).

To READO'RN. *v. a.* (*re* and *adorn.*) To decorate again; to deck anew (*Blackmore*).

READY. *a.* (*redo*, Swedish; hpaꝺe, nimble, Sax.) 1. Prompt; not delaying (*Temple*). 2. Fit for a purpose; not to seek (*Shakspeare*). 3. Prepared; accommodated to any design (*Milton*). 4. Willing; eager; quick (*Spenser*). 5. Being at the point; not distant; near; about to do or be (*Milton*). 6. Being at hand; next to hand (*Dryden*). 7. Facile; easy; opportune; near (*Hooker*). 8. Quick; not done with hesitation (*Clarissa*). 9. Expedite; nimble; not embarrassed; not slow (*Watts*). 10. *To make* READY. To make preparations.

REA'DY. *ad.* Readily; so as not to need delay (*Numbers*).

REA'DY. *s.* Ready money. A low word (*Arbuthnot*).

REAFFI'RMANCE. *s.* (*re* and *affirmance.*) Second confirmation (*Ayliffe*).

REAGENTS. Reagentia. Tests. In chemistry, such substances as enable the chemist to draw conclusions respecting the nature and properties of the bodies to be examined, by means of those alterations which they suffer themselves, or produce in others. As tests or reagents for alkalies are employed the blue syrup of violets; paper stained red, with a decoction of Fernambuc, or Brazil wood; or stained yellow by the tincture of turmeric root; and the tincture of litmus reddened by a very weak acid, and the red alkanet tincture.

RE'AL. *a.* (*reel*, Fr. *realis*, Latin.) 1. Relating to things, not persons; not personal (*Bacon*). 2. Not fictitious; not imaginary; true; genuine (*Glanville*). 3. (In law.) Consisting of things immoveable, as land (*Child*).

REAL (Cæsar Vichard de St.), a polite French writer, son of a counsellor to the senate of Chamberry in Savoy. He came young to

France, distinguished himself at Paris by several ingenious productions, and resided there a long time without title or dignity, intent upon literary pursuits. He died at Chamberry in 1692, advanced in years, though not in circumstances. He was a man of great parts and penetration, a lover of the sciences, and particularly fond of history. A complete edition of his works was printed at Paris, in 3 vols. 4to. 1745, and another in 6 vols. 12mo.

REAL PRESENCE. See TRANSUBSTANTIATION.

REALGAR. A metallic substance of a red colour, more or less lively and transparent, and often crystallized in brilliant needles. It is formed by a combination of arsenic with sulphur. See ARSENIC.

REALISTS, a sect of school-philosophers formed in opposition to the nominalists. Under the realists are included the Scotists, Thomists, and all excepting the followers of Ocham. Their distinguishing tenet is, that universals are realities, and have an actual existence out of an idea or imagination; or, as they express it in the schools, a *parte rei*; whereas the nominalists contend, that they exist only in the mind, and are only ideas, or manners of conceiving things.—Dr. Odo, or Oudard, a native of Orleans, afterwards abbot of St. Martin de Tournay, was the chief of the sect of the realists. He wrote three books of dialectics, where, on the principles of Boethius and the ancients, he maintained that the object of that art is things, not words; whence the sect took its rise and name.

REA'LITY. *s.* (*realité*, French.) 1. Truth; verity; what is, not what merely seems (*Addison*). 2. Something intrinsically important, not merely matter of show (*Milton*).

To RE'ALIZE. *v. a.* (*realiser*, Fr.) 1. To bring into being or act (*Glanville*). 2. To convert money into land.

RE'ALLY. *ad.* (from *real.*) 1. With actual existence (*South*). 2. In truth; truly; not seemingly only (*Law*).

REALM. *s.* (*roiaulme*, Fr.) 1. A kingdom; a king's dominion (*Milton*). 2. Kingly government (*Pope*).

REA'LTY. *s.* Loyalty: not used (*Milton*).

REAM. *s.* (*rame*, French; *riem*, Dutch.) A bundle of paper containing twenty quires (*Pope*).

To REA'NIMATE. *v. a.* (*re* and *animo*, Lat.) To revive; to restore to life (*Glanville*).

To REANNE'X. *v. a.* (*re* and *annex.*) To annex again (*Bacon*).

To REAP. *v. a.* (ꝛepan, Sax.) 1. To cut corn at harvest (*Shakspeare*). 2. To gather; to obtain (*Hooker*).

To REAP. *v. n.* To harvest (*Psalms*).

REA'PER. *s.* (from *reap.*) One that cuts corn at harvest (*Sandys*).

REA'PINGHOOK. *s.* (*reaping* and *hook.*) A hook used to cut corn in harvest (*Dryden*).

REAR. *s.* (*arriere*, French.) 1. The hinder troop of an army, or the hinder line of a fleet (*Knolles*). 2. The last class; the last in order (*Peacham*).

REAR. *a.* (hꝛene, Saxon.) 1. Raw; half roasted; half sodden. 2. Early. A provincial word (*Gay*).

To REAR. *v. a.* (aꝛæꝛan, Sax.) 1. To raise up (*Esdras*). 2. To lift up from a fall (*Spenser*). 3. To move upward (*Milton*). 4. To bring up to maturity (*Bacon*). 5. To educate; to instruct (*Southern*). 6. To exalt; to elevate (*Prior*). 7. To rouse; to stir up (*Dryden*). 8. To raise; to breed (*Harte*).

REAR, a term frequently used in composition, to denote something behind, or backwards, in respect of another, in opposition to van.

REAR OF AN ARMY, signifies, in general, the hindermost part of an army, battalion, regiment, or squadron; also the ground behind either.

REAR-GUARD, is that body of an army which marches after the main-body; for the march of an army is always composed of an advance-guard, a main body, and a rear-guard; the first and last commanded by a general. The old grand-guards of the camp always form the rear-guard of the army, and are to see that every thing come safe to the new camp.

REAR HALF-FILES, are the three hindmost ranks of the battalion, when it is drawn up six deep.

REAR-LINE, of an army encamped, is always 1200 feet at least from the centre line; both of which run parallel to the front line, as also to the reserve.

REAR-RANK, is the last rank of a battalion, when drawn up, and generally 16 or 18 feet from the centre-line when drawn in open order.

REA'RWARD. *s.* (from *rear.*) 1. The last troop (*Sidney*). 2. The end; the tail; a train behind (*Shakspeare*). 3. The latter part. In contempt (*Shakspeare*).

To REASCE'ND. *v. n.* (*re* and *ascend.*) To climb again (*Spenser*).

To REASCE'ND. *v. a.* To mount again.

REA'SON. *s.* (*raison*, Fr.) 1. The power by which man deduces one proposition from another, or proceeds from premises to consequences (*Milton*). 2. Cause; ground or principle (*Tillotson*). 3. Cause efficient (*Hale*). 4. Final cause (*Locke*). 5. Argument; ground of persuasion; motive (*Tillotson*). 6. Ratiocination; discursive act (*Davies*). 7. Clearness of faculties (*Shakspeare*). 8. Right; justice (*Spenser*). 9. Reasonable claim; just practice (*Taylor*). 10. Rationale; just account (*Boyle*). 11. Moderation; moderate demands (*Addison*).

To REA'SON. *v. n.* (*raisonner*, Fr.) 1. To argue rationally; to deduce consequences justly from premises (*Locke*). 2. To debate; to discourse; to talk; to take or give an account: not in use (*Shakspeare*). 3. To raise disquisitions; to make inquiries (*Milton*).

To REA'SON. *v. a.* To examine rationally. A French mode of speech (*Burnet*).

REASON, *ratio*, a faculty or power of the soul, whereby it distinguishes good from evil, and truth from falsehood.

Or, reason is that principle, whereby, comparing several ideas together, we draw consequences from the relations they are found to have.

Some of the latter school-philosophers define reason to be the comprehenson of many principles which the mind successively can conceive, and from which conclusions may be drawn.

Others conceive reason as no other than the understanding itself, considered as it discourses.

Reason, Mr. Locke observes, comprehends two distinct faculties of the mind; viz. sagacity, whereby it finds intermediate ideas; and illation, whereby it so orders and disposes of them, as to discover what connexion there is in each link of the chain, whereby the extremes are held together; and thereby, as it were, draws into view the truth sought for.

Illation, or inference, consists in nothing but the perception of the connexion there is between the ideas in each step of the deduction, whereby the mind comes to see either the certain agreement or disagreement of any two ideas; as in demonstration, in which it arrives at knowledge; or their probable connexion, on which it gives or withholds its assent; as in opinion.

Sense and intuition reach but a little way: the greatest part of our knowledge depends upon deductions, and intermediate ideas. In those cases, where we must take propositions for true, without being certain of their being so, we have need to find out, examine, and compare, the grounds of their probability: in both cases, the faculty which finds out the means, and rightly applies them to discover certainty in the one, and probability in the other, is that which we call reason.

In reason, therefore, we may consider four degrees: first, the discovering and finding out of proofs. See INVENTION.

Secondly, the regular and methodical disposition of them, and laying them in such order, as that their connection may be plainly perceived. See METHOD.

Thirdly, the perceiving of their connexion (see JUDGMENT); and,

Fourthly, the making a right conclusion.

Reason fails us in several instances: as, first, where our ideas fail.

Secondly, it is often at a loss, because of the obscurity, confusion, or imperfection, of the ideas it is employed about. Thus, having no perfect idea of the least extension of matter, nor of infinity, we are at a loss about the divisibility of matter.

Thirdly, our reason is often at a stand, because it perceives not those ideas which would serve to shew the certain or probable agreement or disagreement of any two other ideas.

Fourthly, our reason is often engaged in absurdities and difficulties, by proceeding upon false principles, which, being followed, lead men into contradictions to themselves, and inconsistency in their own thoughts.

Fifthly, dubious words, and uncertain signs, often puzzle men's reason, and bring them to a nonplus.

Though the deducing one proposition from another be a great part of the office of reason, and that about which it is usually employed; yet the principal act of ratiocination is the finding the agreement or disagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by juxta-position. Words have their consequences as the signs of such ideas and things agree or disagree with what they really are; but we observe it only by our ideas.

Hence we may be able to form an idea of that ordinary distinction of things, into such as are according to, those that are above, and those contrary to reason.

Those according to reason are such propositions, whose truth we can discover by examining and tracing those ideas we have from sensation and reflection, and by natural deduction find to be true or probable.

Those above reason are such propositions, whose truth or probability we cannot by reason derive from those principles.

Those contrary to reason are such propositions as are inconsistent with, or irreconcilable to, our clear and distinct ideas.

Thus the existence of one God, is according to reason; the existence of more than one God, is contrary to reason; and the resurrection of the body after death, above reason.

REA'SONABLE. *a.* (*raison*, French.) 1. Having the faculty of reason; endued with reason (*Sidney*). 2. Acting, speaking, or thinking rationally (*Hayward*). 3. Just; rational; agreeable to reason (*Swift*). 4. Not immoderate (*Shakspeare*). 5. Tolerable; being in mediocrity (*Sidney*).

REA'SONABLENESS. *s.* 1. The faculty of reason. 2. Agreeableness to reason (*Clarendon*). 3. Compliance with reason (*Hale*). 4. Moderation.

REA'SONABLY. *ad.* (from *reasonable*.) 1. Agreeable to reason (*Dryden*). 2. Moderately; in a degree reaching to mediocrity (*Bacon*).

REA'SONER. *s.* (*raisonneur*, Fr.) One who reasons; an arguer (*Blackmore*).

REASONING, *ratiocination*, the exercise of that faculty of the mind called reason: or, it is reason deduced into discourse.

The agreement or disagreement of two ideas does not appear from the bare consideration of the ideas themselves, unless some third be called in, and compared, either separately or conjointly therewith: the act, then, whereby from ideas thus disposed and compared, we judge this or that to be so, or not so, is called reasoning. Or, it is that operation of the mind

whereby we infer one thing, i. e. one proposition from two or more propositions premised. Or, again, it is the drawing of a conclusion, which before was either unknown, or dark, or doubtful, from some propositions which are more known and evident. It is the narrowness of the human mind which introduces the necessity of reasoning; for if the mere perception and comparison of two ideas would always show us whether they agree or disagree, then all rational propositions would be matters of intelligence, or first principles, and there would be no use of reasoning, or drawing any consequences. But when we are unable to judge of the truth or falsehood of a proposition in an immediate manner, by the mere contemplation of its subject and predicate, we are then constrained to use a medium, and to compare each of them with some third idea, that by seeing how far they agree or disagree with it, we may be able to judge how far they agree or disagree among themselves.

REA'SONLESS. *a.* Void of reason (*Shakspeare*).

To REASSE'MBLE. *v. a.* (*re* and *assemble.*) To collect anew (*Milton*).

To REASSE'RT. *v. a.* (*re* and *assert.*) To assert anew; to maintain after suspension or cessation (*Atterbury*).

To REASSU'ME. *v. a.* (*reassumo*, Latin.) To resume; to take again (*Denham*).

To REASSU'RE. *v. a.* (*reassurer*, Fr.) To free from fear; to restore from terrour (*Dryden*).

REATE. *s.* A kind of long small grass that grows in water, and complicates itself together (*Walton*).

To REAVE. *v. a.* pret. *reft.* (næpian, Sax.) To take away by stealth or violence (*Carew*).

REALMONT, a town of France, in the department of Upper Garonne, 31 miles N.E. of Toulouse. Lon. 2. 0 E. Lat. 43. 50 N.

REAUMUR (Rene-Antoine-Ferchault, Sieur de), a respectable French philosopher, was born at Rochelle in 1683. After the usual course of school education, he was sent to Poitiers to study philosophy, and, in 1699, to Bourges to study the law, the profession for which he was intended. But philosophy and mathematics having very early been his favourite pursuits, he quitted the law, and repaired to Paris in 1703, to pursue those sciences to the best advantage; and here his character procured him a seat in the academy in the year 1708; which he held till the time of his death, which happened the 18th of November 1757, at 74 years of age.

Reaumur soon justified the choice that was made of him by the Academy. He made innumerable observations, and wrote a great multitude of pieces upon the various branches of natural philosophy. His History of Insects, in 6 vols. quarto, at Paris, is his principal work. Another edition was printed at Holland, in 12 vols. 12mo. He made also great and useful discoveries concerning iron; showing how to change common wrought iron into steel, how to soften cast iron, and to make works in cast iron as fine as in wrought iron. His labours and discoveries concerning iron were rewarded by the duke of Orleans, regent of the kingdom, by a pension of 12 thousand livres, equal to about 500l. sterling; which, however, he would not accept but on condition of its being put under the name of the Academy, who might enjoy it after his death. It was owing to Reaumur's endeavours that there were established in France manufactures of tin plates, of porcelain in imitation of china-ware, &c. They owe to him also a new thermometer, which bears his name, and is pretty generally used on the continent, while that of Fahrenheit is used in England, and some few other places. Reaumur's thermometer is a spirit one, having the freezing point at 0, and the boiling point at 80.

Reaumur is esteemed as an exact and clear writer; and there is an elegance in his style and manner, which is not commonly found among those who have made only the sciences their study. He is represented also as a man of a most amiable disposition, and with qualities to make him beloved as well as admired. He left a great variety of papers and natural curiosities, which he bequeathed to the Academy of Sciences.

The works published by him, are the following:

1. The Art of changing Forged Iron into Steel; of Softening Cast Iron; and of making works of Cast Iron, as fine as of Wrought Iron. Paris, 1722, 1 vol. in 4to.

2. Natural History of Insects, 6 vols. in 4to.

His memoirs printed in the volumes of the Academy of Sciences, are very numerous, amounting to upwards of a hundred, and on various subjects, from the year 1708 to 1763, several papers in almost every volume.

REAUMUR'S THERMOMETER. See THERMOMETER.

REAUMURIA, in botany, a genus of the class polyandria, order pentagynia. Calyx five-leaved; petals five; capsule five-celled, five-valved, many-seeded; seeds woolly. Two species; annuals of Syria.

REBAPTIZATION. *s.* (*rebaptisation*, French.) Renewal of baptism (*Hooker*).

To REBAPTI'ZE. *v. a.* (*rebaptiser*, Fr. *re* and *baptize.*) To baptize again (*Ayliffe*).

To REBA'TE. *v. n.* (*rebattre*, French.) To blunt; to beat to obtuseness; to deprive of keenness (*Creech*).

REBATE, in arithmetic. See DISCOUNT.

REBEC. A Moorish word signifying an instrument with two strings played on with a bow. The Moors brought the rebec into Spain, whence it passed into Italy, and after the addition of a third string, obtained the name of rébeca; whence the old English rebec, or fiddle with three strings.

REBEL, a town of Lower Saxony, in the duchy of Mecklenburg, seated on the lake Muritz, 30 miles SE. of Gustrow. Lon. 12. 36 E. Lat. 53. 32 N.

RE'BEL. *s.* (*rebelle*, French.) One who

opposes lawful authority by violence (*Fenton*).

To REBE'L. *v. n.* (*rebello*, Latin.) To rise in opposition against lawful authority (*Shakspeare*).

REBE'LLER. *s.* (from *rebel.*) One that rebels.

REBE'LLION. *s.* (*rebellion*, Fr. *rebello*, Lat. from *rebel.*) Insurrection against lawful authority (*Milton*).

REBE'LLIOUS. *a.* (from *rebel.*) Opponent to lawful authority (*Deuteronomy*).

REBE'LLIOUSLY. *ad.* In opposition to lawful authority (*Camden*).

REBE'LLIOUSNESS. *s.* (from *rebellious.*) The quality of being rebellious.

To REBE'LLOW. *v. n.* (*re* and *bellow.*) To bellow in return; to echo back a loud noise.

REBOA'TION. *s.* (*reboo*, Lat.) The return of a loud bellowing sound.

To REBOU'ND. *v. n.* (*rebondir*, French; *re* and *bound.*) To spring back; to be reverberated; to fly back in consequence of motion impressed and resisted by a greater power (*Newton*).

To REBOU'ND. *v. a.* To reverberate; to beat back (*Dryden*).

REBOU'ND. *s.* (from the verb.) The act of flying back in consequence of motion resisted; resilition (*Dryden*).

REBU'FF. *s.* (*rebuffade*, Fr. *rebuffo*, Ital.) Repercussion; quick and sudden resistance (*Milton*).

To REBU'FF. *v. a.* (from the noun.) To beat back; to oppose with sudden violence.

To REBU'ILD. *v. n.* (*re* and *build.*) To re-edify; to restore from demolition; to repair (*Tickel*).

REBU'KABLE. *a.* (from *rebuke.*) Worthy of reprehension (*Shakspeare*).

To REBU'KE. *v. a.* (*reboucher*, French.) To chide; to reprehend; to repress by objurgation (*Dryden*).

REBU'KE. *s.* (from the verb.) 1. Reprehension; chiding expression; objurgation (*Pope*). 2. In low language, it signifies any kind of check (*L'Estrange*).

REBU'KER. *s.* (from *rebuke.*) A chider; a reprehender (*Hosea*).

REBUS, a name-device, as Camden Englishes it; or an enigmatical representation of some name, &c. by using figures or pictures, instead of words, or parts of words. Such is that of the gallant mentioned by Camden, who expressed his love to Rose Hill, by painting in the border of his gown a rose, a hill, an eye, a loaf, and a well; which, in the rebus style, is read, *Rose Hill, I love well.* The Picards have the honour of the invention of this notable kind of wit; whence the French, to this day, call it *rebus de Picardie.* Camden adds, that the English first learnt it of them in the reign of our Henry III. by means of the garrisons we then had in Calais, Guienne, and other places bordering on Picardy.

Its origin is by Menage, &c. ascribed to the priests of Picardy, who, it seems, anciently, in carnival time, used every year to make certain libels, entitled, *de rebus quæ geruntur*, being railleries on what intrigues and transactions had passed about the city; wherein they made great use of such sort of equivoques and allusions, breaking and joining words, and supplying them with paintings.

Camden tells us, the rebus was in wonderful esteem among our forefathers; and that he was nobody who could not hammer out of his name an invention by this wit-craft, and picture it accordingly.

The sieur Des Accords has made an ample collection of the most famous rebuses *de Picardie.* And Mr. Camden has done something of the same kind in his Remains.

REBUS, in heraldry, a coat of arms which bears an allusion to the name of the person; as three castles, for Castleton; three cups, for Butler; three conies, for Conisby; a kind of bearings which are of great antiquity.

To REBU'T. *v. n.* (*rebuter*, Fr.) To retire back: obsolete (*Spenser*).

REBUTTER (from the French *bonter*, i. e. *repellere*, to put back or bar), is the answer of defendant to plaintiff's *surrejoinder*; and plaintiff's answer to the rebutter is called a *surrebutter*: but it is very rare the parties go so far in pleading. Rebutter is also where a man by deed or fine grants to warranty any land or hereditament to another; and the person making the warranty, or his heir, sues him to whom the warranty is made, or his heir or assignee, for the same thing; if he who is so sued plead the deed or fine with warranty, and pray judgment, if the plaintiff shall be received to demand the thing which he ought to warrant to the party against the warranty in the deed, &c. this is called a rebutter. And if I grant to a tenant to hold without impeachment of waste, and afterwards implead him for waste done, he may debar me of this action by showing my grant, which is a rebutter.

To RECA'LL. *v. a* (*re* and *call.*) To call back; to call again; to revoke (*Hooker*).

RECA'LL. *s.* (from the verb.) Revocation; act or power of calling back (*Dryden*).

To RECA'NT. *v. a.* (*recanto*, Lat.) To retract; to recall; to contradict what one has once said or done (*Milton*).

To RECA'NT. *v. n.* To revoke a position; to unsay what has been said (*Swift*).

RECANTA'TION. *s.* (from *recant.*) Retractation; declaration contradictory to a former declaration (*Stillingfleet*).

RECA'NTER. *s.* (from *recant.*) One who recants (*Shakspeare*).

To RECAPI'TULATE. *v. a.* (*recapituler*, Fr.) To repeat the sum of a former discourse (*More*).

RECAPITULA'TION. *s.* (from *recapitulate.*) Repetition of the principal points (*Sou.*).

RECAPI'TULATORY. *a.* (from *recapitulate.*) Repeating again (*Garretson*).

To RECA'RRY. *v. a.* (*re* and *carry.*) To carry back (*Walton*).

To RECE'DE. *v. n.* (*recedo*, Latin.) 1. To fall back; to retreat (*Bentley*). 2. To desist; to relax any claim (*Clarendon*).

RECEI'PT. *s.* (*receptum*, Latin.) 1. The act of receiving (*Wiseman*). 2. The place of receiving (*Matthew*). 3. (*recepte*, Fr.) A note given, by which money is acknowledged to have been received. 4. Reception; admission (*Hooker*). 5. Reception; welcome (*Sidney*). 6. (from *recipe.*) Prescription of ingredients for any composition (*Shakspeare*).

RECEI'VABLE. *a.* (*recevable*, Fr.) Capable of being received.

To RECEI'VE. *v. a.* (*recevoir*, Fr. *recipio*, Lat.) 1. To take or obtain any thing as due (*Shakspeare*). 2. To take or obtain from another (*Daniel*). 3. To take any thing communicated (*Locke*). 4. To embrace intellectually (*Locke*). 5. To allow (*Hooker*). 6. To admit (*Watts*). 7. To take as into a vessel (*Acts*). 8. To take into a place or state (*Mark*). 9. To conceive in the mind; to take intellectually (*Shaks.*). 10. To entertain as a guest.

RECEI'VEDNESS. *s.* (from *received.*) General allowance (*Boyle*).

RECEI'VER. *s.* (*receveur*, French.) 1. One to whom any thing is communicated by another (*Donne*). 2. One to whom any thing is given or paid. 3. An officer appointed to receive public money (*Bacon*). 4. One who partakes of the blessed sacrament (*Taylor*). 5. One who co-operates with a robber, by taking the goods which he steals (*Spenser*).

RECEIVER, in pneumatics, a glass vessel for containing the thing on which an experiment in the air-pump is to be made. See PNEUMATICS, and AIR-PUMP.

RECEIVER, in chemistry, a vessel of earth, glass, &c. for receiving any distilled liquor.

RECEIVER. Receiving stolen goods, knowing them to be stolen, is a high misdemeanour at the common law; and by several statutes is made felony and transportation; and in some particular instances, felony without benefit of clergy.

RECEIVER, also signifies an officer, of which there are several kinds, denominated from the particular matters they receive, the places where, or the persons from whom, &c. 1. Receiver of the fines is an officer appointed to receive the money of such persons as compound with the king, upon original writs sued out of chancery. 2. Receiver-general of the duchy of Lancaster, is an officer belonging to the duchy-court, who collects all the revenues, fines, forfeitures, and assessments, within that duchy. 3. Receiver-general of the public revenue, is an officer appointed in every county, to receive the taxes granted by parliament, and remit the money to the treasury.

To RECE'LEBRATE. *v. a.* (*re* and *celebrate.*) To celebrate anew (*Ben Jonson*).

RE'CENCY. *s.* (*recens*, Latin.) Newness; new state (*Wiseman*).

RECE'NSION. *s.* (*recensio*, Latin.) Enumeration; review (*Evelyn*).

RE'CENT *a.* (*recens*, Latin.) 1. New; not of long existence (*Woodward*). 2. Late; not antique (*Bacon*). 3. Fresh; not long dismissed, released, or parted from (*Pope*).

RE'CENTLY. *ad.* Newly; freshly (*Arb.*).

RE'CENTNESS. *s.* (from *recent.*) Newness; freshness (*Hale*).

RECE'PTACLE. *s.* (*receptaculum*, Latin.) A vessel or place into which any thing is received (*Spenser*).

RECEPTACLE. (*receptaculum*, *recipio*, to receive.) In botany. A receptacle.—Basis qua partes fructificationis connectuntur. The base by which the other parts of the fructification are connected.—By Boerhaave named placenta; and by Vaillant thalamus.

1. *Proprium.*—An appropriate or peculiar receptacle: appertaining to one fructification only. Common: connecting several florets or distinct fructifications, so that if any one of them be removed an irregularity is occasioned.—There are instances of this in the umbel, cyme, spadix and rachis, as well as in the compound flowers.

2. *Recept. frutificationis.*—The receptacle of the fructification. Common both to flower and fruit; or embracing the corolla and germ.

Floris.—Receptacle of the flower. The base to which the parts of the flower, exclusive of the germ, are fixed.

Fructus.—Receptacle of the fruit. The base of the fruit only, remote from the receptacle of the flower.

Seminum.—Receptacle of the seeds. The base to which the seeds are fixed: as in adonis.

3. The receptacle may be, *nudum.* Naked. Without chaffs, hairs or bristles.—*Punctatum.* Dotted.—*Pilosum.* Hairy.—*Setosum.* Bristly.—*Paleaceum.* Chaffy.—*Alveolatum* s. *favosum.* Honey-combed; divided into open cells, within each of which a single seed is lodged.

Planum. Flat.—*Convexum.* Convex.—*Subulatum.* Subulate or awl-shaped.—*Ovatum.* Ovate.—*Globosum.* Globular.—*Conicum.* Conical.

RECEPTACULUM CHYLI. (from *recipio*, to receive.) In anatomy. The existence of such a receptacle in the human body is doubted. In brute animals the receptacle of the chyle is situated on the dorsal vertebræ where the lacteals all meet.

RECEPTIBI'LITY. *s.* (*receptus*, Latin.) Possibility of receiving (*Glanville*).

RECE'PTARY. *s.* (*receptus*, Lat.) Thing received: not in use (*Brown*).

RECE'PTION. *s.* (*receptus*, Lat.) 1. The act of receiving (*Brown*). 2. The state of being received (*Milton*). 3. Admission of any thing communicated (*Locke*). 4. Readmission (*Milton*). 5. The act of containing (*Addison*). 6. Treatment at first coming; welcome; entertainment (*Hammond*). 7. Opinion generally admitted (*Locke*). 8. Recovery: not in use.

RECE'PTIVE. *a.* (*receptus*, Lat.) Having the quality of admitting what is communicated (*Glanville*).

RECE'PTORY. *a.* (*receptus*, Lat.) Generally or popularly admitted (*Brown*).

RECE'SS. *s.* (*recessus*, Latin.) 1. Retirement; retreat; withdrawing; secession (*Pri.*). 2. Departure (*Glanville*). 3. Place of retirement; place of secrecy; private abode (*Mil.*). 4. Departure into privacy (*Milton*). 5. Remission or suspension of any procedure (*Bac.*). 6. Removal to distance (*Brown*). 7. Privacy; secrecy of abode (*Dryden*). 8. Secret part (*Hammond*).

RECE'SSION. *s.* (*recessio*, Latin.) The act of retreating.

RECESSION OF THE EQUINOXES. See PRECESSION.

RECHABITES, a kind of religious order among the ancient Jews, instituted by Jonadab the son of Rechab, comprehending only his own family and posterity. Their founder prescribed them three things: first, not to drink any wine; secondly, not to build any houses, but to dwell in tents; and thirdly, not to sow any corn, or plant vines. The Rechabites observed these rules with great strictness, as appears from Jer. xxxv. 6. &c. Whence St. Jerome, in his 13th epistle to Paulinus, calls them *monachi*, monks. Jonadab, their founder, lived under Jehoash king of Judah, contemporary with Jehu king of Israel.

To RECHA'NGE. *v. a.* (*rechanger*, Fr.) To change again (*Dryden*).

To RECHA'RGE. *v. a.* (*récharger*, French.) 1. To accuse in return (*Hooker*). 2. To attack anew (*Dryden*).

RECHASING, among sportsmen, the discovery and driving home of outlying deer, and other beasts, to the district from which they had strayed.

RECHEAT. An old term applied by huntsmen to the series of notes which they wind on the horn to call back the hounds from a false scent, when they have lost their game.

RECHLINGHAUSEN, a town of Germany, in the archbishopric of Cologne, capital of a county of the same name, with a strong citadel, and a chapter of noble ladies. It is seated on the Lippe, 20 miles W. of Ham. Lon. 8. 36 E. Lat. 51. 27 N.

RECIDIVA'TION. *s.* (*recidivus*, Latin.) Backsliding; falling again (*Hammond*).

RECIDI'VOUS. *a.* (*recidivus*, Lat.) Subject to fall again.

RECIPE, in medicine, a prescription or remedy, to be taken by a patient; so called because always beginning with the word recipe, *i. e.* take; which is generally denoted by the abbreviature ℞.

RECI'PIENT. *s.* (*recipiens*, Latin.) 1. The receiver; that to which any thing is communicated (*Glanville*). 2. The vessel into which spirits are driven by the still (*Dec. of Piety*).

RECI'PROCAL. *a.* (*reciprocus*, Latin.) 1. Acting in vicissitude; alternate (*Milton*). 2. Mutual; done by each to each (*L'Estrange*). 3. Mutually interchangeable (*Watts*).

RECIPROCAL, in arithmetic, &c. is the quotient arising by dividing 1 by any number or quantity. So, the reciprocal of 2 is $\frac{1}{2}$; of 3 is $\frac{1}{3}$, and of a is $\frac{1}{a}$, &c. Hence, the reciprocal of a vulgar fraction is found, by barely making the numerator and the denominator mutually change places: so the reciprocal of $\frac{1}{2}$ is $\frac{2}{1}$ or 2; of $\frac{2}{3}$, is $\frac{3}{2}$; of $\frac{a}{b}$, is $\frac{b}{a}$, &c. Hence also, any quantity being multiplied by its reciprocal, the product is always equal to unity or 1: so $\frac{1}{2} \times \frac{2}{1} = \frac{2}{2} = 1$, and $\frac{2}{3} \times \frac{3}{2} = \frac{6}{6} = 1$, and $\frac{a}{b} \times \frac{b}{a} = \frac{ab}{ab} = 1$.

RECIPROCAL PROPORTION, in arithmetic, is when, in four numbers, the fourth is less than the second, by so much as the third is greater than the first; and *vice versa*. This is the foundation of the inverse, or indirect rule of three; thus, 4 : 10 : : 8 : 5. See RULE. Reciprocal proportion is of great use in determining the laws of motion, because in bodies moving with equal momenta the velocities are reciprocally as their masses.

RECIPROCAL TERMS, among logicians, are those which have the same signification; and consequently are convertible, or may be used for each other.

RECIPROCALLY. *ad.* (from *reciprocal.*) Mutually; interchangeably.

RECIPROCALLY, one quantity is reciprocally as another, when the one is greater in proportion as the other is less; or when the one is proportional to the reciprocal of the other. Thus a is reciprocally as b when a is always proportional to $\frac{1}{b}$. So also in mechanics, to perform any given effect, the less the power is, the greater must be the time in performing it, or in a certain sense, what is gained in power is lost in time. If p denote any power or agent, and t the time of performing a given work, then p is as $\frac{1}{t}$, and t is as $\frac{1}{p}$, that is, p and t are reciprocally proportional to each other.

RECI'PROCALNESS. *s.* (from *reciprocal.*) Mutual return; alternateness (*Decay of Piety*).

To RECI'PROCA'TE. *v. n.* (*reciprocus*, Latin.) To act interchangeably; to alternate (*Sewel*).

RECIPROCA'TION. *s.* (*reciprocatio*, Latin.) Alternation; action interchanged.

RECI'SION. *s.* (*recisus*, Latin.) The act of cutting off.

RECI'TAL. *s.* (from *recite.*) 1. Repetition; rehearsal (*Addison*). 2. Narration (*Addison*). 3. Enumeration (*Prior*).

RECITA'TION. *s.* (from *recite.*) Repetition; rehearsal (*Hammond*).

RECITATIVE. A species of musical recitation forming the medium between air and rhetorical declamation, and in which the composer and performer, rejecting the rigorous rules of time, endeavour to imitate the inflexions, accent, and emphasis, of natural speech.

Recitative, so called because its true province lies in narration and recital, was first

introduced in the year 1660, by Signor Emilia del Cavaliere, at Rome, and was so powerfully recommended by its effect as to be speedily adopted in other parts of Italy, and, by degrees, through the rest of Europe.

The force and beauty of this species of composition will ever, in a considerable degree, depend on the character of the language in which it is used; as that is more or less accented and melodious, so the more or less natural and striking will be the effect of the recitative.

The ancient Greeks, whose language itself was melody, recited all their poetry in a kind of recitative, and from the musical tones of their syllables they could, as it were, sing in speaking. But all the modern languages, not excepting even the Italian, are too distant from that musical sweetness to admit of that melodious intonation, and we are consequently obliged either to sing or to speak; we cannot do as it were both at the same time: and it is this distinction which has rendered recitative, or artificial declamation, so necessary to the moderns: the transition from air to natural speech would in our Oratorio, serious Opera, or cantata, be too abrupt not to offend and disgust the ear.

There is no province of musical composition in which genius and science have an ampler scope for their fairest and fullest display than in recitative; nor upon success in which connoisseurs more highly reckon, because they know there is none in which excellence is more difficult of attainment. In Italy it is sufficient to excel in recitative to be ranked with the most illustrious of their composers, and some masters have been immortalized for their talents in this species of writing.

But however highly we may with justice reckon upon the beauty and value of good recitative, though it be nothing less than a species of unmeasured melody, highly impassioned and strongly expressive, and forms an union between the air and the words at once gratifying to the ear and consonant to the feelings, and always introduces the song by which it is succeeded with a heightened and interesting effect, yet it ought nevertheless to be sparingly employed, and should never continue longer at a time than the contexture and business of the scene absolutely demands.

Most vocal composers, from Emilia down to those of the present day, do not appear to have been sufficiently attentive to this necessary brevity, nor sufficiently aware that however beautiful and interesting recitative may be in itself, when duly limited, it becomes wearisome the moment it exceeds a certain length, and by previously fatiguing the attention, not only enfeebles its own intended effect, but defeats the grand object of advantageously preparing the ear for the approaching melody.

RECITATIVE ACCOMPANIED. A recitative is said to be accompanied when besides the bass there are parts for other instruments; as violins, hautboys, flutes, &c. When the recitative is measured, *i. e.* performed to the rules of time, the accompanists have only to observe those rules: but when unmeasured, as recitatives generally are, the instrumental performers take for the guide of their time the syllabic progress of the singer; for which purpose the words as well as notes of the vocal part are written in their books, on separate staves under the notes of the accompaniment. (*Busby*).

To RECI'TE. *v. a.* (*recito*, Latin.) To rehearse; to repeat; to enumerate; to tell over.

RECI'TE. *s.* Recital: not in use (*Temple*).

To RECK. *v. n.* (рecan, Saxon). To care; to heed; to mind: out of use (*Milton*).

To RECK. *v. a.* To heed; to care for (*Shakspeare*).

RE'CKLESSNESS. *s.* (from *reck.*) Carelessness; negligence (*Sidney*).

RE'CKLESS. *a.* (рeccelear, Sax.) Careless; heedless; mindless (*Shakspeare*).

To RE'CKON. *v. a.* (рeccan, Saxon.) 1. To number; to count (*Crashaw*). 2. To esteem; to account (*Hooker*). 3. To assign in an account (*Romans*).

To RE'CKON. *v. n.* 1. To compute; to calculate (*Addison*). 2. To state an account (*Shakspeare*). 3. To charge to account (*Ben Jonson*). 4. To pay a penalty (*Sanderson*). 5. To call to punishment (*Tillotson*). 6. To lay stress or dependance upon (*Temple*).

RE'CKONER. *s.* (from *reckon.*) One who computes; one who calculates cost.

RE'CKONING. *s.* (from *reckon.*) 1. Computation; calculation. 2. Account of time (*Sandys*). 3. Accounts of debtor and creditor (*Daniel*). 4. Money charged by an host (*Shakspeare*). 5. Account taken (*Kings*). 6. Esteem; account; estimation (*Hooker*).

RECKONING, OF A SHIP'S RECKONING, in navigation, is that account, whereby at any time it may be known where the ship is, and on what course or courses she is to steer, in order to gain her port; and that account, taken from the log-board, is called the dead reckoning. See NAVIGATION.

To RECLA'IM. *v. a.* (*réclamo*, Lat.) 1. To reform; to correct (*Brown*). 2. (*reclamer*, French.) To reduce to the state desired (*Bacon*). 3. To recall; to cry out against (*Dryden*). 4. To tame (*Dryden*).

RECLAI'MANT. *s.* (from *reclaim.*) Contradicter (*Waterland*).

RECLINATE LEAF, in botany, a reclined leaf. Quod deorsum curvatur, ut apex fiat basi inferior; quibusdam etiatum reflexum dicitur. Philos. Bot.—Deorsum flexum, ut arcus sit basi inferior, apice adscendente. Delin. pl. Bent downwards, so that the point of the leaf is lower than the base. The latter explanation seems very different; if we understand it rightly, as meaning that the bow is lowest at the base, and rises at the point. In foliation, this term implies, that the leaves are bent downwards towards the petiole: as in podophyllum, aconitum, anemone, adoxa.

RECLINATE STEM. A reclined stem. Bowed towards the earth: as in ficus.

RECLINATION *of a plane in dialling.* See DIALLING.

To RECLI'NE. *v. a.* (*reclino*, Latin.) To lean back; to lean sidewise (*Addison*).

To RECLI'NE. *v. n.* To rest; to repose; to lean.

RECLI'NE. *a.* (*reclinis*, Latin.) In a leaning posture (*Milton*).

To RECLO'SE. *v. a.* (*re* and *close*.) To close again (*Pope*).

To RECLU'DE. *v. a.* (*recludo*, Latin.) To open (*Harvey*).

RECLU'SE. *a.* (*reclus*, French; *reclusus*, Latin.) Shut up; retired (*Decay of Piety*).

RECLU'SE. *s.* A retired person (*Hammond*).

RECOAGULA'TION. *s.* (*re* and *coagulation*.) Second coagulation (*Boyle*).

To RECOGNI'SE. *v. a.* (*recognosco*, Lat.) 1. To acknowledge; to recover and avow knowledge of any person or thing (*Dryden*). 2. To review; to re-examine (*South*).

RECOGNISEE'. *s.* He in whose favour the bond is drawn.

RECO'GNISOR. *s.* He who gives the recognisance.

RECOGNI'TION. *s.* (*recognitio*, Latin.) 1. Review; renovation of knowledge (*Hooker*). 2. Knowledge confessed (*Grew*). 3. Acknowledgment; memorial (*Bacon*).

RECO'GNIZANCE. *s.* (*recognisance*, Fr.) 1. Acknowledgment of person or thing. 2. Badge (*Shakspeare*).

RECOGNIZANCE, in law, is an obligation of record, which a man enters into before some court of record, or magistrate duly authorized, with condition to the same particular act; as to appear at the assizes or quarter-sessions, to keep the peace, &c. If the party does not comply with it, the recognizance is estreated into the Exchequer. In some cases the court will upon motion respite, and in some discharge the recognizance; but all parties should be careful to apply in good time to the court where the recognizance is to be returned.

To RECO'IL. *v. n.* (*reculer*, French.) 1. To rush back in consequence of resistance (*Milton*). 2. To fall back (*Spenser*). 3. To fail; to shrink (*Shakspeare*).

RECOIL, or REBOUND, the resilition, or flying backward of a body, especially a fire-arm. This is the motion by which, upon explosion, it starts or flies backwards; and the cause of it is the resistance of the ball and the impelling force of the powder, which acts equally on the gun and on the ball. It has been commonly said by authors, that the momentum of the ball is equal to that of the gun with its carriage together; but this is a mistake; for the latter momentum is nearly equal to that of the ball and half the weight of the powder together, moving with the velocity of the ball. So that, if the gun, and the ball with half the powder, were of equal weight, the piece would recoil with the same velocity as the ball is discharged. But the heavier any body is, the less will its velocity be, to have the same momentum, or force; and therefore so many times as the cannon and carriage is heavier than the ball and half the powder, just as many times will the velocity of the ball be greater than that of the gun; and in the same ratio nearly is the length of the barrel before the charge, to the quantity the gun recoils in the time the ball is passing along the bore of the gun. So, if a 24 pounder of 10 feet long be 6400lb. weight, and charged with 6lb. of powder; then, when the ball quits the piece, the gun will have recoiled $\frac{28}{6400} \times 10 = \frac{7}{160}$ of a foot, or nearly half an inch.

To RECOI'N. *v. a.* (*re* and *coin*.) To coin over again (*Addison*).

RECOI'NAGE. *s.* (*re* and *coinage*.) The act of coining anew (*Bacon*).

To RECOLLE'CT. *v. a.* (*recollectus*, Lat.) 1. To recover to memory (*Watts*). 2. To recover reason or resolution (*Dryden*). 3. To gather what is scattered; to gather again (*Boyle*).

RECOLLE'CTION. *s.* (from *recollect*.) Recovery of notion; revival in the memory.

To RECO'MFORT. *v. a.* (*re* and *comfort*.) 1. To comfort or console again (*Sidney*). 2. To give new strength (*Bacon*).

To RECOMME'NCE. *v. a.* (*recommencer*, French.) To begin anew.

To RECOMME'ND. *v. a.* (*recommender*, Fr.) 1. To praise to another (*Dryden*). 2. To make acceptable (*Pope*). 3. To commit with prayers (*Acts*).

RECOMME'NDABLE. *a.* (*recommendable*, French.) Worthy of recommendation or praise (*Glanv.*).

RECOMMENDA'TION. *s.* (*recommendation*, French.) 1. The act of recommending. 2. That which secures to one a kind reception from another (*Dryden*).

RECOMME'NDATORY. *a.* (from *recommend*.) That commends to another (*Swift*).

RECOMME'NDER. *s.* (from *recommend*.) One who recommends (*Atterbury*).

To RECOMMI'T. *v. a.* (*re* and *commit*.) To commit anew (*Clarendon*).

To RECOMPA'CT. *v. a.* (*re* and *compact*.) To join anew (*Donne*).

To RE'COMPENCE. *v. a.* (*recompenser*, Fr.) 1. To repay; to requite (*Chronicles*). 2. To give in requital (*Romans*). 3. To compensate; to make up by something equivalent (*Knolles*). 4. To redeem; to pay for (*Numb.*).

RE'COMPENSE. *s.* (*recompense*, French.) 1. Reward; something given as an acknowledgment of merit (*Shakspeare*). 2. Equivalent; compensation (*Clarendon*).

RECOMPI'LEMENT. *s.* (*re* and *compilement*.) New compilement (*Bacon*).

To RECOMPO'SE. *v. a.* (*recomposer*, Fr.) 1. To settle or quiet anew (*Taylor*). 2. To form or adjust anew (*Boyle*).

RECOMPOSI'TION. *s.* Composition renewed.

To RE'CONCILE. *v. a.* (*reconcilier*, Fr.) 1. To make to like again (*Shakspeare*). 2. To make to be liked again (*Clarendon*). 3. To make any thing consistent (*Locke*). 4. To restore to favour (*Ezekiel*).

RECONCI'LEABLE. *a.* (*reconciliable*, Fr.) 1. Capable of renewed kindness. 2. Consistent; possible to be made consistent (*Hammond*).

RECONCI'LEABLENESS. *s.* 1. Consistence; possibility to be reconciled (*Hammond*). 2. Disposition to renew love.

RECONCI'LEMENT. *s.* (from *reconcile.*) 1. Reconciliation; renewal of kindness; favour restored (*Sid.*). 2. Friendship renewed (*Milt.*).

RECONCI'LER. *s.* (from *reconcile.*) 1. One who renews friendship between others. 2 One who discovers the consistence between propositions (*Norris*).

RECONCILIA'TION. *s.* (*reconciliatio*, Lat.) 1. Renewal of friendship. 2. Agreement of things seemingly opposite; solution of seeming contrarieties (*Rogers*). 3. Atonement; expiation (*Hebrews*).

To RECONDE'NSE. *v. a.* (*re* and *condense.*) To condense anew (*Boyle*).

RECO'NDITE. *a.* (*reconditus*, Latin.) Secret; profound; abstruse (*Felton*).

To RECONDU'CT. *v. a.* (*reconduit*, Fr.) To conduct again (*Dryden*).

To RECONJOI'N. *v. a.* (*re* and *conjoin.*) To join anew (*Boyle*).

RECONNOITRE, in military affairs, implies to view and examine the state of things, in order to make a report thereof. Reconnoitring parties are those sent to observe the country, and the enemy, to remark the routes, conveniences, and inconveniences of the first; the position, march, or forces of the second.

To RECO'NQUER. *v. a.* (*reconquerir*, Fr.) To conquer again (*Davis*).

To RECO'NSECRATE. *v. a.* (*re* and *consecrate.*) To consecrate anew (*Ayliffe*).

To RECONVE'NE. *v. a.* (*re* and *convene.*) To assemble anew (*Clarendon*).

To RECONVE'Y. *v. a.* (*re* and *convey.*) To convey again (*Denham*).

To RECO'RD. *v. a.* (*recordor*, Latin.) 1. To register any thing, so that its memory may not be lost (*Shakspeare*). 2. To celebrate; to cause to be remembered solemnly (*Fairfax*).

RE'CORD. *s.* (*record*, French.) Register; authentic memorial (*Shakspeare*).

RECORD, an act committed to writing in any of the king's courts; during the term wherein it is written, is alterable, being no record; but that term once ended, and the act duly inrolled, it is a record, and of that credit, which admits of no alteration on proof to the contrary.

RECORD, among fowlers. A bird is said to record, when it begins to tune or sing within itself; or to form its notes, or dispose its organs for singing. The cock thrush is distinguished from the hen in recording; the first being more loud and frequent in it than the second. Instances have been known of birds beginning to record when they were not a month old. This first essay does not seem to have the least rudiments of the future song; but, as the bird grows older and stronger, one may perceive what the nestling is aiming at. A young bird commonly continues to record for ten or eleven months, when he is able to execute every part of his song, which afterwards continues fixed, and is scarcely ever altered. The term record is probably derived from a musical instrument, formerly used in England, called a recorder; which seems to have been a species of flute, and was probably used to teach young birds to pipe tunes. Lord Bacon describes this instrument (in his Second Century of Experiments) to have been straight, to have had a smaller and greater bore, both above and below, to have required very little breath from the blower, and to have had what he calls a sipple or stopper.

RECORDE (Robert), a learned physician and mathematician, was born of a good family in Wales, and flourished in the reigns of Henry VIII. Edward VI. and Mary. There is no account of the exact time of his birth, though it must have been early in the 16th century, as he was entered of the university of Oxford about the year 1525, where he was elected fellow of Allsouls college in 1531. Making physic his profession, he went to Cambridge, where he was honoured with the degree of doctor in that faculty in 1545, and highly esteemed by all that knew him for his great knowledge in several arts and sciences. He afterwards returned to Oxford, where, as he had done before he went to Cambridge, he publicly taught arithmetic, and other branches of the mathematics, with great applause. It seems he afterwards repaired to London, and it has been said he was physician to Edward VI. and Mary, to which princes he dedicates some of his books; and yet he ended his days in the King's-bench prison, Southwark, where he was confined for debt, in the year 1558, at a very immature age.

Recorde published several mathematical books, which are mostly in dialogue, between the master and scholar. He also wrote various tracts on medicine and natural history.

RECORDARE, or RECORDARI FACIAS, in law, a writ directed to the sheriff, to remove a cause depending in an inferior court, or court of ancient demesne, hundred, or county, to the King's Bench or Common Pleas.

RECORDA'TION. *s.* (*recordatio*, Latin.) Remembrance: not in use (*Shakspeare*).

RECO'RDER. *s.* (from *record.*) 1. One whose business is to register any events.

RECORDER, a person whom the mayor and other magistrates of a city or corporation associate to them, for their better direction in matters of justice, and proceedings in law; on which account this person is generally a counsellor, or other person well skilled in the law. The recorder of London is chosen by the lord-mayor and aldermen; and, as he is held to be the mouth of the city, he delivers the judgment of the courts, and records and certifies the city customs.

RECORDER. An old wind instrument somewhat resembling a flute, but of a smaller bore and shriller tone. It is said to have had six holes, and to have answered to the tibia

minor, or flajeolet, of Mersennus. This instrument has been by some musical authors confounded with the flute; and we meet with old books of instruction for the flute, the directions of which are also professedly given for the recorder.

To RECOU'CH. *v. n.* (*re* and *couch.*) To lie down again (*Wotton*).

To RECO'VER. *v. a.* (*recouvrer*, French.) 1. To restore from sickness or disorder (*Dry.*). 2. To repair (*Rogers*). 3. To regain; to get again (*Knolles*). 4. To release (*Timothy*). 5. To attain; to reach: not in use (*Shakspeare*).

To RECO'VER. *v. n.* To grow well from a disease, or any evil (*Milton*).

RECO'VERABLE. *a.* (*recouvrable*, Fr.) 1. Possible to be restored from sickness. 2. Possible to be regained (*Clarendon*).

RECO'VERY. *s.* (from *recover.*) 1. Restoration from sickness (*Taylor*). 2. Power or act of regaining (*Shakspeare*). 3. The act of cutting off an entail (*Shakspeare*).

RECOVERY, in law, the name of a species of conveyance of great effect and much utility. Common recoveries were invented by the ecclesiastics to elude the statutes of mortmain; and afterwards encouraged by the courts at law, in order to put an end to all fettered inheritances, and bar not only all estates tail, but also all remainders and reversions expectant thereon. A common recovery is so far like a fine, that it is a suit or action, either actual or fictitious; and in it, the lands are recovered against the tenant of the freehold; which recovery by a supposed adjudication of the right, binds all persons, and vests a free and absolute fee simple in the recoverer. And a common recovery is now looked upon as the best assurance, except an act of parliament, that purchasers can have.

There must be three persons at least to make a common recovery, a recoverer, a recoveree, and a vouchee. The recoverer is the plaintiff or demandant, that brings the writ of entry. The recoveree is the defendant or tenant of the land, against whom the writ is brought. The vouchee is he whom the defendant or tenant voucheth or calls to warranty of the land in demand, either to descend the right, or to yield him other lands in value, according to a supposed agreement. And this being by consent and permission of the parties, it is therefore said that a recovery is suffered.

A common recovery may be had of such things, for the most part, as pass by a fine. An use may be raised upon a recovery, as well as upon a fine; and the same rules are generally to be observed and followed for the guiding and directing the uses of a recovery, as are observed for the guidance and direction of a fine. That is to say, that when a fine is levied, or a recovery is suffered, a deed is made between the parties really interested, which declares the purposes of the fine or recovery, and this deed is called a deed to lead or to declare the uses according as it is made before or after the fine or recovery. To enter at full into the learning of fines and recoveries would be impossible in a general dictionary. It is sufficient to say that both of them are in the nature of a sham suit, while one of which is compromised and the other carried on to judgment by default between the parties really interested, and the use of them is to enable a married woman to make a good conveyance, and a tenant in tail to turn his estate into an estate in fee, or as it is called, to dock or bar the entail. See FINE and ESTATE.

To RECO'UNT. *v. a.* (*reconter*, Fr.) To relate in detail; to tell distinctly (*Shakspeare*).

RECO'UNTMENT. *s.* (from *recount.*) Relation; recital (*Shakspeare*).

RECOU'RED, for *recovered*, or *recured.*

RECOU'RSE. *s.* (*recursus*, Lat. *recurs*, Fr.) 1. Frequent passage: obsolete (*Shakspeare*). 2. Return; new attack (*Brown*). 3. Application as for help or protection (*Wotton*). 4. Access (*Shakspeare*).

RECOU'RSEFUL. *a.* (from *recourse.*) Moving alternately (*Drayton*).

RECRE'ANT. *a.* (*recriant*, French) 1. Cowardly; meanspirited; subdued; crying out for mercy (*Spenser*). 2. Apostate; false (*Milton*).

To RE'CREATE. *v. a.* (*recreo*, Latin.) 1. To refresh after toil; to amuse or divert in weariness (*Dryden*). 2. To delight; to gratify (*More*). 3. To relieve; to revive (*Harvey*).

RECREA'TION. *s.* (from *recreate.*) 1. Relief after toil or pain; amusement in sorrow or distress (*Sidney*). 2. Refreshment; amusement; diversion (*Hol.*).

RE'CREATIVE. *a.* (from *recreate.*) Refreshing; giving relief after labour or pain; amusing; diverting (*Taylor*).

RE'CREATIVENESS. *s.* (from *recreative.*) The quality of being recreative.

RE'CREMENT. *s.* (*recrementum*, Latin.) Dross; spume; superfluous or useless parts (*Boyle*).

RECREME'NTAL. RECREMENTI'TIOUS. *a.* (from *recrement.*) Drossy.

To RECRI'MINATE. *v. n.* (*recriminer*, Fr.) To return one accusation with another (*Still.*).

To RECRI'MINATE. *v. a.* To accuse in return (*South*).

RECRIMINA'TION. *s.* (*recrimination*, Fr.) Return of one accusation with another (*Gov. of the Tongue*).

RECRIMINA'TOR. *s.* (from *recriminate.*) He that returns one charge with another.

RECRUDE'SCENT. *a.* (*recrudescens*, Lat.) Growing painful or violent again.

To RECRUI'T. *v. a.* (*recruter*, French.) 1. To repair any thing wasted by new supplies (*Newton*). 2. To supply any army with new men (*Clarendon*).

To RECRUI'T. *v. n.* To raise new soldiers (*Addison*).

RECRUI'T. *s.* (from the verb.) 1. Supply of any thing wasted (*Clarendon*). 2. A new soldier (*Dryden*).

RECTANGLE, in geometry, the same with a right-angled parallelogram. See GEOMETRY and PARALLELOGRAM.

RECTANGLED, RECTANGULAR, or RIGHT-ANGLED, appellations given to figures and solids which have one or more right angles: thus a triangle with one right angle, is termed a rectangled triangle; also parallelograms with right angles, squares, cubes, &c. are rectangular. Solids, as cones, cylinders, &c. are also said to be rectangular with respect to their situation, when their axes are perpendicular to the plane of the horizon.

RECTA'NGULAR. *a.* (*rectangulaire*, Fr.) Right-angled; having angles of ninety degrees (*Wotton*).

RECTA'NGULARLY. *ad.* (from *rectangular.*) With right angles (*Brown*).

RECTIFIABLE. *a.* (from *rectify*). Capable to be set right (*Brown*).

RECTIFICATION. *s.* (*rectification*, Fr.) 1. The act of setting right what is wrong (*For.*).

RECTIFICATION. (from *rectifico*, to make clean). In chemistry, a second distillation, in which substances are purified by their more volatile parts being raised by heat carefully managed; thus, spirit of wine, æther, &c. are rectified by their separation from the less volatile and foreign matter which altered or debased their properties. See SPIRITS DISTILLED.

RECTIFICATION, in geometry, is the finding of a right line equal to a curve. The rectification of curves is a branch of the higher geometry, a branch in which the use of the inverse method of fluxions is especially useful. This is a problem to which all mathematicians, both ancient and modern, have paid the greatest attention, and particularly as to the rectification of the circle, or finding the length of the circumference, or a right line equal to it; but hitherto without the perfect effect: upon this also depends the quadrature of the circle, since it is demonstrated that the area of a circle is equal to a right-angled triangle, of which one of the sides about the right angle is the radius, and the other equal to the circumference: but it is much to be feared that neither the one nor the other will ever be accomplished. Innumerable approximations however have been made, from Archimedes, down to the mathematicians of the present day. See CIRCLE and CIRCUMFERENCE.

The first person who gave the rectification of any curve was Mr. Neal, son of sir Paul Neal, as we find at the end of Dr. Wallis's treatise on the Cissoid; where he says, that Mr. Neal's rectification of the curve of the semicubical parabola was published in July or August, 1657. Two years after, viz. in 1659, Van Haureat, in Holland, also gave the rectification of the same curve; as may be seen in Schooten's Commentary on Des Cartes's Geometry.

The most comprehensive method of rectification of curves, is by the inverse method of fluxions, which is thus: let ACc pl. 149. fig. 1. be any curve line, AB an abscis, and BC a perpendicular ordinate; also *bc* another ordinate indefinitely near to BC; and C*d* drawn parallel to the abscis AB. Put the abscis AB $= x$, the ordinate BC $= y$, and the curve AC $= z$: then is C*d* $=$ B*b* $= \dot{x}$, the fluxion of the abscis AB, and $cd = \dot{y}$, the fluxion of the ordinate BC, also C*c* $= \dot{z}$, the fluxion of the curve AB. Hence because C*cd* may be considered as a plane right-angled triangle, $Cc^2 = Cd^2 + cd^2$, or $\dot{z}^2 = \dot{x}^2 + \dot{y}^2$; and therefore $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2}$ which is the fluxion of the length of any curve; and consequently, out of this equation expelling either $\dot{x}$ or $\dot{y}$, by means of the particular equation expressing the nature of the curve in question, the fluents of the resulting equation, being then taken, will give the length of the curve, in finite terms when it is rectifiable, otherwise in an infinite series, or in a logarithmic or exponential, &c. expression, or by means of some other curve, &c.

Ex. 1. *To rectify the common parabola.*—In this case, the equation of the curve is $2ax = y^2$, where a is half the parameter. The fluxion of this equation is $2a\dot{x} = 2y\dot{y}$, and hence $\dot{x}^2 = \frac{y^2\dot{y}^2}{a^2}$; this being substituted in the general equation $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2}$, it becomes $\dot{z} = \frac{\dot{y}\sqrt{aa+yy}}{a}$; the correct fluents of which give $z = \frac{y\sqrt{aa+yy}}{2a} + \frac{1}{2}a \times$ hyp. log. of $\frac{y+\sqrt{aa+yy}}{a}$, which is the length of the curve AC, when it is a parabola.

And the same might be expressed by an infinite series, by expanding the quantity $\sqrt{aa+yy}$.

Ex. 2. *To rectify the circle.*—The equation of the circle may be expressed either in terms of the sine, or versed sine, or tangent, or secant, &c. and the radius. Let therefore the radius of the circle be DA or DC $= r$, the versed sine AB $= x$, the right sine BC $= y$, the tangent CE $= t$, and the secant DE $= s$; then, by the nature of the circle, we have these equations, $y^2 = 2rx - x^2 = \frac{r^2t^2}{r^2+t^2} = \frac{s^2-r^2}{s^2}r^2$; and by means of the fluxions of these equations, with the generalequation $\dot{z}^2 = \dot{x}^2 + \dot{y}^2$, are obtained the following fluxional forms for the fluxion of the curve, the fluent of any one of which will be the curve itself, viz.

$$\dot{z} = \frac{r\dot{x}}{\sqrt{2rx-xx}} = \frac{r\dot{y}}{\sqrt{rr-yy}} = \frac{r^2\dot{t}}{r^2+t^2} = \frac{r\dot{s}}{\sqrt{s^2-r^2}},$$

Hence the value of the curve, from the fluent of each of these, gives the four following forms, in series, viz. the curve, putting $d = 2r$ the diameter, is z

$$= (1 + \frac{x}{2.3d} + \frac{3x^2}{2.4.5d^2} + \frac{3.5x^3}{2.4.6.7d^3} \&c.)\sqrt{dv},$$

$$= (1 + \frac{y^2}{2.3r^2} + \frac{3y^4}{2.4.5r^4} + \frac{3.5y^6}{2.4.6.7r^6} \&c.)\, y,$$

$$= (1 - \frac{t^2}{3r^2} + \frac{t^4}{5r^4} - \frac{t^6}{7r^6} + \frac{t^8}{9r^8} \quad \&c.)\, t,$$

$$= (\frac{s-r}{s} + \frac{s^3-r^3}{2.3s^3} + \frac{3(s^5-r^5)}{2.4.5s^5} \quad \&c.)\, r.$$

It is evident that the simplest of these series is the third, or that which is expressed in terms of the tangent. It will therefore be the properest form to calculate an example by in numbers. And for this purpose it will be convenient to assume some arc whose tangent, or at least its square, is known to be some small finite number. Now the arc of 45° it is known has its tangent equal to the radius; and therefore, taking the radius $r = 1$, and consequently the tangent of 45° or $t = 1$ also, in this case the arc of 45° to the radius 1 or the quadrant to the diameter 1, will be $= 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9}$ &c. But as this series converges very slowly, some smaller arch must be taken, that the series may converge faster; such as the arc of 30°, whose tangent is $\sqrt{\frac{1}{3}} = .5773502$, or its square $t^2 = \frac{1}{3}$; and hence, after the first term, the succeeding terms will be found by dividing always by 3, and these quotients divided by the absolute numbers 3, 5, 7, 9, &c.; and lastly adding every other term together into two sums, the one the sum of the positive terms, and the other the sum of the negative ones, then lastly the one sum taken from the other leaves the length of the arc of 30°, which is the 12th part of the whole circumference when the radius is 1, or the 6th part when the diameter is 1, and consequently 6 times that arc will be the length of the whole circumference to the diameter 1; therefore multiply the 1st term $\sqrt{\frac{1}{3}}$ by 6, and the product is $\sqrt{\frac{36}{3}}$ or $\sqrt{12} = 3.4641016$; hence the operation will be conveniently made as follows:

		+ Terms.	− Terms.
1)	4.4641016	(3.4641016	
3)	1.1547005	(	0.3849002
5)	3849002	(769800	
7)	1283001	(	183286

		+ 3.5462332	− 0.4046406
		− 0.4046406	
		3.1415926 the circumference.	

For more on this subject, see Hutton's Mensuration, in various places; and the treatises on Fluxions by Simpson, Vince, and Dealtry; also Dr. Hutton's paper on the rectification of the circle, in Phil. Trans. vol. 66, or in the 1st vol. of his own 8vo. Tracts, now publishing.

RECTIFIER, in navigation, an instrument consisting of two parts, which are two circles either laid one upon, or let into, the other, and so fastened together in their centres, that they represent two compasses, one fixed, the other moveable; each of them divided into the thirty-two points of the compass, and three hundred and sixty degrees, and numbered both ways, from the north and the south, ending at the east and west, in ninety degrees.

To RE'CTIFY. *v. a.* (*rectifier*, French.) 1. To make right; to reform; to redress (*Shakspeare*). 2. To exalt and improve by repeated distillation (*Grew*).

RECTILI'NEAR. RECTILI'NEOUS. *a.* (*rectus* and *linea*, Latin.) Consisting of right lines (*Newton*).

RECTITUDE. *s.* (*rectitude*, French.) 1. Straightness; not curvity. 2. Rightness; uprightness; freedom from moral curvity or obliquity (*King Charles*).

RECTO, in law, a writ of right, which is of so high a nature, that whereas other writs in real actions are only to recover the possession of the land or tenements in question, which have been lost by our ancestors or ourselves; this aims to recover both the seisin which some of our ancestors or we had, and also the property of the hiring whereof the ancestor died not seised as of fee; and whereby are pleaded and tried both their rights together, viz. as well of possession as of property; so that if a man ever loses his cause upon this writ, either by judgment or assize, he is without remedy. Pract. Lib. 5.

RECTO DE ADVOCATIONE ECCLESIÆ, a writ of right, lying where a man has a right of advowson, and the parson of the church dying, a stranger presents his clerk to the church; and he not having brought his action of quare impedit, nor darrein presentment, within six months, but suffered the stranger to usurp upon him.

RECTO DE DOTE, a writ of right of dower, which lies for a woman who has received part of her dower, and purposes to demand the remainder in the same town, against the heir, or his guardian if he is a ward.

RECTO DE DOTE UNDE NIHIL HABET, a writ of right which lies in a case, where the husband having divers lands or tenements, has assured no dower to his wife, and she thereby is driven to sue for her thirds, against the heir or his guardian.

RECTO QUANDO DOMINUS REMISIT, a writ of right, which lies in cases, where lands or tenements in the seigniory of any lord are in demand by a writ of right.

RECTOR, a term applied to several persons whose offices are very different; as, 1. The rector of a parish is a clergyman that has the charge and cure of a parish, and possesses all the tythes, &c. 2. The same name is also given to the chief elective officer in several

foreign universities, particularly in that of Paris. 3. Rector is also used in several convents for the superior officer who governs the house; and the jesuits give this name to the superiors of such of their houses as are either seminaries or colleges.

RECTORY, a parish church, parsonage, or spiritual living, with all its rights, tythes, and glebes.

RECTUM. (*rectum*, from its straight position.) In anatomy. Rectum intestinum. The last portion of the large intestines in the pelvis. See INTESTINES.

RECTUS. (from *rectus*, straight.) In anatomy, a generic name given to various muscles in consequence of their direction.

R. ABDOMINIS. This long and straight muscle is situated near its fellow, at the middle and fore part of the abdomen, parallel to the linea alba, and between the aponeuroses of the other abdominal muscles. It arises sometimes by a single broad tendon from the upper and inner part of the os pubis, but more commonly by two heads, one of which is fleshy, and originates from the upper edge of the pubis, and the other tendinous, from the inside of the symphysis pubis, behind the pyramidalis muscle. From these beginnings, the muscle runs upwards the whole length of the linea alba, and, becoming broader and thinner as it ascends, is inserted by a thin aponeurosis into the edge of the cartilago ensiformis, and into the cartilages of the fifth, sixth, and seventh ribs. This aponeurosis is placed under the pectoral muscle, and sometimes adheres to the fourth rib. The fibres of this muscle are commonly divided by three tendinous intersections, which were first noticed by Berenger, or, as he is commonly called, Carpi, an Italian anatomist, who flourished in the sixteenth century. One of these intersections is usually where the muscle runs over the cartilage of the seventh rib; another is at the umbilicus; and the third is between these two. Sometimes there is one, and even two, between the umbilicus and the pubis. When one or both of these occur, however, they seldom extend more than half way across the muscle. As these intersections seldom penetrate through the whole substance of the muscle, they are all of them most apparent on its anterior surface, where they firmly adhere to the sheath; the adhesions of the rectus to the posterior layer of the internal oblique are only by means of cellular membrane, and of a few vessels which pass from one to another.

Albinus and some others have seen this muscle extending as far as the upper part of the sternum.

The use of the rectus is to compress the fore part of the abdomen, but more particularly the lower part; and, according to the different positions of the body it may likewise serve to bend the trunk forwards, or to raise the pelvis. Its situation between the two layers of the internal oblique, and its adhesions to this sheath, secure it in its place, and prevent it from rising into a prominent form when in action; and lastly, its tendinous intersections enable it to contract at any of the intermediate spaces.

R. ANTERIOR BREVIS. See RECTUS CAPITIS INTERNUS MINOR.

R. ANTERIOR LONGUS. See RECTUS CAPITIS INTERNUS MAJOR.

R. CAPITIS INTERNUS MAJOR. Rectus anterior longus of Winslow. This muscle is situated on the anterior part of the neck, close to the vertebræ. It was known to most of the ancient anatomists, but was not distinguished by any particular name until Cowper gave it the present appellation, and which has been adopted by most writers, except Winslow. It is a long muscle, thicker and broader above than below, where it is thin, and terminates in a point It arises, by distinct flat tendons, from the anterior points of the transverse processes of the five inferior vertebræ of the neck, and, ascending obliquely upwards, is inserted into the anterior part of the cuneiform process of the occipital bone. The use of this muscle is to bend the head forwards.

R. CAPITIS INTERNUS MINOR. Cowper, who was the first accurate describer of this little muscle, gave it the name of rectus internus minor, which has been adopted by Douglas and Albinus. Winslow calls it rectus anterior brevis. It is in part covered by the rectus major. It arises fleshy from the upper and fore part of the body of the first vertebra of the neck, near the origin of its transverse process, and, ascending obliquely inwards, is inserted near the root of the condyloid process of the occipital bone, under the last described muscle. It assists in bending the head forwards.

R. CAPITIS LATERALIS. This muscle seems to have been first described by Fallopius. Winslow calls it transversalis anticus primus. It is somewhat larger than the rectus minor, but resembles it in shape, and is situated immediately behind the internal jugular vein, at its coming out of the cranium. It arises fleshy from the upper and fore part of the transverse process of the vertebra of the neck, and, ascending a little obliquely upwards and outwards, is inserted into the occipital bone, opposite to the stylo-mastoid hole of the os temporis. This muscle serves to pull the head to one side.

R. CAPITIS POSTICUS MAJOR. This, which is the rectus major of Douglas and Winslow, is a small, short, and flat muscle, broader above than below, and is situated, not in a straight direction, as its name would insinuate, but obliquely, between the occiput and the second vertebra of the neck, immediatel under the complexus. It arises, by a short thick tendon, from the upper and posterior part of the spinous process of the second vertebra of the neck; it soon becomes broader, and ascending obliquely outwards, is inserted, by a flat tendon, into the external lateral part of the lower semi-circular ridge of the os occipitis. The use of this muscle is to extend the head, and pull it backwards.

R. CAPITIS POSTICUS MINOR. This is

the rectus minor of Douglas and Winslow. It is smaller than the last described muscle, but resembles it in shape, and is placed close by its fellow, in the space between the recti majores. It arises by a short thick tendon, from the upper and lateral part of a little protuberance in the middle of the back part of the first vertebra of the neck, and, becoming broader and thinner as it ascends, is inserted, by a broad flat tendon, into the occipital bone, immediately under the insertion of the last described muscle. The use of it is to assist the rectus major in drawing the head backwards.

R. EXTERNUS OCULI. Abductor oculi. Indignabundus. The outer straight muscle of the eye. It arises from the bony partition between the foramen opticum and lacerum, being the longest of the straight muscles of the eye, and is inserted into the sclerotic membrane, opposite to the outer canthus of the eye. Its use is to move the eye outwards.

R. FEMORIS. Rectus sive gracilis anterior of Winslow. A straight muscle of the thigh, situated immediately at the fore part. It arises from the os ilium by two tendons. The foremost and shortest of these springs from the outer surface of the inferior and anterior spinous process of the ilium; the posterior tendon, which is thicker and longer than the other, arises from the posterior and outer part of the edge of the cotyloid cavity, and from the adjacent capsular ligament. These two tendons soon unite, and form an aponeurosis, which spreads over the anterior surface of the upper part of the muscle; and through its whole length we observe a middle tendon, towards which its fleshy fibres run on each side in an oblique direction, so that it may be styled a penniform muscle. It is inserted tendinous into the upper edge and anterior surface of the patella, and from thence sends off a thin aponeurosis, which adheres to the superior and lateral part of the tibia. Its use is to extend the leg.

R. INFERIOR OCULI. Depressor oculi. Deprimens. Humilis. The inferior of the straight muscles of the eye. It arises within the socket, from below the optic foramen, and passes forwards to be inserted into the sclerotic membrane of the bulb on the wider part. It pulls the eye downwards.

R. INTERNUS FEMORIS. See GRACILIS.

R. INTERNUS OCULI. Adducens oculi. Bibitorius. The internal straight muscle of the eye. It arises from the inferior part of the foramen opticum, between the obliquus superior, and the rectus inferior, being, from its situation, the shortest muscle of the eye, and is inserted into the sclerotic membrane opposite to the inner angle. Its use is to turn the eye towards the nose.

R. MAJOR CAPITIS. See RECTUS CAPITIS POSTICUS MAJOR.

R. SUPERIOR OCULI. Attollens oculi. Levater oculi. Superbus. The uppermost straight muscle of the eye. It arises from the upper part of the foramen opticum of the sphænoid bone below the levator palpebræ superioris, and runs forward to be inserted into the superior and fore part of the sclerotic membrane by a broad and thin tendon.

RECUBA'TION. *s.* (*recubo*, Latin.) The act of lying or leaning (*Brown*).

RECU'LE, for RECOIL. (*reculer*, French.) (*Spenser*).

RECULVER, a village in Kent, the Regnlbium of the Romans, seated near the mouth of the Thames, 12 miles W. of Margate. It is noted for its church, which was anciently collegiate, but is now in ruins, and has two spires, which serve for a seamark, and are called by mariners, the Two Sisters.

RECU'MBENCY. *s.* (from *recumbent.*) 1. The posture of lying or leaning (*Brown*). 2. Rest; repose (*Locke*).

RECU'MBENT. *a.* (*recumbens*, Lat.) Lying; leaning (*Arbuthnot*).

RECUPERA'TION. *s.* (*recuperatio*, Lat.) The recovery of a thing lost.

To RECU'R. *v. n.* (*recurro*, Latin.) 1. To come back to the thought; to revive in the mind (*Calamy*). 2. (*recourir*, Fr.) To have recourse to; to take refuge in (*Locke*).

To RECU'RE. *v. a.* (*re* and *cure.*) To recover from sickness or labour: not used (*Spenser*).

RECU'RE. *s.* Recovery; remedy (*Knolles*).

RECU'RRENCE. RECU'RRENCY. *s.* (from *recurrent.*) Return (*Brown*).

RECU'RRENT. *a.* (*recurrent*, Fr. *recurrens*, Lat.) Returning from time to time (*Harvey*).

RECURRENT NERVES. Two branches of the par vagum in the cavity of the thorax. The right is given off near the subclavian artery, which it surrounds, and is reflected upwards to the thyroid gland; the left a little lower, and reflected around the aorta to the œsophagus, as far as the larynx. They are both distributed to the muscles of the larynx and pharynx.

RECURRING DECIMALS, those which repeat in the same order, at certain intervals. Thus, the fraction $\frac{2}{3}$ is expressed by the recurring decimal ·66666, &c.; and the fraction $\frac{5}{7}$ by the recurring decimal ·714285714285, &c. The former being reckoned a *simple*, the latter a *compound* recurring decimal. See REPETEND and CIRCULATE.

It is curious that all fractions whose denominator is 7, are expressed in decimals by recurs which have the same effective figures, though varied in their position. Thus,

$\frac{1}{7}$ = ·142857142857, &c.
$\frac{2}{7}$ = ·285714285714, &c.
$\frac{3}{7}$ = ·428571428571, &c.
$\frac{4}{7}$ = ·571428571428, &c.
$\frac{5}{7}$ = ·714285714285, &c.
$\frac{6}{7}$ = ·857142857142, &c.

RECU'RSION. *s.* (*recursus*, Latin.) Return (*Boyle*).

RECURVATE LEAF, in botany, a recurved leaf. Deorsum flexum, ut arcus superiora spectet. Delin. Pl.—Bent, or rather

bowed or curved downwards, so that the bow or convexity is upwards. This term does not occur in Philos. Bot. Berkenhout explains it, but we know not on what authority, "bent downward in a greater degree than reclinate, but not so much as revolute."

When applied to a prickle it is said only to be bent outwards, in opposition to incurvate, bent in. In the same sense it is applied to the awn, petiole, calyx, and corol.

RECURVATION. Recu'rvity. *s.* (*recurvo*, Lat.) Flexure backward (*Brown*).

RECURVIROSTRA. Avocet. In zoology, a genus of the class aves, order grallæ. Bill depressed, subulate, recurved; pointed, flexible at the tip; feet palmate, four-toed, the hind toe not connected, very short, and placed high up; nostrils narrow, pervious; tongue short. Three species.

1. R. avocetta. Scooping avocet. Variegated with white and black. Bill three and a half inches long; irids hazel; crown black; behind and beneath the eyes a white spot; rest of the head, neck, back, exterior part of the wings, lesser quill-feathers, tail and body beneath white; inner scapulars and greater quill-feathers without and at the tips, black; legs blueish, very long; membrane connecting the toes indented. Inhabits southern Europe near the sea; eighteen inches long; feeds on worms and insects, which it scoops from the sand and mud with its bill; eggs two, white tinged with green, and marked with large black spots. This species is, in our own country, a bird of passage; and is seen on our coasts only for a short time, in the months of April and November. It departs often the very day after it arrives; and hence it is very seldom that the sportsman is able to kill it. The avocets are seen most frequently on the east and south shores of Britain, where they reside for a month or two, till frosts begin, and afterwards disappear. It is said that they nestle in some parts of France.

2. R. Americana. American avocet. Head and neck reddish; back black, beneath white. Inhabits North America and New Holland; fourteen inches long.

3. R. alba. White avocet. White; lower wing-coverts brownish; bill orange; legs brown. Inhabits Hudson's Bay: fourteen and a half inches long.

RECU'RVOUS. *a.* (*recurvus*, Latin.) Bent backward (*Denham*).

RECUSANTS, such persons as acknowledge the pope to be the supreme head of the church, and refuse to acknowledge the king's supremacy; who are hence called Popish recusants.

RED, in physics, one of the simple or primary colours of natural bodies, or rather of the rays of light.

The red rays are those which are of all rays the least refrangible: hence, as sir Isaac Newton supposes the different degrees of refrangibility to arise from the different magnitudes of the luminous particles whereof the rays consist, the red rays, or red light, is concluded to be that which consists of the largest particles. See Colour and Light.

Authors distinguish three general kinds of red; one bordering on the blue, as colombine, or dove-colour, purple, and crimson; another bordering on yellow, as flame-colour and orange; and between these extremes is a medium, partaking neither of the one nor the other, which is what we properly call red.

Acids generally turn black, blue, and violet into red; and red into yellow; and yellow into a very pale yellow. Alkalis change red into violet, or purple; and yellow into feuille-mort, or dead leaf-colour.

Terrestrial and sulphureous matters become red by extreme heat; and some at length black, as we see in brick, red bole, red chalk, slate, &c. All these, when vitrified by a burning-glass, become black.

Lobsters become red by a moderate fire; and by a violent one, black. Mercury and sulphur mixed and heated over a moderate fire, make a beautiful red, called artificial cinnabar.

Red, in heraldry. See Gules.

Red bird. See Muscicapa.

Red-breast, in ornithology. See Motacilla.

Red-book of the exchequer, an ancient record or manuscript volume, in the keeping of the king's remembrancer, containing divers miscellany treatises relating to the times before the conquest.

Red-crayon, or Ochre. See Ferrum.

Red-cedar, in botany. See Juniperus.

Red-eye, in ornithology. See Cyprinus.

Red-pole, in ornithology. See Fringilla.

Red-shank, in ornithology. See Scolopax.

Red-wing, in ornithology. See Turdus.

Red-start, in ornithology. See Motacilla.

Red saunders. See Santalum rubrum.

Red Russia. See Russia (Red).

Red Sea, a sea celebrated in holy writ. It extends 1300 miles from N. to S. dividing Africa from Arabia, and is 200 broad, in the widest part. It is separated from the Mediterranean Sea on the N. by the isthmus of Suez, and communicates, by the straits of Babelmandel, on the S. with the Arabian Sea and the Indian Ocean.

REDANS. See Redens.

REDBURN, a village in Herts, five miles NW. of St. Alban's. It formerly belonged to the monastery of St. Alban, and was greatly famed for the pretended relics of Amphibalus, who converted St. Alban to christianity.

RE'DCOAT. *s.* A name of contempt for a soldier (*Dryden*).

To RE'DDEN. *v. a.* (from *red.*) To make red (*Dryden*).

To Re'dden. *v. n.* To grow red (*Pope*).

REDDENDUM, a clause in a lease,

whereby the rent is reserved to the lessor. See DEED.

RE'DDISH. *a.* (from *red.*) Somewhat red.

RE'DDISHNESS. *s.* (from *reddish.*) Tendency to redness (*Boyle*).

REDDI'TION. *s.* (from *reddo*, Latin.) Restitution (*Howel*).

RE'DDITIVE. *a.* (*redditivus*, Lat.) Answering to an interrogative.

REDDLE, red-chalk, in mineralogy, a species of the iron genus: its name bespeaks its colour: it soils strongly, and writes; is easily frangible; adheres strongly to the tongue; feels meagre; specific gravity 3.9. Exposed to a red heat it decrepitates, and becomes black; it may even be melted into a greenish grey spumous enamel. In Silesia it is found in compact limestone: it is principally used for drawing; the coarser kinds are used by the carpenter, the finer by the painter. It is sometimes used in its natural state, and sometimes pulverized, washed, and mixed with gum, and cast into moulds.

REDE (William), bishop of Chichester, in the year 1369, and the best mathematician of his time. He built the first library of Merton college, and the castle of Ambarley.

REDE. *s.* (ræban, Saxon.) Counsel; advice (*Shakspeare*).

To REDE. *v. a.* (ræban, Saxon.) To advise (*Spenser*).

To REDEE'M. *v. a.* (*redimo*, Latin.) 1. To ransome; to relieve from forfeiture or captivity by paying a price (*Ruth*). 2. To rescue; to recover (*Shakspeare*). 3. To recompense; to compensate; to make amends for (*Dryden*). 4. To free by paying an atonement (*Shakspeare*). 5. To pay the penalty of (*Milton*).

REDEE'MABLE. *a.* (from *redeem.*) Capable of redemption.

REDEE'MABLENESS. *s.* (from *redeemable.*) The state of being redeemable.

REDEE'MER. *s.* (from *redeem.*) 1. One who ransoms or redeems (*Spenser*). 2. The Saviour of the world (*Shakspeare*).

To REDELI'VER. *v. a.* (*re* and *deliver.*) To deliver back (*Ayliffe*).

REDELI'VERY. *s.* (from *redeliver.*) The act of delivering back.

To REDEMA'ND. *v. a.* (*redemander*, Fr.) To demand back (*Addison*).

REDE'MPTION. *s.* (*redemption*, Fr.) 1. Ransome; release (*Milton*). 2. Purchase of God's favour by the death of Christ (*Shakspeare*).

REDE'MPTORY. *a.* (from *redemptus*, Lat.) Paid for ransome (*Chapman*).

REDENS, REDANS, or REDANT, in fortification, a kind of work indented in form of the teeth of a saw, with saliant and re-entering angles; to the end that one part may flank or defend another.

It is also called saw work, and indented work. The faces in this flank one another.

Redens are frequently used in the fortifying of walls, where it is not necessary to be at the expence of building bastions; as when they stand on the side of a river, a marsh, the sea, &c. But the fault of such fortification is, that the besiegers from one battery may ruin both the sides of the tenaille or front of a place, and make an assault without fear of being enfiladed, since the defences are mined.

The parapet of the corridor also is frequently redented, or carried on by the way of redens.

RED GUM, in medicine. See STROPHULUS.

RED HOT, heated to redness.

REDHEAD, a promontory in Angusshire, on the German Ocean, lying S. of Montrose. Here are the ruins of a castle, almost surrounded by the sea. Till the year 1793, this cape was the point beyond which coal was not permitted to pass without paying a heavy duty, which was taken off by a commutation duty on spirits.

REDI (Francis), an Italian physician, born at Arezzo, in Tuscany, 1662. He was admitted doctor in medicine, and professor of philosophy at Pisa, and the grand duke Ferdinand II. appointed him his physician. He contributed towards compiling the La Crusca dictionary, and Menage, in his Origine de la langue Italianne, and other authors, consider his language so pure as to be considered the standard of perfection. He died in 1697.

REDI (Tomaso), an Italian painter, born at Florence in 1665, and died in 1726. Several historical pictures by him adorn the churches in Tuscany, and he had also an excellent style of painting portraits.

REDITTA. (Italian.) In music, the same as *repeat*, *replica*, *replicato*, and *represa*; all which signify that we are to repeat the strain or movement over which it is written.

REDICULUS, a deity whose name is derived from the word *redire*, to return. The Romans raised a temple to this imaginary deity on the spot where Annibal had retired when he approached Rome, as if to besiege it.

REDI'NTEGRATE. *a.* (*redintegratus*, Latin.) Restored; renewed; made new (*Bacon*).

REDINTEGRA'TION. *s.* (from *redintegrate.*) 1. Renovation; restoration (*Decay of Piety*). 2. *Redintegration* was formerly much used by chemists to denote the restoring any mixed body or matter, whose form has been destroyed, to its former nature and constitution.

RE'DNESS. *s.* (from *red.*) The quality of being red (*Shakspeare*).

RE'DOLENCE. RE'DOLENCY. *s.* (from *redolent.*) Sweet scent (*Boyle*).

RE'DOLENT. *a.* (*redolens*, Latin.) Sweet of scent (*Sandys*).

REDON, a town of France, in the department of Isle and Vilaine. It serves as a mart for the commerce of Rennes, and is seated on the Vilaine, 20 miles E. of Vannes, and 225 E. by S. of Paris. Lon. 2. 10 W. Lat. 37. 48 N.

REDONDELLA, a commercial town of Spain, in Galicia, with a castle. It was pillaged by the English in 1702. There is a fishery for anchovies on the coast. It is seated

at the bottom of a bay of the Atlantic, eight miles S. of Ponte Vedra. Lon. 8. 15 W. Lat. 42. 18 N.

REDONDO, a town of Portugal, in Beira, with a castle. It has a manufacture of cloth, and is seated at the mouth of the Mondego, 17 miles S.W. of Coimbra. Lon. 8. 34 W. Lat. 40. 4 N.

To REDOU'BLE. *v. a.* (*redoubler*, Fr.) 1. To repeat in return (*Spenser*). 2. To repeat often (*Shakspeare*). 3. To increase by addition of the same quantity over and over (*Addison*).

To REDOU'BLE. *v. n.* To become twice as much (*Addison*).

REDOUBLED. An epithet applied to any simple interval carried into its octave: as the thirteenth, composed of a sixth and octave, is a redoubled sixth; and the fifteenth, containing two octaves, is a redoubled octave. To find the simple of any redoubled interval, we must throw out seven as often as the compound will admit, and the remainder will be the name of the simple interval: as seven thrown out from thirteen leaves the simple interval of a sixth; and twice seven taken from fifteen leaves that of a second.

REDOUBT, in fortification, a small square fort, without any defence but in front; used in trenches, lines of circumvallation, contravallation, and approach; as also for the lodgings of the corps-de-gard, and to defend passages.

REDOU'BTABLE. *a.* (*redoubtable*, Fr.) Formidable; terrible to foes (*Pope*).

REDOU'BTED. *a.* (*redoubté*, French.) Dread; awful; formidable: not in use (*Spenser*).

To REDOU'ND. *v. n.* (*redundo*, Latin.) 1. To be sent back by reaction (*Milton*). 2. To conduce in the consequence (*Addison*). 3. To proceed in the consequence (*Addison*).

To REDRE'SS. *v. a.* (*redresser*, French.) 1. To set right; to amend (*Milton*). 2. To relieve; to remedy; to ease (*Sidney*).

REDRE'SS. *s.* (from the verb.) 1. Reformation; amendment (*Hooker*). 2. Relief; remedy (*Bacon*). 3. One who gives relief (*Dryden*).

REDRE'SSIVE. *a.* (from *redress.*) Succouring; affording remedy (*Thomson*).

REDRUTH, a town in Cornwall, whose market is disused. It is seated in the very heart of the mining country, 12 miles N.N.E. of Helstone, and 262 W. by S. of London. Lon. 5. 13 W. Lat. 50. 13 N.

To REDU'CE. *v. a.* (*reduco*, Latin.) 1. To bring back: obsolete (*Shakspeare*). 2. To bring to the former state (*Milton*). 3. To reform from any disorder (*Clarendon*). 4. To bring into any state of diminution (*Boyle*). 5. To degrade; to impair in dignity (*Tillotson*). 6. To bring into any state of misery or meanness (*Arbuthnot*). 7. To subdue (*Milton*). 8. To bring into any state more within reach or power. 9. To reclaim to order (*Milton*). 10. To subject to a rule; to bring into a class.

REDU'CEMENT. *s.* The act of bringing back, subduing, reforming, or diminishing (*Bacon*).

REDU'CER. *s.* (from *reduce.*) One that reduces (*Sidney*).

REDU'CIBLE. *a.* (from *reduce.*) Possible to be reduced (*South*).

REDU'CIBLENESS. *s.* (from *reducible.*) Quality of being reducible (*Boyle*).

REDU'CTION. *s.* (*reduction*, Fr.) The act of reducing (*Hale*).

REDUCTION, in the schools, a manner of bringing a term or proposition, which was before opposite to some other, to be equivalent to it.

REDUCTION, in arithmetic, that rule whereby numbers of different denominations are brought into one denomination. See ARITHMETIC.

REDUCTION OF EQUATIONS, in algebra, is the clearing them from all superfluous quantities, bringing them to their lowest terms, and separating the known from the unknown, till at length only the unknown quantity is found on one side, and known ones on the other. The reduction of an equation is the last part of the resolution of the problem. See ALGEBRA.

REDUCTION OF A FIGURE, DESIGN, OR DRAUGHT, is the making a copy thereof, either larger or smaller than the original; still preserving the form and proportion. The great use of the proportional compasses is the reduction of figures, &c. whence they are called compasses of reduction. There are various methods of reducing figures, the most easy is by means of the pentagraph, or parallelogram; but this has its defects. See PENTAGRAPH.

REDUCTION, in metallurgy, a restoration of metallic substances which have been changed to scoriæ or oxyds, to their reguline state or that of pure metals, exhibiting the lustre which is so eminently characteristic of them when perfect. Reduction is for the most part effected by charcoal, in consequence of the close affinity of its carbon for oxygen, a high temperature being at the same time had recourse to, either with or without the assistance of fluxes. For the various modes of reduction in actual practice, see the articles of the different metals.

All metals, even the few that resist the action of heat and air, undergo a similar change when exposed to acids, especially the sulphuric, the nitric, and the muriatic, or a mixture of the two last. All metals, by these means, may be converted into powders, which have no resemblance to the metals from which they were obtained. These powders were formerly called calces; but at present they are better known by the name of oxyds. They are of various colours, according to the metal and the treatment, and are frequently manufactured in large quantities to serve as paints. When these oxyds are mixed with charcoal powder and heated in a crucible, they lose their earthy appearance, and are changed again into the metals from which they were produced. Oil, tallow, hydrogen gass, and other combustible bodies, may be often substituted for charcoal. By this operation, which is called the reduction

of the oxyds, the combustible is diminished, and indeed undergoes the very same change as when it is burnt. In the language of Stahl, it loses its phlogiston; and this induced him to conclude that metals are composed of earth and phlogiston. Mr. (now sir Humphrey) Davy, as we have seen in other parts of this work, inclines to the opinion that there are only two principles in nature, an inflammable and metallic principle.

REDUCTION, in surgery, denotes an operation whereby a dislocated, luxated, or fractured bone, is restored to former its state or place.

REDU'CTIVE. *a.* (*reductif*, Fr.) Having the power of reducing (*Hale*).

REDU'CTIVELY. *ad.* By reduction; by consequence (*Hammond*).

REDU'NDANCE. REDU'NDANCY. *s.* (*redundantia*, Latin.) Superfluity; superabundance; exuberance (*Bacon*).

REDU'NDANT. *a.* (*redundans*, Latin.) 1. Superabundant; exuberant; superfluous (*Ar.*). 2. Using more words or images than are useful (*Watts*).

REDUNDANT HYPERBOLA, is a curve of the higher kind, called redundant because it exceeds the conic hyperbola in the number of legs; being a triple hyperbola, with six hyperbolic legs.

REDU'NDANTLY. *ad.* (from *redundant.*) Superfluously; superabundantly.

To REDU'PLICATE. *v. a.* (*re* and *duplicate.*) To double.

REDUPLICA'TION. *s.* (from *reduplicate.*) The act of doubling (*Digby*).

REDU'PLICATIVE. *a.* (*reduplicatif*, Fr.) Double (*Watts*).

REDUTTIONE. See DEDUTTIONE.

REDUVIUS. In the entomology of Fabricius, a tribe of the genus CIMEX, which see.

To REE. *v. a.* To riddle; to sift (*Mortimer*).

To REE'CHO. *v. n.* (*re* and *echo.*) To echo back (*Pope*).

REE'CHY. *a.* (from *reck.*) Smoky; sooty; tanned (*Shakspeare*).

REED (Bamboo), in botany. See ARUNDO.

REED (Common), in botany. See ARUNDO.

REED (Spanish or Portugal), in botany. See ARUNDO.

REED (Indian flowering), in botany. See CANNA.

REED, in music, the little moveable tube through which a hautboy, bassoon, or clarinet, is blown. Also the name given by organ-builders to a kind of tongue, consisting of a thin narrow plate of brass, and which being fixed to one end of an organ pipe, is put into a vibratory motion by the action of the wind, and produces a reedy thickness of tone. Those stops of an organ which consist of pipes so furnished are called reed stops.

REE'DEN. *a.* (from *reed.*) Consisting of reeds (*Dryden*).

To REE'DIFY. *v. a.* (*reedifier*, Fr.) To rebuild; to build again (*Shakspeare*).

REE'DLESS. *a.* (from *reed.*) Being without reeds (*May*).

REE'DY. *a.* (from *reed.*) Abounding with reeds (*Blackmore*).

REEK. *s.* (рec, Saxon.) 1. Smoke; steam; vapour (*Shakspeare*). 2. (*reke*, Germ. any thing piled up.) A pile of corn or hay, commonly pronounced *rick*.

To REEK. *v. n.* (рecan, Saxon.) To smoke; to steam; to emit vapour (*Shakspeare*).

REE'KY. *a.* (from *reck.*) Smoky; tanned; black (*Shakspeare*).

REEL. *s.* (рeol, Sax.) A turning frame, upon which yarn is wound into skains from the spindle.

To REEL. *v. a.* (from the noun.) To gather yarn off the spindle (*Wilkins*).

To REEL. *v. n.* (*rollen*, Dutch; *ragla*, Swed.) To stagger; to incline in walking, first to one side and then to the other (*Sandys*).

REELE'CTION. *s.* (*re* and *election.*) Repeated election (*Swift*).

To REENA'CT. *v. n.* (*re* and *enact.*) To enact anew (*Arbuthnot*).

To REENFO'RCE. *v. a.* (*re* and *enforce.*) To strengthen with new assistance (*Collier*).

REENFO'RCEMENT. *s.* (*re* and *enforcement.*) 1. Fresh assistance; new help (*Milton*). 2. Iterated enforcement (*Ward*).

To REENJO'Y. *v. a.* (*re* and *enjoy.*) To enjoy anew or a second time (*Pope*).

To REE'NTER. *v. a.* (*re* and *enter.*) To enter again; to enter anew (*Milton*).

To REENTHRO'NE. *v. a.* To replace in a throne (*Southern*).

REE'NTRANCE. *s.* (*re* and *entrance.*) The act of entering again (*Glanville*).

REE'RMOUSE. *s.* (hрeremur, Saxon.) A bat.

To REESTA'BLISH. *v. a.* (*re* and *establish.*) To establish anew (*Smalridge*).

REESTA'BLISHER. *s.* (from *reestablish.*) One that reestablishes.

REESTA'BLISHMENT. *s.* (from *reestablish.*) The act of reestablishing; the state of being reestablished; restauration (*Addison*).

REEVE. *s.* (зeneрa, Saxon.) A steward (*Dryden*).

REEVING, in the sea language, the putting a rope through a block. Hence the pulling a rope out of a block is called unreeving.

To REEXA'MINE. *v. a.* (*re* and *examine.*) To examine anew (*Hooker*).

To REFE'CT. *v. a.* (*refectus*, Latin.) To refresh; to restore after hunger or fatigue (*Brown*).

REFE'CTION. *s.* (*refectio*, Lat.) Refreshment after hunger or fatigue (*South*).

REFE'CTORY. *s.* (*refectoire*, Fr.) Room of refreshment; eating room (*Dryden*).

To REFE'L. *v. a.* (*refello*, Lat.) To refute; to repress (*Ben Jonson*).

To REFE'R. *v. a.* (*refero*, Latin.) 1. To dismiss for information or judgment (*Burnet*). 2. To betake to for decision (*Shakspeare*). 3. To reduce to, as the ultimate end (*Bacon*). 4. To reduce, as to a class (*Boyle*).

To REFE'R. *v. n.* 1. To respect; to have relation (*Burnet*). 2. To appeal (*Bacon*).

REFEREE'. *s.* (from *refer.*) One to whom any thing is referred (*L'Estrange*).

RE'FERENCE. *s.* (from *refer.*) 1. Relation; respect; view toward; allusion to (*Raleigh*). 2. Dismission to another tribunal (*Swift*).

REFERE'NDARY. *s.* (*referendus*, Latin.) One to whose decision any thing is referred (*Bacon*).

To REFERME'NT. *v. a.* (*re* and *ferment.*) To ferment anew (*Blackmore*).

REFE'RRIBLE. *a.* (from *refer.*) Capable of being considered, as in relation to something else (*Brown*).

To REFI'NE. *v. a.* (*raffiner*, French.) 1. To purify; to clear from dross and recrement (*Zechariah*). 2. To make elegant; to polish.

To REFI'NE. *v. n.* 1. To improve in point of accuracy or delicacy (*Dryden*). 2. To grow pure (*Addison*). 3. To affect nicety (*Atterbury*).

REFI'NEDLY. *ad.* (from *refine.*) With affected elegance (*Dryden*).

REFI'NEMENT. *s.* (from *refine.*) 1. The act of purifying, by clearing any thing from dross and recrement (*Norris*). 2. Improvement in elegance or purity (*Swift*). 3. Artificial practice (*Rogers*). 4. Affectation of elegant improvement (*Addison*).

REFI'NER. *s.* (from *refine.*) 1. Purifier; one who clears from dross or recrement (*Bac.*). 2. Improver in elegance (*Swift*). 3. Inventor of superfluous subtilties (*Addison*).

REFINING, in metallurgy, is a branch of the general process of assaying metals: see the article ASSAY. In a more limited sense it is more frequently applied to the precious metals, as gold and silver, both of which may be refined by various methods which are founded on their essential properties, and acquire different names according to their kinds. Thus for instance, gold having the property which no other metal, not even silver, possesses, of resisting the action of sulphur, of antimony, of nitrous acid, of marine acid, may be purified by these agents from all other metallic substances, and consequently may be refined by them. These operations are distinguished by proper names, as purification of gold by antimony, parting, concentrated parting, dry parting. In a similar manner, as silver has the property, which the imperfect metals have not, of resisting the action of nitre, it may be refined by this salt. The term refining, however, is chiefly applied to the purification of gold or silver by the use of lead in the cupel. This effect is obtained by the destruction, vitrification, or scorification of all the extraneous and destructible metallic substances with which they are alloyed.

As none but the perfect metals can resist the combined action of air and fire without losing their inflammable principle, and being changed into earthy or vitreous matters incapable of remaining any longer united with substances in a metallic state, there is then a possibility of purifying gold and silver from all alloy of imperfect metals merely by the action of fire and air, and only keeping them fused till the alloy is destroyed; but this purification would be exceedingly tedious, and highly expensive from the great quantity of fuel that must necessarily be consumed. Silver alloyed with copper has been exposed more than sixty hours to a glass-house fire without being perfectly refined: the reason of which is that when a small quantity only of imperfect metal remains united with gold or silver it is covered and protected from the action of the air, which is necessary for the combustion of the imperfect metals, as of all other combustible materials.

The refining of gold and silver merely by the action of fire, which was the only method formerly known, was therefore very long, difficult, expensive, and imperfect; but a much shorter and more advantageous method has been discovered in modern times. This consists in adding to the alloyed gold and silver a certain quantity of lead, and afterwards exposing this mixture to the action of fire. Lead is one of the metals which loses most quickly and easily a sufficient quantity of its inflammable principle to cease to be in a metallic state; but at the same time this metal has the remarkable property of retaining, notwithstanding the action of fire, enough of this same inflammable principle to be very easily melted into a vitrified and powerfully vitrifying matter, called litharge.

The lead then which is to be added to the gold and silver to be refined, or which happens naturally to be mixed with these metals, produces in their refining, the following advantages. 1. By increasing the proportion of imperfect metals it prevents them from being so well covered and protected by the perfect metal. 2. By uniting with these imperfect metals it communicates to them its own property of losing very easily a great part of its inflammable principle. 3. By its vitrifying and fusing power which it exercises with all its force upon the calcined, and naturally refracting parts of the other metals, it facilitates and accelerates the fusion, scorification, and separation of these metals.

The lead which in the operation is scorified, and scorifies along with it the imperfect metals, separates from the metallic mass, with which it is then incapable of remaining united: it floats upon the surface, because by losing a part of its phlogiston, or at least some imperceptible constituent material, it loses also part of its specific gravity, and lastly it vitrifies.

These vitrifying and matted matters accumulating more and more upon the surface of the metal while the operation advances, would protect this surface from the contact of air which is so absolutely necessary for the scorification of the rest, and would thus stop the progress of the operation, which could never be finished if a method had not been contrived for their removal. This method consists either in the nature of the vessel in which the melted matter is contained, and which, being porous,

absorbs and imbibes the scorified matter as fast as it is formed; or in a channel cut in the edge of the vessel through which the matter flows out.

The refining vessel is flat and shallow, that the greatest surface of the material may be exposed to the action of the air: in its form it resembles a cup, and has hence been called a cupel. The furnace ought to be vaulted, that the heat may be applied upon the surface of the metal during the whole time of the operation. Upon this surface a crust of dark-coloured pellicle is continually forming. In the instant when all the imperfect metal is destroyed, and consequently the scorification ceases, the surface of the perfect metal is seen, and appears clean and brilliant. This forms a kind of fulguration or corruscation, by which mark the metal is well known to be refined. If the operation be so conducted that the metal sustains only the precise degree of heat necessary to keep it fused before it is perfectly refined we may observe that it fixes or becomes solid all at once in the very instant of the corruscation; because a greater heat is required to keep silver or gold in fusion when they are pure than when they are alloyed with lead.

The operation of refining may be performed in large or in small quantities upon the same principles, but only with some differences in the management. As the refining of small quantities of perfect metals in the same manner as these metals are assayed, the assay being only a very accurate mode of the refining, we again refer the reader to the article ASSAY for additional information.

The art of assaying, observes M. Fabbroni of Florence, was known in the remotest times, as the Scriptures attest. In the time of Pliny is had reached such perfection, that the fineness of gold to which the art was chiefly applied, was ascertained from 21 carats, or 0·875, to 21 carats and 7 twenty-fourths, 0·888, and even to 23 carats and 11 thirty-seconds, 0·973. In those days the assay must have been made in the dry way; first by separating the base metals from the gold by means of lead, and afterwards the silver by means of sulphur or a sulphuret.

The method of refining gold in large quantities was also known, as Strabo says, by cementing or burning it with an argillaceous earth, which, destroying the silver, left the gold in a state of purity. Pliny says, that for this purpose the gold was placed on the fire in an earthen vessel with three times its weight of salt; and that it was afterward exposed anew to the fire with two parts of salt, and one of schist, certainly argillaceous. This would certainly effect the decomposition of the salt, and the volatilization of the muriatic acid in a state of ignition and dry, which would penetrate the substance of the gold, and separate the silver in the form of a volatile muriate; the object and effect of the cementation of the moderns. But Agatharchides has transmitted to us an account of a peculiar method practised in the mines situate between the Nile and the borders of the Red Sea, in which we perceive the well known property of the muriatic acid in separating silver.

This author says, if he express himself accurately, and there be no corruption of the text, that the gold there is enclosed in marble: that the miners burn or calcine this ore: that they break it with hammers, pound, grind, and wash it: and that lastly the gold, placed in a covered crucible with a little lead, some salt, a little tin, and some barley-meal, was exposed to the fire five days.

The mintmen of Darius certainly employed this or a similar method, when this enlightened king was desirous of giving his subjects the noble and useful example of money made with the purest gold, similar to that of fine silver made afterward by his satrap Ariander.

It is not easy, however, to give a plausible explanation of the rationale of the docimastic method transmitted to us by Agatharchides. But if the operation he describes were intended not as a cementation, but a real and prolonged fusion, it remains to be explained, how the employment of a closed crucible, kept on the fire as he directs, is to be reconciled with the object proposed; nor is it easy to comprehend the use of barley-meal.

But on reflecting on the ingenious method, which Hellot found practised at Lyons, for refining, purifying, and separating cupelled silver from the little lead that remains with it after the first refining, we may form some notion of it.

The practice in that city was to take a crucible thirteen inches high, and five inches wide at the mouth: to put a layer of small charcoal three inches deep at the bottom, and cover it with a triangular piece of a crucible, fastened by a little lute at each corner, its sides answering to the corners of the crucible; and on this false bottom to place sixty or sixty-five pounds of silver in long slender ingots, to be melted and purified. The wind-furnace used for this purpose was fourteen inches high, seven in diameter at the grate, and nine at the top. The metal, as it melted, was observed to sink to three inches below the edges of the crucible; and then, when it had acquired a sufficient degree of heat, it was seen to boil like water exposed to a strong fire. In this state it was kept seven or eight hours.

The elastic fluid, which in this case was evolved from the charcoal beneath, caused the agitation here mentioned; the charcoal constituting, as we may say, a kind of bellows ingeniously placed at the bottom of the crucible.

Charcoal, placed in close vessels of glass or metal, we know is not altered, though heated red-hot. This we are taught by theory, and the truth is confirmed by many experiments. But the observation reported by the judicious Hellot equally attests, that in this case the charcoal beneath the melted silver is decomposed, and continues to furnish elastic fluid; since this learned chemist found, that silver kept in the same degree of heat, without any charcoal beneath, has a tremulous motion at its surface,

and proceeds from the centre to the sides and back again, but does not boil with such noise: whence then comes the elastic fluid?

Priestley, the founder of modern pneumatic chemistry by an immense number of facts, demonstrates in the most evident manner, what has since been confirmed by many other experiments, that earthen vessels, heated to such a degree as to give a passage to light, are filters, or rather sieves, giving admission even to the external air. Thus caloric and light penetrating the bottom of the crucible, and with them the air, attracted chemically by the charcoal within its oxygen, coming into contact with the incandescent charcoal, inflames a portion of it, combines with it and caloric, and forms carbonic acid. This elastic fluid, through the uninterrupted action of the fire, acquires sufficient force to overcome the pressure of a column of seven inches of liquid silver above it, and passes through it, agitating it violently. The small residue of lead, which was combined and diffused throughout the mass, being brought by the continual agitation into contact with the carbonic acid gass and the atmosphere (the latter, and perhaps the former, being decomposed by a superior affinity from the concurrence of circumstances), is oxyded, and, from the dimunition of its specific gravity, is compelled to occupy the upper surface.

In fact, Hellot observed a kind of yellowish oil rise from the interior of the melted silver, and float on it. This oil was a pure oxyd of lead in fusion; formed by the contact of the continually renewed atmospheric air. The refiners collect this melted oxyd, by enveloping and absorbing it with glass or a meagre earth; this earth being removed more readily from the silver it covers, and then the metal remains pure and limpid.

If we refer to this method the process of Agatharchides reported above, though very imperfectly, we may suppose, that the barley, or its meal, was employed instead of charcoal, to form what the Lyonese call the soul of the crucible; that it was placed at the bottom of the crucible, and retained there by a cover (whence probably the expression of a closed crucible); and that on this was poured the gold fused with a little lead, to vitrify the base metals it might contain, and common salt, and sulphuret of antimony or of lead, to seize the fine silver, and volatilize it with the lead, or reduce it to scoriæ. The elastic fluids evolved from the vegetable matter by the action of the fire would perform the office of bellows, to agitate the metal violently and incessantly for several days, which would occasion all the impurities to float on the surface, where they would be scummed off, as is done by the Lyonese.

But, to say the truth, a fire continued for five days gives rather an idea of the cementation of the moderns, analogous to that transmitted to us by Pliny, than of a real fusion in closed crucibles; a circumstance directly opposite to the purpose intended. Thus in Hungary, the better to open all the interior parts of the gold to the muriatic acid reduced to vapour in the process of cementation, it is customary to add lead to the mass, which is afterward reduced into small hollow drops, or grains as they are called. It is possible, that the lead mentioned by Agatharchides was intended for the same purpose; that tin is a mistaken expression for crude antimony, or native sulphuret of lead; and that the barley meal was intended merely to promote the uniform distribution of the little salt, a stratum of which was to be placed on the gold, and assisted perhaps in decomposing it, as clay or sulphate of iron does now.

To obtain some light on this curious subject, into a crucible, covered by another inverted over it, were put 720 grs of barley meal, and 576 grs of common salt. This mixture was heated till it acquired the colour of a redhot coal, and in this state it was kept for six and thirty hours. More from curiosity than to derive any important conclusion from it, into it had been put a small slip of gold, at 21 carats 3 eighths, or 0·891, a third of a millimeter (about 0·13 of a line Eng.) thick, and weighing 24 grs; and a slip of silver, at 11 dwts and half, or 0·958, half a millimeter (near 0·2 of a line) thick, and weighing 40 grs. The lower crucible, in which these were placed, was half full; and in the luting of that above was left an opening of 5 mil. (near 2 lines) for the issue of the elastic vapour.

At the expiration of this time the apparatus, after being cooled, was opened. In it was found a very little earthy residuum, slightly saline, whitish, weighing scarcely 11·5 grs. The gold was above it, and increased in weight an eighth of a grain, being perceptibly whitened by the fusion of some very small particles of silver, separated from the remains of the little slip of that metal, which was found sticking upon the gold in the form of an agglutinated dust possessing very little adhesion. These remains were pure silver, and weighed 6 grs and an eighth. The gold, which was silvered only on its surface, was boiled some time in pure nitric acid; when it lost entirely its silvery hue, and was found, on assaying it, to be of 24 carats.

The little earthy residuum was then examined. In it were found no saline particles but a few atoms of muriate of soda, and barely a trace of muriate of copper. The muriate of silver, which from the loss of the metal must have weighed 45·5 grs, had certainly evaporated with the other elastic vapours. In the formation of this muriate only 11·5 grs of muriatic acid had been employed. The 324 grs of acid beside, contained in the salt employed, were dissipated (leaving the small portion of copper out of the question) by a decomposition effected through the means of the vegetable matter mixed with it. But what is difficult to account for, and is foreign to our purpose, is the entire evaporation of 240 grs of soda, which the common salt contained, and which should have remained fixed at the bottom of the crucible. This must have been rendered volatile either by decomposition,

or by forming a new compound, and escaped through the opening in the apparatus.

It is not probable therefore, that Philip employed similar methods of refining, either by fusion or by cementation, because he would have reduced the gold to a state of perfect purity, as Darius thought proper to do subsequently; or he would not have confined himself to so small a portion of alloy, or perhaps that alloy would not have been silver. And if he employed the gold as he found it, we must necessarily infer, that nature yields gold at 23 carats and half, or 0·979 (7).

Many perhaps will doubt, whether gold be found in nature so near to perfect purity; though Strabo says, that gold was found pure in the Noric Alps; while Pliny is quoted for the assertion, that none is found free from silver. But, without being left in suspense by the assertions and opinions of others, I have the means of removing all doubt on the question; having had an opportunity of ascertaining by my own examination, that gold is actually found native at 24 carats.

I had for some time the keeping of the rich collection of natural history belonging to our first king, who was very fond of these things, and eminently versed in natural philosophy.

In it were many specimens of mineralized gold and native gold, among which I observed two well-formed crystals of gold; one cubical, the other a tetraedral prism surmounted by a four-sided pyramid. It would be gratifying to know what substances united to the gold determined these different figures, naturally formed in the bowels of the earth, and altogether different from those produced in our laboratories by cooling after fusion. The cube is very pale; the prism is of a deeper colour; but these two crystals, which I found by chance in selecting a great many native grains, are unique in the collection, so that it is impossible to think of subjecting them to an examination that would spoil their figure.

An amorphous but remarkable specimen from Brazil enriched the same collection. It was given by the prince of Brazil, at Badajoz, to the late king of Etruria, then infant of Spain and hereditary prince of Parma. The weight of this piece is about 14 lbs. (12 lbs. 9 oz. troy), beside a small fragment of the same, the nature of which, through the kindness of the king's apothecary, John Ulrici, I was enabled to examine by cupellation and parting; without neglecting to test its solution in nitromuriatic acid by sulphate of iron, and neutral salts with base of potash. By all these trials I was convinced that it is very pure gold of 24 carats, if the whole mass be homogeneous, without any portion of inferior metal.

As no person has ever doubted that very coarse gold is found in minerals containing it, I am now certain, that nature likewise presents us with it of the greatest fineness, and even perfectly pure. This is what I purposed to show by this new fact, in writing this little essay, as a present to the lovers of mineralogy and antiquities.

Notes on the preceding paper by Mr. D'Arcet, verifier of assays at the mint of France.

(1) Pliny says, book 33, that there is no gold more pure than that obtained from the sands of rivers; and that all gold obtained by arrugiæ has no occasion to be melted, being pure native gold. But Pliny says in the same book, that lead is more malleable and heavier than gold, which is a mistake, and proves, that the gold considered by Pliny as pure was an alloy. He says also farther on, that all gold is mixed with silver; and that the freest from silver known is the gold of Albicrare in Gaul, which contained but a thirty-sixth: whence it follows, that the testimony of Pliny to this point is of no weight, and that we must appeal to experiment.

(2) I delivered to Mr. Mongez the analysis of an ancient coin with the effigies of Philip, which proves, that in his reign coins were made of alloys, the composition of which was native, or at least unknown; for this piece contained

Silver	368
Gold	184
Copper	448
	1000.

It is not probable, that the regulations of the mint required such or so complex an alloy, at a time when the methods of analysis or assay were but approximations; and when they were unquestionably far from the accuracy that may be obtained even by employing only the touchstone, touchneedles, and prepared acid, used at present.

(3) The art of assaying was as far as possible from perfect in those remote periods. Under the emperors even the fineness of gold and of silver was judged by the colour it took in the fire, and that of its streak on the touchstone.

These methods, though practised by experienced men, can give only very inaccurate results, and which may be varied by a number of circumstances; as strong cleaning by aqua fortis, a complication in the alloy, a difference in the alloy, &c.

Archimedes would not have applied the laws of specific gravity to ascertain the falsification of the crown of Hiero, if he could have done it by a better method, and particularly by a method known and commonly practised.

It is well known too, that, under the triumvirate of Mark Antony, every street in Rome erected a statue to Marius Gratianus, who had invented and introduced one of these approximate methods, that have been mentioned; and this denotes the infancy of a useful art, the first steps of which are highly encouraged, because they are considered as conducive to the public welfare.

(4) By employing alkaline sulphurets the solution of gold may be effected: metallic sulphurets only must be understood here.

(5) Mr. de Robilant, in his account of the processes employed in the mint of Turin, says, that cementation is the process of refining commonly employed at Venice, Genoa, and Florence, where zechins are coined of nearly pure gold.

(6) As Mr. Fabbroni says, it is not easy to explain the grounds of the process described by Agatharchides, or of that which appears to be still practised at Lyons. These processes should be repeated, attending to their progress with care, and applying to them the means of modern chemical analysis, particularly the pneumatochemical apparatus. The nature of the gass that traverses the fluid silver should be ascertained, why it forms under such a pressure, why it does not flow back through the pores of the crucible, &c.

The experiment related by Mr. Fabbroni does not appear to me sufficiently conclusive, to decide the question.

(7) Reaumur says, Mémoires de l'Ac. des Sciences, An. 1718, p. 87, that

The gold of the river Cèze is at 18 car. 8 grs

Rhone - - 20
Rhine - - - 21·52
Arriège - - 22.25.

He farther observes, that the fineness varies in the same piece of native gold. He says, that the piece of 56 marks, which was seen at the academy, was in one place 23 carats and a half, in another 23 carats, and in another 22. The piece of 63 marks belonging to father Feuillée was at its upper part 52 carats 2 grs; a little lower, 21 carats, ½ gr.; and at two inches from the bottom only 17 carats and half. (Reaumur's grain is a twelfth of a carat, a division used in Germany.)

Mr. G. A. Deluc announced in the Journal de Physique, vol. lii. p. 205, that pieces of gold, found in the county of Wicklow, in Ireland, contained a ninth of their weight of silver, without any other alloy.

"My father," says Mr. Fabbroni, "having been appointed to assay the piece of native gold belonging to the academy, during the time of the revolution, made two assays of it, both of which were 23 car. 26 thirty-seconds. This comes very near to pure gold; and proves, that gold is found in nature alloyed with very variable quantities of silver."

Mr. Fabbroni is the first who has demonstrated, that gold is found also quite pure. This is an important observation; but it does not seem to overturn the general principle, that native gold is a natural alloy of gold and silver: a principle established by a great number of facts, and to which only one exception is yet known.

It is desirable, that the presence of lead should be sought for in ancient coins or medals: as this would be the most certain method of ascertaining, whether the ancients refined their gold, or employed it as nature gave it them.

To REFIT. *v. a.* (*refait*, Fr. *re* and *fit.*) To repair; to restore after damage (*Woodward*).

To REFLE'CT. *v. n.* (*reflechir*, French; *reflecto*, Latin.) To throw back (*Milton*).

To REFLE'CT. *v. n.* 1. To throw back light (*Shakspeare*). 2. To bend back (*Bent.*). 3. To throw back the thoughts upon the past or on themselves (*Taylor*). 4. To consider attentively (*Prior*). 5. To throw reproach or censure (*Swift*). 6. To bring reproach (*Dryden*).

REFLE'CTENT. *a.* (*reflectens*, Latin.) Bending back; flying back (*Digby*).

REFLECTING SEMICIRCLE. The objects of the reflecting circle or semicircle (and especially of that invented by sir Howard Douglas) are to combine the measuring principle with a circular or semicircular protractor, in such a manner that, in measuring any angle, the index or limb of the instrument shall pass over the whole of the measured angle.

By this contrivance any angle taken in the field may be at once protracted in actual magnitude on the sketch, without the trouble of reading off. This is particularly useful in military survey, where the true situations of objects can at once be determined, and the sketch corrected at the same time that it is taken.

The description of the instrument is as follows:

To the radius or limb of a semicircular (or circular) protractor ABC (plate 120, fig. 3.) the index glass DE is fixed. The horizon glass FG is fixed to a bar HI, which has a motion on the centre K. This bar slides upon a pin O attached to the limb or radius carrying the index glass, which pin is adjusted so that there shall be no apparent index error, and exactly in the same circle with the point K. The sliding bar will then move over half the real angle measured, and the principal limb protract the true angle.

Thus, the new reflecting circle or semicircle is divided into 180° or 360° instead of the double number as in the repeating circle, and the arc on which the divisions are engraven is equal to that of a sextant, whose radius is equal to the length of the sliding bar, that is, diameter of the circle.

A vernier is applied to read off with accuracy.

A 4-inch plotting or diagonal scale of a mile divided into yards, is engraven on the fixed limb of the instrument, by which addition all the cases of trigonometry can be solved by construction.

To those who have used the common sextant, the use of the reflecting semicircle will be obvious. It should be held in the right hand by the end of the fixed limb, and directed so that the left or the direct object is seen through the unsilvered part of the horizon glass. Apply the thumb of the left hand to the end of the moveable limb, and move it till the other object is seen reflected in the lower part of the horizon glass, and the angle is measured, which can be protracted at once. The

errors or mistakes arising from reading off in a hurry are thus avoided. There is no necessity for keeping a field-book on these rapid occasions. The operations of protracting the points and sketching the features of ground are combined; and the transfer of the sketch to the fair sheet is much sooner accomplished.

The above instrument is made by Mr. Cary, optician, No. 182, Strand.

For other instruments of reflection, see our article CIRCULAR INSTRUMENT.

REFLE'CTION. *s.* (from *reflect.*) 1. The act of throwing back (*Cheyne*). 2. The act of bending back (*Bentley*). 3. That which is reflected (*Shakspeare*). 4. Thought thrown back upon the past (*Denham*). 5. The action of the mind upon itself (*Locke*). 6. Attentive consideration (*South*). 7. Censure (*Prior*).

REFLECTION, or REFLEXION, in mechanics, is the return, or regressive motion of a moveable body, occasioned by the resistance of another body, which hinders it from pursuing its former course of direction.

Reflection is conceived, by the latest and best authors, as a motion peculiar to elastic bodies, by which, after striking on others which they cannot remove, they recede, or turn back, or aside, by their elastic power.

On this principle it is asserted, that there may be, and is, a period of rest between the incidence and the reflection; since the reflected motion is not a continuation of the other, but a new motion, arising from a new cause or principle, viz. the power of elasticity.

It is one of the great laws of reflection, that the angle of incidence is equal to the angle of reflection; i. e. that the angle which the direction of motion of a striking body makes with the surface of the body struck, is equal to the angle made between the same surface and the direction of motion after the stroke. See INCIDENCE and PERCUSSION.

Reflection of the rays of light, like that of other bodies, is their motion after being reflected from the surfaces of bodies.

The reflection of the rays of light from the surfaces of bodies, is the means by which those bodies become visible. And the disposition of bodies to reflect this or that kind of rays most copiously, is the cause of their being of this or that colour. Also, the reflection of light, from the surfaces of mirrors, makes the subject of catoptrics.

The reflection of light, Newton has shown, is not effected by the rays striking on the very parts of the bodies; but by some power of the body equally diffused throughout its whole surface, by which it acts upon the ray, attracting or repelling it without any real immediate contact. This power he also shows is the same by which, in other circumstances, the rays are refracted; and by which they are at first emitted from the lucid body.

Dr. Priestley says, it is not more probable, that the rays of light are transmitted from the sun, with an uniform disposition to be reflected or refracted, according to the circumstances of the bodies on which they impinge; and that the transmission of some of the rays, apparently under the same circumstances, with others that are reflected, is owing to the minute vibrations of the small parts of the surfaces of the mediums through which the rays pass; vibrations that are independent of action and reaction between the bodies and the particles of light at the time of their impinging, though probably excited by the action of preceding rays. See OPTICS, CATOPTRICS, MIRROR, &c.

As the rays of light are reflected by polished surfaces, so it is found that the rays of caloric have the same property. The Swedish chemist Scheele discovered, that the angle of reflection of the rays of caloric is equal to the angle of incidence. This has been more fully established by Dr. Herschel. Some very interesting experiments were made by professor Pictet of Geneva, which proved the same thing.

These experiments were conducted in the following manner. Two concave mirrors of tin, of nine inches focus, were placed at the distance of twelve feet two inches from each other. In the focus of the one was placed the bulb of a thermometer, and in that of the other a ball of iron two inches in diameter, which was just heated so as not to be visible in the dark. In the space of six minutes the thermometer rose 22°. A similar effect was produced by substituting a lighted candle in place of the ball of iron. Supposing that both the light and heat acted in the last experiment, he interposed between the two mirrors a plate of glass, with the view of separating the rays of light from those of caloric. The rays of caloric were thus interrupted by the plate of glass, but the rays of light were not perceptibly diminished. In nine minutes the thermometer sunk 14°; and in seven minutes after the glass was removed, it rose about 12°. He therefore justly concluded, that the caloric reflected by the mirror was the cause of the rise of the thermometer. He made another experiment, substituting boiling water in a glass vessel in place of the iron ball; and when the apparatus was adjusted, and a screen of silk which had been placed between the two mirrors removed, the thermometer rose 3°; namely, from 47° to 50°. The experiments were varied by removing the tin mirrors to the distance of 90 inches from each other. The glass vessel, with boiling water, was placed in one focus, and a sensible thermometer in the other. In the middle space between the mirrors, there was suspended a common glass mirror, so that either side could be turned towards the glass vessel. When the polished side of this mirror was turned towards the glass vessel, the thermometer rose only five-tenths of a degree; but when the other side, which was darkened, was turned towards the glass vessel, the thermometer rose 3° 5′. And in another experiment performed in the same way, the thermometer rose 3° when the polished side of the mirror was turned to the glass ves-

sel, and 9° when the other side was turned. These experiments show clearly, that the rays of caloric are reflected from polished surfaces, as well as the rays of light. Transparent bodies have the power of refracting the rays of caloric, as well as those of light. They differ also in their refrangibility. So far as experiment goes, the most of the rays of caloric are less refrangible than the red rays of light. The experiments of Dr. Herschel show that the rays of caloric, from hot or burning bodies, as hot iron, hot water, fires and candles, are refrangible, as well as the rays of caloric which are emitted by the sun. Whether all transparent bodies have the power of transmitting these rays, or what is the difference in the refractive power of these bodies, is not yet known.

The light which proceeds from the sun seems to be composed of three distinct substances. Scheele discovered, that a glass mirror held before the fire, reflected the rays of light, but not the rays of caloric; but when a metallic mirror was placed in the same situation, both heat and light were reflected. The mirror of glass became hot in a short time, but no change of temperature took place on the metallic mirror. This experiment shows that the glass mirror absorbed the rays of caloric, and reflected those of light; while the metallic mirror, suffering no change of temperature, reflected both. And if a plate of glass be held before a burning body, the rays of light are not sensibly interrupted, but the rays of caloric are intercepted; for no sensible heat is observed on the opposite side of the glass; but when the glass has reached a proper degree of temperature, the rays of caloric are transmitted with the same facility as those of light. And thus the rays of light and caloric may be separated. But the curious experiments of Dr. Herschel have clearly proved, that the invisible rays which are emitted by the sun have the greatest heating power. In these experiments the different coloured rays were thrown on the bulb of a very delicate thermometer, and their heating power was observed. The heating power of the violet, green, and red rays, were found to be to each other as the following numbers:

Violet - - - - - - -	16.0
Green - - - - - - -	22.4
Red - - - - - - - -	55.0

The heating power of the most refrangible rays was least, and this power increases as the refrangibility diminishes. The red ray, therefore, has the greatest heating power, and the violet, which is the most refrangible, the least. The illuminating power, it has been already observed, is greatest in the middle of the spectrum, and it diminishes towards both extremities; but the heating power, which is least at the violet end, increases from that to the red extremity; and when the thermometer was placed beyond the limit of the red ray, it rose still higher than in the red ray, which has the greatest heating power in the spectrum. The heating power of these invisible rays was greatest at the distance of half an inch beyond the red ray, but it was sensible at the distance of one inch and a half.

REFLE'CTIVE. *a.* (from *reflect.*) 1. Throwing back images (*Dryden*). 2. Considering things past; considering the operations of the mind (*Prior*).

REFLE'CTOR. *s.* Considerer (*Boyle*).

REFLE'X. *a.* (*reflexus*, Latin.) Directed backward (*Bentley*).

REFLEX. Reflexus. In botany. Bent back. Rami reflexi. Perpendiculariter dependentes. Delin. Pl.—Hanging down perpendicularly.—Reflexum folium. A reflex leaf: as in euphorbia portlandica.—Reflexum perianthium. A reflex perianth: as in asclepias and leontodon.—Reflexus flos. Reflexa corolla. Reflexa petala. A reflex flower, corol or petals: as in lilium chalcedonicum, cyclamen narcissus triandrus, &c.—Applied also to the stipule and bracte. See RETROFLEX.

REFLEX. *s.* (*reflexus*, Latin.) Reflection.

REFLEXIBI'LITY. *s.* (from *reflexible.*) The quality of being reflexible (*Newton*).

REFLE'XIBLE. *a.* (from *reflexus*, Latin.) Capable to be thrown back (*Cheyne*).

REFLE'XIVE. *a.* (*reflexus*, Lat.) Having respect to something past (*Hammond*).

REFLE'XIVELY. *ad.* In a backward direction (*Gov. of the Tongue*).

REFLO'AT. *s.* (*re* and *float.*) Ebb; reflux (*Bacon*).

To REFLOU'RISH. *v. n.* (*re* and *flourish.*) To flourish anew (*Milton*).

To REFLO'W. *v. n.* (*refluer*, French.) To flow back.

REFLU'ENT. *a.* (*refluens*, Lat.) Running back; flowing back (*Arbuthnot*).

REFLU'X. *s.* (*reflux*, French.) Backward course of water (*Brown*).

REFOCILLA'TION. *s.* (*refocillo*, Latin.) Restoration of strength by refreshment.

To REFO'RM. *v. a.* (*reformo*, Latin.) To change from worse to better (*Hooker*).

To REFO'RM. *v. n.* To pass by change from worse to better (*Atterbury*).

REFORM means a change from worse to better, a re-establishment or revival of former neglected discipline, or a correction of abuses therein. The term is much used in a monastic sense for the reducing an order or congregation of religious to the ancient severity of the rule from which it had gradually swerved, or even for improving on the ancient rule and institution itself, and voluntarily making it more severe. In this sense the order of St. Bernard is said to be only a reform of that of St. Benedict. In this country it is applied both to politics and religion, and may innocently be applied to any endeavours to change an establishment from worse to better.

REFORMATION, the act of reforming or correcting an error or abuse in religion, discipline, or the like. The Reformation, so called by way of eminence, is the separation of the protestants from the church of Rome, in the begin-

ning and towards the middle of the sixteenth century. See LUTHERANS and LUTHERANISM.

An event of such magnitude, with which the progress of the arts and universal learning is so intimately connected, demands a more enlarged and detailed account than the prescribed limits of our work will admit. It would, nevertheless, be highly improper wholly to omit the notice of so very important an era in the history of Europe.

At a time when the peace and harmony of the Romish church seemed fully established, and when the authority of the Holy See had just received a most signal triumph by the labours of the council of the Lateran; when the address and perseverance of Leo X. had surmounted a thousand difficulties, and given peace to his dominions; when Rome had begun once more to assume its ancient grandeur, and was again become the centre of genius, letters, and the arts; when the dark clouds of the middle ages were scattered before the rays of science, and the light of genius had begun to illumine the moral horizon, the attention of the whole Christian world was directed to an event that threatened nothing less than the speedy ruin of the papal authority, and the complete demolition of that fabric of religious magnificence which the labours of myriads had united to raise, and which the lapse of centuries had left rather established than impaired. It is curious to reflect, that what bid fair to have been the glory and security of the church, conspired to her destruction, and threatened her total overthrow. Leo X. in aiming to enhance the glory of his pontificate by the encouragement of literature and the patronage of the arts, was fostering in his bosom an enemy to destroy his peace and degrade his power. The seeds of learning which his father, Lorenzo de' Medici, had sown, and he so plentifully watered, sprung up to choak his pleasures, and reward him with trouble. No sooner had the human mind begun to be emancipated from its slavery, than it employed its newly restored liberty in bold and presumptuous investigations into the conduct of the Roman pontiffs, the extravagancies of the papal court, the foundations of church governments, and the truth of established doctrines. The errors and misconduct of the clergy were exposed to the shafts of ridicule and the remonstrances of reason. The hardy and intrepid genius of Dante, which placed the vicars of Christ in the infernal regions, lighted up the fire of Petrarca, and encouraged him to identify the court of Rome with that of ancient Babylon. He made the vices and errors of the church the subject of his sonnets, and the constant theme of his abuse. Protected by their genius, and respected for their character, these two great men not only escaped the censures of the Holy See, but emboldened the populace to question the infallibility of a church which had nothing but luxury in its train, and learning for its boast.

To support the expenses of a luxurious court, Leo X. had availed himself of an ancient custom in the church to raise money by the sale of indulgences, by which the purchasers were allowed the practice of several sins, and a deliverance from the pains of purgatory. To defend these indulgences, it was urged, that as one drop of Christ's blood is sufficient to atone for the sins of the whole world, the remainder of blood shed by the death of the Saviour belonged to the church, and that its efficacy might be sold out to the people. It was supposed also, that to the church belonged all the good works of the saints beyond what were employed in their own justification. These superabundant merits were accordingly sold to the unthinking multitude at various prices, according to the nature of the offence for which they were to atone. The form of these indulgences not being very generally known, we will give an exact copy of one of these most extraordinary instruments.

"May our Lord Jesus Christ have mercy upon thee, and absolve thee by the merits of his most holy passion. And I, by his authority, that of his blessed apostles, Peter and Paul, and of the most holy pope, granted and committed to me in these parts, do absolve thee, first from all ecclesiastical censures, in whatever manner they have been incurred; and then, from all thy sins, transgressions, and excesses, how enormous soever they may be, even from such as are reserved for the cognizance of the holy see; and as far as the keys of the holy church extend, I remit you all punishment you deserve in purgatory on their account; and I restore you to the holy sacraments of the church, to the unity of the faithful, and to that innocence and purity you possessed at baptism; so that when you die, the gates of punishment shall be shut, and the gates of the paradise of life shall be opened; and if you shall not die at present, this grace shall remain in full force when you are at the point of death. In the name of the Father, of the Son, and of the Holy Ghost. Amen."

This is the form of absolution sold by the agents of Leo X. in various parts of the Christian world; an instrument so absurd, that were it not well authenticated, and had we not even in our day a similiar instance of imposture on the one hand and credulity on the other in the seals disposed of by Johanna Southcott, one might be tempted to doubt the truth of its existence.

The promulgation of these indulgences in Germany, together with a share arising from the profits in the sale of them, was assigned to Albert, elector of Mentz, and archbishop of Magdeburg, who, as his chief agent for retailing them, employed one Tetzel, a Dominican friar of licentious morals, but of a bold and active spirit. Tetzel, assisted by the monks of his order, executed this ignoble commission with great zeal and success; but with the most shameless indecency and indiscretion; at the same time magnifying the benefits of these indulgences in the most extravagant manner. To such enormities did Tetzel proceed in describing the efficacy of these pretended dispensations, that he even said "if any one had ravished the mother of God, he (Tetzel) had wherewithal to efface his guilt." He also boasted, that "he had saved more souls from hell by these indulgences, than St. Peter had converted to christianity by his preaching." These enormous blasphemies and abuses roused the indignation of Martin Luther, a monk of the Augustinian Eremites, and professor of divinity in the academy at Wittemberg, to such a pitch of fervour, that he began to declaim with boldness against these scandals of the Christian name. In ninety-five propositions, maintained publicly at Wittemberg, on the 30th of September 1517, he censured the extravagant extortions of the questors, and plainly pointed out the Roman pontiff as a partaker of their guilt, since he suffered the people to be seduced, by such delusions, from placing their principal confidence in Christ, the only proper object of their trust. So daring an opposition from an

obscure monk in a corner of Germany, excited the surprise and admiration of all the world, except Rome itself, which seemed most likely to have been first alarmed. Luther had no sooner published his propositions than multitudes flocked to his standard, and joined him in the outcry against the shameful abominations of the Church of Rome. It was, however, some time before an irruption took place; or that the friends of reform declared open war against the decrees and authority of the church. Tetzel and others vainly attempted to defend the indulgences; but were continually repulsed, and put to shame by the arguments and intrepidity of Luther. The history of the various disputes which called forth the energies of this reformer, and exposed the nakedness of the church, is both interesting and curious: we must nevertheless pass over this portion of the history of the reformation in Germany; observing that Luther and his adherents soon found most powerful auxiliaries in the University of Wittemberg, and the protection of Frederick, elector of Saxony.

The same corruptions in the church of Rome which Luther condemned had been attacked long before his appearance, and the same opinions which he propagated had been published in different places, and supported by the same arguments. Waldus in the 12th century, Wickliff in the 14th, and Huss in the 15th, had inveighed against the errors of popery with great boldness, and confuted them with more ingenuity and learning than could have been expected in those illiterate ages in which they flourished. But all these premature attempts towards a reformation proved abortive. Many powerful causes contributed to facilitate Luther's progress, which either did not exist, or did not operate with full force in their days; the principal of these we shall here enumerate. The long and scandalous schism which divided the church, during the latter part of the fourteenth and the beginning of the fifteenth centuries, had a great effect in diminishing the veneration with which the world had been accustomed to view the papal dignity. The proceedings of the councils of Constance and Basil spread this disrespect for the Romish see still wider, and by their bold exertion of authority in deposing and electing popes, taught the world that there was in the church a jurisdiction superior even to the papal power, which they had long believed to be supreme. The wound given on that occasion to the papal authority was scarcely healed, when the pontificates of Alexander VI. and Julius II. both able princes, but detestable ecclesiastics, raised new scandal in Christendom. Besides, many of the dignified clergy, secular as well as regular, neglected the duties of their office, and indulged themselves without reserve in all the vices to which great wealth and idleness naturally give birth: and gross ignorance and low debauchery rendered the inferior clergy as contemptible as the others were odious. So that we find, long before the sixteenth century, that many authors of reputation give such description of the dissolute morals of the clergy, as seem almost incredible in the present age. The scandal of these crimes, which very generally prevailed, was greatly increased by the facility with which such as committed them obtained pardon. The exorbitant wealth of the church, the vast personal immunities of ecclesiastics, and their encroachments on the jurisdiction of the laity, and their various devices to secure their usurpations, created much dissatisfaction among the people, and disposed them to pay particular attention to the invectives of Luther. Besides these causes of his rapid progress, we may also reckon the invention of the art of printing, about half a century before his time, the revival of learning at the same period, and the bold spirit of inquiry which it excited in Europe; so that many were prepared to embrace his doctrines, who did not really wish success to his undertaking. In the writings of Beuchlin, Hutter, and the other revivers of learning in Germany, the corruptions of the church of Rome are censured with an acrimony of style little inferior to that of Luther himself. The raillery and oblique censures of Erasmus in particular, upon the errors of the church, as well as upon the ignorance and vices of the clergy, prepared the way for Luther's invectives and more direct attacks. To all which we may add, that the theological doctrines of popery were so repugnant to the spirit of Christianity, and so destitute of any foundation in reason, in the word of God, or in the practice of the church, that this circumstance combined in favouring the progress of Luther's opinions, and in weakening the resistance of his adversaries.

The rise of the reformation in Switzerland was at least as early as in Germany; for Ulric Zuingle had, in the year 1516, begun to explain the Scriptures to the people, and to censure, though with great prudence and moderation, the errors of a corrupt church. He had very noble and extensive ideas of a general reformation, at the time when Luther retained almost the whole system of popery, indulgences excepted; and he had actually called in question the authority and supremacy of the pope, before the name of Luther was known in that country. In the year 1524, Nuremberg, Francfort, Hamburgh, and several other cities in Germany, of the first rank, openly embraced the reformed religion, and by the authority of their magistrates abolished the mass, and the other superstitious rites of popery. The elector of Brandenburgh, the dukes of Brunswick and Lunenburgh, and prince of Anhalt, became avowed patrons of Luther's opinions, and countenanced the preaching of them among their subjects. The reformers derived great advantage from the transactions of the diet at Nuremberg, which presented to the pope a catalogue of a hundred grievances, which the empire imputed to the iniquitous dominion of the papal see. The progress of the reformation in Germany was likewise promoted by the proceedings of the diet, held at Spire in the years 1526 and 1529.

During these transactions in Germany, the dawn of truth arose upon other nations. The light of the reformation spread itself far and wide; and almost all the European states welcomed its salutary beams, and exulted in the prospect of an approaching deliverance from the yoke of superstition and spiritual despotism. Some of the most considerable provinces of Europe had already broke their chains, and openly withdrawn themselves from the discipline of Rome and the jurisdiction of its pontiff. The reformed religion was propagated in Sweden, soon after Luther's rupture with Rome, by Olaus Petri, one of his disciples, who was countenanced and encouraged by the valiant and public-spirited prince Gustavus Vasa Ericson, to whose firmness and magnanimity it was owing, that from the year 1527 the papal empire in Sweden was entirely overturned, and

Gustavus declared head of the church. The light of the reformation was also received in Denmark so early as the year 1521, in consequence of the ardent desire discovered by Christian or Christiern II. for purposes of mere ambition, of having his disciples instructed in the doctrines of Luther. His successor Frederick, duke of Holstein and Silesia, contributed greatly to the progress of the reformation, by his successful attempts in favour of religious liberty, at the assembly of states that was held at Odensee, in the year 1527, when he procured the publication of that famous edict which declared every subject of Denmark free, either to adhere to the tenets of the church of Rome, or embrace the doctrine of Luther; that no person should be molested on account of his religion; that a royal protection should be granted to the Lutherans; and that ecclesiastics of every order should be allowed to marry. But the honour of accomplishing this glorious work was reserved for Christiern III. a prince equally distinguished by his piety and prudence. The religious doctrine, discipline, and worship of this kingdom, were settled according to a plan laid down by Bugenhagius. And the assembly of the states at Odensee, in 1539, gave a solemn sanction to all these transactions, and thus the work of reformation was brought to perfection in Denmark.

In France, the auspicious patronage of Margaret, queen of Navarre, sister to Francis I. encouraged several pious and learned men, whose religious sentiments were the same as her own, to propagate the principles of the reformation, and even to erect several protestant churches in that kingdom. It appears, that, so early as the year 1523, there were many, and even persons of rank, and some of the episcopal order, who had conceived the utmost aversion both against the doctrine and tyranny of Rome. But the wavering and inconsistent conduct of Francis I. rendered the situation of the protestants in this country always precarious, often distressed. Upon the whole, we may observe, that, before the diet of Augsburg, the doctrine of Luther had made a considerable, though perhaps a secret progress in Spain, Hungary, Bohemia, Britain, Poland, and the Netherlands; and had, in all these countries, many friends, of whom several repaired to Wittemberg, to improve their knowledge, and enlarge their views under such an eminent master. At this diet, held in 1530, the Augsburg or Augustan Confession was presented to the emperor Charles V. and after many debates between the friends of liberty and the votaries of Rome, the latter prevailed; and the diet, in compliance with the opinion and remonstrances of Campeggio, the papal nuncio, issued a decree, condemning most of the peculiar tenets held by the protestants; forbidding any person to protect or tolerate those who taught them; enjoining a strict observance of the established rites, and prohibiting any farther innovation, under severe penalties. Those who refused to obey this decree were declared incapable of acting as judges, or of appearing as parties in the imperial chamber, the supreme court of judicature in the empire. The protestants, alarmed at this severity of the decree, assembled at Smalcal, and concluded a league of mutual defence against all aggressors, by which they formed the protestant states of the empire into one regular body; and they resolved to apply to the kings of England, France, and Denmark, to implore them to assist and patronize this new confederacy. After various negociations between the emperor and the protestant princes, terms of pacification were agreed upon at Nuremberg, and ratified solemnly in the diet at Ratisbon, in the year 1532. In this treaty it was stipulated, that universal peace be established in Germany, until the meeting of a general council, the convocation of which, within six months, the emperor shall endeavour to procure; that no person be molested on account of religion; that a stop be put to all processes begun by the imperial chamber against protestants, and the sentences already passed to their detriment be declared void. On their part, the protestants engaged to assist the emperor with all their forces in resisting the invasion of the Turks. Thus the protestants, by their firmness, unanimity, and dexterity in availing themselves of the emperor's situation, obtained terms which amounted almost to a toleration of their religion. But neither the emperor nor the pope were disposed to abide by the unbiassed sense of a general council, assembled, as the protestants wished, within the limits of the empire, but determined to decide their religious debates by the force of arms. After many evasions and delays, it was proposed, in the 1545, to assemble a council at Trent, which was vigorously opposed by the protestants. The emperor and the pope had mutually agreed to destroy all who should dare to oppose this council. The meeting of that assembly was to serve as a signal for their taking arms; and accordingly its deliberations were scarcely begun, in the year 1546, when the protestants perceived undoubted marks of a formidable union to overwhelm and crush them by one blow. The fathers, assembled in the council of Trent, promulgated their decrees; and the protestant princes in the diet of Ratisbon protested against their authority, and were, in consequence of this, proscribed by the emperor, who raised an army to reduce them to obedience. Thus commenced the war of Smalcald, which was prosecuted with various success on both sides, till, in the year 1552, Charles was surprised at Inspruck by Maurice of Saxony, and was constrained to conclude at Passau the famous treaty of pacification with the protestants, which is considered by those of Germany as the basis of their religious liberty; and to promise in six months to assemble a diet, in which all the tumults and dissentions that had been occasioned by a variety of sentiments in religious matters should be entirely removed. This diet, though not assembled at the stipulated time, met, however, at Augsburg, in the year 1555, and terminated those deplorable scenes of bloodshed, desolation, and discord, that had so long afflicted both church and state by that religious peace, as it is commonly called, which secured to the protestants the free exercise of their religion, and established this inestimable liberty upon the firmest foundations. For after various debates, the following memorable acts were passed: that the protestants, who followed the confession of Augsburg, should for the future be considered as entirely exempted from the jurisdiction of the Roman pontiff, and from the authority and superintendance of the bishops; that they were left at perfect liberty to enact laws for themselves, relating to their religious sentiments, discipline, and worship; that all the inhabitants of the German empire should be allowed to judge for themselves in religious matters, and to join themselves to that church whose doctrine and worship they thought the purest and

most consonant to the spirit of Christianity; and that all those who should injure or persecute any person under religious pretexts, and on account of their opinions, should be declared, and proceeded against, as public enemies of the empire, invaders of its liberty, and disturbers of its peace.

In the year 1533 Henry VIII. king of England, who, in the beginning of these troubles, had opposed the doctrine and views of Luther with the utmost vehemence, having sued for a divorce from Catharine of Arragon, his brother's widow, at the court of Rome, for almost six years, during which period Clement VII. negotiated, promised, retracted, and concluded nothing, determined to apply to another tribunal for that decree which he had unsuccessfully solicited at Rome. Cranmer, archbishop of Canterbury, by a sentence founded on the authority of universities, doctors, and rabbies, who had been consulted with respect to the point, annulled the king's marriage with Catharine; and Anna Boleyn, whose charms had captivated the king, was acknowledged as queen of England. Clement, apprehensive lest England would revolt from the holy see, determined to give Henry such satisfaction as might still retain him within the bosom of the church. But the violence of the cardinals precipitated him, in 1534, to issue a bull rescinding Cranmer's sentence, confirming Henry's marriage with Catharine, and declaring him excommunicated, if, within a time specified, he did not abandon the wife he had taken, and return to her whom he had deserted. Enraged at this unexpected decree, Henry kept no longer any measures with the court of Rome; his subjects seconded his resentment; an act of parliament was passed, abolishing the papal power and jurisdiction in England; by another the king was declared supreme head of the church, and all the authority of which the popes were deprived was vested in him; the monasteries were suppressed, and their revenues applied to other purposes. Henry, however, with the caprice peculiar to his character, continued to defend the doctrines of the Romish church as fiercely as he attacked its jurisdiction. He alternately persecuted the protestants for rejecting the former, and the catholics for acknowledging the latter. Nevertheless his subjects having been encouraged, by his example, to break some of their fetters, were so impatient to shake off all that remained, that in the following reign, under his son Edward VI. with the general applause of the nation, a total separation was made from the church of Rome in articles of doctrine, as well as in matters of discipline and jurisdiction. In 1553 his death retarded the progress of the reformation; and his sister Mary, who succeeded him, imposed a-new the arbitrary laws and tyrannical yoke of Rome upon the people of England. But the execution of a great number of persons, who were burnt for the protestant faith in the five years of her persecuting and bloody reign, so alienated the people from popery, that queen Elizabeth, her sister, found it no hard matter to deliver her subjects from the bondage of Rome, and to establish that form of religious doctrine and ecclesiastical government, which still subsists in England.

The seeds of the reformation were very early sown in Scotland, by several noblemen of that nation, who had resided in Germany during the religious disputes that divided the empire. The first and most eminent opposer of the papal jurisdiction was John Knox, a disciple of Calvin, who set out from Geneva for Scotland in 1559, and in a little while prevailed with the greatest part of the Scotch nation entirely to abandon the superstitions of Rome, and to aim at nothing less than the total extirpation of popery. From that period to the present times the form of doctrine, worship and discipline, that had been established at Geneva by the ministry of Calvin, has been maintained in Scotland with invincible obstinacy and zeal, and every attempt to introduce into that kingdom the rites and government of the church of England has proved impotent and unsuccessful. See PRESBYTERIANS: see also Dr. Cook's History of the Reformation in Scotland.

The cause of the reformation in Ireland underwent the same vicissitudes that had attended it in England. When Henry VIII. after the abolition of the papal authority, was declared supreme head of the church of England, George Brown, a native of England, and a monk of the Augustin order, whom that monarch had created, in the year 1535, archbishop of Dublin, began to act with the utmost vigour in consequence of this change in the hierarchy. He purged the churches of his diocese from superstition in all its forms, pulled down images, destroyed relics, abolished absurd and idolatrous rites, and by the influence as well as authority he had in Ireland, caused the king's supremacy to be acknowledged in that nation. Henry showed soon after that this supremacy was not a vain title, for he banished the monks out of that kingdom, confiscated their revenues, and destroyed their convents. In the reign of Edward VI. farther progress was made in the reformation, but the accession of Mary retarded it, in consequence of which Brown and other protestant bishops were deprived of their dignities in the church. When Elizabeth ascended the throne, the Irish were again obliged to submit to the form of worship and discipline established in England.

The reformation had not been long established in Britain, when the Belgic provinces, united by a respectable confederacy, withdrew from their spiritual allegiance to the Roman pontiff. The means which Philip II. king of Spain used to obstruct the reformation, promoted it: the nobility formed themselves into an association, in the year 1566, and roused the people; who, under the heroic conduct of William of Nassau, prince of Orange, seconded by the succours of England and France, delivered this state from the Spanish yoke: in consequence of which the reformed religion, as it was professed in Switzerland, was established in the United Provinces: and, at the same time, an universal toleration granted to those whose religious sentiments were of a different nature, whether they retained the faith of Rome, or embraced the reformation in another form, provided that they made no attempts against the authority of the government, or the the tranquillity of the public. See, on the subject of this article, Robertson's Hist. of Charles V. vol. ii. p. 113, &c. vol. iii. p. 44, &c. Mosheim's Eccl. Hist. Eng. ed. 8vo. vol. iii. p. 284, &c. Burnet's Hist. of the Reformation, passim. Cope's Memoirs of the House of Austria. Villers on the Influence of the Reformation, &c.

REFORMER. *s.* (from *reform.*) 1. One who makes a change for the better; an amender (*Sprat*). 2. One of those who changed religion from popish corruptions and innovations (*Bacon*).

REFRACTION.

To REFRA'CT. *v. n.* (*refractus*, Lat.) To break the natural course of rays (*Cheyne*).

REFRACT, in botany. Refracted. As it were broken.—Refract corol. Recurvata angulo acuto. Delin. Pl. Bent back at an acute angle. See RETROFRACT.

REFRACTING TELESCOPE. See TELESCOPE.

REFRACTION, in mechanics, is the deviation of a moving body from its direct course, by reason of the different density of the medium it moves in; or a flexion and change of determination, occasioned by a body's passing obliquely out of one medium into another of a different density.

REFRACTION OF LIGHT, in optics, is an inflection or deviation of the rays from their rectilinear course on passing obliquely out of one medium into another of a different density.

That a body may be refracted, it is necessary that it should fall obliquely on the second medium: in perpendicular incidence there is no refraction. Yet Voscius and Snellius imagined they had observed a perpendicular ray of light undergo a refraction; a perpendicular object appearing in the water nearer than it really was: but this was attributing that to a refraction of the perpendicular rays, which was owing to the divergency of the oblique rays after refraction, from a nearer point. Yet there is a manifest refraction even of perpendicular rays found in island crystal.

Rohault adds, that though an oblique incidence be necessary in all other mediums we know of, yet the obliquity must not exceed a certain degree; if it do, the body will not penetrate the medium, but will be reflected instead of being refracted. Thus, cannon-balls, in sea engagements, falling very obliquely on the surface of the water, are observed to bound or rise from it, and to sweep the men from off the enemy's decks. And the same thing happens to the little stones with which children make their ducks and drakes along the surface of the water.

The ancients confounded refraction with reflection; and it was Newton who first taught the true difference between them. He shews however that there is a good deal of analogy between them, and particularly in the case of light.

The laws of refraction of the rays of light in mediums differently terminated, i. e. whose surfaces are plane, concave, and convex, make the subject of dioptrics.—By refraction it is, that convex glasses, or lenses, collect the rays, magnify objects, burn, &c. and hence the foundation of microscopes, telescopes, &c.—And by refraction it is, that all remote objects are seen out of their real places; particularly, that the heavenly bodies are apparently higher than they are in reality. The refraction of the air has many times so uncertain an influence on the places of celestial objects near the horizon, that wherever refraction is concerned, the conclusions deduced from observations that are much affected by it will always remain doubtful, and sometimes too precarious to be relied on. See OPTICS and DIOPTRICS.

The true law of refraction, viz. that the ratio of the sines of the angles made by the perpendicular (to the plane bounding the mediums) with the incident and refracted rays, is a constant and fixed ratio, was first discovered by Willebrord Snell, professor of mathematics, at Leyden. From this law it follows that one angle of inclination, and its corresponding refracted angle, being found by observation, the refracted angles corresponding to the several other angles of inclination are thence easily computed. Now Zahnius and Kircher have found that if the angle of inclination be 70°, the refracted angle out of air into glass will be 38° 50′; on which principle Zahnius has constructed a table of these refractions for the several degrees of the angle of inclination; a specimen of which here follows:

Angle of Inclination.	Refracted Angle.			Angle of Refraction.		
°	°	′	″	°	′	″
1	0	40	5	0	19	55
2	1	20	6	0	39	54
3	2	0	4	0	59	56
4	2	40	5	1	19	55
5	3	20	3	1	39	57
10	6	39	16	3	20	44
20	13	11	35	6	48	25
30	19	29	29	10	30	31
45	28	9	19	16	50	41
90	41	51	40	48	8	20

Hence it appears, that if the angle of inclination be less than 20°, the angle of refraction out of air into glass is almost $\frac{1}{3}$ of the angle of inclination; and therefore a ray is refracted to the axis of refraction by almost a third part of the quantity of its angle of inclination. And on this principle it is that Kepler, and most other dioptrical writers, demonstrate the refractions in glasses; though, in estimating the law of these refractions, he followed the example of Alhazen and Vitello, and sought to discover it in the proportion of the angles, and not in that of the sines, or cosecants, as discovered by Snell, as mentioned above.

The refractive powers of several substances, as determined by different philosophers, may be seen in the following tables; in which the ray is supposed to pass out of air into each of the substances, and the annexed numbers shew the proportion to unity or 1, between the sines of the angles of incidence and refraction.

Refraction (Atmospherical). It is evident from the nature and progression of light that rays in passing from any object through the atmosphere, or part of it, to the eye, do not proceed in a right line; but the atmosphere being composed of an infinitude of strata (if we may so call them) whose density increases as they are posited nearer the earth, the luminous rays which pass through it are acted on as if they passed successively through media of increasing density, and are therefore inflected more and more towards the earth as the density augments. In consequence of this it is, that rays from objects, whether celestial or terrestrial, proceed in curves which are concave towards the earth; and thus it happens, since the eye always refers the place of objects to the direction in which the rays reach the eye, that is, to the direction of the tangent to the curve at that point, that the apparent or observed elevations of objects are always greater than the true ones. The difference of these elevations, which is, in fact, the effect of refraction, is, for the sake of brevity, called refraction: and it is distinguished into two kinds, horizontal, or terrestrial refraction, being that which affects the altitudes of hills, towers, and other objects on the earth's surface; and astronomical refraction, or that which is observed with regard to the altitudes of heavenly bodies. Refraction is found to vary with the state of the atmosphere, in regard to heat or cold, humidity or siccity, &c.: so that determinations obtained for one state of the atmosphere will not answer correctly for another, without modification. Tables commonly exhibit the refraction at different altitudes, for some assumed mean state.

2. With regard to the horizontal refraction, the following method of determining it has been successfully practised in the English Trigonometrical Survey.

Let A, A,′ pl. 149, fig. 2, be two elevated stations on the surface of the earth, BD the intercepted arc of the earth's surface, C the earth's centre, AH′, A′H, the horizontal lines at A, A′, produced to meet the opposite vertical lines CH′, CH. Let a, a', represent the apparent places of the objects A, A′, then is $a'AA'$ the refraction observed at A, and $aA'A$ the refraction observed at A′; and half the sum of those angles will be the horizontal refraction, if we assume it equal at each station.

Now, an instrument being placed at each of the stations A, A′, the reciprocal observations are made at the same instant of time, which is determined by means of signals or watches previously regulated for that purpose; that is, the observer at A takes the apparent depression of A′, at the same moment that the other observer takes the apparent depression of A.

In the quadrilateral ACA′I, the two angles A, A′, are right angles, and therefore the angles I and C are together equal to two right angles: but the three angles of the triangle IAA′ are together equal to two right angles; and consequently the angles A and A′ are together equal to the angle C, which is measured by the arc BD. If therefore the sum of the two depressions $HA'a$, $H'Aa'$ be taken from the sum of the angles HA′A, H′AA′, or, which is equivalent, from the angle C, (which is known, because its measure BD is known); the remainder is the sum of both refractions, or angles $aA'A$, $a'AA'$. Hence this rule—take the sum of the two depressions from the measure of the intercepted terrestrial arc, half the remainder is the refraction.

3. If, by reason of the minuteness of the contained arc BD, one of the objects, instead of being depressed, appears elevated, as suppose A′ to a'': then the sum of the angles $a''AA'$ and $aA'A$ will be greater than the sum IAA′+IA′A, or than C, by the angle of elevation $a''AA'$; but if from the former sum there be taken the depression HA′A, there will remain the sum of the two refractions. So that in this case the rule becomes as follows: take the depression from the sum of the contained arc and elevation, half the remainder is the refraction.

4. The quantity of this terrestrial refraction is estimated by Dr. Maskelyne at one-tenth of the distance of the object observed, expressed in degrees of a great circle. So, if the distance be 10000 fathoms, its 10th part 1000 fathoms, is the 60th part of a degree of a great circle on the earth, or 1′, which therefore is the refraction in the altitude of the object at that distance.

But M. Le Gendre is induced, he says, by several experiments, to allow only $\frac{1}{14}$th part of the distance for the refraction in altitude. So that, on the distance of 10000 fathoms, the 14th part of which is 714 fathoms, he allows only 44″ of terrestrial refraction, so many being contained in the 714 fathoms. See his Memoir concerning the Trigonometrical Operations, &c.

Again, M. Delambre, an ingenious French astronomer, makes the quantity of the terrestrial refraction to be the 11th part of the arch of distance. But the English measurers, especially colonel Mudge, from a multitude of exact observations, determine the quantity of the medium refraction to be the 12th part of the said distance.

The quantity of this refraction, however, is found to vary considerably, with the different states of the weather and atmosphere, from the $\frac{1}{5}$th to the $\frac{1}{18}$th of the contained arc. Trigonometrical Survey, vol. i. p. 160, 355.

Having thus given the mean results of observations on the terrestrial refraction, it may not be amiss, though we cannot enter at large into the investigation, to present here a correct table of mean astronomical refractions. The table which has been most commonly given in books of astronomy is Dr. Bradley's, computed from the rule $r = 57'' \times \cot.\ (a + 3r)$, where a is the altitude, r the refraction, and $r = 2'\,35''$ when $a = 20°$. But it has been found by numerous observations, that the refractions thus computed are rather too small. Laplace, in his Mecanique Celeste, tome iv. p. 27, deduces a formula which is strictly similar to Bradley's; for it is $r = m \times \tan\ (z - nr)$ where z is the zenith distance, &c. m and n are two constant quantities to be determined from observation. The only advantage of the formula given by the French philosopher over that given by the English astronomer, is, that Laplace and his colleagues have found more correct coefficients than Bradley had.

Now, if R = 57° 2957795, the arc equal to the radius, if we make $m = \frac{k\,R}{n}$, (where k is a constant coefficient which, as well as n, is an abstract number,) the preceding equation will become

$$\frac{nr}{R} = k \times \tan\ (z - nr).$$

Here, as the refraction r is always very small, as well as the correction nr, the trigonometrical tangent of the arc nr may be substituted for $\frac{nr}{R}$; thus we shall have

$$\tan.\ nr = k.\ \tan\ (z - nr).$$

But $nr = \frac{1}{2}z - (\frac{1}{2}z - nr) \ldots\ldots z - nr = \frac{1}{2}z + (\frac{1}{2}z - nr)$; consequently

$$\frac{\tan nr}{\tan\ (z - nr)} = \frac{\tan\left(\frac{z}{2} - \frac{z - 2nr}{2}\right)}{\tan\left(\frac{z}{2} + \frac{z - 2nr}{2}\right)} =$$

$$\frac{\sin z - \sin\ (z - 2nr)}{\sin z + \sin\ (z - 2nr)} = k.$$

Hence, $\sin\ (z - 2nr) = \frac{1 - k}{1 + k} \cdot \sin z.$

This formula is easy to use, when the coefficients n and $\frac{1 - k}{1 + k}$ are known: and it has been ascertained, by a mean of many observations, that these are 4 and ·99765175 respectively. Thus Laplace's equation becomes

$$\sin\ (z - 8r) = \cdot 99765175 \sin z:$$

and from this the following table has been computed. Besides the refractions, the differences of refraction, for every 10 minutes of altitude, are given; an addition which will render the table more extensively useful in all cases where great accuracy is required.

With respect to the refraction under different temperatures and at different states of the barometer the following theorems have been given, the 1st by Dr. Maskelyne, the 2d by Dr. Brinkley, viz.

$$\text{Ref.} = \frac{a}{29{\cdot}6} \times \tan(z - 3r) \times 57'' \times \frac{400}{350 + h}.$$

$$\text{Ref.} = \frac{a}{29{\cdot}6} \times \tan(z - 3{\cdot}2r)\ 56.''9 \times \frac{500}{450 + h}.$$

Where a = altitude of barometer in inches, h = height of Fahrenheit's thermometer in degrees, $r = 57''$ tan z.

Many curious and some whimsical effects of atmospherical refraction, have been noticed by ingenious men; for which see the article REFRACTION in Dr. Hutton's Dictionary, and the papers of Vince, Huddart, Lathom, &c. in the Philosophical Transactions. For more on the theory of atmospherical refraction, the reader may consult the treatises on astronomy by Vince, Gregory, Biot, and Woodhouse, and the Architecture Hydraulique of Prony.

REFRACTION OF ALTITUDE, is an arc of a vertical circle, by which the altitude of a star is increased by the refraction.

REFRACTION OF ASCENSION AND DESCENSION is an arc of the equator, by which the ascension and descension of a star, whether right or oblique, is increased or diminished by the refraction.

REFRACTION OF DECLINATION, is an arc of a circle of declination, by which the declination of a star is increased or diminished by refraction.

REFRACTION OF LATITUDE, is an arc of a circle of latitude, by which the latitude of a star is increased or diminished by the refraction.

REFRACTION OF LONGITUDE, is an arc of the ecliptic, by which the longitude of a star is in-

creased or diminished by means of the refraction.

Refraction (Double), a phenomenon manifested by several mineral substances, which have the singular property of soliciting a ray which penetrates them to divide itself into two parts following two different routes.

We owe the knowledge of this phenomenon to Erasmus Bartholinus, who, having looked at the image of a line through a transparent rhomboid of carbonate of lime (calcareous spar), observed that the image appeared double. The explanation of this singular effect has exercised the sagacity of many distinguished philosophers, at the head of whom are Huygens and Newton. But we cannot here detail their theories. An interesting account of them is given by M. Haüy in the 2d vol. of his Natural Philosophy, as well as of a theory devised by M. Haüy himself, which we think more satisfactory than any preceding hypothesis.

REFRA'CTIVE. *a.* (from *refract.*) Having the power of refraction (*Newton*).

REFRA'CTORINESS. *s.* (from *refractory.*) Sullen obstinacy (*Saunderson*).

REFRA'CTORY. *a.* (*refractoire,* French.) Obstinate; perverse; contumacious (*Bacon*).

REFRA'GABLE. *a.* (*refragabilis,* Latin.) Capable of confutation and conviction.

To REFRA'IN. *v. a.* (*refrener,* French.) To hold back; to keep from action (*Milton*).

To Refra'in. *v. n.* To forbear; to abstain; to spare (*Hooker*).

REFRANGIBILITY OF LIGHT, the disposition of rays to be refracted. The term is chiefly applied to the disposition of rays to produce different colours, according to their different degrees of refrangibility. See Chromatics, Colour, and Optics.

REFRA'NGIBLE. *a.* (*re* and *frango,* Lat.) That may be turned out of its course, in passing from one medium to another (*Locke*).

REFRENA'TION. *s.* (*re* and *fræno,* Lat.) The act of restraining.

To REFRE'SH. *v. a.* (*refraischer,* French.) 1. To recreate; to relieve after pain, fatigue, or want (*Shakspeare*). 2. To improve by new touches any thing impaired (*Dryden*). 3. To refrigerate; to cool (*Ecclus.*).

REFRE'SHER. *s.* (from *refresh.*) That which refreshes (*Thomson*).

REFRE'SHMENT. *s.* (from *refresh.*) 1. Relief after pain, want, or fatigue. 2. That which gives relief, as food, rest (*South*).

REFRI'GERANT. *a.* (*refrigerant,* French; from *refrigerate.*) Cooling; mitigating heat (*Wiseman*).

To REFRI'GERATE. *v. a.* (*refrigero,* Lat.) To cool (*Brown*).

REFRIGERA'TION. *s.* (*refrigeratio,* Lat.) The act of cooling; the state of being cooled (*Wilkie*).

REFRI'GERATIVE. Refrigeratory. *a.* (*refrigeratorius,* Latin.) Cooling; having the power to cool.

Refrigerative, in medicine, a remedy which refreshes the inward parts by cooling them; as clysters, ptisans, &c.

REFRIGERATORY, among chemical utensils, that part of a distilling apparatus in which the vapour is cooled and condensed. In the alembic it is situated at the top; in the common-still it constitutes the worm-tub.

REFRIGE'RIUM. *s.* (Latin.) Cool refreshment; refrigeration (*South*).

REFT. part. pret. of *reave.* 1. Deprived; taken away (*Ascham*). 2. (preterit of *reave.*) Took away (*Spenser*).

RE'FUGE. *s.* (*refuge,* Fr. *refugium,* Lat.) 1. Shelter from any danger or distress; protection (*Milton*). 2. That which gives shelter or protection (*Dryden*). 3. Expedient in distress (*Shakspeare*). 4. Expedient in general (*Wotton*).

To Re'fuge. *v. a.* (*refugier,* French.) To shelter; to protect (*Dryden*).

Refuge (Cities of), were places provided as asyla, for such as against their will should happen to kill a man. Of these cities there were three on each side Jordan: on this side were Kedish of Napthali, Hebron, and Schechem; beyond Jordon were Bezer, Golan, and Ramoth-Gilead. When any of the Hebrews, or strangers that dwelt in their country, happened to spill the blood of a man, they might retire thither to be out of the reach of the violent attempts of the relations of the deceased, and to prepare for their defence and justification before the judges. The manslayer underwent two trials; first before the judges of the city of refuge to which he had fled; and secondly before the judges of his own city. If found guilty, he was put to death with all the severity of the law. If he was acquitted, he was not immediately set at liberty; but, to inspire a degree of horror against even involuntary homicide, he was reconducted to the place of refuge, and obliged to continue there in a sort of banishment till the death of the high-priest. If, before this time, he ventured out, the revenger of blood might freely kill him; but after the high-priest's death he was at liberty to go where he pleased without molestation. It was necessary that the person who fled to any of the cities of refuge should understand some trade or calling, that he might not be burthensome to the inhabitants. The cities of refuge were required to be well supplied with water and necessary provisions. They were also to be of easy access, to have good roads leading to them, with commodious bridges where there was occasion. The width of the roads was to be 32 cubits or 48 feet at least. It was further required, that at all cross-ways direction-posts should be erected, with an inscription pointing out the road to the cities of refuge.

REFUGEE'. *s.* (*refugié,* French.) One who flies to shelter or protection (*Dryden*).

REFU'LGENCE. *s.* (from *refulgent.*) Splendour; brightness.

REFU'LGENT. *a.* (*refulgens,* Lat.) Bright; shining; glittering; splendid (*Dryden*).

To REFU'ND. *v. a.* (*refundo,* Lat.) 1. To pour back (*Ray*). 2. To repay what is received; to restore (*L'Estrange*).

REFU'SAL. *s.* (from *refuse.*) 1. The act of refusing; denial of any thing demanded

or solicited (*Rogers*). 2. The preemption; the right of having any thing before another; option (*Swift*).

To REFU'SE. *v. a.* (*refuser*, French.) 1. To deny what is solicited or required (*Shakspeare*). 2. To reject; to dismiss without a grant (*Shakspeare*).

To REFU'SE. *v. n.* Not to accept (*Milton*).

RE'FUSE. *a.* (from the verb.) Unworthy of reception; left when the rest is taken (*Fell*).

RE'FUSE. *s.* That which remains disregarded when the rest is taken (*Dryden*).

REFU'SER. *s.* (from *refuse*.) He who refuses.

REFU'TAL. *s.* (from *refute*.) Refutation.

REFU'TATION. *s.* (*refutatio*, Latin.) The act of refuting; the act of proving false or erroneous (*Bentley*).

To REFU'TE. *v. a.* (*refuto*, French.) To prove false or erroneous (*Milton*).

To REGAI'N. *v. a.* (*regagner*, French.) To recover; to gain anew (*Dryden*).

RE'GAL. *a.* (*regal*, French; *regalis*, Lat.) Royal; kingly (*Milton*).

RE'GAL. *s.* (*regale*, French.) A musical instrument (*Bacon*).

REGA'LE. *s.* (Latin.) The prerogative of monarchy.

To REGA'LE. *v. a.* (*regaler*, French.) To refresh; to entertain; to gratify (*Philips*).

REGALE'MENT. *s.* (*regalement*, French.) Refreshment; entertainment (*Philips*).

REGALIA, in law, the royal rights or prerogatives of a king.

These are reckoned by civilians to be six:—1. Power of judicature. 2. Power of life and death. 3. Power of war and peace. 4. Masterless goods, as waifs, estrays, &c. 5. Assessments. 6. Minting of money.

REGALIA is also used for the several parts of the apparatus of a coronation; as the sceptre with the cross; sceptre with the dove; St. Edward's staff; four several swords; the globe, and the orb with the cross, &c. used at the coronation of our kings.

REGALIA OF THE CHURCH are those rights and privileges which cathedrals, &c. enjoy by grants, and other concessions of kings.

REGA'LITY. *s.* (*regalis*, Latin.) Royalty; sovereignty; kingship (*Bacon*).

To REGA'RD. *v. a.* (*regarder*, French.) 1. To value; to attend to as worthy of notice (*Shaks.*). 2. To observe; to remark (*Shaks.*). 3. To mind as an object of grief or terrour. 4. To observe religiously (*Romans*). 5. To pay attention to (*Proverbs*). 6. To respect; to have relation to. 7. To look toward (*Sandys*).

REGA'RD. *s.* (*regard*, French.) 1. Attention as to a matter of importance (*Atter.*). 1. Respect; reverence (*Milton*). 3. Note; eminence (*Spenser*). 4. Respect; account (*Hooker*). 5. Relation; reference (*Watts*). 6. Look; aspect directed to another (*Dryden*). 7. Prospect; object of sight: not used (*Shakspeare*).

REGA'RDABLE. *a.* (from *regard*.) 1. Observable: not used (*Brown*). 2. Worthy of notice: not used (*Carew*).

REGARDANT, in heraldry, signifies looking behind; and is used for a lion, or other beast, with his face turned towards his tail. See HERALDRY.

REGA'RDER. *s.* One that regards.

REGA'RDFUL. *a.* (*regard* and *full*.) Attentive; taking notice of (*Hayward*).

REGA'RDFULLY. *ad.* 1. Attentively; heedfully. 2. Respectfully (*Shakspeare*).

REGA'RDLESLY. *ad.* (from *regardless*.) Without heed.

REGA'RDLESNESS. *s.* (from *regardless*.) Heedlessness; negligence; inattention.

REGA'RDLESS. *a.* (from *regard*.) Heedless; negligent; inattentive (*Spenser*).

REGATTA is a name given, at Venice, to a kind of exhibition on the water, in which the gondoliers contest for superiority in the art of rowing their gondolas.

A splendid entertainment, under this appellation, was exhibited on the Thames in 1775; and similar festivities have sometimes taken place upon our fresh-water lakes, especially Whittlesea Mere.

REGE INCONSULTO, in law, is a writ issued from the king to the judges, not to proceed in a cause which may prejudice the king, until he is advised. A *rege inconsulto* may be awarded, not only for the party to the plea, but upon suggestion of a stranger, on cause shewn that the king may be prejudiced by the proceeding, &c.

REGEL, or RIGEL, a fixed star of the first magnitude, in Orion's left foot. Its longitude, latitude, &c. see among the rest of the constellation ORION.

RE'GENCY. *s.* (from *regent*.) 1. Authority; government (*Grew*). 2. Vicarious government (*Temple*). 3. The district governed by a vicegerent (*Milton*). 4. Those to whom vicarious regality is intrusted.

To REGE'NERATE. *v. a.* (*regenero*, Lat.) 1. To reproduce; to produce anew (*Blackman*). 2. To make to be born anew; to renew by change of carnal nature to a christian life (*Addison*).

REGE'NERATE. *a.* (*regeneratus*, Latin.) 1. Reproduced (*Shakspeare*). 2. Born anew by grace to a christian life (*Milton*).

REGE'NERATENESS. *s.* (from *regenerate*.) The state of being regenerate.

REGENERA'TION. *s.* (*regeneration*, Fr.) New birth; birth by grace from carnal affections to a christian life. See CONVERSION.

REGENT, one who governs a kingdom during the minority or absence of the king. Before the revolution in France, the queen-mother had the regency of the kingdom during the minority of the king, under the title of queen-regent. In England, the methods of appointing this guardian or regent have been so various, and the duration of his power so uncertain, that from hence alone it may be collected that his office is unknown to the common law; and therefore (as sir Edward Coke says, 4 Inst. 58.) the surest way is to have him made by authority of the great council in parliament. The earl of Pembroke by his own authority assumed in very troublesome times the regency of

Henry III who was then only nine years old; but was declared of full age by the pope at 17, confirmed the great charter at 18, and took upon him the administration of the government at 20. A guardian and councils of regency were named for Edward III. by the parliament, which deposed his father; the young king being then 15, and not assuming the government till three years after. When Richard II. succeeded at the age of 11, the duke of Lancaster took upon him the management of the kingdom till the parliament met, which appointed a nominal council to assist him. Henry V. on his deathbed named a regent and a guardian for his infant son Henry VI. then nine months old: but the parliament altered his disposition, and appointed a protector and council, with a special limited authority. Both these princes remained in a state of pupilage till the age of 23. Edward V. at the age of 13, was recommended by his father to the care of the duke of Gloucester; who was declared protector by the privy-council. The statutes 25 Henry VIII. c. 12. and 28 Henry VIII. c. 7. provided, that the successor, if a male and under 18, or if a female and under 16, should be till such age in the governance of his or her natural mother, (if approved by the king,) and such other counsellors as his majesty should by will or otherwise appoint: and he accordingly appointed his 16 executors to have the government of his son Edward VI. and the kingdom, which executors elected the earl of Hartford protector. The statutes 24 Geo. II. c. 24. in case the crown should descend to any of the children of Frederic, late prince of Wales, under the age of 18, appointed the princess dowager;—and that of 5 Geo. III. c. 27. in case of a like descent to any of his present majesty's children, empowers the king to name either the queen or princess dowager, or any descendant of king George II. residing in this kingdom, to be guardian and regent till the successor attains such age, assisted by a council of regency; the powers of them all being expressly defined and set down in the several acts. During the present unhappy malady of the king of England, the prince of Wales has been regent of the British realms, first with very restricted powers, but now with the powers which usually characterize the royal functions in this country.

REGENT also signifies a professor of arts and sciences in a college, having pupils under his care; but it is generally restrained to the lower classes, as to rhetoric, logic, &c. those of philosophy being called professors. In the English universities it is applied to masters of arts under five years standing, and to doctors under two, as non-regent is to those above that standing.

RE'GENT. *a.* (*regent*, Fr. *regens*, Lat.) 1. Governing; ruling (*Hale*). 2. Exercising vicarious authority (*Milton*).

RE'GENTSHIP. *s.* (from *regent*.) 1. Power of governing. 2. Deputed authority (*Shakspeare*).

REGERMINA'TION. *s.* (*re* and *germination*.) The act of sprouting again.

REGGIO, a seaport of Naples, in Calabria Ulteriore, and an archbishop's see. The churches, convents, and many houses are built of stones from ancient edifices, and numerous inscriptions are to be met with on the walls of them. The environs produce the best silk in Calabria; and on the coast is found a species of muscle, that yields a kind of wool, of which gloves and stockings are made. Reggio was nearly destroyed by an earthquake in 1783. It is seated on the strait of Messina, 12 miles ESE. of Messina, and 95 S. by W. of Cosenza. Lon. 16. 0 E. Lat. 38. 4 N.

REGGIO, a city of Italy, capital of a duchy of the same name, included in that of Modena, and a bishop's see, with a strong citadel. In the cathedral are paintings by the greatest masters; and in the square is the statue of Brennus, chief of the Gauls. The principal trade is in silk. It was taken by prince Eugene in 1706, and by the king of Sardinia in 1742. In 1796, the inhabitants were the first Italians that renounced allegiance to their sovereign, and solicited the protection of the French. Reggio is the birthplace of the poet Ariosto. It is seated in a fertile country, on the river Tessone, 15 miles N.W. of Modena, and 80 S.E. of Milan. Lon. 11. 5 E. Lat. 44. 43 N.

REGHEBIL, a town of Negroland, in the country of Wangara, situate on a lake at the influx of a branch of the Niger, 240 miles E. by S. of Ghanara. Lon. 19. 10 E. Lat. 13. 20 N.

RE'GIBLE. *a.* Governable.

RE'GICIDE. *s.* (*regicida*, *regicidum*, Lat.) 1. Murderer of his king (*Dryden*). 2. Murder of his king (*Decay of Piety*).

REGILLÆ, a town in the country of the Sabines, about 20 miles from Rome, celebrated for a battle fought there, A. U. C. 258, between 24,000 Romans, and 40,000 Etrurians, who were headed by the Tarquins. The Romans obtained the victory, and scarce 10,000 of the enemy escaped from the field of battle.

REGIMEN, the regulation of diet, and in a more general sense, of all the non-naturals, with a view to preserve or restore health. See MATERIA MEDICA, DIET, &c.

REGIMEN, in grammar, that part of syntax or construction which regulates the dependancy of words, and the alterations which one occasions in another.

REGIMENT, a term applied to any body of troops: which, if cavalry, consists of one or more squadrons, commanded by a colonel; and if infantry, of one or more battalions, each commanded in the same manner. The squadrons in cavalry regiments are divided, sometimes into six, and sometimes into nine troops. The battalions of British infantry are generally divided into ten companies, two of which are called the flanks; one on the right consisting of grenadiers, and another on the left formed of light troops. There is not, however, any established rule on this head; as both cavalry and infantry regiments differ according to the exigencies of service in time of war, or the principles of economy in time of peace. We are humbly of

opinion, that every regiment of foot should consist of 2400 men, making three battalions of 800 each. The German regiments frequently consist of 2000 men; and the regiment of Picardy in the old French service had 6000. The French have made a distinction between the commanding officer of a regiment of cavalry, and the commanding officer of a regiment of infantry: the former was styled mestre de camp; the latter colonel, as with us.

REGIME'NTAL. *a.* (from *regiment.*) Belonging to a regiment; military.

REGINA PRATI. See ULMARIA.

REGIOMONTANUS. See MULLER.

RE'GION. *s.* (*region*, French; *regio*, Lat.) 1. Tract of land; country; tract of space (*Shakspeare*). 2. Part of the body (*Shakspeare*). 3. Place; rank (*Shakspeare*).

REGIS (Peter Sylvain), a French philosopher, and great propagator of Cartesianism, was born in Agenois, 1632. He cultivated the languages and philosophy under the Jesuits at Cahors, and afterwards divinity in the university of that town, being designed for the church. He made so uncommon a progress, that at the end of four years he was offered a doctor's degree without the usual charges; but he did not think it became him to accept of it till he had studied also in the Sorbonne at Paris. He went thither, but was soon disgusted with theology; and as the philosophy of Des Cartes began at that time to make a noise through the lectures of Rohault, he conceived a taste for it, and gave himself up entirely to it. He frequented these lectures; and becoming an adept, went to Toulouse in 1665, and read lectures in it himself. Having fine parts, a clear and fluent manner, and a happy way of making himself understood, he drew all sorts of people; the magistrates, the learned, the ecclesiastics, and the very women, who now all affected to abjure the ancient philosophy. In 1680 he returned to Paris; where the concourse about him was such, that the sticklers for Peripateticism began to be alarmed. They applied to the archbishop of Paris, who thought it expedient, in the name of the king, to put a stop to the lectures; which accordingly were discontinued for several months. The whole life of Regis was spent in propagating the new philosophy. In 1690 he published a formal system of it, containing logic, metaphysics, physics, and morals, in 3 vols. 4to, and written in French. It was reprinted the year after at Amsterdam, with the addition of a discourse upon ancient and modern philosophy. He wrote afterwards several pieces in defence of his system; in which he had disputes with M. Huet, Du Hamel, Malebranche, and others. His works, though abounding with ingenuity and learning, have been disregarded, in consequence of the great discoveries and advancement in philosophic knowledge that have been since made. He died in 1707. He had been chosen member of the academy of sciences in 1699.

REGIS (St.), a town of Lower Canada, situate on the boundary line that separates Canada from the United States, and on a river of its name, at its junction with the St. Lawrence; 50 miles S.W. of Montreal. Lon. 74. 10 W. Lat. 45. 0 N.

REGISTER, a public book in which is entered and recorded memoirs, acts, and minutes to be had recourse to occasionally, for knowing and proving matters of fact. Of these there are several kinds; as, 1. Registers of deeds in Yorkshire and Middlesex, in which are registered all deeds, conveyances, wills, &c. that affect any lands or tenements in those counties, which are otherwise void against any subsequent purchasers or mortgagees, &c.; but this does not extend to any copyhold estate, nor to leases at a rack rent, or where they do not exceed twenty-one years. The registered memorials must be engrossed on parchment, under the hand and seal of some of the grantors or grantees, attested by witnesses who are to prove the signing or sealing of them, and the execution of the deed. But these registers, which are confined to two counties, are in Scotland general, by which the laws of North Britain are rendered very easy and regular. Of these there are two kinds: the one general, fixed at Edinburgh, under the direction of the lord register; and the other is kept in the several shires, stewartries, and regalities, the clerks of which are obliged to transmit the registers of their respective courts to the general register. No man in Scotland can have a right to any estate, but it must become registered within forty days of his becoming seised thereof; by which means all secret conveyances are cut off. 2. Parish registers are books in which are registered the baptisms, marriages, and burials of each parish.

Among dissenters who admit of infant baptism, each minister is supposed to keep a register of the several children baptized by him. But as these are frequently lost, by the succession of new ministers to the same congregation; or at best do not give an account of the date of the births, which may have happened many weeks or months before baptism, it is now almost generally the custom among dissenters of all denominations to register the births of their children at the Library in Red-cross Street, Cripplegate, for which the charge is sixpence. This register is admitted in the courts of law.

REGISTER, is also used for the clerk or keeper of a register. Of these we have several, denominated from the registers they keep; as Register of the High Court of Delegates; Register of the Arches Court of Canterbury; Register of the Court of Admiralty; Register of the Prerogative Court; Register of the Garter, &c.

REGISTER SHIPS, in commerce, are vessels which obtain a permission either from the king of Spain, or the council of the Indies, to traffic in the ports of the Spanish West Indies; which are thus called from their being registered before they set sail from Cadiz, for Buenos Ayres. Each of these permissions costs 30,000 pieces of eight, and by the tenor of the cedula, or permit, they are not to exceed 300 tons; but there is such a good understanding between the merchants and the council of the Indies, that ships

of 5 or 600 tons frequently pass unnoted; and though the quantity and quality of the merchandizes on board are always expressed, yet, by means of presents, the officers, both in Spain and the Indies, allow them to load and unload vastly more than the permission expresses.

REGISTER, in printing, is disposing the forms on the press so as that the lines and pages printed on one side of the sheet fall exactly on those of the other.

REGISTER, among letter-founders, is one of the inner parts of the mould in which the printing types are cast. Its use is to direct the joining the mould justly together again, after opening it to take out the new cast letter.

REGISTERS, in chemistry, are holes, or chinks with stopples, contrived in the sides of furnaces, to regulate the fire; that is, to make the heat more intense, or remiss, by opening them to let in the air, or keeping them close to exclude it.

To RE'GISTER. *v. a.* (*registrer*, Fr.) 1. To record; to preserve from oblivion by authentic accounts (*Addison*). 2. To enroll; to set down in a list (*Milton*).

REGISTRAR, an officer in the English universities, who has the keeping of all the public records.

RE'GISTRY. *s.* (from *register*.) 1. The act of inserting in the register (*Graunt*). 2. The place where the register is kept. 3. A series of facts recorded (*Temple*).

REGIUM. Now REGGIO.

REGLE DE L'OCTAVE. (French.) Rule of the octave. An expression applied by the old writers on harmony to the rule for accompanying the eight notes of a key: which they sometimes also call *quadreble syghte*.

RE'GLEMENT. *s.* (French.) Regulation (*Bacon*).

RE'GLET. *s.* (*reglette*, French.) Ledge of wood exactly planed, by which printers separate their lines in pages widely printed.

REGNARD (John Francis), one of the best French comic writers after Moliere, was born at Paris in 1647. He had scarcely finished his studies, when an ardent passion for travelling carried him over the greatest part of Europe. When he settled in his own country, he was made a treasurer of France, and lieutenant of the waters and forests: he wrote a great many comedies; and, though naturally of a gay genius, died of chagrin in the 52d year of his age. His works, consisting of comedies and travels, were printed at Rouen, in 5 vols. 12mo, 1732.

REGNIER (Mathurin), the first French poet who succeeded in satire, was born at Chartres in 1573. He was brought up to the church, a place for which his debaucheries rendered him very unsuitable; and these by his own confession were so excessive, that at 30 he had all the infirmities of age. Yet he obtained a canonry in the church of Chartres, with other benefices; and died in 1613. There is a neat Elzevir edition of his works, 12mo, 1652, Leyden; but the most elegant is that with notes by M. Brossette, 4to, 1729, London.

REGNIER DES MARETS (Seraphin), a French poet, born at Paris in 1632. He distinguished himself early by his poetical talents, and in 1684 was made perpetual secretary to the French academy on the death of Mezeray: it was he who drew up all those papers in the name of the academy against Furetiere: the king gave him the priory of Grammont, and he had also an abbey. He died in 1713, and his works are, French, Italian, Spanish, and Latin poems, 2 vols. a French grammar; and an Italian translation of Anacreon's odes, with some other translations.

RE'GNANT. *a.* (French.) 1. Reigning; having regal authority (*Wotton*). 2. Predominant; having power (*Waller*).

To REGO'RGE. *v. a.* (*re* and *gorge*.) 1. To vomit up; to throw back (*Hayward*). 2. To swallow eagerly (*Milton*). 3. (*regorger*, Fr.) To swallow back (*Dryden*).

To REGRA'FT. *v. a.* (*regreffer*, French.) To graft again (*Bacon*).

To REGRA'NT. *v. a.* (*re* and *grant*.) To grant back (*Ayliffe*).

To REGRA'TE. *v. a.* 1. To offend; to shock (*Derham*). 2. (*regratter*, Fr.) To engross; to forestal (*Spenser*).

REGRATOR, one who buys and sells any wares or victuals in the same market or fair: and regrators are particularly described to be those who buy, or get into their hands, in fairs or markets, any grain, fish, butter, cheese, sheep, lambs, calves, swine, pigs, geese, capons, hens, chickens, pigeons, conies, or other dead victuals whatsoever, brought to a fair or market to be sold there, and do sell the same again in the same fair, market, or place, or in some other within four miles thereof. Regrating is a kind of huckstry, by which victuals are made dearer; for every seller will gain something, which must of consequence enhance the price. And in ancient times, both the engrosser and regrator were comprehended under the word forestaller. Regrators are punishable by loss and forfeiture of goods, and imprisonment, according to the first, second, or third offence, &c.

To REGREE'T. *v. a.* (*re* and *greet*.) To resalute; to greet a second time (*Shakspeare*).

REGREE'T. *s.* Return or exchange of salutation: not in use (*Shakspeare*).

REGRE'SS. *s.* (*regressus*, Latin.) Passage back; power of passing back (*Burnet*).

To REGRE'SS. *v. a.* (*regressus*, Latin.) To go back; to return (*Brown*).

REGRE'SSION. *s.* (*regressus*, Latin.) The act of returning or going back (*Brown*).

REGRE'T. *s.* (*regret*, Fr. *regretto*, Italian.) 1. Vexation at something past; bitterness of reflection (*South*). 2. Grief; sorrow (*Clarendon*). 3. Dislike; aversion: not proper (*Decay of Piety*).

To REGRE'T. *v. a.* (*regretter*, French.) To repent; to grieve at (*Boyle*).

REGUE'RDON. *s.* (*re* and *guerdon*.) Reward; recompence: obsolete (*Shakspeare*).

To REGUE'RDON. *v. a.* To reward (*Shak.*).

RE'GULAR. *a.* (*regularis*, Lat.) 1. Agreeable to rule; consistent with the mode prescribed (*Addison*). 2. Governed by strict regulations (*Pope*). 3. Instituted or initiated according to established forms or discipline. 4. Methodical; orderly (*Law*).

REGULAR BODY, called also *platonic body*, is a body or solid comprehended by like, equal, and regular plane figures, and whose solid angles are all equal.

The plane figures by which the solid is contained are the faces of the solid; and the sides of the plane figures are the edges, or linear sides of the solid.

There are only five regular solids, viz.

The tetraedron, or regular triangular pyramid, having four triangular faces;

The hexaedron, or cube, having six square faces;

The octaedron, having eight triangular faces;

The dodecaedron, having twelve pentagonal faces;

The icosaedron, having twenty triangular faces.

Besides these five, there can be no other regular bodies in nature. See BODY.

PROB. 1. *To construct or form the regular solids.*—See the method of describing these figures under the article BODY.

2. *To find either the surface or the solid content of any of the regular bodies.*—Multiply the proper tabular area or surface (taken from the following table) by the square of the linear edge of the solid, for the superficies. And

Multiply the tabular solidity, in the last column of the table, by the cube of the linear edge, for the solid content.

Surfaces and solidities of regular bodies, the side being unity or 1.

No. of sides.	Name.	Surface.	Solidity.
4	Tetraedron	1·7320508	0·1178513
6	Hexaedron	6·0000000	1·0000000
8	Octaedron	3·4641016	0·4714045
12	Dodecaedron	20·6457788	7·6631189
20	Icosaedron	8·6602540	2·1816950

3. The diameter of a sphere being given, to find the side of any of the platonic bodies, that may be either inscribed in the sphere, or circumscribed about the sphere, or that is equal to the sphere.

Multiply the given diameter of the sphere by the proper or corresponding number, in the following table, answering to the thing sought, and the product will be the side of the platonic body required.

The diam. of a sphere being 1, the side of a	That may be inscribed in the sphere, is	That may be circumscribed about the sphere, is	That is equal to the sphere, is
Tetraedron	0·816497	2·44948	1·64417
Hexaedron	0·577350	1·00000	0·88610
Octaedron	0·707107	1·22474	1·03576
Dodecaedron	0·525731	0·66158	0·62153
Icosaedron	0·356822	0·44903	0·40883

4. The side of any of the five platonic bodies being given, to find the diameter of a sphere, that may either be inscribed in that body, or circumscribed about it, or that is equal to it.—As the respective number in the table above, under the title, *inscribed, circumscribed,* or *equal,* is to 1, so is the side of the given platonic body, to the diameter of its inscribed, circumscribed, or equal sphere.

5. The side of any one of the five platonic bodies being given; to find the side of any of the other four bodies, that may be equal in solidity to that of the given body.—As the number under the title *equal* in the last column of the table above, against the given platonic body, is to the number under the same title, against the body whose side is sought, so is the side of the given body, to the side of the required one. (*Hutton's Mens.*)

REGULAR COROL, in botany, applied to the corol. Æqualis figura, magnitudine et proportione partium. Equal in the figure, size and proportion of the parts: as in privet, lilac, jasmin, &c.

REGULAR GOUT. See ARTHRITIS.

RE'GULAR. *s.* (*regulier*, French.) In the Romish church, one that professes and follows a certain rule of life, and observes the three vows of poverty, chastity, and obedience (*Ayliffe*).

REGULA'RITY. *s.* (*regularité*, French.) 1. Agreeableness to rule. 2. Method; certain order (*Grew*).

RE'GULARLY. *ad.* (from *regular.*) In a manner concordant to rule; exactly (*Prior*).

To RE'GULATE. *v. a.* (*regula*, Lat.) 1. To adjust by rule or method (*Locke*). 2. To direct (*Wiseman*).

REGULA'TION. *s.* (from *regulate.*) 1. The act of regulating (*Ray*). 2. Method; the effect of being regulated.

REGULA'TOR. *s.* (from *regulate.*) 1. One that regulates (*Grew*). 2. That part of a machine which makes the motion equable.

REGULBIUM, or REGULVIUM, (Notitia Imperii); mentioned nowhere else more early: a town of the Cantii, in Britain. Now Reculver, a village on the coast, near the island

of Thanet, towards the Thames, to the north of Canterbury. (*Camden*).

REGULUS (M. Atilius), a consul during the first Punic war. He reduced Brundusium; and in his second consulship took 64, and sunk 30 gallies of the Carthaginian fleet, on the coasts of Sicily. Afterwards he landed in Africa, where he took 200 places of consequence on the coast. The Carthaginians sued for peace, but the conqueror refused to grant it, and soon after he was defeated in a battle by Xanthippus, and 30,000 of his men were left on the field of battle, and 15,000 taken prisoners. Regulus was in the number of the captives, and he was carried in triumph to Carthage. He was sent by the enemy to Rome, to propose an exchange of prisoners; and if his commission was unsuccessful, he was bound by the most solemn oaths to return to Carthage, without delay. When he came to Rome, Regulus dissuaded his countrymen from accepting the terms which the enemy proposed, and when his opinion had had due influence on the senate, Regulus retired to Carthage agreeable to his engagements. The Carthaginians punished him with the greatest severity. His eyebrows were cut, and he was exposed for some days to the excessive heat of the meridian sun, and afterwards confined in a barrel, whose sides were every where filled with large iron spikes, till he died in the greatest agonies. Regulus died about 251 years before Christ.

REGULUS. (*regulus*, dim. of *rex*, a king; so called because the alchemists expected to find gold, the king of metals, collected at the bottom of the crucible after fusion.) A name given by the alchemists to metallic matters when separated from other substances by fusion; as, regulus of antimony, regulus of arsenic, &c.

It is, however, a term applied by some metallurgists to metals of every kind when reduced to a state of purity: though it is still chiefly applied by way of distinction to those which, like antimony, arsenic, and cobalt, have one common name for the metal, and the ore or sulphuret; the name having been made use of to distinguish the last before the pure metal was known.

REGULUS OF ANTIMONY. The pure semi-metal antimony. See ANTIMONY.

REGULUS OF ARSENIC. Pure arsenic. See ARSENIC, and so of other metals.

REGULUS, in astronomy, is a star of the first magnitude, in the constellation Leo; called also, from its situation, Cor Leonis, or the Lion's Heart; by the Arabs, Alhabor; and by the Chaldeans, Kalbeleced, or Kalbeleceid; from an opinion of its influencing the affairs of the heavens; as is observed by Theon.

The right ascension of regulus (for Jan. 1, 1810) was 9h. 58m. 14s. annual diff. 3·20 sec. the declination 12° 53′ 40″ N. an. diff. 16″·9.

To REGU'RGITATE. *v. a.* (*re* and *gurges*, Latin.) To throw back; to pour back (*Bentley*).

To REGU'RGITATE. *v. n.* To be poured back (*Harvey*).

REGURGITATION. *s.* (from *regurgitate.*) Resorption; the act of swallowing back (*Sharp*).

To REHEA'R. *v. a.* (*re* and *hear.*) To hear again (*Addison*).

REHEA'RSAL. *s.* (from *rehearse.*) 1. Repetition; recital (*South*). 2. The recital of any thing previous to public exhibition (*Dryden*).

To REHEA'RSE. *v. a.* (from *rehear.*) 1. To repeat; to recite (*Swift*). 2. To relate; to tell (*Dryden*). 3. To recite previously to public exhibition.

REICHELIA, in botany, a genus of the class pentandria, order trigynia. Calyx five-parted; corol campanulate, five-cleft; capsule three-celled, opening transversely all round; seeds adhering to a very large receptacle. One species: a native of Guinea, with blue axillary flowers, clustered, each on a short peduncle.

REICHENAU, an island of Suabia, in the Zeller See, or lower lake of Constance, three miles long and one broad. It abounds with vines and other fruit-trees, and lately had a rich abbey, of which the bishop of Constance was abbot. It is four miles W. of Constance.

REICHENAU, a town of Swisserland, in the country of the Grisons, seated in a rich and fertile valley, at the conflux of the two branches that form the Rhine. Here are two curious bridges. One of these is thrown across the lower branch of the Rhine, and is 105 feet in length. The other, built across the Rhine, below the point of union, is a wooden one, of a single arch, the span of which is 220 feet. Reichenau is seven miles S.W. of Coire.

REICHENBACH, a river of Swisserland, which has its source at the foot of Mount Wetterhorn, and rolls its numerous cataracts down the steep sides of Mount Sheidec, till it unites with the Aar, near Meyringen. It conveys into the Aar the gold dust that is found in the bed of that river.

REICHENFELLS, a town of Germany, in the duchy of Carinthia, 24 miles N.E. of Clagenfurt, and 24 E. of Muhrau. Lon. 14. 4 E. Lat. 47. 9 N.

REICHENHALL, a town of Upper Bavaria, on the Sala, with a rich salt spring, nine miles S.W. of Saltzburg, and 64 S.W. of Munich. Lon. 13. 2 E. Lat. 47. 23 N.

REICHENSTEIN, a town of Silesia, famous for the silver mines in its neighbourhood. It is 12 miles W. of Grotskaw.

REICHSHOFEN, a town of France, in the department of Lower Rhine, with a castle, in the neighbourhood of Haguenau.

REID (Thomas) a distinguished moral and metaphysical writer, was the son of the Rev. Lewis Reid, minister of the parish of Strachan, in the county of Kincardine, North Britain. He was born at the parsonage house of Strachan in April 1710, and received the rudiments of his education at the parish school of Kincardine-oniel; and was removed from thence to the Marischal college, Aberdeen, when not more than twelve years of age.

After the usual course of four years employed in the study of Latin, Greek, mathematics, and philosophy, he probably took his degree of M. A. which at that period, and for a long time subsequent to it, was the universal practice in the university of Aberdeen, and then commenced the study of theology. In due time he was licensed to preach the gospel according to the forms of the church of Scotland; but continued to reside for some years in Aberdeen, cultivating his favourite science, mathematics.

The mathematical chair in the Marischal college was then filled by Mr. John Stuart, a man of great eminence in his profession; but who, like many other profound mathematicians, was not happy in his mode of communicating science, at least to the duller part of his pupils. Mr. Reid occasionally read lectures for the professor, and became very popular with his fellow pupils. He could not however spend his life in the study of mathematics, and in reading barren lectures for other men. He had been educated for the church; and it was in the church only that he had the prospect of gaining a livelihood. He was accordingly presented, we know not in what year, to the church of New Machar in Aberdeenshire, at a time when the good people of Scotland were very far from being reconciled to the rights of patronage; and the consequence was, that his settlement met with much popular opposition. Even a little riot took place in the church at his ordination; but he soon gained the affections of his flock by his good sense, his acknowledged worth, and his unwearied attention to all their wants, which he was ever ready to relieve to the utmost extent of his abilities. So deeply rooted indeed was their regard for him at last, that though it is now half a century since his relation to the parish of New Machar ceased, his memory continues to be revered in that parish even at the present day.

In the year 1751, about the beginning of the session or annual term, one of the professors of philosophy in King's college, Aberdeen, died; and the late Dr. John Gregory, then professor of medicine, with the Rev. Dr. Macleod, the present sub-principal of King's college, were deputed to visit Mr. Reid, and to request his immediate acceptance of the vacant professorship. He yielded to the request, not without some hesitation, and was admitted professor of philosophy on the 22d of November.

He was now in the very situation for which nature seemed to have intended him. He had not only an opportunity, but it was his duty to cultivate the science to which his attachment was so strong; and the duties of his office made him turn his attention more closely than he had hitherto done to another science, in which he was destined to make a more conspicuous figure than he ever made even in his favourite mathematics.

It was during his professorship in the university of Aberdeen that he wrote his Essay on Quantity, which was published in the 45th volume of the Philosophical Transactions, and is perhaps the finest specimen of metaphysical mathematics, if we may use such an expression, that is extant in our own or in any other language. See QUANTITY. It was during the same period that he published his Enquiry into the Human Mind on the Principles of Common Sense; a work of unquestionable merit, which has contributed more than any other work whatever to give a rational turn to metaphysical speculations. It was about this period that the degree of D.D. was conferred upon him by his mother-college.

The well-earned fame of Dr. Reid attracted the attention of the university of Glasgow to him as the fittest person to succeed the celebrated Dr. Adam Smith; and he was admitted professor of moral philosophy in that university on the 11th of June, 1764. There his attention was not distracted by a multitude of sciences, which it was his duty to teach; and he had leisure to improve his metaphysical system, though he continued through life to amuse himself occasionally with mathematical speculations.

In the year 1773 appeared, in lord Kames's Sketches of the History of Man, A brief Account of Aristotle's Logic; with remarks by Dr. Reid. It would seem that he had entered upon this task rather reluctantly, and merely in compliance with the solicitations of his friend, the author of the Sketches.

But when it is known that the late Dr. Doig of Stirling, to whom Greek was as familiar as his mother tongue, and an equally learned doctor of Oxford, who has been reading Aristotle ever since he was fourteen years of age, agreed in opinion, that a more accurate view of his logic could not be given in the same compass than had been given by Dr. Reid, we may surely affirm, with some degree of confidence, that this small work adds much to the fame of its author.

Though Dr. Reid's health continued good, and his mental faculties unimpaired, till a very short time before his death, he ceased for some years to read lectures from his professorial chair, employing that time in preparations for eternity, and in fitting his lectures for the press. These were published in two volumes 4to: the first in 1785, under the title of Essays on the Intellectual Powers of Man, dedicated to his friends Dr. Gregory and professor Stewart, both of the university of Edinburgh; and the second in 1788, under the title of Essays on the Active Powers of Man, without any dedication or preface. He continued to enjoy the fame acquired by this work, as well as the affection of his friends, and the reverence of the public for eight years, dying at Glasgow in the end of September, or the beginning of October, 1796, in the 87th year of his age. He had been married, and he left behind him one daughter.

To do justice to the biography of such a man as this, we should here attempt to draw his intellectual character, and to appreciate the merits of his works; but to perform this task

in a manner at all worthy of him, or we hope of ourselves, would require more room than our limits permit us to allot to any article of the kind; and our readers will be pleased to learn, that they may confidently expect an account of his life, with a critique on his works, by a man better qualified to do justice to both, than the writer of this short sketch pretends to be. His works are in the hands of the speculative public; and by that public will be duly valued, as long as sound sense shall be preferred to impious jargon. How long that may be, God only knows; but if any thing can guard the minds of our youth against that sophistry of which the object is to attribute real agency to material fluids, and to represent the elective attractions of chemistry as perfectly similar to human volitions, it will be the unbiassed study of Dr. Reid's Essays on the Intellectual and Active Powers of Man. They will there find metaphysics divested of mystery, and the profoundest speculations rendered intelligible by the constant use of words in one determined sense.

Candour however obliges us to acknowledge, that he has advanced some doctrines which we cannot admit as true. Though not in general partial to Locke, he has adopted his notions respecting our power of abstraction, with hardly any other variation than the substituting of the term *conceptions* for Locke's favourite phrase *ideas*. He has likewise endeavoured to prove, that we may distinctly conceive what cannot possibly exist. These mistakes, however, for such they appear to us, are infinitely more than counterbalanced by his clear, accurate, and satisfactory disquisitions on our notions of active power. Had Dr. Reid never written a sentence but the essay which treats of this delicate and important subject, he would have been entitled to a place in the very first rank of useful metaphysicians; for, previous to the appearance of his works, we had nothing written directly on power but contradictory and unintelligible jargon. We recommend the serious perusal of this essay, the first in his second volume, to such of our readers as fancy that they distinctly conceive the powers of chemical agents, and that intelligence and volition may result from mechanical organization, or any combination whatever of matter and motion.

To REJE'CT. *v. a.* (*rejectus*, Lat.) 1. To dismiss without compliance with proposal or acceptance of offer (*Knolles*). 2. To cast off; to make an abject (*Isaiah*). 3. To refuse; not to accept (*Locke*). 4. To throw aside (*Beattie*).

REJE'CTION, *s.* (*rejectio*, Lat.) The act of casting off or throwing aside (*Bacon*).

REI'GLE. *s.* (*reigle*, Fr.) A hollow cut to guide any thing (*Carew*).

To REIGN. *v. a.* (*regno*, Lat. *regner*, Fr.) 1. To enjoy or exercise sovereign authority. 2. To be predominant; to prevail (*Bacon*). 3. To obtain power or dominion (*Romans*).

REIGN. *s.* (*regne*, Fr. *regnum*, Latin.) 1. Royal authority; sovereignty (*Pope*). 2. Time of a king's government (*Thomson*). 3. Kingdom; dominions (*Pope*). 4. Power; influence (*Chapman*).

To REIMBO'DY. *v. n.* (*re* and *imbody*.) To imbody again (*Boyle*).

To REIMBU'RSE. *v. a.* (*re*, *in*, and *bourse*, Fr. a purse.) To pay; to repair loss or expence by an equivalent (*Swift*).

REIMBU'RSEMENT. *s.* (from *reimburse*.) Reparation or repayment (*Ayliffe*).

To REIMPRE'GNATE. *v. a.* (*re* and *impregnate*.) To impregnate anew (*Brown*).

REIMPRE'SSION. *s.* (*re* and *impression*.) A second or repeated impression.

REIN. *s.* (*resnes*, Fr.) 1. The part of the bridle which extends from the horse's head to the driver or rider's hand. 2. Used as an instrument of government, or for government (*Shakspeare*). 3. *To give the* REINS. To give license (*Milton*).

To REIN. *v. a.* (from the noun.) 1. To govern by a bridle (*Milton*). 2. To restrain; to control (*Shakspeare*).

REIN-DEER. See CERVUS.

REINS. *s.* (*renes*, Lat. *rein*, Fr.) The kidneys; the lower part of the back (*Job*).

To REINSE'RT. *v. a.* (*re* and *insert*.) To insert a second time.

To REINSPI'RE. *v. a.* (*re* and *inspire*.) To inspire anew (*Dryden*).

To REINSTA'LL. *v. a.* (*re* and *install*.) 1. To seat again (*Milton*). 2. To put again in possession (*Shakspeare*).

To REINSTA'TE. *v. a.* (*re* and *instate*.) To put again in possession (*Addison*).

To REI'NTEGRATE. *v. a.* (*reinteger*, French.) To renew with regard to any state or quality; to repair; to restore (*Bacon*).

To REINVE'ST. *v. a.* (*re* and *invest*). To invest anew.

To REJOI'CE. *v. n.* (*rejouer*, Fr.) To be glad; to joy; to exult (*Milton*).

To REJOI'CE. *v. a.* To exhilarate; to gladden; to make joyful; to glad (*Prior*).

REJOI'CER. *s.* (from *rejoice*.) One that rejoices (*Taylor*).

To REJOI'N. *v. a.* (*rejoindre*, Fr.) 1. To join again (*Brown*). 2. To meet one again (*Pope*).

To REJOI'N. *v. n.* To answer an answer.

REJOINDER, in law, the defendant's answer to the plaintiff's replication. The order of the court of chancery is thus: first, the defendant puts in an answer or plea to the plaintiff's bill, which is sometimes also called an exception; the plaintiff's answer to this is called a replication; and the defendant's answer to that, a rejoinder.

The plaintiff may answer the rejoinder by a sur-rejoinder; upon which the defendant may rebut; and the plaintiff may answer him by a sur-rebutter: which pleas, replications, rejoinders, sur-rejoinders, rebutters, and sur-rebutters, answer to the exceptio, duplicatio, triplicatio, and quadruplicatio of the Roman laws. See PLEADING.

REISENBURG, a town of Prussia, in the province of Oberland, formerly the residence

of the bishops of Pomerania. Near it is an ancient castle. It is 78 miles S.W. of Konigsberg. Lon. 20. 5 E. Lat. 53. 52 N.

REISKE (John James), an eminent critic, born in the duchy of Anhalt, 1706. He studied at Leipsic, and went to Leyden, where he resided eight years, till the severity of his remarks on Burman's Petronius excited a cabal against him. In 1758 he was appointed rector of the academy of Leipsic, and his classical reputation was increased by his marriage, in 1764, with Ernestina Christina Muller, a lady of great talents, well qualified to assist and cheer his literary labors. He died 1774. He published animadversiones in auctores Græcos, 5 vols. a valuable work—an edition of the Greek orators, 12 vols. 8vo. completed by his widow—Dionysius of Halicarnassus, 7 vols—Plutarch's works, in 9 vols.—Theocritus, &c.

REJO'LT. *s.* (*rejailler*, French.) Shock; succussion (*South*).

REIT. *s.* Sedge, or sea-weed (*Bailey*).

To REI'TERATE. *v. a.* (*reiterer*, Fr.) To repeat again and again (*Smalridge*).

REITERATION. *s.* (*reiteration*, Fr.) Repetition (*Boyle*).

To REJU'DGE. *v. a.* (*re* and *judge*.) To reexamine; to review; to recall to a new trial (*Pope*).

To REKI'NDLE. *v. a.* (*re* and *kindle*.) To set on fire again (*Cheyne*).

To RELA'PSE. *v. n.* (*relapsus*, Lat.) 1. To slip back; to slide or fall back. 2. To fall back into vice or errour (*Taylor*). 3. To fall back from a state of recovery to sickness (*Wiseman*).

RELA'PSE. *s.* (from the verb.) 1. Fall into vice or errour once forsaken (*Milton*). 2. Regression from a state of recovery to sickness (*Spenser*). 3. Return to any state (*Shakspeare*).

To RELA'TE. *v. a.* (*relatus*, Lat.) 1. To tell; to recite (*Dryden*). 2. To vent by words (*Bacon*). 3. To ally by kindred (*Pope*). 4. To bring back; to restore (*Spenser*).

To RELA'TE. *v. n.* To have reference; to have respect (*Locke*).

RELA'TER. *s.* (from *relate*.) Teller; narrator; historian (*Brown*).

RELATION. *s.* (*relation*, Fr.) 1. Manner of belonging to any person or thing. 2. Respect; reference; regard (*Locke*). 3. Connexion between one thing and another (*Beattie*). 4. Kindred; alliance of kin (*Dryden*). 5. Person related by birth or marriage; kinsman; kinswoman (*Swift*). 6. Narrative; tale; account; narration (*Dennis*).

RELATION, *relatio*, in philosophy, the mutual respect of two things; or what each is with regard to the other.

The word is formed *a referendo*; relation consisting in this, that one thing is referred to another; whence it is also called respect, habitude, and comparison.

The idea of relation we acquire, when the mind so considers any thing, that it doth, as it were, bring it to, and set it by, another, and carry its view from the one to the other. Hence the denominations given to things intimating this respect, are called relatives; and the things so brought together, are said to be related.

Thus, when I call Caius husband, or this wall whiter, I intimate some other person or thing in both cases, with which I compare him or it. Hence the wall is called by the schoolmen the subject; the thing it exceeds in whiteness, the term; and the whiteness, the foundation of the relation.

Relation may be considered two ways; either on the part of the mind referring one thing to another; in which sense relation is only a mode or affection of the mind, whereby we make such comparison: or on the part of the things referred, which being no other than ideas, relation, in this sense, is only a new idea resulting or arising in the mind upon considering of two other ideas. So that relation, take it as you will, is only in the mind, and has nothing to do with the things themselves.

Any of our ideas, Mr. Locke observes, may be the foundation of relation. Though, where languages have failed to give correlative names, the relation is not easily taken notice of; as in concubine, which is a relative name, as well as wife.

There is, in effect, no idea but is capable of an infinite number of relations: thus, one single man may at once sustain the relations of father, brother, son, husband, friend, subject, general, European, Englishman, islander, master, servant, bigger, less, &c. to an almost infinite number; he being capable of as many relations as there can be occasions of comparing him to other things in any manner of agreement or disagreement, or any respect whatsoever.

The ideas of relations are much clearer and more distinct than those of the things related; because the knowledge of one simple idea is oftentimes sufficient to give the notion of a relation; but, to the knowing of any substantial being, an accurate collection of several ideas is necessary.

The perception we have of the relations between various ideas wherein the mind acquiesces, makes what we call judgment. Thus, when I judge that twice 2 make 4, or do not make 5, I only perceive the equality between twice 2 and 4, and the inequality between twice 2 and 5.

The perception we have of the relations between the relations of various things, constitutes what we call reasoning. Thus, when from this, that 4 is a smaller number than 6, and that twice 2 is equal to 4, I gather, that twice 2 is a less number than 6; I only perceive together the relation of the numbers twice 2 and 4, and the relation of 4 and 6.

The ideas of cause and effect, we get from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. That which produceth, is the cause; that which is produced, is the effect.

Thus, fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

The denominations of things taken from time are, for the most part, only relations. Thus, when it is said, that queen Elizabeth lived sixty-nine, and reigned forty-five years, no more is meant, than that the duration of her existence was equal to sixty-nine, and of her government to forty-five, annual revolutions of the sun; and so are all words answering to how long.

RELATION, in mathematics. See RATIO.

RE'LATIVE. *a.* (*relativus*, Lat.) 1. Having relation; respecting (*Locke*). 2. Considered not absolutely, but as belonging to, or respecting something else (*South*). 3. Particular; positive: not in use (*Shakspeare*).

RELATIVE-TERMS, in logic, are words which imply relation; such are master and servant, husband and wife, &c. In grammar, relative words are those which answer to some other word foregoing, called the antecedent; such are the relative pronouns *qui, quæ, quod*, &c. and in English, who, whom, which, &c. The word answering to these relatives is often understood, as "I know whom you mean," for "I know the person whom you mean."

RE'LATIVE. *s.* 1. Relation; kinsman (*Taylor*). 2. Pronoun answering to an antecedent (*Asch.*). 3. Somewhat respecting something else (*Locke*).

RE'LATIVELY. *ad.* (from *relative*.) As it respects something else; not absolutely (*Sprat*).

RE'LATIVENESS. *s.* (from *relative*.) The state of having relation.

To RELA'X. *v. a.* (*relaxo*, Latin.) 1. To slacken; to make less tense (*Bacon*). 2. To remit; to make less severe or rigorous (*Swift*). 3. To make less attentive or laborious (*V. of W.*). 4. To ease; to divert. 5. To open; to loose (*Milton*).

To RELA'X. *v. n.* To be mild; to be remiss; to be not rigorous (*Prior*).

RELAXA'TION. *s.* (*relaxation*, French.) 1. Diminution of tension; the act of loosening (*Arbuthnot*). 2. Cessation of restraint (*Burnet*). 3. Remission; abatement of rigour (*Hooker*). 4. Remission of attention or application (*Addison*).

RELA'Y. *s.* (*relais*, Fr.) Horses on the road to relieve others.

To RELEA'SE. *v. a.* (*relascher*, Fr.) 1. To set free from confinement or servitude. 2. To set free from pain. 3. To free from obligation, or penalty (*Milton*). 4. To quit; to let go (*Dryden*). 5. To relax; to slacken: not in use (*Hooker*).

RELEA'SE. *s.* (*relasche*, Fr.) 1. Dismission from confinement, servitude, or pain. 2. Relaxation of a penalty (*Prior*). 3. Remission of a claim (*Bacon*). 4. Acquittance from a debt signed by the creditor.

RELEASE, in law, is an instrument in writing, by which estates, rights, titles, entries, actions, and other things, are extinguished and discharged; and sometimes transferred, abridged or enlarged; and in general, it signifies one person's giving up or discharging the right or action he has, or claims to have, against another, or his lands, &c.

A release may be either in fact or in law; a release in fact is where it is expressly declared, by the very words, as the act and deed of the party; and a release in law is that which acquits by way of consequence, as where a feme creditor takes the debtor to be her husband.

To RE'LEGATE. *v. a.* (*relegner*, French; *relego*, Lat.) To banish; to exile.

RELEGA'TION. *s.* (*relegatio*, Latin.) Exile; judicial banishment (*Ayliffe*).

To RELE'NT. *v. n.* (*relentir*, Fr.) 1. To soften; to grow less rigid or hard (*Bacon*). 2. To melt; to grow moist (*Boyle*). 3. To grow less intense (*Digby*). 4. To soften in temper; to grow tender; to feel compassion (*Milton*).

To RELE'NT. *v. a.* Obsolete. 1. To slacken; to remit (*Spenser*). 2. To soften; to mollify (*Spenser*).

RELE'NTLESS. *a.* (from *relent*.) Unpitying; unmoved by kindness or tenderness (*Prior*).

RE'LEVANT. *a.* (Fr.) Relieving.

RELEVA'TION. *s.* (*relevatio*, Latin.) A raising or lifting up.

RELHANIA, in botany, a genus of the class syngenesia, order polygamia superflua. Receptacle chaffy; seeds crowned with a short cylindrical membrane; calyx imbricate, scarious; florets of the ray numerous. Nineteen species. Cape herbs, some with clustered, others with solitary flowers.

RELI'ANCE. *s.* (from *rely*.) Trust; dependence; confidence (*Woodward*).

RELICS, in the Romish church, the remains of the bodies or clothes of saints or martyrs, and the instruments by which they were put to death, devoutly preserved, in honour to their memory; kissed, revered, and carried in procession. The respect which was justly due to the martyrs and teachers of the Christian faith, in a few ages increased almost to adoration; and at length adoration was really paid both to departed saints and to relics of holy men or holy things. The abuses of the church of Rome, with respect to relics, are very flagrant and notorious. For, such was the rage for them at one time, that, as F. Mabillon a Benedictine justly complains, the altars were loaded with suspected relicts; numerous spurious ones being every where offered to the piety and devotion of the faithful. He adds, too, that bones are often consecrated, which, so far from belonging to saints, probably do not belong to Christians. From the catacombs numerous relics have been taken, and yet it is not known who were the persons interred therein. In the 11th century, relics were tried by fire, and those which did not consume were reckoned genuine, and the rest not. Relics were, and still are, preserved on the altars whereon mass is celebrated; a square hole being made in the middle of the altar, big enough to receive the hand, and herein is the relic deposited, being

first wrapped in red silk, and enclosed in a leaden box.

The Rominists plead antiquity in behalf of relics: for the Manichees, out of hatred to the flesh, which they considered as an evil principle, refused to honour the relics of saints; which is reckoned a kind of proof that the Catholics did it in the first ages.

We know, indeed, that the touching of linen cloths on relics, from an opinion of some extraordinary virtue derived therefrom, was as ancient as the first ages, there being a hole made in the coffins of the 40 martyrs at Constantinople expressly for this purpose. The honouring the relics of saints, on which the church of Rome afterwards founded her superstitious and lucrative use of them, as objects of devotion, as a kind of charms or amulets, and as instruments of pretended miracles, appears to have originated in a very ancient custom that prevailed among Christians, of assembling at the cemeteries or burying-places of the martyrs, for the purpose of commemorating them, and of performing divine worship. When the profession of Christianity obtained the protection of the civil government, under Constantine the Great, stately churches were erected over their sepulchres, and their names and memories were treated with every possible token of affection and respect. This reverence, however, gradually exceeded all reasonable bounds; and those prayers and religious services were thought to have a peculiar sanctity and virtue, which were performed over their tombs. Hence the practice which afterwards obtained, of depositing relics of saints and martyrs under the altars in all churches. This practice was then thought of such importance, that St. Ambrose would not consecrate a church because it had no relics; and the council of Constantinople in Trullo ordained, that those altars should be demolished under which there were found no relics. The rage of procuring relics for this and other purposes of a similar nature became so excessive, that in 386 the emperor Theodosius the Great was obliged to pass a law, forbidding the people to dig up the bodies of the martyrs, and to traffic in their relics.

Such was the origin of that respect for sacred relics, which afterwards was perverted into a formal worship of them, and became the occasion of innumerable processions, pilgrimages, and miracles, from which the church of Rome, till very lately, derived incredible advantage. Besides the arguments from antiquity to which the Papists refer, in vindication of their worship of relics, Bellarmine appeals to Scripture in support of it, and cites the following passages, viz. Exod. xiii. 19. Deut. xxxiv. 6. 2 Kings xiii. 21. 2 Kings xxiii. 16, 17, 18. Isaiah xi. 10. Matthew xi. 20, 21, 22. Acts v. 12—15. Acts xix. 11, 12. See POPERY.

The Roman Catholics in Great Britain do not acknowledge any worship to be due to relics, but merely a high veneration and respect, by which means they think they honour God, who, they say, has often wrought very extraordinary miracles by them. But, however proper this veneration and respect may be, its abuse has been so great and so general, as fully to warrant the rejection of them altogether.

Relics are forbidden to be used or brought into England by several statutes: and justices of peace are empowered to search houses for popish books and relics, which when found, are to be defaced and burnt, &c. 3 Jac. I. cap. 26.

RE'LICLY. *ad.* (from *relic.*) In the manner of relics: not used (*Donne*).

RE'LICT. *s.* (*relicte*, old Fr.) A widow; a wife desolate by the death of her husband (*Sprat*).

RELIE'F. *s.* (*relief*, French.) 1. Alleviation of calamity; mitigation of pain or sorrow (*Milton*). 2. That which frees from pain or sorrow (*Dryden*). 3. Dismission of a sentinel from his post (*Shakspeare*). 4. (*relevium*, law Lat.) Legal remedy of wrongs. 5. The prominence of a figure in stone or metal; the seeming prominence of a picture (*Pope*). 6. The exposure of any thing, by the proximity of something different.

RELIEF, in law, a certain sum of money which the tenant holding by knight's service, grand serjeantry, or other tenure (for which homage, or legal service, is due), and being at full age at the death of his ancestor, paid to his lord at his entrance.

RELIE'VABLE. *a.* (from *relieve.*) Capable of relief (*Hale*).

To RELIE'VE. *v. a.* (*relevo*, Lat.) 1. To ease pain or sorrow. 2. To succour by assistance (*Dryden*). 3. To set a sentinel at rest, by placing another on his post (*Shakspeare*). 4. To right by law. 5. To recommend by the interposition of something dissimilar (*Stepney*). 6. To support; to assist (*Brown*).

RELIEVE, in a military sense, is to send off those men that are upon duty, and to bring others to take their place; thus, to relieve the guard, the trenches, &c. is to bring fresh men upon duty, and to discharge those who were upon duty before.

RELIE'VER. *s.* (from *relieve.*) One that relieves (*Rogers*).

RELIEVO, or RELIEF, in sculpture, &c. is the projecture or standing out of a figure which rises prominent from the ground or plane on which it is formed; whether that figure be cut with the chisel, moulded, or cast. There are three kinds or degrees of relievo, viz. alto, basso, and demi-relievo. The alto-relievo, called also haut-relief, or high-relievo, is when the figure is formed after nature, and projects as much as the life. Basso-relievo, bas-relief, or low relievo, is when the work is raised a little from the ground, as in medals, and the frontispieces of buildings; and particularly in the histories, festoons, foliages, and other ornaments of friezes. Demi-relievo is when one half of the figure rises from the plane. When, in a basso-relievo, there are parts that stand clear out, detached from the rest, the work is called a demi-basso. In architecture, the relievo or projecture of the ornaments ought

always to be proportioned to the magnitude of the building it adorns, and to the distance at which it is to be viewed.

RELIEVO, or RELIEF, in painting, is the degree of boldness with which the figures seem, at a due distance, to stand out from the ground of the painting. The relievo depends much upon the depth of the shadow, and the strength of the light; or on the height of the different colours, bordering on one another; and particularly on the difference of the colour of the figure from that of the ground: thus, when the light is so disposed as to make the nearest parts of the figure advance, and is well diffused on the masses, yet insensibly diminishing, and terminating in a large spacious shadow, brought off insensibly, the relievo is said to be bold, and the clair obscure well understood.

To RELI'GHT. *v. a.* (*re* and *light.*) To light anew (*Pope*).

RELI'GION. *s.* (*religio*, Lat.) 1. Virtue, as founded upon reverence of God, and expectation of future rewards and punishments (*Ben Jonson*). 2. A system of divine faith and worship, as opposite to others (*Tillotson*).

RELIGION, *religio*, that worship or homage which is due to God, considered as Creator, Preserver, and, with Christians, as Redeemer, of the world.

The foundation of all religion is, that there is a God; and that he requires some service at the hands of his creatures. From the different manners wherein we arrive at the knowledge of this service, religion is divided into natural and revealed.

Natural religion is whatever we discover to be due and meet, by the mere dictates of natural reason; as to love and honour God, not to abuse his creatures, &c.

Revealed religion is what we receive as the express declaration of God himself, by the mouths of prophets, &c. See REVELATION.

The first flows immediately from the relation between the creature and the Creator; the latter does not follow from such a relation, but is superadded from the mere will and pleasure of the Creator.

The first we ordinarily call morality, or ethics; because immediately conversant about the manners and duties of men towards one another; and towards themselves, considered as creatures of that Being.

The latter we call, by way of eminence, religion, as being the rule of our duty immediately to God himself.

The first supposes a God, a providence, a future state, rewards and punishments; the latter likewise supposes an immediate mission from God himself, attested by miracles, &c. See CHRISTIAN RELIGION.

RELIGION is more particularly used for that special system of faith and worship, which obtains in a particular age, sect, or country, &c.

In this sense we say the Romish religion, the reformed religion, the religion of the Greeks, the Mahometan religion, the Jewish religion, &c. See JUDAISM, MAHOMETANISM, &c.

RELI'GIONIST. *s.* (from *religion.*) A bigot to any religious persuasion (*Swift*).

The word is sometimes used to denote a religious person. But we do not much admire the use of it in either sense.

RELI'GIOUS. *a.* (*religiosus*, Latin.) 1. Pious; disposed to the duties of religion (*Shakspeare*). 2. Teaching religion (*Wotton*). 3. Among the Romanists, bound by the vows of poverty, chastity, and obedience (*Addison*). 4. Exact; strict. 5. Appropriated to strict observance of holy duties (*Law*).

RELI'GIOUSLY. *ad.* (from *religious.*) 1. Piously; with obedience to the dictates of religion (*Drayton*). 2. According to the rites of religion (*Shakspeare*). 3. Reverently; with veneration (*Duppa*). 4. Exactly; with strict observance (*Bacon*).

RELI'GIOUSNESS. *s.* (from *religious.*) The quality or state of being religious.

To RELI'NQUISH. *v. a.* (*relinquo*, Lat.) 1. To forsake; to abandon; to leave; to desert (*Davies*). 2. To quit; to release; to give up (*South*). 3. To forbear; to depart from (*Hooker*).

RELI'NQUISHMENT. *s.* (from *relinquish.*) The act of forsaking (*South*).

RE'LISH. *s.* (from *relecher*, Fr. to lick again.) 1. Taste; the effect of any thing on the palate: it is commonly used of a pleasing taste (*Boyle*). 2. Taste; small quantity just perceptible (*Shakspeare*). 3. Likely; delight in any thing (*Addison*). 4. Sense; power of perceiving excellence; taste (*Seed.*). 5. Delight given by any thing; the power by which pleasure is given (*Addison*). 6. Cast; manner (*Pope*).

To RE'LISH. *v. a.* (from the noun). 1. To give a taste to any thing (*Dryden*). 2. To taste; to have a liking (*Baker*).

To RE'LISH. *v. n.* 1. To have a pleasing taste (*Hakewill*). 2. To give pleasure (*Shakspeare*). 3. To have a flavour (*Woodward*).

RE'LISHABLE. *a.* (from *relish.*) Gustable; having a taste.

To RELI'VE. *v. n.* (*re* and *live.*) To revive; to live anew: not used (*Spenser*).

To RELO'VE. *v. a.* (*re* and *love.*) To love in return: not used (*Boyle*).

RELU'CENT. *a.* (*relucens*, Latin.) Shining; transparent; pellucid (*Thomson*).

To RELU'CT. *v. n.* (*reluctor*, Latin.) To struggle again (*Decay of Piety*).

RELU'CTANCE. RELU'CTANCY. *s.* (*reluctor*, Latin.) Unwillingness; repugnance (*Boyle*).

RELU'CTANT. *a.* (*reluctans*, Latin.) Unwilling; acting with repugnance (*Tickel*).

To RELU'CTATE. *v. n.* (*reluctor*, Lat.) To resist; to struggle against (*Decay of Piety*).

RELUCTA'TION. *s.* (*reluctor*, Lat.) Repugnance; resistance (*Bacon*).

To RELU'ME. *v. a.* To light anew; to rekindle (*Pope*).

To RELU'MINE. *v. a.* To light anew (*Shakspeare*).

To RELY'. *v. n.* (*re* and *lie.*) To lean upon with confidence; to put trust in; to rest upon; to depend upon (*Rogers*).

To REMAI'N. *v. n.* (*remaneo*, Lat.) 1. To be left out of a greater quantity or number (*Job*). 2. To continue; to endure; to be left in a particular state (*Milton*). 3. To be left after any event (*Locke*). 4. Not to be lost (*Spenser*). 5. To be left as not comprised.

To REMAI'N. *v. a.* To await; to be left to (*Spenser*).

REMAI'N. *s.* (from the verb.) 1. Relic; that which is left. Generally used in the plural (*Pope*). 2. The body left by the soul (*Pope*). 3. Abode; habitation: not in use (*Shakspeare*).

REMAI'NDER. *a.* (from *remain.*) Remaining; refuse; left (*Shakspeare*).

REMAI'NDER. *s.* 1. What is left; relics (*Bacon*). 2. The body when the soul is departed; remains (*Shakspeare*).

REMAINDER, in law, is an estate limited in lands, tenements, or rents, to be enjoyed after the expiration of another particular estate.

An estate in remainder is an estate limited to take effect and be enjoyed after another estate is determined. As if a man seised in fee simple grants lands to one for 20 years, and after the determination of the said term, then to another and his heirs for ever: here the former is tenant for years, remainder to the latter in fee. In the first place, an estate for years is created or carved out of the fee, and given to the former, and the residue and the remainder of it is given to the latter. Both their interests are in fact only one estate; the present term of years, and the remainder afterwards, when added together, being equal only to one estate in fee. 2 Black. c. 11.

The word remainder is no term of art, nor is it necessary to create a remainder. So that any words sufficient to shew the intent of the party, will create a remainder; because such estates take their denomination of remainder more from the nature and manner of their existence after they are limited, than from any previous quality inherent in the word. See Fearne on Remainders.

There is this difference between a remainder and a reversion: in case of a reversion, the estate granted, after the limited time, reverts to the grantor or his heirs; but by a remainder it goes to some third person, or a stranger.

To REMA'KE. *v. a.* (*re* and *make.*) To make anew (*Glanville*).

To REMA'ND. *v. a.* (*re* and *mando*, Lat.) To send back; to call back (*Davies*).

RE'MANENT. *s.* (*remanens*, Lat. *remanant*, old French. It is now contracted to *remnant.*) The part remaining (*Bacon*).

REMA'RK. *s.* (*remarque*, Fr.) Observation; note; notice taken (*Collier*).

To REMA'RK. *v. a.* (*remarquer*, Fr.) 1. To note; to observe (*Locke*). 2. To distinguish; to point out; to mark: not used (*Milton*).

REMA'RKABLE. *a.* (*remarquable*, Fr.) Observable; worthy of note (*Raleigh*).

REMA'RKABLENESS. *s.* Observableness; worthiness of observation (*Hammond*).

REMA'RKABLY. *ad.* (from *remarkable*). Observably; in a manner worthy of observation.

REMA'RKER. *s.* (*remarquer*, Fr.) Observer; one that remarks (*Watts*).

REMBRANDT (Van Rein), a Flemish painter, son of a miller, born near Leyden, 1606. His education was neglected, and he scarce knew how to read, but nature supplied all deficiencies, and gave him a genius, which soared to affluence and immortality. His manner was entirely his own, and his knowledge of the chiaro obscuro was particularly correct. His chief aim was to imitate living nature, and he succeeded to an admirable degree. He was singular in his conduct, he was fond of low company, and in his appearance slovenly. He died at Amsterdam about 1668. When once told that his grounds were dark, he replied, that he was a painter, not a dyer. He engraved some pieces after his own designs with great judgment.

REME'DIABLE. *a.* (from *remedy.*) Capable of remedy.

REME'DIATE. *a.* (from *remedy.*) Medicinal; affording a remedy: not in use (*Shakspeare*).

REME'DILESS. *a.* (from *remedy.*) Not admitting remedy; irreparable; cureless (*Raleigh*).

REME'DILESSNESS. *s.* (from *remediless.*) Incurableness.

REMEDIUM DIVINUM. See IMPERATORIA.

RE'MEDY. *s.* (*remedium*, Lat. *remede*, French.) 1. A medicine by which any illness is cured (*Swift*). 2. Cure of any uneasiness (*Dryden*). 3. That which counteracts any evil (*Locke*). 4. Reparation; means of repairing any hurt (*Shakspeare*).

To RE'MEDY. *v. a.* (*remedier*, Fr.) 1. To cure; to heal (*Hooker*). 2. To repair or remove mischief.

To REME'MBER. *v. a.* (*remembrare*, Ital.) 1. To bear in mind any thing; not to forget (*Psalms*). 2. To recollect; to call to mind (*Sidney*). 3. To keep in mind; to have present to the attention (*Locke*). 4. To bear in mind, with intent of reward or punishment (*Milton*). 5. To mention; not to omit (*Ayliffe*). 6. To put in mind; to force to recollect; to remind (*Sidney*). 7. To preserve from being forgotten (*Shakspeare*).

REME'MBERER. *s.* (from *remember.*) One who remembers (*Wotton*).

REME'MBRANCE. *s.* (*remembrance*, Fr.) 1. Retention in memory (*Denham*). 2. Recollection; revival of any idea (*Locke*). 3. Honourable memory: out of use (*Shakspeare*). 4. Transmission of a fact from one to another (*Addison*). 5. Account preserved (*Hale*). 6. Memorial (*Dryden*). 7. A token by which any one is kept in the memory (*Shakspeare*). 8. Notice of something absent (*Shakspeare*). 9. Power of remembering (*Milton*).

REME'MBRANCER. *s.* (from *remembrance.*) 1. One that reminds; one that puts in mind.

REMEMBRANCERS, anciently called clerks of the remembrance, certain officers in the exchequer, whereof three are distinguished by the names of the king's remembrancer, the lord treasurer's remembrancer, and the remembrancer of the first fruits. The king's remembrancer enters in his office all recognizances taken before the barons, for any of the king's debts, for appearances, or observing of orders; he also takes all bonds for the king's debts, &c. and makes out processes thereon. He likewise issues processes against the collectors of the customs, excise, and others, for their accounts; and informations upon penal statutes are entered and sued in his office, where all proceeding in matters upon English bills in the exchequer-chamber remain. His duty further is to make out the bills of compositions upon penal laws, to take the statement of debts; and into his office are delivered all kinds of indentures and other evidences, which concern the assuring of any lands to the crown. He every year, in crastino Animarum, reads in open court the statute for election of sheriffs; and likewise openly reads in court, the oaths of all the officers, when they are admitted.

The lord treasurer's remembrancer is charged to make out process against all sheriffs, escheators, receivers, and bailiffs, for their accounts. He also makes out writs of fieri facias, and extent for debts due to the king, either in the pipe or with the auditors; and process for all such revenue as is due to the king, on account of his tenures. He takes the account of sheriffs; and also keeps a record, by which it appears whether the sheriffs or other accountants pay their proffers due at Easter and Michaelmas; and at the same time he makes a record, whereby the sheriffs or other accountants keep their prefixed days; there are likewise brought into this office all the accounts of customers, comptrollers, and accountants, in order to make entry thereof on record; also all estreats and amercements are certified here, &c.

The remembrancer of the first fruits takes all compositions and bonds for the payment of first fruits and tenths; and makes out process against such as do not pay the same.

To REME'RCIE. *v. a.* (*remercier*, French.) To thank: obsolete (*Spenser*).

REMI (Joseph Honoré), of Remiremont, was advocate in the parliament of Paris. He lost his eye-sight at the age of eight by the small-pox, but recovered it six years after. He was author of Cosmopolisma—days, a burlesque, in opposition to Young's night thoughts—la code des François, 2 vols. 12mo.—eloge on de l'Hopital, a valuable work crowned by the French academy, though censured by the Sorbonne—eloges on Moliere, Colbert, Fenelon, &c.

To RE'MIGRATE. *v. n.* (*remigro*, Lat.) To remove back again (*Boyle*).

REMIGRA'TION. *s.* (from *remigrate.*) Removal back again (*Hale*).

To REMI'ND. *v. a.* (*re* and *mind.*) To put in mind; to force to remember (*South*).

REMINI'SCENCE. *s.* (*reminiscens*, Lat.) Recollection; recovery of ideas (*Hale*).

REMINISCE'NTIAL. *a.* (from *reminiscence.*) Relating to reminiscence (*Brown*).

REMI'SS. *a.* (*remis*, Fr. *remissus*, Latin.) 1. Not vigorous; slack (*Woodward*). 2. Not careful; slothful (*Shakspeare*). 3. Not intense (*Roscommon*).

REMI'SSIBLE. *a.* (from *remit.*) Admitting forgiveness.

REMI'SSION. *s.* (*remission*, Fr. *remissio*, Lat.) 1. Abatement; relaxation; moderation (*Bacon*). 2. Cessation of intenseness (*Woodward*). 3. In physic, *remission* is when a distemper abates, but does not go quite off before it returns again. 4. Release; abatement of right (*Swift*). 5. Forgiveness; pardon (*Taylor*).

REMI'SSLY. *ad.* (from *remiss.*) 1. Carelessly; negligently; without close attention (*Hooker*). 2. Not vigorously; not with ardour or eagerness; slackly (*Clarendon*).

REMI'SSNESS. *s.* (from *remiss.*) Carelessness; negligence; coldness; want of ardour (*Rogers*).

To REMI'T. *v. a.* (*remitto*, Latin.) 1. To relax; to make less intense (*Milton*). 2. To forgive a punishment (*Dryden*). 3. (*remettre*, Fr.) To pardon a fault (*Shakspeare*). 4. To give up; to resign (*Hayward*). 5. To defer; to refer (*Gov. of the Tongue*). 6. To put again in custody (*Dryden*). 7. To send money to a distant place (*Addison*). 8. To restore: not in use (*Hayward*).

To REMI'T. *v. n.* 1. To slacken; to grow less intense (*Broome*). 2. To abate by growing less eager (*South*). 3. In physic, to grow by intervals less violent.

REMI'TMENT. *s.* (from *remit.*) The act of remitting to custody.

REMI'TTANCE. *s.* (from *remit.*) 1. The act of paying money at a distant place. 2. Sum sent to a distant place (*Addison*).

REMITTENT FEVER. See FEBRIS CONTINUA.

REMI'TTER. *s.* (*remettre*, French.) 1. One who remits, or procures the conveyance and payment of money.

REMITTER, in law, is where one that has a right to lands, but is out of possession, has afterwards the freehold cast upon him by some subsequent defective title, and enters by virtue of that title; in this case the law remits him to his ancient and more certain right, and by an equitable fiction supposes him to have gained possession in consequence and by virtue thereof; and this, because he cannot possibly obtain judgment at law, to be restored to his prior right, since he is himself the tenant of the land. 3 Black. 190.

RE'MNANT. *s.* (corrupted from *remanent.*) Residue; that which is left (*Shakspeare*).

RE'MNANT. *a.* Remaining; yet left (*Prior*).

REMO (St.), a town of the territory of Genoa, situate in a fruitful valley, with a good

harbour, in the Mediterranean, seven miles E. by N. of Vintimiglia, and 17 W.N.W. of Oneglia.

REMO'LTEN. *part.* (from *remelt.*) Melted again (*Bacon*).

REMO'NSTRANCE. *s.* (*remonstrance*, Fr.) 1. Show; discovery: not in use (*Shakspeare*). 2. Strong representation (*Hooker*).

To REMO'NSTRATE. *v. n.* (*remonstro*, Lat.) To make a strong representation.

REMORA. The sucking fish. See ECHENEIS.

REMORA ARATRI. (*remoror*, to hinder, and *aratrum*, a plough; so called because it hinders the plough). See ONONIS.

To RE'MORATE. *v. a.* (*remorer*, Lat.) To hinder.

REMO'RSE. *s.* (*remorsus*, Latin.) 1. Pain of guilt (*Clarendon*). 2. Tenderness; pity; sympathetic sorrow (*Spenser*).

REMO'RSEFUL. *a.* (*remorse* and *full.*) Tender; compassionate (*Shakspeare*).

REMO'RSELESS. *a.* (from *remorse.*) Unpitying; cruel; savage (*South*).

REMO'TE. *a.* (*remotus*, Lat.) 1. Distant; not immediate (*Locke*). 2. Distant; not at hand (*Milton*). 3. Removed far off; placed not near (*Milton*). 4. Foreign. 5. Distant; not closely connected (*Glanville*). 6. Alien; not agreeing (*Locke*). 7. Abstracted (*Locke*).

REMOTE CAUSE, in medicine. See EXCITING CAUSE.

REMO'TELY. *ad.* Not nearly; at a distance.

REMO'TENESS. *s.* (from *remote.*) State of being remote; distance; not nearness (*Boyle*).

REMO'TION. *s.* (from *remotus*, Latin.) The act of removing; the state of being removed to distance (*Brown*).

REMO'VABLE. *a.* (from *remove.*) Such as may be removed (*Spenser*).

REMO'VAL. *s.* (from *remove.*) 1. The act of putting out of any place (*Hooker*). 2. The act of putting away (*Arbuthnot*). 3. Dismission from a post (*Swift*). 4. The state of being removed (*Locke*).

To REMO'VE. *v. a.* (*removeo*, Lat.) 1. To put from its place; to take or put away. 2. To place at a distance (*Locke*).

To REMO'VE. *v. n.* 1. To change place. 2. To go from one place to another (*Dryden*).

REMO'VE. *s.* (from the verb.) 1. Change of place. 2. Susceptibility of being removed (*Glanville*). 3. Translation of one to the place of another (*Shakspeare*). 4. State of being removed (*Locke*). 5. Act of moving a chessman or draught. 6. Departure; act of going away (*Waller*). 7. The act of changing place (*Bacon*). 8. A step in the scale of gradation (*Locke*). 9. A small distance (*Rogers*). 10. Act of putting a horse's shoes upon different feet (*Swift*). 11. A dish to be changed while the rest of the course remains.

REMO'VED. *particip. a.* Remote; separate from others (*Shakspeare*).

REMO'VEDNESS. *s.* (from *removed.*) The state of being removed; remoteness (*Shakspeare*).

REMO'VER. *s.* (from *remove.*) One that removes (*Bacon*).

REMOVER, in law, is where a suit is removed or taken out of one court into another; and is the opposite of remanding a cause, or sending it back into the same court whence it was first called.

To REMOU'NT. *v. n.* (*remonter*, French.) To mount again (*Dryden*).

REMPHAN, an idol or Pagan god whom St. Stephen says the Israelites worshipped in the wilderness as they passed from Egypt to the Land of Promise: "Yea, ye took up the tabernacle of Moloch, and the star of your god Remphan: figures which ye made to worship them." That the martyr here quotes the following words of the prophet Amos, all commentators are agreed: "Ye have borne the tabernacle of your Moloch and Chiun your images, the star of your god, which ye made to yourselves." But if this coincidence between the Christian preacher and the Jewish prophet be admitted, it follows, that Chiun and Remphan are two names of one and the same deity. This is indeed further evident from the LXX translators having substituted in their version the word Ραιφαν, instead of Chiun, which we read in the Hebrew and English bibles. But the question which still remains to be answered is, what god was worshipped by the name of Remphan, Raiphan, or Chiun? for about the other divinity here mentioned there is no dispute. See MOLOCH.

The word Chiun may with equal propriety be written Kiun, Kion, or even Kyon, the Hebrew *jod* being convertible into the Greek υ or the Roman *y*; but the words Cane, Chan, Kan, or Khan, which are often diversified into Ken, Kyn, Cohen, Cahan, signifying head, chief, prince, king, &c. are diffused through a great part of Asia and Europe. In the Chinese language Quin, which signifies a king, is so similar to the word Chiun or Khiun under consideration, that no etymologist will hesitate to pronounce them of the same original and the same import. The word Kan or Khan is universally known to be an honorary title in Tartary; and Kaian or Kain, which is manifestly cognate of the word Chiun or Kiun, is, in the Plhevi or old Persian language, the epithet applied to the dynasty of princes which succeeded Cyrus the Great. Among the Scythians or ancient Tartars, Ghiun signifies the sun and likewise the day; and Kung, Kinung, Kun, runs through all the dialects of the Gothic tongue, every where denoting a chief or sovereign. In the Syrian dialect, Kon signifies a prince; and hence the Almighty is styled (Gen. xiv. 19.) Konah, which is translated possessor, but might have, with perhaps more propriety, been rendered Sovereign of heaven and earth. In Hebrew, the word Kahan or Kahen, which is the very same with Khan or Kan, signifies either a priest or a prince; and in Egypt Kon was the name of

the first Hercules or the sun. Hence the same word in composition denotes greatness, as Can-obus the great serpent; Can-athoth, the great Thoth or Mercury; Can-osiris, the great Osiris.

From this deduction we would conclude, that the word, which is found in so many tongues, and always denotes chief, prince, sovereign, is the very word Chiun which the Egyptians and Hebrews applied to Sothis, as being, in their conceptions, the chief or sovereign of all the stars. This will appear still more probable, when we have ascertained the import of the word Remphan, or, as the LXX have it, Raiphan.

Phan, the latter part of this word, is unquestionably the same with Pan, the most ancient of the Egyptian gods (see PAN). It is likewise a cognate of the Hebrew Phanah, conspexit, spectavit, vidit; and the radical word seems to be Phah, which signifies sometimes the countenance, and sometimes light. Hence Phaethon, which is compounded of *pha* light, *eth* or *esh* fire, and *on* strength, came to be one of the names of the sun. Rai, which we commonly write Rajah, has long signified, among the Indians, a subordinate prince; and we know that between India and Egypt there was a very early intercourse. Raiphan, therefore, may be either the royal light or the bright prince, subordinate to Osiris; and in either sense it was a very proper epithet of Sothis in the Egyptian kalendar. The word Rem or Rom, again (for it is sometimes written Remphan, and sometimes Rompha), is no other than the Hebrew רום *Rum*, high, exalted. Hence Remphan is the high or exalted light, which Sothis certainly was.

For this etymological disquisition we are indebted to Dr. Doig, the learned author of Letters on the Savage State, who has written a dissertation on Chiun and Remphan, of great value. What confirms his interpretation is, that the idol consecrated by the Egyptians to Sothis, or the dog-star, was a female figure with a star on her head; and hence the prophet upbraids his countrymen with having borne the star of their deity.

It ought to be observed, however, that several learned men are of opinion that both Remphan and Chiun were names for Saturn. See the note to archbishop Newcome's translation of Amos, v. 26. Hammond on Acts vii. 43, &c.

REMULUS, a chief of Tibur, whose arms were seized by the Rutulians, and afterwards became part of the plunder which Euryalus obtained.—2. A friend of Turnus, trampled to death by his horse which Orsilochus had wounded.

REMU'NERABLE. *a.* (from *remunerate.*) Rewardable.

To REMU'NERATE. *v. a.* (*remunero*, Latin.) To reward; to repay; to requite (*Boyle*).

REMUNERATION. *s.* (*remuneratio*, Lat.) Reward; requital; recompense; repayment.

REMU'NERATIVE. *a.* (from *remunerate.*) Exercised in giving rewards (*Boyle*).

REMURIA, festivals established at Rome by Romulus, to appease the manes of his brother Remus. They were afterwards called Lemuria, and celebrated yearly.

To REMU'RMUR. *v. a.* (*re* and *murmur.*) To utter back in murmurs; to repeat in low hoarse sounds (*Pope*).

To REMU'RMUR. *v. n.* (*remurmuro*, Latin.) To murmur back; to echo a low hoarse sound (*Dryden*).

REMUS, the son of Rhea Silvia, and Romulus his brother: they were twins, and ordered by the command of their uncle Amulius Silvius to be thrown into the Tiber; but they were taken up and saved by Faustulus, who was Numitor's shepherd. He carried them to his wife, by whom they were carefully nursed. Some said that while the cradle was upon the brink of the river, a she-wolf, brought thither by the crying of the infants, gave them suck. Others have been of opinion, that the wantonness of Laurentia, Faustulus's wife, gave occasion to this fable, because such women were called she-wolves. Authors vary in their opinions concerning the death of Remus; some saying, that Romulus slew his brother, because he ridiculed him upon the account of the fortifications he had made to his new city; while others will have him to have been killed by the soldiery: but be it as it will, it is certain Remus cemented the walls of Rome with his own blood.

REMY (St.), a town of France, in the department of Mouths of the Rhone. A triumphal arch, and a mausoleum, in the neighbourhood, display the taste of the Augustan age: the first is not entire; but the second is in the best state of preservation. St. Remy is 10 miles N.E. of Arles.

RENAL GLANDS. Glandulæ renales. Renal capsules. Supra-renal glands. The supra-renal glands are two hollow bodies, like glands in fabric, and placed one on each side upon the kidney. They are covered by a double tunic, and their cavities are filled with a liquor of a brownish red colour. Their figure is triangular; and they are larger in the fœtus than the kidneys; but in adults they are less than the kidneys. The right is affixed to the liver, the left to the spleen and pancreas, and both to the diaphragm and kidneys. They have arteries, veins, and lymphatics and nerves; their arteries arise from the diaphragmatic, the aorta, and the renal arteries. The vein of the right supra-renal gland empties itself into the vena cava; that of the left into the renal vein; their lymphatic vessels go directly to the thoracic duct; these are nerves common alike to these glands and the kidneys. They have no excretory duct, and their use is at present unknown. It is supposed they answer one use in the fœtus, and another in the adult, but what these uses are is uncertain. Boerhaave supposed their use to consist in their furnishing lymph to dilute the blood returned after the

secretion of the urine in the renal vein; but this is very improbable, since the vein of the right supra-lenal gland goes to the vena cava, and the blood carried back by the renal vein wants no dilution. It has also been said, that these glands not only prepare lymph, by which the blood is fitted for the nutrition of the delicate fœtus; but that in adults they serve to restore in themselves, to the blood of the vena cava, the irritable parts which it loses by the secretion of bile and urine. Some, again, have considered them as diverticula in the fœtus, to divert the blood from the kidneys, and lessen the quantity of urine. The celebrated Morgagni believed their office to consist in conveying something to the thoracic duct. It is singular, that in children who are born without the cerebrum, these glands are extremely small, and sometimes wanting.

RENAL VESSELS. See EMULGENT VESSELS.

RE'NARD. *s.* (*renard*, a fox, Fr.) The name of a fox in fable (*Dryden*).

RENA'SCENT. *a.* (*renascens*, Lat.) Produced again; rising again into being.

RENA'SCIBLE. *a.* (*renascor*, Lat.) Possible to be produced again.

To RENA'VIGATE. *v. a.* (*re* and *navigate.*) To sail again.

RENAU D'ELISAGARAY (Bernard), a mathematician of Bearn. He was employed by Lewis XIV. in improving the construction of vessels, for which he was rewarded with a pension. He advised the bombarding of Algiers, which succeeded against the opinion of other engineers, and afterwards he conducted the sieges of Philipsburg, Manheim, &c. He was made counsellor of marines, and grand cross of the order of St. Louis, and enjoyed the rank and privileges of a captain of the navy. He died 1719, aged 67. He wrote the theory of the management of ships, 1689, 8vo.—letters in answer to the objections of Huygens and Bernouilli against his opinions, &c.

RENAUDOT (Theophrastus), known as the first editor of gazettes in France, 1631, was born at Loudun, and died at Paris, 1653, aged 70. He published an abridgment of the prince de Conde's life, 4to.—marshal Gassion's life—cardinal Michael Mazarin's life, 4to. &c.

RENAUDOT (Eusebius), born at Paris in 1646, and distinguished for his learning in oriental history. He was of the congregation of the oratory, but his reputation increasing by his publications, the cardinal de Noailles took him to Rome, where Clement V. honoured him with the priory of Frossay in Britanny. He was made a member of the academy de la Crusca, and afterwards became a member of the academy of Inscriptions, and of the French academy. He died in 1720.

RENCOU'NTER. *s.* (*rencontre*, French.) 1. Clash; collision (*Collier*). 2. Personal opposition (*Addison*). 3. Loose or casual engagement (*Addison*). 4. Sudden combat without premeditation.

To RENCOU'NTER. *v. n.* (*rencontrer*, Fr.) 1. To clash; to collide. 2. To meet an enemy unexpectedly. 3. To skirmish with another. 4. To fight hand to hand.

To REND. *v. a.* pret. and part. pass. *rent.* (pendan, Saxon.) To tear with violence; to lacerate (*Pope*).

RE'NDER. *s.* (from *rend.*) One that rends; a tearer.

To RE'NDER. *v. a.* (*rendre*, Fr.) 1. To return; to pay back (*Locke*). 2. To restore; to give back (*Addison*). 3. To give upon demand (*Proverbs*). 4. To invest with qualities; to make (*South*). 5. To represent; to exhibit (*Shakspeare*). 6. To translate (*Burnet*). 7. To render; to yield; to give up (*Clarendon*). 8. To offer; to give to be used (*Watts*).

RE'NDER. *s.* (from the verb.) Surrender (*Shakspeare*).

RE'NDEZVOUS. *s.* (*rendez vous*, Fr.) 1. Assembly; meeting appointed (*Raleigh*). 2. A sign that draws men together (*Bacon*). 3. Place appointed for assembly (*Clarendon*).

To RE'NDEZVOUS. *v. n.* (from the noun.) To meet at a place appointed.

RENDI'TION. *s.* (from *render.*) Surrendering; the act of yielding.

RENDSBURG, a fortified town of Lower Saxony, in the duchy of Holstein, on the frontiers of Sleswick, and on the river Eyder. It is composed of three parts, the Old Town, the Sklcusskule, and the New Town; the former of which stands on an island formed by the river. The principal manufactures are porcelain, earthen ware, and gold and silver lace; and its trade in timber, by means of the Eyder canal, is considerable. It is 15 miles W. of Kiel, and 16 S.S.E. of Sleswick. Lon. 9. 53 E. Lat. 54. 20 N.

RENEALMIA, in botany, a genus of the class monandria, order monogynia. Corol three-cleft; nectary oblong; calyx one-leafed, broken into two or three irregular teeth; anther sessile, opposite the nectary; berry fleshy. One species; a Surinam tree, twenty feet high; leaves lanceolate, with an undulate margin; raceme proceeding from the trunk above the root.

RENEGA'DE. RENEGA'DO. *s.* (*renegado*, Spanish.) 1. One that apostatizes from the faith; an apostate (*Addison*). 2. One who deserts to the enemy; a revolter.

To RENE'GE. *v. a.* (*renego*, Lat. *renier*, Fr.) To disown (*King Charles*).

RENES. (απο του ρειν; because through them the urine flows.) See KIDNEYS.

RENETTE, an instrument of polished steel, with which farriers discover a prick in a horse's foot.

To RENE'W. *v. a.* (*re* and *new.*) 1. To renovate; to restore to the former state. 2. To repeat; to put again in act (*Dryden*). 3. To begin again (*Dryden*). 4. In theology, to make anew; to transform to new life (*Romans*).

RENE'WABLE. *a.* (from *renew.*) Capable to be renewed (*Swift*).

RENE'WAL. *s.* (from *renew.*) The act of renewing; renovation (*Forbes*).

RENFREW, a borough of Scotland, and the county-town of Renfrewshire. The principal branch of trade is the thread, but many looms are employed in the silk and muslin manufactures. Robert II. had a palace here, of which nothing remains but the exterior ditch. It is seated near the Clyde, to which there is a canal, 11 miles W. by N. of Glasgow, and 13 E. by S. of Greenock. Lon. 4. 26 W. Lat. 55. 54 N.

RENFREWSHIRE, a county of Scotland, 28 miles long, and from 10 to 20 broad; bounded on the W. and N. by the frith of Clyde, E. by Lanerkshire, and S. by Ayrshire. It is divided into 17 parishes, and the number of inhabitants in 1801 was 78,058. In the N. part, toward the borders of the Clyde, the soil is fertile, but the S. part is mountainous, and rather barren. Besides the Clyde, it is watered by the Gryfe, and the White and Black Cart. The largest town is Paisley.

RENIFORM LEAF, in botany. A kidney-shaped leaf.—Subrotundum, basi excavatum, angulis destitutum. Philos. Bot.—Subrotundum, basi exsculptum absque angulis posticis. Delin. Pl.—Roundish, hollowed out at the base, without angles: as in convolvulus soldanella, the lower leaves of campanula rotundifolia, saxifraga granulata, glecoma hederacea.—This term is applied also to the anther and seed.

RE'NITENCY. *s.* (from *renitent.*) The resistance in solid bodies, when they press upon, or are impelled one against another (*Quincy*).

RENI'TENT. *a.* (*renitens*, Lat.) Acting against any impulse by elastic power (*Ray*).

RENNES, a city of France, capital of the department of Ille and Vilaine, and a bishop's see. It contains eight parish-churches, beside the cathedral, and several convents. The streets are broad and straight; but they were narrow before the fire in 1720, which lasted seven days, and consumed 850 houses. In the great square is the Palace of Justice, and the Hotel de Ville. It is seated on the Vilaine, which divides it into two parts, 58 miles N. by W. of Nantes, and 190 W.S.W. of Paris. Lon. 1. 42 W. Lat. 48. 7 N.

RENNET, or RUNNET; the juice or gastric fluid found in the stomach of sucking quadrupeds which have received no other nourishment than their mother's milk. In ruminating animals, which have several stomachs, it is generally found in the left or lowest, which is, in reality, the only proper stomach, the others being only ventricles or vestibules to it. Rennet, however, is occasionally traced even in the third or lowest stomach but one, and which, in vulgar language, is denominated the *maniplus* or rather *manyplies*, from its convolute structure, as the last of all is the *red* from its colour; by the French *le caillé*, or the curdle, since in this division the milk of a sucking quadruped first assumes a curdled appearance.

If the rennet or gastric juice be dried in the sun, and then kept close, it may be preserved in perfection for years. The stomach itself however of the sucking calf may be employed instead of the rennet or gastric juice for the purpose of curdling milk, and will require no previous preparation. The common mode of preserving it for this purpose is merely to clean it well, salt it, and hang it up in brown paper: when it is wanted, a piece about the length of the finger is cut off, and put into a glass, and three or four spoonsfull of water are poured upon it, and suffered to remain from sixteen to twenty-four hours: after which the infusion is mixed with the milk, and the curdle becomes instantly produced.

This property possessed by rennet of coagulating the caseous part of milk was known in the time of Dioscorides; and as it has been remarked that acids have the same effect, this property of the rennet has been also ascribed to an acid; and many celebrated writers have observed that the gastric juice of carnivorous animals is occasionally acid. Thus Floyer asserts that he found it so in carnivorous birds; Marsigli in the eagle; Viridet in carnivorous fishes; and Lorenzini in the gymnotus or cramp-fish: but all have attributed this acidity to a morbid state of the gastric juice. With respect however to the rennet, it is the fourth stomach of quadrupeds alone that naturally possesses this property: thus the juice found in the crops of birds is destitute of it. Macquer looked upon its coagulating power as arising from the remnant of sour milky matter, which he thought was sufficient to coagulate other milk. It has since, however, been sufficiently proved that, though limited to the organ before us, the coagulating quality is seated, as we have already observed, in the gastric juice; and that it is merely communicated to the coat of the stomach and to a certain range of the neighbouring parts in consequence of their being impregnated with this fluid. But it still remains to determine whether this property proceed from the gastric juice of the fourth stomach of the calf, being an acid of a very peculiar nature, or whether it proceeds from any other quality of this fluid.

To decide this question Morveau digested at different times parts of the interior tunic of the stomach of the calf, both in hot and cold water, previously distilled: he then poured some spirit of wine upon it, which occasioned a precipitate, and he always found that the filtrated liquor sensibly changed blue water to a red, hence clearly appearing to show the existence of an acid; and as he found a similar effect produced very generally by treating the gastric juice of various other quadrupeds in the same manner, he has ventured to place it in the French Encyclopédie among the animal acids, under the name of gastric acid, at the same time expressing some doubt whether acidity be an essential part of its nature. Spalanzani, however, seems to have shown that the acid property is at least in various instances accidental, and depends altogether upon the nature of the materials that form the food: and Monck in several instances found that calcined magnesia was not in the smallest degree soluble

in the gastric juices of different animals, and consequently possessed no acidity whatever; although he admits that under particular circumstances such an acid may be produced. The result of the whole is that we are not sufficiently acquainted with the nature of the gastric juice in any animal to determine on the cause of its coagulating property in the organ before us.

To RE'NOVATE. *v. a.* (*renovo*, Lat.) To renew; to restore to the first state (*Thomson*).

RENOVA'TION. *s.* (*renovatio*, Lat.) Renewal; the act of renewing (*Bacon*).

To RENOU'NCE. *v. a.* (*renoncer*, Fr.) 1. To disown; to abnegate (*Dryden*). 2. To quit upon oath (*Kettlewell*).

To RENOU'NCE. *v. n.* To declare renunciation (*Dryden*).

RENOU'NCEMENT. *s.* (from *renounce.*) Act of renouncing; renunciation (*Shak.*).

RENO'WN. *s.* (*renommée*, Fr.) Fame; celebrity; praise widely spread (*Waller*).

To RENO'WN. *v. a.* (*renommer*, Fr.) To make famous (*Pope*).

RENO'WNED. *particip. a.* (from *renown.*) Famous; celebrated; eminent; famed (*Dryden*).

RENT. *s.* (from *rend.*) A break; a laceration.

To RENT. *v. a.* (rather to *rend.*) To tear; to lacerate (*Ecclus.*).

To RENT. *v. n.* To roar; to rant (*Hudibras*).

RENT. *s.* (*rente*, Fr.) 1. Revenue; annual payment (*Pope*). 2. Money paid for any thing held of another.

RENT, is a certain profit issuing yearly, out of lands and tenement corporeal.

There are at common law three kinds of rents; rent service, rent charge, and rent seck, or rack rent.

Rent service is where the tenant holds his land of his lord by fealty and certain rent; or by homage, fealty, and certain rent; or by other service and certain rent; and it is called a rent service, because it has some corporal service incident to it, which at least is fealty. Rent charge is so called because the land for payment of it is charged with a distress. Rent seck, or rack rent, is where the land is granted without any clause of distress for the same. 1 Inst. 141.

The time for payment of rent, and consequently for a demand, is such a convenient time before the sun-setting of the last day, as will be sufficient to have the money counted; but if the tenant meets the lessor on the land at any time of the last day of payment, and tenders the rent, that is sufficient tender, because the money is to be paid indefinitely on that day, and therefore a tender on that day is sufficient. See DISTRESS.

To RENT. *v. a.* (*renter*, French.) 1. To hold by paying rent (*Addison*). 2 To set to a tenant.

RE'NTABLE. *a.* (from *rent.*) That may be rented.

RE'NTAL. *s.* (from *rent.*) Schedule or account of rents.

RE'NTER. *s.* (from *rent.*) He that holds by paying rent (*Locke*).

RENTERING, in the manufactories, the same with fine-drawing. It consists in sewing two pieces of cloth edge to edge, without doubling them, so that the seam scarcely appears; and hence it is denominated fine-drawing. It is a French word meaning the same thing, and is derived from the Latin *retrahere*, or *re*, in, and *trahere*, because the seam is drawn in or covered. It is said, that in the East Indies, if a piece of fine muslin is torn, and afterwards mended by the fine-drawers, it will be impossible to discover where the rent was. In this country the dexterity of the fine-drawers is not so great as that of those in the East; but it is still such as to enable them to defraud the revenue, by sewing a head or slip of English cloth on a piece of Dutch, Spanish, or other foreign cloth; or a slip of foreign cloth on a piece of English, so as to pass the whole as of a piece, and by that means avoid the duties, penalties, &c. The trick was first discovered in France, by M. Savary.

RENTERING, in tapestry, is the working new warp into a piece of damaged tapestry, whether eaten by the rats or otherwise destroyed, and on this warp to restore the antient pattern or design. The warp is to be of woollen, not linen. Among the titles of the French tapestry-makers is included that of renterers.

RENTOWN, a village of Scotland, four miles N.W. of Dumbarton. Near it is one of the most considerable printfields in Scotland; also the old mansion of Dalquhurn, where Dr. Smollett was born, and the lofty column erected to his memory, on the bank of the Leven.

RENTY, a town of France, in the department of Pas de Calais, seated on the river Aa, 12 miles S.W. of Aire, and 50 N.W. of Arras.

RE'NVERSED. *a.* (*renversé*, Fr.) Overturned (*Spenser*).

RENUNCIA'TION. *s.* (*renunciatio*, Lat.) The act of renouncing (*Taylor*).

To REORDA'IN. *v. a.* (*reordiner*, Fr.) To ordain again, on supposition of some defect in the commission granted to a minister.

REORDINA'TION. *s.* (from *reordain.*) Repetition of ordination (*Atterbury*).

To REPA'CIFY. *v. a.* (*re* and *pacify.*) To pacify again (*Daniel*).

REPAILLÆ, a town of Savoy, in Chablais, famous for the retreat of Amadeus, duke of Savoy, in 1440, when he went to enjoy the pleasures of a country life. Here is a Carthusian monastery, remarkable for its extensive prospects. It is seated on a river which runs into the lake of Geneva, 20 miles N.E. of Geneva.

To REPAI'R. *v. a.* (*reparo*, Lat. *reparer*, Fr.) 1. To restore after injury or dilapidation (*Clarendon*). 2. To amend an injury by an equivalent (*Milton*). 3. To fill up anew, by

something put in the place of what is lost (*Milton*).

REPAI'R. *s.* (from the verb.) Reparation; supply of loss; restoration after dilapidation (*Wilk.*).

To REPAI'R. *v. n.* (*repairer*, Fr.) To go to; to betake himself (*Pope*).

REPAI'R. *s.* (*repaire*, Fr.) 1. Resort; abode (*Dryden*). 2. Act of betaking himself any whither (*Clarendon*).

REPAI'RER. *s.* (from *repair.*) Amender; restorer (*South*).

REPAND LEAF. Repandum folium. In botany. Cujus margo angulis, eisque interjectis sinubus, circuli segmento inscriptis terminatur. The rim of which is terminated by angles, having sinuses between them inscribed in the segment of a circle.—In Delin. Pl. it is differently described margine flexuoso, tamen plano: with a flexuose or waving rim, but flat. Properly speaking, says Dr. Berkenhout, having a serpentine margin, without any angles at all. But this by no means agrees with the first explanation from Linnéus's Philosophia Botanica.—It is clearly distinct from the undulating or waving leaf; for the curvature in that respects the disk; but in this, the edge only.

REPA'NDOUS. *a.* (*repandus*, Lat.) Bent upward (*Brown*).

RE'PARABLE. *a.* (*reparabilis*, Lat.) Capable of being amended, retrieved, or supplied by something equivalent (*Bacon*).

RE'PARABLY. *ad.* (from *reparable.*) In a manner capable of remedy by restoration, amendment, or supply.

REPARA'TION. *s.* (*reparatio*, Latin.) 1. The act of repairing; instauration (*Arbuthnot*). 2. Supply of what is wasted (*Arbuthnot*). 3. Recompense for any injury; amends (*Dryden*).

REPA'RATIVE. *s.* (from *repair.*) Whatever makes amends for loss or injury (*Wotton*).

REPARTEE'. *s.* (*repartie*, French.) Smart reply.

To REPARTEE'. *v. n.* To make smart replies.

To REPA'SS. *v. a.* (*repasser*, Fr.) To pass again; to pass back (*Raleigh*).

To REPA'SS. *v. n.* To go back in a road (*Dryden*).

REPA'ST. *s.* (*repas*, Fr.) 1. A meal; act of taking food (*Denham*). 2. Food; victuals (*Shakspeare*).

To REPA'ST. *v. a.* (*repaistre*, French.) To feed; to feast (*Shakspeare*).

REPA'STURE. *s.* (*re* and *pasture*). Entertainment: not in use (*Shakspeare*).

To REPA'Y. *v. a.* (*repayer*, Fr.) 1. To pay back in return, in requital, or in revenge (*Bacon*). 2. To recompense (*Milton*). 3. To compensate (*Bacon*). 4. To requite either good or ill (*Pope*). 5. To reimburse with what is owed (*Shakspeare*).

REPA'YMENT. *s.* (from *repay.*) 1. The act of repaying. 2. The thing repaid (*Arbuthnot*).

To REPEA'L. *v. a.* (*repeller*, Fr.) 1. To recall: out of use (*Shakspeare*). 2. To abrogate; to revoke (*Dryden*).

REPEA'L. *s.* (from the verb.) 1. Recall from exile: not in use (*Shakspeare*). 2. Revocation; abrogation (*Davies*).

No act of parliament can be repealed the same session in which it was made or passed.

To REPEAT. *v. a.* (*repeto*, Lat.) 1. To iterate; to use again; to do again (*Arbuthnot*). 2. To speak again (*Hooker*). 3. To try again (*Dryden*). 4. To recite; to rehearse (*Milton.*)

REPEAT, in music, a character shewing that what was last played or sung, must be repeated, or gone over again.

The repeat serves instead of writing the same thing twice over. There are two kinds of repeats; the great and the small.

The great repeat, is only a double bar, dotted on each side; or two parallel lines drawn perpendicular across the staff; with dots on either hand.

The small repeat, is where only some of the last measures of a strain are to be repeated: this is denoted by a character set over the place where the repetition begins (see CHARACTERS in music), and continues to the end of the strain. See MUSIC.

REPEA'TEDLY. *ad.* (from *repeated.*) Over and over; more than once (*Stephens*).

REPEA'TER. *s.* (from *repeat.*) 1. One that repeats; one that recites. 2. A watch that strikes the hours at will.

REPEHAM, a town in Norfolk, with a market on Saturday. It has two churches in one churchyard, and is seated in a valley, 15 miles N.W. of Norwich, and 111 N.E. of London.

To REPE'L. *v. a.* (*repello*, Lat.) 1. To drive back any thing (*Hooker*). 2. To drive back an assailant (*Dryden*).

To REPE'L. *v. n.* 1. To act with force contrary to force impressed. 2. To *repel* in medicine, is to prevent such an afflux of a fluid to any particular part as would raise it into a tumour (*Quincy*).

REPELLENTS, in medicine, remedies which drive back a morbid humour into the mass of blood, from which it was unduly secreted.

REPE'LLER. *s.* (from *repel.*) One that repels.

To REPE'NT. *v. n.* (*repentir*, Fr.) 1. To think on any thing past with sorrow. 2. To express sorrow for something past (*Shakspeare*). 3. To change the mind from some painful motive (*Exodus*). 4. To have such sorrow for sin, as produces amendment of life (*Matthew*).

To REPE'NT. *v. a.* 1. To remember with sorrow (*Shakspeare*). 2. To remember with pious sorrow (*Donne*).

REPENT ROOT, in botany, a creeping root. —Longe excurrens hinc inde germinans, s. radiculas demittens.—Repent stem, creeping stem; radiculas hinc inde exserens procumbendo; as in hedera, bignonia, &c.

REPE'NTANCE. *s.* (*repentance*, French.) 1. Sorrow for any thing past (*Law*). 2. Sorrow for sin, such as produces newness of life; penitence (*Whitgift*).

REPE'NTANT. *a.* (*repentant*, French.) 1. Sorrowful for the past. 2. Sorrowful for sin (*Milton*). 3. Expressing sorrow for sin (*Shakspeare*).

To REPEO'PLE. *v. a.* (*re* and *people*.) To stock with people anew (*Hale*).

To REPERCU'SS. *v. a.* (*repercussus*, Lat.) To beat back; to drive back: not in use (*Bacon*).

REPERCU'SSION. *s.* (*repercussio*, Lat.) The act of driving back; rebound (*Bacon*).

REPERCU'SSIVE. *s.* (*repercussif*, Fr.) 1. Having the power of driving back, or causing a rebound (*Pattison*). 2. Repellent (*Bacon*). 3. Driven back; rebounding (*Thomson*).

REPERTI'TIOUS. *a.* (*repertus*, Latin.) Found; gained by finding.

REPE'RTORY. *s.* (*repertorium*, Lat.) A treasury; a magazine; a book in which any thing is to be found.

In this latter sense there has for some years been published monthly a Repertory of Arts and Manufactures, containing, besides other interesting matter, a more complete collection of specifications of patents than is any where else to be met with.

REPETENT, in arithmetic. See CIRCULATING DECIMAL and RECUR.

REPETI'TION. *s.* (*repetitio*, Lat.) 1. Iteration of the same thing (*Arbuthnot*). 2. Recital of the same words over again (*Hooker*). 3. The act of reciting or rehearsing (*Shakspeare*). 4. Recital (*Chapman*).

To REPI'NE. *v. n.* (*re* and *pine*.) 1. To fret; to be discontented (*Temple*). 2. To envy (*Dryden*).

REPI'NER. *s.* (from *repine*.) One that frets or murmurs.

To REPLA'CE. *v. a.* (*replacer*, Fr.) 1. To put again in the former place (*Bacon*). 2. To put in a new place (*Dryden*).

To REPLAI'T. *v. a.* (*re* and *plait*.) To fold one part often over another (*Dryden*).

To REPLA'NT. *v. a.* (*replant*, Fr.) To plant anew (*Bacon*).

REPLANTA'TION. *s.* (from *replant*.) The act of planting again.

To REPLE'NISH. *v. a.* (*repleo*, Lat.) 1. To stock; to fill (*Milton*). 2. To finish; to complete: not proper (*Shakspeare*).

To REPLE'NISH. *v. n.* To recover the former fulness: not in use (*Bacon*).

REPLE'TE. *a.* (*replete*, Fr.) Full; completely filled; filled to exuberance (*Bacon*).

REPLE'TION. *s.* (*repletion*, Fr.) The state of being over full (*Arbuthnot*).

REPLE'VIABLE. *a.* (*replegiabilis*, barbarous Lat.) What may be replevined.

To REPLE'VIN. *To* REPLE'VY. *v. a.* (*replegio*, low Lat.) To take back or set at liberty, upon security, any thing seized (*Hudibras*).

REPLEVIN, in law, is a writ by him, who has cattle or other goods distrained by another, for any cause. If he wishes to dispute the propriety of the distress, he sues this writ, and upon putting in surety to the sheriff, that upon delivery of the thing distrained, he will prosecute the action against the distrainer, the cattle or goods are delivered back, and said to be replevied. In this writ, or action, both the plaintiff and defendant are called actors; the one, that is the plaintiff, suing for damages, and the defendant, who is also called avowant, to have a return of the goods or cattle.

Replevins by writ issue properly out of Chancery, returnable into the courts of King's Bench and Common Pleas at Westminster.

After the goods are delivered back to the party replevying, he is bound to bring his action of replevin against the distrainer; which may be prosecuted in the county court, be the distress of what value it may: but either party may remove it to the superior courts of King's Bench or Common Pleas, the plaintiff at pleasure, and the defendant upon reasonable cause.

If the sheriff is shown a stranger's goods, and he takes them, an action of trespass lies against him, for otherwise he could have no remedy; for being a stranger, he cannot have the writ *de proprietate probanda*, and were he not entitled to this remedy, it would be in the power of the sheriff to strip a man's house of all his goods.

If the replevin be determined for the plaintiff, namely, that the distress was wrongfully taken, he has already got his goods back into his own possession, and shall keep them, and recover damages. But if the defendant prevail, by the default or non-suit of the plaintiff, then he shall have a writ *de returno habendo*, or to have a return, whereby the goods or chattels, which were distrained and then replevied, are returned again into his custody, to be sold, or otherwise disposed of, as if no replevin had been made. If the distress were for damage feasant, that is, for cattle breaking through fences, and coming upon the land of the party, the distrainer may keep the goods so returned, until tender shall be made of sufficient amends.

REPLICA'TION. *s.* (*replico*, Latin.) 1. Rebound; repercussion: not used (*Shakspeare*). 2. Reply; answer (*Broome*).

To REPLY'. *v. n.* (*repliquer*, French.) To answer; to make a return to an answer (*Atterbury*).

To REPLY'. *v. a.* To return for an answer (*Milton*).

REPLY'. *s.* (*replique*, Fr.) Answer; return to an answer (*Watts*).

REPLY'ER. *s.* (from *reply*.) He that makes a return to an answer (*Bacon*).

To REPO'LISH. *v. a.* (*repolir*, Fr.) To polish again (*Donne*).

To REPO'RT. *v. a.* (*rapporter*, Fr.) 1. To noise by popular rumour (*Shakspeare*). 2. To give repute (*Timothy*). 3. To give an account of (*Nehemiah*). 4. To return; to rebound; to give back (*Bacon*).

REPO'RT. *s.* (from the verb.) 1. Rumour; popular fame. 2. Repute; public character

(*Shakspeare*). 3. Account returned (*Waller*). 4. Account given by lawyers of cases (*Watts*). 5. Sound; loud noise; repercussion (*Bacon*).

REPO'RTER. *s.* (from *report.*) Relater; one that gives an account (*Hayward*).

REPO'RTINGLY. *ad.* (from *reporting.*) By common fame (*Shakspeare*).

REPO'SAL. *s.* (from *repose.*) The act of reposing (*Shakspeare*).

To REPO'SE. *v. a.* (*repono*, Latin.) 1. To lay to rest (*Milton*). 2. To place as in confidence or trust (*Rogers*). 3. To lodge; to lay up (*Woodward*).

To REPO'SE. *v. n.* (*reposer*, Fr.) 1. To sleep; to be at rest (*Chapman*). 2. To rest in confidence (*Shakspeare*).

REPO'SE. *s.* (*repos*, Fr.) 1. Sleep; rest; quiet (*Philips*). 2. Cause of rest (*Dryden*).

REPO'SEDNESS. *s.* (from *reposed.*) State of being at rest.

To REPO'SITE. *v. a.* (*repositus*, Lat.) To lay up; to lodge as in a place of safety (*Derham*).

REPOSI'TION. *s.* (from *reposite.*) The act of replacing (*Wiseman*).

REPO'SITORY. *s.* (*repositorium*, Lat.) A place where any thing is safely laid up (*Rogers*).

To REPOSSE'SS. *v. a.* (*re* and *possess.*) To possess again (*Spenser*).

REPOSTE, in the manage, the vindictive motion of a horse that answers the spur with a kick of his foot.

To REPREHE'ND. *v. a.* (*reprehendo*, Lat.) 1. To reprove; to chide (*Shakspeare*). 2. To blame; to censure (*Philips*). 3. To detect of fallacy (*Bacon*). 4. To charge with as a fault (*Bacon*).

REPREHE'NDER. *s.* (from *reprehend.*) Blamer; censurer (*Hooker*).

REPREHE'NSIBLE. *a.* (*reprehensible*, Fr.) Blamable; culpable; censurable.

REPREHE'NSIBLENESS. *s.* (from *reprehensible.*) Blamableness; culpableness.

REPREHE'NSIBLY. *ad.* (from *reprehensible.*) Blamably; culpably.

REPREHE'NSION. *s.* (*reprehensio*, Lat.) Reproof; open blame (*Hammond*).

REPREHE'NSIVE. *a.* (from *reprehend.*) Given to repoof.

To REPRESE'NT. *v. a.* (*represento*, Lat.) 1. To exhibit, as if the thing exhibited were present (*Milton*). 2. To describe; to shew in any particular character (*Addison*). 3. To fill the place of another by a vicarious character; to personate. 4. To exhibit; to show. 5. To shew by modest arguments or narrations (*Decay of Piety*).

REPRESENTA'TION. *s.* (*representation*, Fr.) 1. Image; likeness (*Stillingfleet*). 2. Act of supporting a vicarious character. 3. Respectful declaration. 4. Public exhibition.

REPRESE'NTATIVE. *a.* (*representatif*, Fr.) 1. Exhibiting a similitude (*Atterbury*). 2. Bearing the character or power of another (*Swift*).

REPRESE'NTATIVE. *s.* 1. One exhibiting the likeness of another (*Addison*). 2. One exercising the vicarious power given by another (*Blount*). 3. That by which any thing is shown (*Locke*).

The House of Commons is constituted of the representatives of the people in parliament. See PARLIAMENT.

REPRESE'NTER. *s.* (from *represent.*) 1. One who shows or exhibits (*Brown*). 2. One who bears a vicarious character (*Swift*).

REPRESE'NTMENT. *s.* (from *represent.*) Image or idea proposed, as exhibiting the likeness of something (*Taylor*).

To REPRE'SS. *v. a.* (*repressus*, Lat.) To crush; to put down; to subdue (*Pope*).

REPRE'SS. *s.* (from the verb.) Repression; act of crushing: not in use (*Government of the Tongue*).

REPRE'SSION. *s.* (from *repress.*) Act of repressing (*King Charles*).

REPRE'SSIVE. *a.* (from *repress.*) Having power to repress; acting to repress.

To REPRIE'VE. *v. a.* (*reprendre*, *repris*, Fr.) To respite after sentence of death; to give a respite (*South*).

REPRIEVE, in criminal law (from *reprendre*, to take back), is the withdrawing of a sentence for an interval of time; whereby the execution is suspended. See JUDGMENT. According to judge Blackstone, this may be, first, *ex arbitrio judicis*, either before or after judgment: as where the judge is not satisfied with the verdict, or the evidence is suspicious, or the indictment is insufficient, or he is doubtful whether the offence be within clergy; or, sometimes, if it be a small felony, or any favourable circumstances appear in the criminal's character, in order to give room to apply to the crown for either an absolute or conditional pardon. These arbitrary reprieves may be granted or taken off by the justices of gaol-delivery, although their session be finished, and their commission expired: but this rather by common usage than of strict right.

Reprieves may also be *ex necessitate legis*: as where a woman is capitally convicted, and pleads her pregnancy. Though this is no cause to stay judgment, yet it is to respite the execution till she be delivered. This is a mercy dictated by the law of nature, *in favorem prolis*; and therefore no part of the bloody proceedings in the reign of queen Mary hath been more justly detested, than the cruelty that was exercised in the island of Guernsey, of burning a woman big with child; and, when through the violence of the flames the infant sprang forth at the stake, and was preserved by the by-standers, after some deliberations of the priests who assisted at the sacrifice, they cast it into the fire as a young heretic. A barbarity which they never learned from the laws of ancient Rome; which directs, with the same humanity as our own, *quod prægnantis mulieris damnatæ pœna differatur, quoad pariat*: which doctrine has also prevailed in England, as early as the first memorials of our law will reach. In case this plea be made in stay of execution, the judge must direct a jury of twelve matrons or discreet women to inquire into the fact: and if they bring in their verdict

quick with child (for barely *with child*, unless it be alive in the womb, is not sufficient), execution shall be staid generally till the next session; and so from session to session, till either she is delivered, or proves by the course of nature not to have been with child at all. But if she once hath had the benefit of this reprieve, and been delivered, and afterwards becomes pregnant again, she shall not be entitled to the benefit of a further respite for that cause. For she may now be executed before the child is quick in the womb; and shall not, by her own incontinence, evade the sentence of justice.

Another cause of regular reprieve is, if the offender become *non compos* between the judgment and the award of execution: for, regularly, though a man be *compos* when he commits a capital crime, yet, if he becomes *non compos* after, he shall not be indicted; if after indictment, he shall not be convicted; if after conviction, he shall not receive judgment; if after judgment, he shall not be ordered for execution: for *furiosus solo furore punitur*; and the law knows not but he might have offered some reason, if in his senses, to have stayed these respective proceedings. It is therefore an invariable rule, when any time intervenes between the attainder and the award of execution, to demand of the prisoner what he hath to allege why execution should not be awarded against him; and, if he appears to be insane, the judge in his discretion may and ought to reprieve him.

To REPRIMA'ND. *v. a.* (*reprimander*, Fr.) To chide; to check; to reprehend (*Arbuthnot*).

REPRIMA'ND. *s.* (*reprimande*, Fr.) Reproof; reprehension (*Addison*).

To REPRI'NT. *v. a.* (*re* and *print.*) 1. To renew the impression of any thing (*South*). 2. To print a new edition (*Pope*).

REPRI'SAL. *s.* (*reprisalia*, low Latin.) Something seized by way of retaliation for robbery or injury (*Hayward*).

REPRI'SE. *s.* (*reprise*, French.) The act of taking something in retaliation of injury (*Dryden*).

REPRISE, or REPRIZE, at sea, is a merchant ship which, after its being taken by a corsair, privateer, or other enemy, is retaken by the opposite party. If a vessel thus retaken has been twenty-four hours in the possession of the enemy, it is deemed a lawful prize; but if it be retaken within that time, it is to be restored to the proprietor, with every thing therein, upon his allowing one-third to the vessel who made the reprise. Also if the reprise has been abandoned by the enemy, either in a tempest or from any other cause, before it has been led into any port, it is to be restored to the proprietor.

REPRISE, a lesson repeated, or a manage recommenced; as, to give breath to a horse upon the four corners of the volt, with only one reprise; that is, all with one breath.

To REPROA'CH. *v. a.* (*reprocher*, French.) 1. To censure in opprobrious terms, as a crime (*Dryden*). 2. To charge with a fault in severe language (*Milton*). 3. To upbraid in general (*Rogers*).

REPROA'CH. *s.* (*reproche*, Fr.) Censure; infamy; shame (*Milton*).

REPROA'CHABLE. *a.* (*reprochable*, Fr.) Worthy of reproach.

REPROA'CHFUL. *a.* (from *reproach.*) 1. Scurrilous; opprobrious (*Shakspeare*). 2. Shameful; infamous; vile (*Hammond*).

REPROA'CHFULLY. *ad.* (from *reproach.*) 1. Opprobriously; scurrilously (*Shakspeare*). 2. Shamefully; infamously.

RE'PROBATE. *a.* (*reprobus*, Lat.) Lost to virtue; lost to grace; abandoned (*South*).

RE'PROBATE. *s.* A man lost to virtue; a wretch abandoned to wickedness (*Taylor*).

To RE'PROBATE. *v. a.* (*reprobo*, Lat.) 1. To disallow; to reject (*Ayliffe*). 2. To abandon to wickedness and eternal destruction (*Hammond*). 3. To abandon to his sentence, without hope of pardon (*Southern*).

RE'PROBATENESS. *s.* (from *reprobate.*) The state of being reprobate.

REPROBA'TION. *s.* (*reprobation*, Fr.) 1. The act of abandoning, or state of being abandoned to eternal destruction (*Maine*). 2. A condemnatory sentence (*Dryden*).

To REPRODU'CE. *v. a.* (*re* and *produce.*) To produce again; to produce anew (*Newton*).

REPRODU'CTION. *s.* (from *reproduce.*) The act of producing anew (*Boyle*).

REPRODUCTION, in physiology, the generation of new successions of animals or vegetables from the same parent stock.

The reproduction or generation of living organized bodies is the great criterion or characteristic which distinguishes life from mechanism. Fluids may circulate in hydraulic machines, as mercury for example in the thermometer or barometer, but the power of producing an embryon that shall gradually acquire similitude to its parent distinguishes organized from inorganic matter.

The reproduction of plants and animals seems to be of two kinds, solitary and sexual: and we shall briefly notice it under this division.

Solitary reproduction occurs, among plants, in the formation of the buds of trees, and the bulbs of tulips, nearly similar to the parent, but often exhibiting a higher degree of perfection, and finally producing sexual organs, or flowers and seeds as consequent upon them.

The same fact occurs among several of the inferior kinds of animals. Thus the aphis or vine-fretter is viviparous in the spring and summer for eight or nine generations, which successively produce living descendants without sexual intercourse, and perhaps without sexual organs. In the autumn, however, the same insect brings forth males and females, and these pair together and lay eggs, which lie dormant during the winter, and are hatched by the vernal sun.

There are other instances both among animals and vegetables that, not on particular occasions alone, but constantly, reproduce by a solitary exertion of their own physical powers:

as the truffle, and perhaps the mushroom among plants, and the polype and tænia among worms, all of which are equally destitute of sexual character, and consequently altogether incapable of reproducing by sexual generation. One extremity of the tænia, or tape-worm, is said by Linnæus to grow old, whilst at the other end new animals are generated proceeding to infinity like the roots of the grasses. The microscopic animalcule called volvox globator is transparent, and carries within itself children and grandchildren to the fifth generation like the aphides; so that the progeny of the tænia is produced longitudinally in a chain-like series, and that of the volvox circularly in an included series.

There are other minute animals, again, that propagate a progeny by lateral sections, or in other words by splitting or dividing, which is the case with the hydra or polype, the hirudo viridis or green-leech, and various others; while many, of a larger kind, as oysters and perhaps eels, produce, from a common gender, a progeny which requires no maternal care to supply it with rest, nutriment, or oxygenation; and which hence again accurately resemble the production of the buds of trees, the wires of some herbaceous plants, as of knot-grass and strawberries, and the bulbs of other plants, as of onions and potatoes. There are other plants, on the contrary, that palpably possess both kinds of sexual organs, as snails and dew-worms, which nevertheless are not able to generate of their own power, but require the aid of sexual union, as in the case of the more perfect animals, with this only difference, that the male and female organs being in both instances applied to one another, each animal becomes equally impregnated. Poupart conceived that the hermaphrodite animals of different descriptions exceed in number those divided into sexes.

The most perfect mode of reproduction, however, both in animal and vegetable life, is by sexual intercourse, and the medium by which life is hence imparted and increased is uniformly that of eggs or ova; the egg being in various instances hatched in the body of the mother, and in others out of the body, either by her own vital warmth applied to it, as in the case of incubation, or by the common warmth of the sun or the surrounding atmosphere. The former mode of increase is usually denominated viviparous, and the latter oviparous production; a distinction by no means correct, and leading to erroneous views, since, as we have just observed, the egg is the common organ of life in both cases, only that in the first it is perfected and broken before the expulsion of the fetus, or embryon, and in the second not till afterwards.

The former is the process pursued in almost all mammalian animals, in several kinds of amphibials, especially the poisonous serpents; in a few fishes, of which the shark tribes furnish the most striking example; and perhaps the greater number of worms. The latter is met with in the bird class, the innoxious serpents, insects, with a single exception or two, and various worms, as some of the oscaris kind, the fluke, tape-worm, and cuttle-fish.

Perhaps the only oviparous quadrupeds, using the term oviparous in its common sense are the opossum and kangaroo. Both these animals are well known to be provided with a marsupium or pouch for the reception of the embryon or fetus as soon as it is extruded, where it remains, each attached to a distinct teat, and is allowed by the mother, as it increases in bulk, to quit it for a longer period of time, and at a greater distance, till having acquired a sufficient degree of maturity to provide for itself, it deserts its parent altogether; which by this period is not unfrequently found to be once more breeding uterinely, and stands in need of the pouch for a new progeny. Of the size and nature of this progeny, however, on its first extrusion, or of the means by which the mother introduces it into the pouch, and attaches it to a distinct teat, we know but very little. Dr. Barton of Philadelphia published a short history of the process a few years ago, so far as he had been able to collect it both from the observations of himself and other naturalists: and according to this statement, the young and minute opossum on its birth seldom exceeds three, and sometimes not a single grain; and there is much reason for supposing it to be at this time a mere embryon in its egg, which alone acquires maturity by what may be denominated marsupial incubation. The breeding process of the kangaroo appears to be of the same kind, though we cannot yet speak with certainty upon the subject, notwithstanding that this elegant animal may now be considered as naturalized in England, from a residence of some years in the royal domains at Richmond; and its having in many instances produced young in that appropriate situation.

Closely connected with this subject is the doctrine of spontaneous vitality, which has so much occupied the attention of natural philosophers in past and present ages; and upon which we can even at present only speak with great caution and doubtfulness. In general we may affirm that plants and animals only exist by parental generation either solitary or sexual, but there are various, we may almost add innumerable, instances among the lower kinds of both kingdoms in which they seem to be produced without any known or traceable parentage, and from the mere union and mutual action of perhaps given molecules in given circumstances, and which Buffon has hence denominated, unquestionably incorrectly, organic.

Such a doctrine has been supposed by many excellent persons to strike at the root of all natural order, and consequently to lead indirectly to atheism, or the disbelief of a governing and infinitely wise intelligence. But this is a mere chimæra; for the mode by which such productive molecules operate, admitting them to exist and operate at all, may be, and must be, rigidly subject to a system of law, and consequently as strongly in proof, were we acquainted

with the nature of the law, of a supreme intelligent power, as the process of ordinary generation: and hence the production of monsters of every possible form and deformity must be as effectually guarded against by the admission as by the rejection of such a system. There are however various and innumerable difficulties upon the subject which way soever we turn, and the lesson they should chiefly teach us is to be modest in our own opinions, and charitable to those of others. Let us point out a few of those productions, before we conclude, to which we principally allude, and which seem to press heaviest upon the theory of universal parental generation.

Of the numerous tribes of hydatids that are found in the brain, digestive organs, and muscles of different animals, each distinct kind is only found in its own particular nidus, and the moment it is removed it dies. Who can determine the means by which the egg or embryon (admitting such to exist) can possibly be conveyed from the same organ in one individual to the same organ in another? or who is there that can conceive that any such material is conveyed at all? The fasciola hepatica or common fluke is found in the liver of sheep, and only moreover when the animal is labouring under the disease called the rot; but whether the cause or the effect of this disease is unknown. By what means can this animal be introduced into such a situation?

According to the experiments of Buffon, Reaumur, Ellis, Ingenhouz, and others, microscopic animals are produced in three or four days (according to the warmth of the season) in the infusions of all vegetable or animal matter. By some of these experimenters, boiling veal broth was put into a phial, previously heated in the fire, and sealed up hermetically or with melted wax, yet in three or four days it was observed to be full of animalcules.

Some of these seem, after such apparently spontaneous production, to have a power of generating others like themselves by solitary reproduction without sex, in the same manner as vegetable seedlings which at first are only capable of generating by solitary reproduction, as buds or bulbs, afterwards rear perfect flowers, and give birth to the different sexes. Mr. Ellis, in Phil. Trans. vol. lix. gives drawings of six kinds of infusory animalcules which increase into two animals by dividing across the middle. Thus in paste composed of flour and water, which has been suffered to become acescent, the animalcules called infusory eels, vibrio anguillula, are seen in great abundance: their motions are rapid and strong; they are viviparous, and produce at intervals a numerous progeny: similar animals are found in vinegar. These eels were probably at first as minute as other microscopic animalcules; but by frequent, perhaps hourly reproduction, they have gradually become the large animals now described, possessing great strength and activity.

To suppose the eggs of the first series of these animalcules to float in the atmosphere, and to pass through the sealed glass phial, is so contrary to all we know of nature as to be totally incredible; and as the next series are viviparous, it is equally absurd to suppose that their parents float universally in the atmosphere to lay their young in an appropriate nidus. This in truth in the case of many of the hydatids, flukes, and other worms, we know to be impossible, because we know that they cannot exist out of the peculiar viscera in which they are traced, and die as soon as the attempt is made.

There are some vegetables that appear to be produced in the same manner, and which, at least in one instance, is propagated and enlarged in so short a time by solitary generation, as to become visible to the naked eye; the instance we particularly allude to is the conferva fontinalis or green matter on the surface of stagnant water, first attended to by Dr. Priestley. The proofs that this material is a vegatable are derived from its giving forth so much oxygen when exposed to the sun-shine, and from its green colour. Dr. Ingenhouz asserts that by filling a bottle with well-water, and inverting it immediately into a basin of well-water, this green vegetable is formed in great quantity; and he believes that the water itself, or some substance contained in the water, is converted into this kind of vegetation, which then quickly propagates itself. Mucor or mouldiness, the minute beginnings of the growth of which Mr. Ellis first accurately noticed by his microscope, near the surface of all putrefying animal or vegetable matter, is a plant that appears to be produced somewhat in the same manner, and with the same rapidity, its vegetation being so quick as to be almost seen, and soon becoming so large as to be completely visible to the naked eye. It is difficult to conceive how the seeds of this mucor can float so universally in the atmosphere, as to fix itself on all putrid matter in all places. There are various other fungi that seem to originate in a similar way; as those growing in close wine-vaults, from decaying trees, or rotten timber. Such also may perhaps be the common esculent mushroom, which as Kennedy observes may be produced from horsedung at any time, and in any place.

REPROO'F. *s.* (from *reprove.*) 1. Blame to the face; reprehension (*Pope*). 2. Censure; slander: out of use (*Psalms*).

REPRO'VABLE. *a.* (from *reprove.*) Culpable; blamable; worthy of reprehension.

To REPRO'VE. *v. a.* (*reprover*, French.) 1. To blame; to censure (*Psalms*). 2. To charge to the face with a fault; to check; to chide; to reprehend (*Taylor*). 3. To refute; to disprove (*Shakspeare*). 4. To blame for (*Carew*).

REPRO'VER. *s.* (from *reprove.*) A reprehender; one that reproves (*South*).

To REPRU'NE. *v. a.* (*re* and *prune.*) To prune a second time (*Evelyn*).

RE'PTILE. *a.* (*reptile*, Lat.) Creeping upon many feet (*Gay*).

RE'PTILE. *s.* An animal that creeps upon many feet. See REPTILIA.

REPTILIA. Reptiles. In zoology, the first order of Linnéus's class amphibia, characterised ordinarily by their having feet, and flat naked ears without auricles. See AMPHIBIOLOGY and ZOOLOGY.

Of these there are five genera, viz.

Testudo,	Draco,
Lacerta,	Rana,
Siren.	

REPTON, a village in Derbyshire, eight miles S.S.W. of Derby, celebrated as the burial-place of several of the Saxon kings of Mercia, and for several antiquities. Here is a noted free-school, which appears to have been the refectory of a priory.

REPUBLIC. (*respublica*, commonwealth.) A popular state or government; or a nation where the body, or only a part of the people, have the government in their own hands. When the body of the people is possessed of the supreme power, this is called a democracy. When the supreme power is lodged in the hands of a part of the people, it is then an aristocracy.

The celebrated republics of antiquity are those of Athens, Sparta, Rome, and Carthage. At present there is scarce any such thing as a real republic; i. e. a strictly popular state. Holland, which, till within these few years, consisted of about fifty republics, was then a confederate republic. But it has lately been moulded into a kingdom, to suit the pleasure of the present emperor of France.

REPUBLIC OF LETTERS, is a phrase used in speaking collectively of the whole body of the people of study and learning.

There is a journal, begun in Holland by M. Bayle, and continued by M. Bernard, consisting of extracts of books printed in the course of the year, called Nouvelles de la Republique des Lettres, News from the Republic of Letters.

REPU'BLICAN. *a.* (from *republic.*) Placing the government in the people.

REPU'BLICAN. *s.* (from *republic.*) One who thinks a commonwealth without monarchy the best government (*Addison*). 2. One who is under a republican form of government.

REPU'DIABLE. *a.* (from *repudiate.*) Fit to be rejected.

To REPU'DIATE. *v. a.* (*repudio*, Latin.) To divorce; to reject; to put away (*Bentley*).

REPUDIA'TION. *s.* (from *repudiate.*) Divorce; rejection (*Arbuthnot*).

REPU'GNANCE. REPU'GNANCY. *s.* (*repugnance*, French.) 1. Inconsistency; contrariety (*Bentley*). 2. Reluctance; resistance (*Shakspeare*). 3. Struggle of opposite passions (*South*). 4. Aversion; unwillingness (*Dryden*).

REPU'GNANT. *a.* (*repugnant*, Fr.) 1. Disobedient; not obsequious (*Shakspeare*). 2. Contrary; opposite (*Woodward*).

REPU'GNANTLY. *ad.* Contradictorily (*Brown*).

To REPU'LLULATE. *v. n.* (*repulluler*, French.) To bud again (*Howel*).

REPU'LSE. *s.* (*repulse*, Fr. *repulsa*, Lat.) The condition of being driven off or put aside from any attempt (*King Charles*).

To REPU'LSE. *v. a.* (*repulsus*, Latin.) To beat back; to drive off (*Knolles*).

REPU'LSION. *s.* (*repulsus*, Latin.) The act or power of driving off from itself (*Arbuthnot*).

REPULSION, in physics, that property in bodies, whereby, if they are placed just beyond the sphere of each other's attraction of cohesion, they mutually fly from each other. Thus, if an oily substance, lighter than water, be placed on the surface thereof, or if a piece of iron be laid upon mercury, the surface of the fluid will be depressed about the body laid on it: this depression is manifestly occasioned by a repelling power in the bodies, which hinders the approach of the fluid towards them. But it is possible, in some cases, to press or force the repelling bodies into the sphere of one another's attraction; and then they will mutually tend towards each other, as when we mix oil and water till they incorporate. Dr. Knight defines repulsion to be that cause which makes bodies mutually endeavour to recede from each other, with different forces, at different times; and that such a cause exists in nature, he thinks evident for the following reasons. 1. Because all bodies are electrical, or capable of being made so; and it is well known, that electrical bodies both attract and repel. 2. Both attraction and repulsion are very conspicuous in all magnetical bodies. 3. Sir Isaac Newton has shown from experiments, that the surfaces of two convex glasses repel each other. 4. The same great philosopher has explained the elasticity of the air, by supposing its particles mutually to repel each other. 5. The particles of light are, in part at least, repelled from the surfaces of all bodies. 6. Lastly, it seems highly probable that the particles of light mutually repel each other, as well as the particles of air. The same gentleman ascribes the cause of repulsion, as well as that of attraction, to the immediate effect of God's will; and as attraction and repulsion are contraries, and consequently cannot, at the same time, belong to the same substance, the doctor supposes there are in nature two kinds of matter, one attracting, the other repelling; and that those particles of matter which repel each other, are subject to the general law of attraction in respect of other matter. A repellent matter being thus supposed, equally dispersed through the whole universe, the doctor attempts to account for many natural phænomena by means thereof. He thinks light is nothing but this repellent matter put into violent vibrations, by the repellent corpuscles which compose the atmosphere of the sun and stars: and that, therefore, we have no reason to believe they are gulphs of fire, but, like the rest of the heavenly bodies, inhabitable worlds. From the same principles, he attempts to explain the nature of fire and heat, the various phænomena of the magnet, and the cause of the variation of the needle: and, indeed, it is

difficult, if not impossible, by the doctrine of attraction alone, to account for all the phænomena observable in experiments made with magnets, which may now be solved by admitting this doctrine of a repellent fluid; but whether it will be sufficient to account for all the particular phænomena of nature which are the proper tests of an hypothesis, time and experience alone must determine. The doctor also endeavours to show, that the attractions of cohesion, gravity, and magnetism, are the same, and that by these two active principles, viz. attraction and repulsion, all the phænomena of nature may be explained; but as his ingenious treatise on this subject is laid down in a series of propositions, all connected together, it would be impossible to do justice to his arguments without transcribing the whole: we shall therefore refer the curious to the book itself.

According to 's Gravesande and others, when light is reflected from a polished spherical surface, the particles of light do not strike upon the solid parts, and so rebound from them; but are repelled from the surface, at a small distance before they touch it, by a power extended all over the said polished surface. And sir Isaac Newton observes, that the rays of light are also expelled by the edges of bodies, as they pass near them; so as to make their shadows, in some cases, larger than they would otherwise be.

REPULSION, in chemistry. Sir Isaac Newton demonstrated, that if this law be correct, then the force, by which the particles of air recede from each other, increases or diminishes at the same rate that the distance between the centres of the particles, or atoms, of which it is composed, diminishes or increases; or, which is the same thing, that the repulsion between the particles of gaseous bodies is always inversely as the distance of their centres from each other. Now the distance between the centres of the atoms of elastic fluids always varies as the cube root of their density, taking the word in its common acceptation. Thus, if the density of air, under the mean pressure of the atmosphere, be supposed 1; if it be forced into $\frac{1}{8}$th of its bulk, its density becomes 8. In these two cases we have the distance between the atoms of air inversely as the cube root of 1, to the cube root of 8, or as 1 to 2. So that if air be compressed into $\frac{1}{8}$th of its bulk, the distance between its particles is reduced to one half, and of course the repulsion between them is doubled. If air be rarified 300 times, we have its density reduced to $\frac{1}{300}$th of that of common air. Here we have the distance between the atoms of common and the rarified air, as $\sqrt[3]{1} : \sqrt[3]{300}$, or nearly as 1 : 7. So that when air is rarified 300 times, the distance between its particles becomes almost seven times greater, and of course their repulsion is diminished almost sevenfold.

REPU'LSIVE. *a.* (from *repulse.*) Driving off; having the power to beat back (*Newton*).

To REPU'RCHASE. *v. a.* (*re* and *purchase.*) To buy again (*Shakspeare*).

REPUTABLE. *a.* (from *repute.*) Honourable; not infamous (*Rogers*).

REPUTABLY. *ad.* (from *reputable.*) Without discredit (*Atterbury*).

REPUTA'TION. *s.* (*reputation*, French.) 1. Character of good or bad (*Addison*). 2. Credit; honour (*Pope*).

To REPU'TE. *v. a.* (*reputo*, Lat.) To hold; to account; to think (*Donne*).

REPU'TE. *s.* (from the verb.) 1. Character; reputation. 2. Established opinion (*Milton*).

REPU'TELESS. *a.* (from *repute.*) Disreputable; disgraceful (*Shakspeare*).

REQUENA, a town of Spain, in New Castile, with a castle, and a considerable manufacture of silks. It was taken by the English in 1706, and retaken by the French the next year. It is seated on a hill, between the river Oliana and a ridge of mountains on the borders of Valencia, 64 miles E.S.E. of Cuenza. Lon. 1. 9 W. Lat. 39. 44 N.

REQUE'ST. *s.* (*requeste*, French.) 1. Petition; entreaty (*Shakspeare*). 2. Demand; repute; credit (*Boyle*).

To REQUE'ST. *v. a.* (*requester*, Fr.) To ask; to solicit; to entreat (*Knolles*).

REQUE'STER. *s.* (from *request.*) Petitioner; solicitor.

REQUESTS (Court of), *curia requisitionum* was a court of equity, of the same nature with the court of chancery, but inferior to it; principally instituted for the relief of such petitioners as in conscionable cases addressed themselves by supplication to his majesty. Of this court the lord privy-seal was chief judge, assisted by the masters of requests; and it had beginning about the 9 Hen. VII. according to sir Julius Cæsar's tractate upon this subject: though Mr. Gwyn, in his preface to his Readings, saith it began from a commission first granted by king Henry VIII.—This court having assumed great power to itself, so that it became burthensome, Mich. anno 40 and 41 Eliz. in the court of common pleas it was adjudged upon solemn argument, that the court of requests was no court of judicature, &c. and by stat. 16 and 17 Car. I. c. 10. it was taken away.

To REQUI'CKEN. *v. a.* (*re* and *quicken.*) To reanimate (*Shakspeare*).

RE'QUIEM. *s.* (Latin.) 1. A hymn in which they implore for the dead *requiem* or rest (*Shakspeare*). 2. Rest; quiet; peace: not in use (*Sandys*).

REQUI'RABLE. *a.* (from *require.*) Fit to be required (*Hale*).

To REQUI'RE. *v. a.* (*requiro*, Latin.) 1. To demand; to ask a thing as of right (*Shakspeare*). 2. To make necessary; to need (*Dryden*).

RE'QUISITE. *a.* (*requisitus*, Lat.) Necessary; needful; required by the nature of things (*Dryden*).

RE'QUISITE. *s.* Any thing necessary (*Dryden*).

RE'QUISITELY. *ad.* (from *requisite.*) Necessarily; in a requisite manner (*Boyle*).

RE'QUISITENESS. *s.* (from *requisite.*) Necessity; the state of being requisite (*Boyle*).

REQUI'TAL. *s.* (from *requite.*) 1. Return for any good or bad office; retaliation (*Hooker*). 2. Return; reciprocal action (*Waller*). 3. Reward; recompense (*South*).

To REQUI'TE. *v. a.* (*requiter*, French.) 1. To repay; to retaliate; to recompense. 2. To do or give in reciprocation (*Samuel*).

To RESAI'L. *v. a.* (*re* and *sail.*) To sail back (*Pope*).

RESA'LE. *s.* (*re* and *sale.*) Sale at second hand (*Bacon*).

To RESALU'TE. *v. a.* (*resaluto*, Latin; *resaleur*, Fr.) To salute or greet anew (*Chapman*).

To RESCI'ND. *v. a.* (*rescindo*, Lat. *rescinder*, Fr.) To cut off; to abrogate a law (*Dryden*).

RESCI'SSION. *s.* (*rescission*, Fr. *rescissos*, Lat.) The act of cutting off; abrogation (*Bacon*).

RESCI'SSORY. *a.* (*rescissioire*, French; *rescissus*, Latin.) Having the power to cut off.

To RESCRI'BE. *v. a.* (*rescribo*, Latin.) 1. To write back (*Ayliffe*). 2. To write over again (*Howel*).

RE'SCRIPT. *s.* (*rescriptum*, Latin.) Edict of an emperour (*Bacon*).

To RE'SCUE. *a. a.* (*rescorre*, old Fr.) To set free from any violence, confinement, or danger (*Shakspeare*).

RE'SCUE. *s.* (*rescousse*, old Fr.) Deliverance from violence, danger, or confinement (*Shakspeare*).

RESCUE, or RESCOUS, is the taking away and setting at liberty, against law, any distress taken for rent, or services, or damage feasant; but the more general notion of rescous is, the forcibly liberating another from an arrest or some legal commitment. This is a high offence, and subjects the offender not only to an action at the suit of the party injured, but likewise to fine and imprisonment at the suit of the king. If goods are distrained without cause, or contrary to law, the owner may make rescue; but if they are once impounded, even though taken without any cause, the owner may not break the pound and take them out, for then they are in custody of the law.

RE'SCUER. *s.* (from *rescue.*) One that rescues.

RESEA'RCH. *s.* (*recherche*, Fr.) Inquiry; search (*Rogers*).

To RESEA'RCH. *v. a.* (*rechercher*, French.) To examine; to inquire (*Wotton*).

To RESEA'T. *v. a.* (*re* and *seat.*) To seat again (*Dryden*).

RESEDA. Dyers' weed; weld; wild-wood; yellow weed. In botany, a genus of the class dodecandria, order trigynia. Calyx one-leafed, divided; petals jagged; capsule superior, open at top, one-celled, many-seeded. Thirteen species—scattered over the globe; two indigenous to our own country.

The following are chiefly entitled to notice:

1. R. luteola. Common weld, or dyers' weed. Stalk a yard high, terminating in a long naked spike of yellowish-green flowers; leaves lanceolate, entire, flat; calyx in four segments. Found wild amidst rubbish, and in the wastes of our own country; but much cultivated on account of its great utility in dyeing silk and wool of a yellow colour, for which see the article DYEING.

It grows without trouble, on the poorest soils; and is commonly sown along with, or immediately after barley or oats, without farther trouble than drawing a harrow or bush over the seeds. The reaping the corn does it no injury, as it grows but little the first year; but is pulled the next summer and dried like flax. The seed or stalk, however, are often damaged by pulling the plant too green, or letting it remain too long.

2. R. odorata. Mignonette; sweet reseda. Root composed of many strong fibres, running deeply into the ground; stems small, about a foot long, dividing into many small branches; leaves entire, three-lobed; calyx as long as the petals; styles often four; flowers produced in loose spikes terminal on the branches; corols of an herbaceous white colour and fine odour. A native of Barbary; flowers from June to winter; and is biennial. It is raised from seeds, which should be sown on a moderate hot-bed in March; and when the plants are strong enough they should be pricked out into another moderate hot-bed. They may be preserved through the winter in a green-house.

RESE'IZER. *s.* One that seizes again.

RESEI'ZURE. *s.* (*re* and *seizure.*) Repeated seizure; seizure a second time (*Bacon*).

RESE'MBLANCE. *s.* (*resemblance*, Fr.) Likeness; similitude; representation (*Hooker*).

To RESE'MBLE. *v. a.* (*resembler*, French.) 1. To compare; to represent as like something else (*Raleigh*). 2. To be like; to have likeness to (*Addison*).

To RESE'ND. *v. a.* (*re* and *send.*) To send back; to send again: not used (*Shakspeare*).

To RESE'NT. *v. a.* (*resentir*, French.) 1. To take well or ill (*Bacon*). 2. To take ill; to consider as an injury or affront. The most usual sense (*Milton*).

RESE'NTER. *s.* (from *resent.*) One who feels injuries deeply (*Wotton*).

RESE'NTFUL. *a.* (*resent* and *full.*) Malignant; easily provoked to anger, and long retaining it.

RESE'NTINGLY. *ad.* (from *resenting.*) 1. With deep sense; with strong perception (*More*). 2. With continued anger.

RESE'NTMENT. *s.* (*resentiment*, French.) 1. Strong perception of good or ill (*Glanville*). 2. Deep sense of injury (*Swift*).

RESERVA'TION. *s.* (*reservation*, French.) 1. Reserve; concealment of something in the mind (*Sanderson*). 2. Something kept back; something not given up (*Swift*). 3. Custody; state of being treasured up (*Shakspeare*).

RESERVATION (Mental), a proposition which, strictly taken, and according to the natural import of the terms, is false; but, if qua-

lified by something concealed in the mind, becomes true. Mental reservations are the great refuge of religious hypocrites, who use them to accommodate their consciences with their interests: the Jesuits are zealous advocates for mental reservations; yet are they real lies, as including an intention to deceive.

RESE'RVATORY. *s.* (*reservoir*, French.) Place in which any thing is reserved or kept (*Woodward*).

To RESE'RVE. *v. a.* (*reserver*, French.) 1. To keep in store; to save to some other purpose (*Spenser*). 2. To retain; to keep; to hold (*Shakspeare*). 3. To lay up to a future time (*Decay of Piety*).

RESE'RVE. *s.* (from the verb.) 1. Store kept untouched (*Locke*). 2. Something kept for exigence (*Tillotson*). 3. Something concealed in the mind (*Addison*). 4. Exception; prohibition (*Milton*). 5. Exception in favour (*Rogers*). 6. Modesty; caution in personal behaviour (*Prior*).

RESERVE (Body of), or CORPS DE RESERVE, in military affairs, the third or last line of an army, drawn up for battle; so called because they are reserved to sustain the rest as occasion requires, and not to engage but in case of necessity.

RESE'RVED. *a.* (from *reserve.*) 1. Modest; not loosely free (*Walsh*). 2. Sullen; not open; not frank (*Dryden*).

RESE'RVEDLY. *ad.* (from *reserved.*) 1. Not with frankness; not with openness; with reserve (*Woodward*). 2. Scrupulously; coldly.

RESE'RVEDNESS. *s.* Closeness; want of frankness; want of openness (*South*).

RESE'RVER. *s.* (from *reserve.*) One that reserves.

RESERVOI'R. *s.* (*reservoir*, Fr.) Place where any thing is kept in store (*Pope*).

To RESE'TTLE. *v. a.* (*re* and *settle.*) To settle again (*Swift*).

RESE'TTLEMENT. *s.* (from *resettle.*) 1. The act of settling again (*Norris*). 2. The state of settling again (*Mortimer*).

RESHT, a city of Persia, capital of Ghilan. It has a considerable trade, particularly in silk; and much rice grows in the environs. It is seated on a river, six miles from the Caspian sea, and 100 N. of Casbin. Lon. 51. 80 E. Lat. 37. 58 N.

RESI'ANCE. *s.* (from *resiant.*) Residence; abode; dwelling (*Bacon*).

RESI'ANT. *a.* (*resseant*, Fr.) Resident; present in a place (*Knolles*).

To RESI'DE. *v. n.* (*resideo*, Latin; *resider*, French.) 1. To have abode; to live; to dwell; to be present (*Milton*). 2. (*resido*, Latin.) To sink; to subside; to fall to the bottom (*Boyle*).

RE'SIDENCE. *s.* (*residence*, French.) 1. Act of dwelling in a place (*Hale*). 2. Place of abode; dwelling (*Milton*). 3. (from *resido*, Latin.) That which settles at the bottom of liquors (*Brown*).

RE'SIDENT. *a.* (*residens*, Lat.) Dwelling or having abode in any place (*Burnet*).

RE'SIDENT. *s.* (from the adj.) An agent, minister, or officer residing in any distant place with the dignity of an ambassador (*Addison*).

RESIDE'NTIARY. *a.* (from *resident.*) Holding residence (*More*).

RESI'DUAL. RESI'DUARY. *a.* (from *residuum*, Latin.) Relating to the residue; relating to the part remaining (*Ayliffe*).

RESIDUAL FIGURE, in geometry, the figure remaining after subtracting a lesser from a greater.

RESIDUAL ROOT, in algebra, a root composed of two parts or members, connected together by the sign —. Thus $x-y$ is a residual root, so called, because its value is no more than the difference between its parts x and y.

RESIDUARY LEGATEE, is he to whom the residue of a personal estate is given by will; and such legatee being made executor with others, shall retain against the rest. If there is no residuary clause in a will, all the property which is not particularly devised goes to the executor, if it is personal; but, if real, to the heir.

RE'SIDUE. *s.* (*residuum*, Latin.) The remaining part; that which is left (*Arbuthnot*).

To RESIE'GE. *v. a.* (*re* and *siege*, French.) To seat again: obsolete (*Spenser*).

To RESI'GN. *v. a.* (*resigno*, Latin.) 1. To give up a claim or possession (*Denham*). 2. To yield up (*Locke*). 3. To give up in confidence (*Tillotson*). 4. To submit; particularly to submit to providence (*Dryden*). 5. To submit without resistance or murmur (*Shakspeare*).

RESIGNA'TION. *s.* (*resignation*, French.) 1. The act of resigning or giving up a claim or possession (*Hayward*). 2. Submission; unresisting acquiescence (*Addison*). 3. Submission without murmur to the will of God.

RESI'GNER. *s.* (from *resign.*) One that resigns.

RESI'GNMENT. *s.* (from *resign.*) Act of resigning.

RESI'LIENCE. RESI'LIENCY. *s.* (from *resilio*, Latin.) The act of starting or leaping back (*Bacon*).

RESI'LIENT. *a.* (*resiliens*, Latin.) Starting or springing back.

RESILI'TION. *s.* (*resilio*, Lat.) The act of springing back; resilience.

RESIN (Black). See RESINA NIGRA.

RESIN (Elastic). See INDIAN RUBBER.

RESIN-TREE (Elastic). See INDIAN RUBBER, and CAOUTCHOUC.

RESIN (White). See RESINA FLAVA.

RESIN (Yellow). See RESINA FLAVA.

RESINA FLAVA. Resina alba. Yellow resin is what remains in the still after distilling oil of turpentine, by adding water to the common turpentine. It is of very extensive use in surgery as an active detergent, and forms the base of the unguentum resinæ flavæ.

RESINA LUTEA NOVI BELGII. Botany-bay gum. All the information that has been

hitherto collected respecting the history of the yellow gum is the following:

The plant that produces it is low and small, with long grassy leaves; but the fructification of it shoots out in a singular manner from the centre of the leaves, on a single straight stem, to the height of twelve or fourteen feet. Of this stem, which is strong and light, like some of the reed class, the natives usually make their spears. The resin is generally dug up out of the soil under the tree, not collected from it, and may perhaps be that which Tasman calls gum lac of the ground.

Mr. Boles, surgeon of the Lady Penrhyn, gives a somewhat different account; and as this gentleman appears to have paid considerable attention to the subject, his account may certainly be relied upon. After describing the tree in precisely the same manner as above, he observes, that at the top of the trunk of the tree, long grassy leaves grow in great abundance. The gum is found under these leaves in considerable quantities; it commonly exudes in round tears, or drops, from the size of a large pea to that of a marble, and sometimes much larger. These are by the heat of the sun frequently so much softened, that they fall on the ground, and in this soft state adhere to whatever they fall upon; hence the gum is frequently found mixed with dirt, wood, the bark of the tree, and various other substances: so that one lump has been seen composed of many small pure pieces of various sizes united together, which weighed nearly half a hundred weight. It is produced in such abundance, that one man may collect thirty or forty pounds in the space of a few hours. The convicts have another method of collecting it; they dig round the tree, and break off pieces of the roots which always have some, and frequently considerable quantities of the gum in them. This gum appears nearly, but not entirely, the same as that which exudes from the trunk of the tree; the former is often mixed with a strong smelling resinous substance of a black nature, and is so interwoven in the wood itself, that it is with difficulty separated. The latter appears a pure unmixed resinous substance.

Several experiments have been made principally with the view of determining what menstruum would dissolve the gum the most readily, and in the greatest quantity. The following table offers the general results, the quantity of each menstruum being an ounce,

	℥	ʒ	℈	gr.
Alcohol	2			
Rectified sp.	2			
Ether	1	3		
Sp. eth. vitr.	1	3		
Sp. eth. nitr.	1	3

Acid. vitr. dil.				2
Acid. nitr. dil.				2
Acet. dist.				2
Aq. calcis				2
Ol. oliv.				2

The diseases in which this resin is administered, are those of the primæ viæ, and principally such as arise from spasm, a debility, a loss of tone, or a diminished action in the muscular fibres of the stomach and bowels, such as loss of appetite, sickness, vomiting, flatulency, heart-burn, pains in the stomach, &c. when they were really idiopathic complaints, and not dependent upon any disease in the stomach, or affections of other parts of the body communicated to the stomach. In debilities and relaxations of the bowels, and the symptoms from thence arising, such as purging and flatulency, it has been found of good effect. In certain cases of diarrhæa, however (and it seemed those in which an unusual degree of irritability prevailed), it did not answer so well, unless given in small doses, and combined with opiates, when the patient seemed to gain greater advantage than when opiates only were had recourse to. In case of amenorrhæa, depending on (what most of those cases do depend upon), a sluggishness, a debility, and flaccidity of the system, this medicine, when assisted by proper exercise and diet, has, by removing the symptoms of dyspepsia, and by restoring the tone and action of the muscular fibres, been found very serviceable. This medicine does not, in the dose of about half a drachm, appear to possess any remarkably sensible operation. It neither vomits, purges, nor binds the belly, nor does it materially increase the secretion of

urine or perspiration. It has indeed sometimes been said to purge, and at others to occasion sweating, but they are not constant effects, and when they are not constant effects, and when they do occur, it generally depends on some accidental circumstance. It should seem to possess in a very extensive degree the property of allaying morbid irritability, and of restoring tone, strength, and action, to the debilitated and relaxed fibre. When the gum itself is given, it should always be the pure unmixed part; if given in the form of a draught, it should be mixed in water with mucilage of gum arabic; if made into pills, a small portion of castile soap may be employed; it was found the lixiv. sapon. dissolved it entirely. It is commonly, however, made into a tincture by mixing equal parts of the gum and rectified spirit; one drachm of this tincture (containing half a drachm of the pure gum), made into a draught with water and syrup, by the assistance of 15 grains of gum arabic in mucilage, forms an elegant medicine, and at the same time very palatable.

Resina nigra. Colophonia. What remains in the retort after distilling the balsam of turpentine from the common turpentine.

Resin. (*Harze*, Germ.) A generic name for a great variety of substances of very different qualities and texture that exsude spontaneously or are extracted by incisions made in the bark of the resinous trees, and most of which acquire more or less hardness by exposure to the atmosphere. A further portion of the same material may also be extracted artificially, and by the aid of chemistry, from the tree that produces it. Resin is also very generally met with in certain parts of vegetables, though its quantity is so small, or its combination with other constituent parts so strong, as not to appear in its proper form till extracted by chemical analysis. Thus the bark of the cinchona (Peruvian bark-tree) contains no inconsiderable quantity of resin, though none appears to the eye on mere inspection, or probably could be extracted by incision through the living tree.

The chemical properties which are usually understood to characterize a resin are the following: it is first softened and then melted by heat; and when kindled it burns readily with a strong and generally a fragrant smell, with copious flame and smoke, and leaves scarcely any residue behind. It is insoluble in water, and most watery liquids; and is not easily acted on by acids or alkalis, except they are concentrated, and the action assisted by heat or long digestion. But it readily and totally dissolves in alkohol, forming a clear but coloured solution from which by far the greater part of the resin is precipitated in a pulverulent form unaltered, by the addition of water, which immediately renders the solution opake and turbid. It is also soluble in sulphuric ether, and in the fixed and volatile oils, particularly the latter.

But though all resins agree in the qualities of inflammability, insolubility in water, and solubility in alkohol, there are several other circumstances which have usually been employed to distinguish the classes of resins.

Balsams, according to the ancient sense of the word, was certainly applied simply to those resins that always remained in a fluid, or semi-fluid state, such as the balsam of Capivi, of Mecca, of Canada: and these appear to be resins holding a superabundance of essential oil; so that when distilled *per se*, a vast quantity of oil arises, and a hard brittle resin is left behind if the heat employed is only moderate. Thus turpentine, which is a natural balsam, yields by distillation abundance of the oil of turpentine, while common rosin, which is a true resin, is left behind.

The term balsam, however, has of late years been injudiciously applied in the modern chemical nomenclature, to those two or three species of resins that contain a notable quantity of benzoic acid, as styrax and what is called balsam of Tolu.

Gum resins are natural mixtures of a true resin with another substance apparently of the nature of gum, and soluble in water. Hence if they are triturated with water they remain suspended in it in pretty intimate mixture for a considerable time, forming an opake emulsive liquor. By standing, however, the resin subsides, and the liquor becomes clear, but it retains the flavour and smell of the gum resin, and leaves, on evaporation, a small quantity of brown extractive matter. Gum-ammoniac is an example of this kind. This distinction, however, is not very precise, and is more useful in pharmacy than in pure chemistry.

There are some substances, evidently resinous in their nature and origin, which have other peculiar properties that cause them to be excluded from the list of resins; as camphor, caoutchouc, copal, and perhaps amber. And hence though no classification will correctly correspond with their chemical properties, the limits between the resins and gum-resins not being very precise, we may usefully arrange the greater part of these substances under the head of *liquid resins* or *balsams*, *solid resins*, and *gum resins*. The two first classes are entirely or almost entirely insoluble in water, unless they contain benzoic acid, but are totally soluble in alkohol. Distillation with water extracts from the liquid resins a quantity of essential oil, and leaves a residue much resembling the solid resins. The gum-resins are partly soluble in water and partly in alkohol.

Liquid resins.—1. Turpentines. Under this name we may include all the liquid resins exfuding from the different species of pine, which from their importance in the arts and the immense consumption of them will be separately described under the article Turpentine.

They all yield abundance of the limpid essential oil of turpentine when distilled, and by different modes of preparation furnish several varieties of rosin, pitch, tar, &c.

There are at least four species of turpentines commonly known in the shops, the Chio, Venice, and common turpentine, and the Canada balsam.

2. Balsam of Capivi or Copaiba is a clear yellowish resinous juice, about the consistence of thin treacle, which flows in considerable quantity from incisions made in the bark of a large tree of South America, the copaifera officinalis. This balsam has a very agreeable smell, and a pungent bitterish taste. It grows stiffer by long keeping, but never concretes into a solid. It dissolves totally in alcohol.

When distilled with water it yields nearly half of its essential oil, and a little inodorous resin is left. It appears therefore to be a natural combination, simply of resin and essential oil.

3. Balsam of Mecca. Opobalsam, or balsam of Gilead. This is a liquid resin which exsudes from the amyris opobalsamum, a small ever-green tree

that grows in many parts of the Levant, and also in great perfection on the shores of the Red Sea. It bears an extremely high price among the Turks, who employ it chiefly as a cosmetic, and it is scarcely ever found genuine in any part of Europe.

It is moderately fluid, of a yellowish white colour, very fragrant, and of a slightly bitter taste. Its chemical properties closely resemble those of the last-mentioned species, and it is only mentioned in this place on account of the extravagant value which the Turks set upon it, which is far beyond that of all the other aromatics.

4. Balsam of Peru. This is a dark-brown balsam of the consistence of thin honey, obtained from the myroxylon peruiferum (as it is said) by boiling the twigs and bark in water, and when cold, the balsam swims at the top of the liquor and is skimmed off. There appears to be two species of this balsam, the white and the brown, but the latter is the only one commonly known. This juice has a very fragrant smell and pungent taste. It is entirely immissible with water and with the fixed oils, but dissolves in the essential oils, and in alcohol. When this balsam has long remained at rest in any vessel, it deposits crystals, from which the benzoic acid may be obtained by sublimation. By distillation with water this balsam yields $\frac{1}{16}$ of its weight of an essential oil, of a reddish colour, and a pungent taste. This oil probably also contains benzoic acid. When completely charred by sulphuric acid, Mr. Hatchett found 100 grs. to yield 64 grs. of mere charcoal. A compound tincture of this balsam forms the common friers balsam, used as an application in cuts and slight wounds.

5. Balsam of Tolu. This juice flows from incisions made in the trunk of the Toluifera balsamum, a large tree resembling the pine which abounds in the province of Tolu, in South America: it is of a yellowish brown colour, and when fresh of a thick tenacious consistence, but by age it hardens so as to be moderately brittle in cold weather. This balsam has a most fragrant smell, more so than most of the resins, somewhat resembling lemons. When chewed it clings to the teeth, at first gives very little taste, but after a time it leaves an agreeable pungency in the mouth. When kindled it burns with copious flame and smoke (like all the other resins), but this is accompanied with a very pungent fragrant vapour which excites coughing, and is owing to the volatilization of the benzoic acid, that this balsam contains in some abundance, though in much less proportion than the gum-benzoin. When this balsam is boiled with water it melts, and settles at the bottom of the vessel, and appears to remain there unaltered; but the water, without losing its transparency, becomes highly fragrant and pungent, and contains a notable quantity of benzoic acid. This acid may be procured from it by the same methods by which it is extracted from the gum benzoin.

Balsam of Tolu is totally soluble in alcohol, and it is entirely separated from this menstruum (the benzoic acid excepted) by water. If the solution is not concentrated, this precipitated balsam remains for a time suspended in the liquor, and gives it a milky appearance.

By distillation this balsam yields an essential oil and benzoic acid. A hundred grains of the balsam charred by sulphuric acid gave 54 grains of charcoal.

6. Liquidambar, or liquid storax. This is a resinous juice which flows from the trunk of the liquidambar styraciflua, a tree resembling the maple, found in Virginia and Mexico. This balsam is of the consistence of honey, reddish brown, nearly transparent, of an acrid unctuous taste, and a fragrant smell. It is seldom seen, and has not been much examined.

Solid resins.—7. Gum anime. This resin, which is very rarely met with, exsudes from the trunk of the hymenæa courbaril, a large tree growing in Brazil and New Spain. It is brought over either in small roundish tears, or in large masses with the surface covered with a white powder. The colour is yellowish white and pellucid, it is very brittle, and gives a shining fracture. It resembles copal in appearance, but is readily distinguishable from it (among other things) by being easily and totally soluble in alcohol, which copal is not, without much difficulty and particular management. This resin has very little taste. It is soluble in water, but forms a grateful yellow tincture with alcohol, which has a bitterish pungent taste. Distilled with water it gives a very small quantity of essential oil. The natives of the countries whence it is procured chew it, but it is never used in Europe.

8. Benzoin. This resin, which contains more of the benzoic acid than any other substance, has already been described under this article.

9. Dragon's blood. The origin of this valuable resin is not precisely known: it appears to be obtained from several large trees growing in many parts of the East Indies and the Indian Archipelago, of which the most known are the calamus rotang and pterocarpus draco. This resin is very largely mixed and adulterated, so that the samples to be found in the different shops often have scarcely any other resemblance than in colour. The best dragon's blood is found in irregular roundish pieces about the size of a walnut, often wrapped in palm leaves, and of a deep uniform dull red colour, without smell or taste. When broken, its texture appears homogeneous, but evidently cellular. If a little of it is rubbed much in a mortar the colour brightens, and somewhat approaches that of vermilion. Pure dragon's blood is entirely insoluble in water, but totally soluble in alcohol, forming a tincture of a fine blood-red colour. It burns with a bright flame, and readily consumes, leaving only a small portion of a white ash. When charred with sulphuric acid 100 grains leave 48 grains of coal. Dragon's blood is soluble in the essential oils, and also in the fixed, giving them a fine red colour. This resin is largely used in VARNISHING (which see), in lacquering and painting where a full-bodied red is wanted.

10. Gum elemi. This resin comes over from South America in semi-pellucid yellow masses generally wrapped up in leaves, and visibly contaminated with bits of twigs and bark, friable in the fingers, softening by heat, of a fragrant smell and bitterish taste. The tree that yields it is supposed to be the amyris elemifera. Water dissolves only about $\frac{1}{16}$ of this resin, the remainder is soluble in alcohol.

11. Gum hederæ is a resin which exsudes in hot countries from the stalks and leaves of ivy, (hedera helix). It appears in hard compact masses, reddish brown externally, internally of a bright yellow nearly opake, brittle, and with a vitreous fracture. The smell is agreeable when rubbed, the taste slightly astringent. It is not entirely soluble either in water or alcohol, so that in strictness it hardly ought to be called a true

resin. It is little known, and has not been carefully examined.

12. Labdanum, or ladanum. This resin exsudes spontaneously from the leaves and branches of a fragrant shrub (citus creticus), which grows abundantly in the dry mountainous regions of the isle of Candia, Syria, and other parts of the Levant. Ladanum is a black, hard, heavy, resinous mass, rough externally, and in fragments, and its fracture shows distinct sparkling particles. When chewed it gives a gritty feel to the mouth, and a bitterish taste, but does not dissolve. The smell is fragrant. When distilled with water it imparts its grateful smell, but does not sensibly dissolve therein. By distillation it gives a fragrant essential oil, and a tasteless brittle resin remains. Alcohol dissolves all the resin, and always shows in the undissolved residue a considerable quantity of sand and other impurities.

13. Mastich. This very valuable resin is procured from the pistacia lentiscus, a tree that grows to ten or twelve feet high, and is cultivated in many parts of the Levant, particularly in the island of Chio. The best mastich is in the form of small roundish tears, hard and brittle, of a faint yellow colour, nearly transparent, with a light but pleasant smell, and little or no taste. When chewed it softens in the mouth, and excites a considerable flow of saliva. It is nearly insoluble in water, but gives a pleasant flavour when boiled with it. Alcohol and the essential oils dissolve mastich entirely, forming a clear light-yellow tenacious solution, which, either alone or with other resins, is much employed in varnish and other arts. When charred with sulphuric acid, 100 grains afford 66 of charcoal.

14. Sandarac.—This resin exsudes from the bark of several kinds of juniper, and concretes in nearly pellucid yellowish tears, of a pleasant smell and scarcely any taste. It is completely soluble in alcohol, and in oils fixed or essential, and is much used in varnishing.

15. Tacamahacca.—This resin is obtained from the fagara octandra, a tree found in many parts of South America. There are two sorts of this resin; the best is collected in gourd shells, and is unctuous and soft, of a greenish-yellow colour, a delightful smell, approaching to that of lavender, and a bitterish aromatic taste. It is seldom used.

16. Styrax, or storax, is a very fragrant resin procured from the styrax officinalis, a middling-sized tree, a native of Asia. There are two sorts of this resin; the styrax calamita, composed of reddish-brown masses of a waxy consistence, and free from visible impurities. The other, which is by much the commonest sort, is so largely adulterated with saw-dust, that it looks rather like a mass of saw-dust somewhat agglutinated by means of a soft clammy resin. Common styrax infused in water gives it a golden colour, a fragrant smell, and a slight balsamic taste, and contains benzoic acid, which may be extracted in the way mentioned under this article. When styrax is distilled *per se*, it yields along with an empyreumatic oil some crystallized flowers of benzoin. Alcohol dissolves all the true styrax from the impure mass. In flavour, and, when pure, in other properties, this resin strongly resembles the balsam of Tolu.

Gum resins.—These substances, as already mentioned under this article, are not entirely soluble in either water or pure alcohol singly, but completely in a mixture of the two. Many of them have very strong sensible properties, and they are altogether much more active when used medicinally than the resins. When rubbed with water, they form a thick emulsion, from which most of the resinous part separates by repose. The gum resins are principally, though not entirely, used in medicine.

17. Asafœtida. This gum resin is the dried juice of a large umbelliferous plant (ferula asafœtida) which grows in the mountains of Persia and Arabia. It is collected by cutting the mature plant a little above the ground, which causes a quantity of white juice to exsude on the cut surface of the stalk that soon concretes into a brownish soft gum. This removed, a fresh surface is made on the stalks by cutting it down an inch or two, and more of the juice is collected, till after a time the whole is exhausted, and the stalk dies. Asafœtida is brought to us in irregular masses mostly of a brownish colour approaching to red, and involving smaller lumps that are nearly white. It has a very strong fetid smell like garlic, extremely permanent and diffusive; its taste is nauseous and bitterish. If rubbed with water it entirely resolves into a milky emulsion, from which, after standing for some time, most of the resinous part subsides, leaving a clear supernatant liquor containing much gum in solution. Pure alcohol dissolves only the resinous part, and makes a clear yellow solution. Diluted alcohol dissolves the entire resin, and forms a brownish rather turbid tincture. Water distilled off assafœtida rises strongly impregnated with its peculiar smell. A hundred grains, charred by sulphuric acid, yield 58 grains of charcoal.

18. Galbanum is the concrete gummy-resinous juice of an umbelliferous plant of Ethiopia (bubon galbanum), and is brought over in pale, semi-transparent, soft, tenacious masses, intermixed with clear white tears of the same resin. This juice has a strong, unpleasant smell, and a bitterish, warm taste. When rubbed with water it dissolves into a milky emulsion, and has all other chemical properties of the gum resins.

19. Gum ammoniacum. A gum-resin brought from the East Indies, composed of small white lumps or tears, more brittle than most of the other gum-resins, and easily reduced to fine powder in cold weather. It unites perfectly with water into a milky emulsion, and water and alcohol separately dissolves only a portion of the gum. It is sometimes employed in a small degree in the composition of cements and varnishes. A hundred grains, charred by sulphuric acid, give 58 of charcoal.

20. Opoponax is a strong-smelling gummy resinous juice procured from the pastinaca opoponax, and brought from Turkey and the East Indies in small round drops or irregular lumps of a reddish yellow colour. It mingles perfectly with water, and agrees in chemical properties with the other gum-resins.

21. Gum sagapenum is a fetid gum much resembling asafœtida, but weaker in sensible properties; it is brought from Alexandria in soft irregular masses, sticking to the fingers when handled. In chemical properties it agrees very closely with asafœtida.

22. Olibanum. A gum-resin brought from Turkey and the East Indies in large roundish lumps, semi-pellucid, and when of the purest kind, of a slight yellow colour. When chewed it has a bitterish pungent taste, and makes the saliva milky. The smell is moderately strong, and not disagreeable. When laid on hot iron it burns with

a strong, penetrating, and rather fragrant smell, and is supposed to have been used by the ancients for incense.

23. Gamboge. For a description of this valuable gum, see the article GAMBOGE.

24. Euphorbium is a juice procured from a plant of this name, brought chiefly from Barbary, in drops of an irregular form, of a pale yellow and brittle. This gum-resin has but little smell, but the taste is one of the most biting and acrid of any known substance, and the effect on the organs remains for a considerable time. It consists of about equal parts of gum and resin.

25. Myrrh. This gum-resin exsudes from a tree which grows in Abyssinia and many parts of Arabia, but is little known. It comes over in rounded pieces of various size, and still more varying in colour, consistence, taste, and smell. The best sort is semi-transparent, friable, unctuous to the touch, of an uniform light or reddish-yellow colour, of a strong but not ungrateful smell, and a slightly pungent and very bitter taste. It burns with some difficulty. It completely dissolves in boiling water, when previously pulverized; but on cooling, a yellow resinous sediment falls down. The supernatant liquor evaporated nearly to dryness yields a saponaceous extract, which retains much of the flavour of the myrrh. Alcohol digested with myrrh forms a very strong smelling, intensely bitter tincture, of a very fine golden yellow colour, which is made turbid by the addition of water.

Guaiacum. This substance has usually been reckoned among the perfect resins, but late experiments, though they are not complete, show that it has some very peculiar properties, so that it cannot be classed properly either with the gums or resins. This gum is procured from the guaiacum wood or lignum vita, which is a very hard ponderous wood, obviously abounding with resin, and as if it were soaked in it, so that it has a peculiar greasy feel, and a very strong and peculiar smell when rubbed. Gum guaiacum is brought over in irregular masses, easily friable, of a dusky green colour. It is in some degree transparent, and it breaks with a vitreous fracture. When pulverized, it is of a grey colour, but becomes green by exposure to air. It melts when heated, and gives a very pungent aromatic odour. The smell is fragrant; it gives scarcely any taste in the mouth, but when swallowed it excites a strong burning sensation in the throat. Mr. Hatchett has observed that guaiacum, though apparently a pure resin, differs from all the pure resins, in giving much oxalic acid by the nitric, and in yielding scarcely any artificial tannin with the nitric acid. Mr. Brande has since given an interesting analysis of this substance.

RE'SINOUS. *a.* (*resineaux*, French.) Containing resin; consisting of resin (*Boyle*).

RESINOUS ELECTRICITY, is that kind of electricity which is produced by exciting bodies of the resinous kind, and which is generally negative. See ELECTRICITY.

RE'SINOUSNESS. *s.* (from *resinous.*) The quality of being resinous.

RESIPI'SCENCE. *s.* (*resipiscence*, Fr.) Wisdom after the fact; repentance.

To RESI'ST. *v. a.* (*resisto*, Latin.) 1. To oppose; to act against (*Shakspeare*). 2. To not admit impression or force (*Milton*).

To RESI'ST. *v. n.* To make opposition.

RESI'STANCE. *s.* (*resistance*, French.) 1. The act of resisting; opposition (*Macca.*).

2. The quality of not yielding to force, or external impression (*Bacon*).

RESISTANCE, or RESISTING FORCE, in physics, any power which acts in opposition to another, so as to destroy or diminish its effect.

There are various kinds of resistance, arising from the various natures and properties of the resisting bodies, and governed by various laws: as the resistance of solids, the resistance of fluids, the resistance of the air, &c. Of each of these in their order.

RESISTANCE OF SOLIDS, in mechanics, is the force with which the quiescent parts of solid bodies oppose the motion of others contiguous to them.

Of these, there are two kinds. The first where the resisting and the resisted parts, i. e. the moving and quiescent bodies, are only contiguous, and do not cohere; constituting separate bodies or masses. This resistance is what Leibnitz calls resistance of the surface, but which is more properly called friction: for the laws of which, see the article FRICTION.

The second case of resistance, is where the resisting and resisted parts are not only contiguous, but cohere, being parts of the same continued body or mass. This resistance was first considered by Galileo, and may properly be called renitency.

As to what regards the resistance of bodies when struck by others in motion, see PERCUSSION and COLLISION. And for the resistance of solids to fracture, see STRENGTH and STRESS.

RESISTANCE OF FLUIDS, is the force with which bodies, moving in fluid mediums, are impeded and retarded in their motion.

A body moving in a fluid is resisted from two causes. The first of these is the cohesion of the parts of the fluid. For a body, in its motion, separating the parts of a fluid, must overcome the force with which those parts cohere. The second is the inertia, or inactivity of matter, by which a certain force is required to move the particles from their places, in order to let the body pass.

The retardation from the first cause is always the same in the same space, whatever the velocity be, the body remaining the same: that is, the resistance is as the space run through in the same time: but the velocity is also in the same ratio of the space run over in the same time; and therefore the resistance, from this cause, is as the velocity itelf.

The resistance from the second cause, when a body moves through the same fluid with different velocities, is as the square of the velocity. For, first the resistance increases according to the number of particles or quantity of the fluid struck in the same time; which number must be as the space run through in that time, that is, as the velocity: but the resistance also increases in proportion to the force with which the body strikes against every part; which force is also as the velocity of the body, so as to be double with a double velocity, and triple with a triple one, &c.; therefore, on both these accounts, the resistance is as the velocity multiplied by the velocity, or as the square of the velocity. Upon the whole therefore, on account of both causes, viz. the tenacity and inertia of the fluid, the body is resisted partly as the velocity and partly as the square of the velocity.

But when the same body moves through different fluids with the same velocity, the resistance from

the second cause follows the proportion of the matter to be removed in the same time, which is as the density of the fluid.

Hence therefore, if d denote the density of the fluid,

v the velocity of the body,

and a and b constant coefficients:

then $adv^2 + bv$ will be proportional to the whole resistance to the same body, moving with different velocities, in the same direction, through fluids of different densities, but of the same tenacity.

But, to take in the consideration of different tenacities of fluids; if t denote the tenacity, or the cohesion of the parts of the fluid, then $adv^2 + btv$ will be as the said whole resistance.

Indeed the quantity of resistance from the cohesion of the parts of fluids, except in glutinous ones, is very small in respect of the other resistance; and it also increases in a much lower degree, being only as the velocity, while the other increases as the square of the velocity, and rather more. Hence then the term btv is very small in respect of the other term adv^2; and consequently the resistance is nearly as this latter term; or nearly as the square of the velocity. Which rule has been employed by most authors, and is very near the truth in slow motions; but in very rapid ones, it differs considerably from the truth, as we shall perceive below; not indeed from the omission of the small term ctv, due to the cohesion, but from the want of the full counter pressure on the hinder part of the body, a vacuum, either perfect or partial, being left behind the body in its motion; and also perhaps to some compression or accumulation of the fluid against the fore part of the body. Hence,

To conceive the resistance of fluids to a body moving in them, we must distinguish between those fluids which, being greatly compressed by some incumbent weight, always close up the space behind the body in motion, without leaving any vacuity there; and those fluids which, not being much compressed, do not quickly fill up the space quitted by the body in motion, but leave a kind of vacuum behind it. These differences, in the resisting fluids, will occasion very remarkable varieties in the laws of their resistance, and are absolutely necessary to be considered in the determination of the action of the air on shot and shells; for the air partakes of both these affections, according to the different velocities of the projected body.

In treating of these resistances too, the fluids may be considered either as continued or discontinued, that is, having their particles contiguous or else as separated and unconnected; and also either as elastic or non-elastic. If a fluid were so constituted, that all the particles composing it were at some distance from each other, and having no action between them, then the resistance of a body moving in it would be easily computed, from the quantity of motion communicated to those particles; for instance, if a cylinder moved in such a fluid in the direction of its axis, it would communicate to the particles it met with a velocity equal to its own, and in its own direction, when neither the cylinder nor the parts of the fluid are elastic: whence, if the velocity and diameter of the cylinder be known, and also the density of the fluid, there would thence be determined the quantity of motion communicated to the fluid, which (as action and reaction are equal) is the same with the quantity lost by the cylinder, and consequently the resistance would thus be ascertained.

In this kind of discontinued fluid, the particles being detached from each other, every one of them can pursue its own motion in any direction, at least for some time, independent of the neighbouring ones; so that, instead of a cylinder moving in the direction of its axis, if a body with a surface oblique to its direction be supposed to move in such a fluid, the motion which the parts of the fluid will hence acquire, will not be in the direction of the resisted body, but perpendicular to its oblique surface; whence the resistance to such a body will not be estimated from the whole motion communicated to the particles of the fluid, but from that part of it only which is in the direction of the resisted body. In fluids then, where the parts are thus discontinued from each other, the different obliquities of that surface which goes foremost, will occasion considerable changes in the resistance; although the transverse section of the solid should in all cases be the same: and Newton has particularly determined that, in a fluid thus constituted, the resistance of a globe is but half the resistance of a cylinder of the same diameter, moving, in the direction of its axis, with the same velocity.

But though the hypothesis of a fluid thus constituted be of great use in explaining the nature of resistances, yet we know of no such fluid existing in nature; all the fluids with which we are conversant being so formed, that their particles either lie contiguous to each other, or at least act on each other in the same manner as if they did: consequently, in these fluids, no one particle that is contiguous to the resisted body can be moved, without moving at the same time a great number of others, some of which will be distant from it; and the motion thus communicated to a mass of the fluid will not be in any one determined direction, but different in all the particles, according to the different positions in which they lie in contact with those from which they receive their impulse; whence, great numbers of the particles being diverted into oblique directions, the resistance of the moving body, which will depend on the quantity of motion communicated to the fluid in its own direction, will be different in quantity from what it would be in the foregoing supposition, and its estimation becomes much more complicated and operose.

If the fluid be compressed by the incumbent weight of its upper parts (as all fluids are with us, except at their very surface), and if the velocity of the moving body be much less than that with which the parts of the fluid would rush into a void space, in consequence of their compression; it is evident, that in this case the space left by the moving body will be instantaneously filled up by the fluid; and the parts of the fluid against which the foremost part of the body presses in its motion, will, instead of being impelled forwards in the direction of the body, in some measure circulate towards the hinder part of the body, in order to restore the equilibrium, which the constant influx of the fluid behind the body would otherwise destroy; whence the progressive motion of the fluid, and consequently the resistance of the body, which depends upon it, would in this instance be much less, than in the hypothesis where each particle is supposed to acquire, from the stroke of the resisting body, a velocity equal to that with which the body moved, and in the same direction. Newton has

determined, that the resistance of a cylinder moving in the direction of its axis, in such a compressed fluid as we have here treated of, is but one-fourth part of the resistance to the same cylinder, if it moved with the same velocity in a fluid constituted in the manner described in the first hypothesis, each fluid being supposed of the same density.

But again, it is not only in the quantity of their resistance that these fluids differ, but also in the different manner in which they act upon solids of different forms moving in them. In the discontinued fluid, first described, the obliquity of the foremost surface of the moving body would diminish the resistance; but the same thing does not hold true in compressed fluids, at least not in any considerable degree; for the chief resistance in compressed fluids arises from the greater or less facility with which the fluid, impelled by the fore part of the body, can circulate towards its hinder part; and this being little, if at all, affected by the form of the moving body, whether it be cylindrical, conical, or spherical, it follows, that while the transverse section of the body is the same, and consequently the quantity of impelled fluid also, the change of figure in the body will scarcely affect the quantity of its resistance.

And this case, viz. the resistance of a compressed fluid to a solid, moving in it with a velocity much less than what the parts of the fluid would acquire from their compression, has been very fully considered by Newton, who has ascertained the quantity of such a resistance, to the different magnitudes of the moving body, and the density of the fluid. But he expressly informs us that the rules he has laid down are not generally true, but only upon a supposition that the compression of the fluid be increased in the greater velocities of the moving body: however, some unskilful writers, who have followed him, overlooking this caution, have applied his determination to bodies moving with all sorts of velocities, without attending to the different compressions of the fluids they are resisted by; and by this means they have accounted the resistance, for instance, of the air to musket and cannon shot, to be but one-third part of what it is found to be by experience.

It is indeed evident that the resisting power of the medium must be increased, when the resisted body moves so fast that the fluid cannot instantaneously press in behind it, and fill the deserted space; for when this happens, the body will be deprived of the pressure of the fluid behind it; which in some measure balanced its resistance, or at least the fore pressure, and must support on its fore part the whole weight of a column of the fluid, over and above the motion it gives to the parts of the same; and besides, the motion in the particles driven before the body, is less affected in this case by the compression of the fluid, and consequently they are less deflected from the direction in which they are impelled by the resisted surface; whence it happens that this species of resistance approaches more and more to that described in the first hypothesis, where each particle of the fluid being unconnected with the neighbouring ones, pursued its own motion, in its own direction, without being interrupted or deflected by their contiguity; and therefore, as the resistance of a discontinued fluid to a cylinder, moving in the direction of its axis, is four times greater than the resistance of a fluid sufficiently compressed of the same density, it follows that the resistance of a fluid, when a vacuity is left behind the moving body, may be near four times greater than that of the same fluid, when no such vacuity is formed; for when a void space is thus left, the resistance approaches in its nature to that of a discontinued fluid.

This then may probably be the case in a cylinder moving in the same compressed fluid, according to the different degrees of its velocity; so that if it set out with a great velocity, and moves in the fluid till that velocity be much diminished, the resisting power of the medium may be near four times greater in the beginning of its motion than in the end.

In a globe, the difference will not be so great, because, on account of its oblique surface, its resistance in a discontinued medium is but about twice as much as in one properly compressed; for its oblique surface diminishes its resistance in one case, and not in the other: however, as the compression of the medium, even when a vacuity is left behind the moving body, may yet confine the oblique motion of the parts of the fluid, which are driven before the body, and as in an elastic fluid, such as our air is, there will be some degree of condensation in those parts; it is highly probable that the resistance of a globe, moving in a compressed fluid with a great velocity, may greatly exceed the proportion of the resistance to slow motions.

And as this increase of the resisting power of the medium will take place, when the velocity of the moving body is so great, that a perfect vacuum is left behind it, so some degree of augmentation will be sensible in velocities much short of this; for even when, by the compression of the fluid, the space left behind the body is instantaneously filled up; yet, if the velocity with which the parts of the fluid rush in behind, is not much greater than that with which the body moves, the same reasons that have been urged above, in the case of an absolute vacuity, will hold in a less degree in this instance: and therefore it is not to be supposed that, in the increased resistance which has been hitherto treated of, it immediately vanishes when the compression of the fluid is just sufficient to prevent a vacuum behind the resisted body; but we must consider it as diminishing only according as the velocity, with which the parts of the fluid follow the body, exceeds that with which the body moves.

Hence then it may be concluded, that if a globe sets out in a resisting medium, with a velocity much exceeding that with which the particles of the medium would rush into a void space, in consequence of their compression, so that a vacuum is necessarily left behind the globe in its motion; the resistance of this medium to the globe will be much greater, in proportion to its velocity, than what we are sure, from Sir I. Newton, would take place in a slower motion. We may farther conclude, that the resisting power of the medium will gradually diminish as the velocity of the globe decreases, till at last, when it moves with velocities which bear but a small proportion to that with which the particles of the medium follow it, the resistance becomes the same with what is assigned by Newton in the case of a compressed fluid.

And from this determination may be seen, how false that position is, which asserts the resistance of any medium to be always in the duplicate ratio of the velocity of the resisted body; for it plainly

appears, by what has been said, that this can only be considered as nearly true in small variations of velocity, and can never be applied in comparing together the resistances to all velocities whatever, without incurring the most enormous errors. See Robins's Gunnery, chap. 2. prop. 1. and Hutton's Select Exercises, pa. 235, &c. See also the articles RESISTANCE OF THE AIR, PROJECTILE, and GUNNERY.

Resistance and retardation are used indifferently for each other, as being both in the same proportion, and the same resistance always generating the same retardation. But with regard to different bodies, the same resistance frequently generates different retardations; the resistance being as the quantity of motion, and the retardation that of the celerity. For the difference and measure of the two, see RETARDATION.

The retardations from this resistance may be compared together, by comparing the resistance with the gravity or quantity of matter. It is demonstrated that the resistance of a cylinder, which moves in the direction of its axis, is equal to the weight of a column of the fluid, whose base is equal to that of the cylinder, and its altitude equal to the height through which a body must fall in vacuo, by the force of gravity, to acquire the velocity of the moving body. So that, if a denote the area of the face or end of the cylinder, or other prism, v its velocity, and n the specific gravity of the fluid; then, the altitude due to the velocity v being $\frac{v^2}{4g}$, the whole resistance, or motive force m, will be $a \times n \times \frac{v^2}{4g} = \frac{anv^2}{4g}$; the quantity g being $= 16\frac{1}{12}$ feet, or the space a body falls, in vacuo, in the first second of time. And the resistance to a globe of the same diameter would be the half of this. Let a ball, for instance, of 3 inches diameter, be moved in water with a celerity of 16 feet per second of time: now from experiments on pendulums, and on falling bodies, it has been found, that this is the celerity which a body acquires in falling from the height of 4 feet; therefore the weight of a cylinder of water of 3 inches diameter, and 4 feet high, that is a weight of about 12lb. 4oz. is equal to the resistance of a cylinder; and consequently the half of it, or 6lb. 2oz. is that of the ball. Or, the formula $\frac{anv^2}{4g}$ gives $\frac{\cdot 7854 \times 9 \times 1000 \times 16 \times 16}{144 \times 4 \times 16} = 196$ oz. or 12lb. 4oz. for the resistance of the cylinder, or 6lb. 2oz. for that of the ball, the same as before.

Let now the resistance, so discovered, be divided by the weight of the body, and the quotient will show the ratio of the retardation to the force of gravity. So if the said ball, of 3 inches diameter, be of cast iron, it will weigh nearly 61 ounces, or $3\frac{13}{16}$lb; and the resistance being 6lb. 2oz. or 98 ounces; therefore, the resistance being to the gravity as 98 to 61, the retardation, or retarding force, will be $\frac{98}{61}$ or $1\frac{3}{5}$, the force of gravity being 1. Or thus; because a the area of a great circle of the ball, is $+ pd^2$, where d is the diameter, and $p = \cdot 7854$, therefore the resistance to the ball is $m = \frac{pud^2v^2}{8g}$; and because its solid content is $= \frac{2}{3}pd^3$, and its weight $\frac{2}{3}$ N pd^3, where N denotes its specific gravity; therefore, dividing the resistance or motive force m by the weight w, gives $\frac{m}{w} = \frac{3nv^2}{16\,\mathrm{N}\,dg} = f$ the retardation, or retarding force, that of gravity being 1; which is therefore as the square of the velocity directly, and as the diameter inversely; and this is the reason why a large ball overcomes the resistance better than a small one, of the same density.

The resistance of bodies of different figures, moving in one and the same medium, has been considered by Mr. J. Bernouli, and the rules he lays down on this subject are the following: 1. If an isosceles triangle be moved in the fluid according to the direction of a line which is normal to its base; first with the vertex foremost, and then with its base; the resistances will be as the legs, and as the square of the base, and as the sum of the legs. 2. The resistance of a square moved according to the direction of its side, and of its diagonal, is as the diagonal to the side. 3. The resistance of a circular segment (less than a semicircle) carried in a direction perpendicular to its basis, when it goes with the base foremost, and when with its vertex foremost (the same direction and celerity continuing, which is all along supposed) is as the square of the diameter to the same, less one-third of the square of the base of the segment. Hence the resistances of a semicircle, when its base, and when its vertex go foremost, are to one another in a sesquialterate ratio. 4. A parabola moving in the direction of its axis, with its basis, and then its vertex foremost, has its resistances, as the tangent to an arch of a circle, whose diameter is equal to the parameter, and the tangent equal to half the basis of the parabola. 5. The resistances of an hyperbola, or the semi-ellipsis, when the base and when the vertex go foremost, may be thus computed; let it be, as the sum, or difference, of the transverse axis and latus rectum is to the transverse axis, so is the square of the latus rectum to the square of the diameter of a certain circle; in which circle apply a tangent equal to half the basis of the hyperbola or ellipsis. Then say again, as the sum, or difference, of the axis and parameter is to the parameter, so is the aforesaid tangent to another right line. And further, as the sum, or difference, of the axis and parameter is to the axis, so is the circular arch corresponding to the aforesaid tangent, to another arch. This done, the resistance will be as the tangent to the sum, or difference, of the right line thus found, and that arch last mentioned. 6. In general, the resistances of any figure whatsoever going now with its base foremost, and then with its vertex, are as the figure of the basis to the sum of all the cubes of the element of the basis divided by the squares of the element of the curve line. All which rules, he thinks, may be of use in the fabric or construction of ships, and in perfecting the art of navigation universally. As also for determining the figures of the balls of pendulums for clocks.

RESISTANCE OF THE AIR, is the force with which the motion of bodies, particularly of projectiles, is retarded by the opposition of the air or atmosphere. See GUNNERY, PROJECTILES, &c.

The air being a fluid, the general laws of the resistance of fluids obtain in it; subject only to some variations and irregularities from the different degrees of density in the different stations or regions of the atmosphere.

The resistance of the air is chiefly of use in military projectiles, in order to allow for the differences caused in their flight and range by it. Before the time of Mr. Robins, it was thought that this resistance to the motion of such heavy bodies as iron balls and shells, was too inconsiderable to be regarded; and that the rules

and conclusions derived from the common parabolic theory, were sufficiently exact for the common practice of gunnery. But that gentleman showed, in his New Principles of Gunnery, that, so far from being inconsiderable, it is in reality enormously great, and by no means to be rejected without incurring the grossest errors; so much so, that balls or shells which range, at the most, in the air, to the distance of two or three miles, would in a vacuum range to 20 or 30 miles, or more. To determine the quantity of this resistance, in the case of different velocities, Mr. Robins discharged musket-balls, with various degrees of known velocity, against his balistic pendulums, placed at several different distances, and so discovered by experiment the quantity of velocity lost, when passing through those distances, or spaces of air, with the several known degrees of celerity. For having thus known the velocity lost or destroyed, in passing over a certain space, in a certain time, (which time is very nearly equal to the quotient of the space divided by the medium velocity between the greatest and least, or between the velocity at the mouth of the gun and that at the pendulum); that is, knowing the velocity v, the space s, and time t; the resisting force is thence easily known, being equal to $\frac{vb}{2gt}$ or $\frac{vvb}{2gs}$, where b denotes the weight of the ball, and V the medium velocity above-mentioned. The balls employed upon this occasion by Mr. Robins were leaden ones, of $\frac{1}{12}$ of a pound weight, and $\frac{3}{4}$ of an inch diameter; and to the medium velocity of

1600 feet, the resistance was 11 lb.
1065 feet, ... $2\frac{4}{5}$;

but by the theory of Newton, before laid down, the former of these should be only $4\frac{3}{4}$ lb. and the latter 1 lb.; so that, in the former case the real resistance is more than double of that by the theory, being increased as 9 to 22; and in the lesser velocity the increase is from 2 to $2\frac{4}{5}$, or as 5 to 7 only.

Mr. Euler has shewn, that the common doctrine of resistance answers pretty well when the motion is not very swift, but in swift motions it gives the resistance less than it ought to be, on two accounts: 1. Because in quick motions, the air does not fill up the space behind the body fast enough to press on the hinder parts, to counterbalance the weight of the atmosphere on the fore part. 2. The density of the air before the ball being increased by the quick motion, will press more strongly on the fore part, and so will resist more than lighter air in its natural state. He has shewn that Mr. Robins has restrained his rule to velocities not exceeding 1670 feet per second; whereas had he extended it to greater velocities, the result must have been erroneous; and he gives another formula himself, and deduces conclusions differing from those of Mr. Robins.

The subject of the resistance of the air, as begun by Robins, has been prosecuted by Dr. Hutton, to a very great extent and variety, both with the whirling-machine, and with cannon balls of all sizes, from 1lb. to 6lb. weight, as well as with figures of many other different shapes, both on the fore part and hind part of them, and with planes set at all varieties of angles of inclination to the path of motion of the same; from all which he has obtained the real resistance to bodies for all velocities, from 1 up to 2000 feet per second; together with the law of the resistance to the same body for all different velocities, and for different sizes with the same velocity, and also for all angles of inclination.

In this table are contained the resistances to several forms of bodies, when moved with several degrees of velocity, from three feet per second to twenty. The names of the bodies are at the tops of the columns, as also which end went foremost through the air; the different velocities are in the first column, and the resistances on the same line, in their several columns, in avordupois ounces and decimal parts. So on the first line are contained the resistances when the bodies move with a velocity of three feet in a second, viz. in the second column for the small hemisphere, of $4\frac{3}{4}$ inches diameter, its resistance ·028 ounces when the flat side went foremost; in the third and fourth columns the resistances to a larger hemisphere, first with the flat side, and next the round side foremost; the diameter of this, as well as all the following figures, being $6\frac{3}{8}$ inches, and therefore the area of the great circle $=32$ square inches, or $\frac{2}{9}$ of a square foot; then in the 5th and 6th columns are the resistances to a cone, first its vertex, and then its base foremost, the altitude of the cone being $6\frac{3}{8}$ inches, the same as the diameter of its base; in the seventh column the resistance to the end of the cylinder, and in the eighth, that against the whole globe or sphere. All the numbers shew the real weights which are equal to the resistances; and at the bottoms of the columns are placed proportional numbers, which shew the mean proportions of the resistances of all the figures to one another, with any velocity. Lastly, in the ninth column are placed the exponents of the power of the velocity which the resistances in the eighth column bear to each other, viz. which that of the ten-feet velocity bears to each of the following ones, the medium of all of them being as the 2·04 power of the velocity, that is, very little above the square or second power of the velocity, so far as the velocities in this table extend.

From this table the following inferences are easily deduced:

1. That the resistance is nearly in the same proportion as the surfaces; a small increase only taking place in the greater surfaces, and for the greater velocities. Thus, by comparing together the numbers in the second and third columns, for the bases of the two hemispheres, the areas of which bases are in the proportion of $17\frac{3}{4}$ to 32, or 5 to 9 very nearly, it appears that the numbers in those two columns, expressing the resistances, are nearly as 1 to 2 or 5 to 10, as far as the velocity of 12 feet; but after that, the resistances on the greater surface increase gradually more and more above that proportion.

2. The resistance to the same surface with different velocities is, in these slow motions, nearly as the square of the velocity; but gradually increases more and more above that proportion as the velocity increases. This is manifest from all the columns: and the index of the power of the velocity is set down in the ninth column, for the resistances in the eighth, the medium being 2·04; by which it appears that the resistance to the same body is, in these slow motions, as the 2·04 power of the velocity, or nearly as the square of it.

3. The round ends, and sharp ends, of solids, suffer less resistance than the flat or plane ends, of the same diameter; but the sharper end has not always the less resistance. Thus, the cylinder, and the flat ends of the hemisphere and cone, have more resistance than the round or sharp ends of the same; but the round side of the hemisphere has less resistance than the sharper end of the cone.

4. The resistance on the base of the hemisphere is to that on the round, or whole sphere, as $2\frac{1}{3}$ to 1, instead of 2 to 1, as the theory gives that relation. Also the experimented resistance, on each of these, is nearly $\frac{1}{4}$ more than the quantity assigned by the theory.

5. The resistance on the base of the cone, is to that on the vertex, nearly as $2\frac{1}{10}$ to 1; and in the same ratio is radius to the sine of the angle of inclination of the side of the cone to its path or axis. So that, in this instance, the resistance is directly as the sine of the angle of incidence, the transverse section being the same.

6. When the hinder parts of bodies are of different forms, the resistances are different, though the foreparts are exactly alike and equal; owing probably to the different pressures of the air on the hinder parts. Thus, the resistance to the forepart of the cylinder, is less than on the equal flat surface of the cone, or of the hemisphere; because the hinder part of the cylinder is more pressed or pushed by the following air than those of the other two figures; also, for the same reason, the base of the hemisphere suffers a less resistance than that of the cone, and the round side of the hemisphere less than the whole sphere.

For more on the subject of this article, see Newton's Principia; Gregory's Mechanics, vol. 1; Repertory of Arts and Manufactures, vol. 4, second series, p. 121; Playfair's Outlines of Natural Philosophy; Hutton's Course, vols. 2 and 3; and our articles GUNNERY and PROJECTILE.

RESISTIBI'LITY. *s.* (from *resistible.*) 1. Quality of resisting. 2. Quality of being resistible (*Hammond*).

RESI'STIBLE. *s.* (from *resist.*) That may be resisted (*Hale*).

RESI'STLESS. *a.* (from *resist.*) Irresistible; that cannot be opposed (*Raleigh*).

RESO'LVABLE. *a.* (from *resolve.*) 1. That may be referred or reduced (*South*). 2. Dissoluble; admitting separation of parts (*Arbuth.*). 3. Capable of solution, or of being made less obscure (*Brown*).

RESO'LUBLE. *a.* (*resoluble*, French.) That may be melted or dissolved.

To RESO'LVE. *v. a.* (*resolvo*, Latin.) 1. To inform; to free from a doubt or difficulty (*Shakspeare*). 2. To solve; to clear (*Rogers*). 3. To settle in an opinion (*Shakspeare*). 4. To fix in a determination (*Dryden*). 5. To fix in constancy; to confirm (*Shakspeare*). 6. To melt; to dissolve (*Arbuthnot*). 7. To analyze; to reduce (*Tillotson*).

To RESO'LVE. *v. n.* 1. To determine; to decree with one's self (*Milton*). 2. To melt; to be dissolved (*South*). 3. To be settled in opinion (*Locke*).

RESO'LVE. *s.* (from the verb.) Resolution; fixed determination (*Denham*).

RESO'LVEDLY. *ad.* (from *resolved.*) With firmness and constancy (*Grew*).

RESO'LVEDNESS. *s.* (from *resolved.*) Resolution; constancy; firmness (*D. of Piety*).

RESO'LVENT. *s.* (*resolvens*, Latin.) That has the power of causing solution (*Wiseman*).

RESOLVENTS. (*medicamenta resolventia*, from *resolvo*, to loosen.) A term applied by

surgeons to such substances as discuss inflammatory tumours.

RESO'LVER. *s.* (from *resolve.*) 1. One that forms a firm resolution (*Hammond*). 2. One that dissolves; one that separates parts (*Boyle*).

RE'SOLUTE. *a.* (*resolu*, French.) Determined; fixed; constant; steady; firm (*Shakspeare*).

RE'SOLUTELY. *ad.* Determinately; firmly; constantly; steadily (*Roscommon*).

RE'SOLUTENESS. *s.* Determinateness; state of being fixed in resolution (*Boyle*).

RESOLU'TION. *s.* (*resolutio*, Latin.) 1. Act of clearing difficulties (*Brown*). 2. Analysis; act of separating any thing into constituent parts (*Hale*). 3. Dissolution (*Digby*). 4. (from *resolute.*) Fixed determination; settled thought (*King Charles*). 5. Constancy; firmness; steadiness in good or bad (*Sidney*). 6. Determination of a cause in courts of justice (*Hale*).

RESOLUTION, in music. See MUSIC.

RESOLUTION ISLAND, an island in the Atlantic ocean, 50 miles long and 20 broad, on the N. side of the entrance into Hudson strait. Lon. 65. 0 W. Lat. 61. 40 N.

RESOLUTION ISLE, a small island in the Pacific ocean, 160 leagues E. of Otaheite, so called from the ship in which Cook made his second voyage. Lon. 141. 15 W. Lat. 17. 23 S.

RE'SOLUTIVE. *a.* (*resolutus*, Lat. *resolutif*, French.) Having the power to dissolve or relax.

RE'SONANCE. *s.* (from *resono*, Latin.) Sound; resound (*Boyle*).

RE'SONANT. *a.* (*resonans*, Lat.) Resounding (*Milton*).

To RESO'RT. *v. n.* (*ressortir*, French.) 1. To have recourse (*Clarendon*). 2. To go publicly (*Milton*). 3. To repair to (*Pope*). 4. To fall back. In law (*Hale*).

RESO'RT. *s.* (from the verb.) 1. Frequency; assembly; meeting (*Dryden*). 2. Concourse; confluence (*Swift*). 3. Act of visiting (*Shakspeare*). 4. (*ressort*, French.) Movement; active power; spring (*Bacon*).

RESO'RTER. *s.* (from *resort.*) One that frequents, or visits.

To RESOU'ND. *v. a.* (*resono*, Latin.) 1. To echo; to sound back (*Pope*). 2. To celebrate by sound (*Peacham*). 3. To sound; to tell so as to be heard far (*Pope*).

To RESOU'ND. *v. n.* 1. To be echoed back (*South*). 2. To be much and loudly mentioned (*Milton*).

RESOU'RCE. *s.* (*ressourse*, Fr.) Some new or unexpected means that offer; resort; expedient (*Dryden*).

To RESO'W. *v. a.* (*re* and *sow.*) To sow anew (*Bacon*).

RESP, the name of a disorder to which sheep are subject. See ROT.

To RESPEA'K. *v. n.* (*re* and *speak.*) To answer (*Shakspeare*).

To RESPE'CT. *v. a.* (*respectus*, Latin.) 1. To regard; to have regard to (*Bacon*). 2. (*respecter*, Fr.) To consider with a lower degree of reverence (*Sidney*). 3. To have relation to. 4. To look toward (*Brown*).

RESPE'CT. *s.* (*respect*, Fr. *respectus*, Lat.) 1. Regard; attention (*Shakspeare*). 2. Reverence; honour (*Prior*). 3. Awful kindness (*Locke*). 4. Good-will (*Shakspeare*). 5. Partial regard (*Proverbs*). 6. Reverend character (*Shakspeare*). 7. Manner of treating others (*Wotton*). 8. Consideration; motive (*Hooker*). 9. Relation; regard (*Tillotson*).

RESPE'CTABLE. *a.* (*respectable*, Fr.) Venerable; meriting respect.

RESPE'CTER. *s.* (from *respect.*) One that has partial regard (*Swift*).

RESPE'CTFUL. *a.* (*respect* and *full.*) Ceremonious; full of outward civility (*Prior*).

RESPE'CTFULLY. *ad.* With some degree of reverence (*Dryden*).

RESPE'CTFULNESS. *s.* (from *respectful.*) The quality of being respectful.

RESPE'CTIVE. *a.* (from *respect.*) 1. Particular; relating to particular persons or things (*Burnet*). 2. Relative; not absolute (*Rogers*). 3. Worthy of reverence: not in use (*Shaksp.*). 4. Careful; cautious: obsolete (*Hooker*).

RESPE'CTIVELY. *ad.* 1. Particularly; as each belongs to each (*South*). 2. Relatively; not absolutely (*Raleigh*). 3. Partially; with respect to private views: obsolete (*Hooker*). 4. With great reverence: not used (*Shakspeare*).

RESPE'RSION. *s.* (*respersio*, Lat.) The act of sprinkling.

RESPIRA'TION. *s.* (*respiratio*, Fr.) 1. The act of breathing (*Bacon*). 2. Relief from toil (*Milton*).

RESPIRATION, in physiology, a function equally necessary to animals and vegetables, by which a something is separated and introduced into the system from the surrounding atmosphere, and thrown forth into the surrounding atmosphere, from the respiratory organ. This organ, however, though thus uniformly employed for the same purpose, is by no means uniformly of the same structure. In mammals, birds, and amphibials, it consists of lungs; in fishes, of gills; in the siren, an eel-shaped aquatic quadruped, the proper place of which in natural history has never yet been satisfactorily pointed out, of both gills and lungs; and in insects, of holes which are called stemmata or stigmata, of different shapes and numbers, in some kinds round, in others oval, and in others and more usually oblong like the figure of a button-hole. In the grasshopper they are nine on each side of the mouth; in the slug and snail we find only a single aperture, which is on the top of the head; while in different species of the monoculus and crab, they converge by four, five, or six into a cluster, which in some species is situate under the tail, in others in the claw, and in others again in the neck. In zoophytic worms we are not acquainted with the nature of this organ, although its existence is perfectly obvious; since all animals of this description die as soon as others if exposed to a perfect vacuum. It is probable that the common pores of the skin answer the purpose, and that the perspiratory and respiratory organ is one and the same. In plants the organ of respiration is the leaves: and hence if

oil or any other viscid substance that precludes a free entrance of the air be smeared over the skin of insects and the leaves of plants, both will equally perish for want of breathing.

Let us first attend to the physiology of this important function as it occurs in man and the more perfect animals, and next to its chemistry.

In order to delineate the physiology of this function, it is necessary to give a brief anatomical description of the several parts engaged. The bags of the pleura are filled by the lungs; by which we understand two viscera, one right and another left, in figure corresponding with the bags themselves which they fill, having a broad basis below, and being terminated above at the first rib by an obtuse cone. Anteriorly their surface is flat, laterally convex, and posteriorly it is rounded; internally it is concave, especially that of the left lungs, for the purpose of containing the heart. The right lung is the largest, and is most frequently divided into three lobes, which is seldom the case with the left. They are freely suspended by the great blood-vessels. Between the lungs and pleura is found a watery vapour, of a coagulable nature, like that of the pericardium; which transudes from the surface of the lungs and of the pleura, continually in the fœtus, and not unfrequently in the adult. In dropsy, this vapour is increased, or thickens to a kind of sebaceous matter; or, lastly, it concretes into fibres, forming adhesions of the lungs.

The external membrane of the lungs is simple, and thinner than the pleura, although continuous with it. It spreads from the adhesion of the great blood-vessels of the heart, over the lungs in every direction, and when entire, may be easily inflated, even after being separated from the lungs. The same membrane passes over the intervals between the lobules, like a bridge. It is joined to the lungs by cellular texture.

The lungs are made up of lobes separated by intermediate intervals, in which there is loose cellular substance. Their first division is into two large lobes, and one middle one of a smaller size, which, however, cohere together: they are afterwards repeatedly subdivided into successively smaller lobes, always surrounded by cellular membrane, till at last the lobules are resolved into very small membranous cells, which in adults are filled with air, are of various figures, and communicate on all sides with each other. The elementary parts of the lungs, therefore, are not oval bags, surrounded by muscular texture, with a single orifice which receive the air from the windpipe, but they admit the air exhaling from the ultimate branches of the trachea, so that being effused into irregular spaces, it passes and repasses freely from any one portion of the lungs into all the others. This is demonstrated by inflation, for air blown into any, even the most minute lobule, through its branch of the trachea, passes into all the rest. In man, and in the smaller animals, the cellular fabric of the intervals is neither shut up from the vesicles of the lungs, nor are the lobes surrounded by any peculiar membrane; in the largest animals, there is no communication between the air vesicles and the cellular spaces which surround the lobules.

The air passes into these vesicles through the wind-pipe. The wind-pipe arises from the larynx, and receives the air through it alone. Its first part is single and simple, partly fleshy and partly cartilaginous, the œsophagus lying below it and to its left, is supported on the broad and flat vertebræ of the neck; in other words, within the cellular substance that surrounds the wind-pipe there is situated a canal, composed of alternate cartilaginous and muscular rings. The cartilaginous rings, thin and elastic, anteriorly somewhat flat and thick, are joined together by their posterior extremities, which are thinner; and the circle is completed by strong transverse muscular fibres, adhering to both the loose extremities of the cartilage. The lower circles are less the uppermost is often augmented by an appendix, that next to the division is perpendicular.

The fleshy ring, situated alternately with the cartilaginous ones, are composed of red muscular fibres. Some of these are transverse, connecting the detached ends of the annular cartilages; others descend from each upper to the next lower ring. But other muscular fibres again, descend from the cricoid cartilage, and having reached below the division of the bronchia, vanish upon the lungs. The transverse fibres contract the wind-pipe; the longitudinal ones shorten it. Within the lungs, between the imperfect rings, there is a sort of muscular fabric, but less uniformly disposed.

In the cellular coat which surrounds the muscular one, but especially behind, in the interval between the cartilages, are placed numberless simple glands, which, by very small ducts, like pores, opening into the cavity of the wind-pipe, deposit within that cavity a watery and pellucid mucus, not coagulable into films, and very bland, which is of the greatest use in defending the exceedingly sensible membrane from the impurities of the air, which is loaded with particles, irritating bytheir mechanical figure or chemical acrimony. Numerous conglobate glands are situated around the trachea and its bronchia, but these are of the lymphatic kind, although their black fluid frequently penetrates into the trachea. Lastly, the internal tube of the wind-pipe is lined by a membrane, covered by epidermis, continuous with the skin and membranes of the mouth, smooth, soft, and very irritable. It is connected with the muscular coat by cellular substance.

The vessels of this entire part of the wind-pipe, in the neck, come from the lower thyroids; in the thorax, from other small branches of the subclavian trunks, or the mammaries, or the bronchials properly so called. Its nerves, arising from the recurrent and intercostals, are numerous.

In the upper part of the thorax the wind-pipe is received between the laminæ of the posterior mediastinum; and at the third vertebra, or a little above, is divided into two branches similar to the trunk, formed in like manner of imperfect cartilages, and furnished with similar glands; each of these enters the lung to which it corresponds, and the right is something shorter and larger than the left. Having entered the lungs, the cartilaginous rings gradually degenerate into fragments, become more angular, triangular, and intermixed with a larger portion of membrane, till at length, by the diminution of the cartilages, the ultimate branches of the bronchia become membranous.

Its ultimate branches are invisible, and exhale air into the cellular spaces of the lungs in adults, and from the same spaces receive the arterial expired vapour.

The vessels of the bronchia are the bronchial veins and arteries. The latter are generally two; one coming from the upper intercostal of the aorta, which is distributed either to the right only

or to both the lungs; the other, from the trunk of the aorta, goes to the left lung. Sometimes there are more; as when there are three, by the addition of a second from the aorta. At other times, there is only one artery common to both lungs. The thoracic part of the bronchia, situated without the lungs, has its proper vessels from the aorta, or from the subclavian, or the mammary, or the intercostal. The bronchial veins are very commonly two; the right from the vena azygos, the left from a peculiar branch of the subclavian vein, the left superior intercostal. These blood-vessels accompany the branches of the trachea, and descend into their membranes; the arteries inosculate with the pulmonary arteries, and the veins with the veins, forming a vascular web in the internal cellular substance. There are some instances where the pulmonary vein itself has given small branches to the lungs, to the wind-pipe, and to the surface of the lungs.

But there are other larger vessels belonging to the lungs, the pulmonary artery, and the vein. The great artery, in the fetus larger than the aorta, and in the adult but little less, has two branches; the right larger but shorter, the left narrower and longer. In the fetus, the trunk itself is continued into the descending aorta, and is known by the name of ductus arteriosus. In the adult, that trunk degenerates into a solid ligament. The four pulmonary veins accompany the branches of the artery and of the trachea, through the lungs, surrounded by a good deal of cellular substance; which substance, being increased, at last composes the lungs themselves. Within this cellular fabric, the air-vessels and blood-vessels are subdivided, and in the ultimate cellular spaces, the ultimate veins and arteries spread, reticularly interwoven; and here the small arteries exhale a plentiful vapour into the aërial cells of the lungs, and the veins absorb a watery vapour from them. Hence, coloured water, the whey of milk, or thin wax, being injected into the pulmonary artery, flows with froth into the wind-pipe; or, on the contrary, penetrates from the bronchia into the pulmonary artery. In like manner, injections pass from the pulmonary vein into the bronchia; or thence, into the veins: lastly, they readily pass from the arteries into the pulmonary veins; or return from the veins into the arteries.

The lymphatic vessels, as in other parts, form a net-work upon the surface of the lungs, whence branches run to the cavity of the posterior mediastinum, to the glands seated on the œsophagus, and to the thoracic duct. The nerves are small, especially the anterior, the posterior ones being somewhat larger: they come from a nerve of the eight pair: but they receive some addition, accompanying the large blood-vessels, from the recurrent, and likewise from the cardiac plexus. Hence the lungs have but little sensation; but that of the little nerves, divided upon the substance of the bronchia, is very acute. Nor are the lungs of an irritable nature.

The quantity of blood which enters into the lungs is exceedingly great, equal to (or even perhaps greater than) that which is sent in the same time throughout the rest of the body; which, therefore, indicates this viscus to be subservient to some very important purpose. That this use depends manifestly upon the air, appears from the universal consent of nature, in which we scarcely find an animal which does not respire; also from the structure of the lungs in the fetus, in which being useless, on account of the absence of air, they receive only a very small portion of that blood, which the pulmonary artery conveys from the heart. We come now to speak of respiration, or the inhalation and expulsion of air by the lungs.

Air, physically considered, is an element, fluid, invisible, elastic, with an indestructible spring, and soniferous. But the air, which we commonly receive into the lungs, is impure, filled with a great quantity of watery and other vapours, as also with salts, acids, &c. with the seeds of plants and animals, and other foreign particles; and is ponderous; weighing, however, 850 times less than water, a cubic foot of air being between 610 and 694 grains. This air, which surrounds the earth on all sides, being compressed by its incumbent columns, perpendicularly and laterally, enters with great force wherever it meets with less resistance, as appears from experiments made in vacuo, and from the phænomena of the air-pump: so that its pressure on the human body is not less than 30,000 pounds. It is repelled chiefly by the pores of membranes, though these are permeable by water: it likewise penetrates oil or mucus with difficulty.

The ambient air is excluded from all parts of the human body, by dense skin, which, even when dry, is impervious to the air; by the fat lying under it, by the narrowness of the absorbent vessels, and by the equability of the resistance. We must investigate why the air enters the lungs, which, in an adult, are always filled with air, and therefore resist the pressure of the whole atmosphere with an equivalent force. That the lungs always contain air is evident; because, however you compress them, they are still lighter than water; and even after they have been inflated but a few times, they always swim; whereas, in the fetus, before air has been admitted into them, they sink to the bottom.

On the equilibrium being destroyed, the air invariably descends in every direction to that place where it meets with least resistance. But air that is dense and heavy descends more easily than that which is light, whose force scarcely exceeds that of the air in the lungs, nor is able by the same force to overcome the resistance of the bronchia, and of the force by which the air contained in the lungs is compressed. Hence an animal lives with greater ease in a dense than in a light atmosphere; although that air is always better tolerated, which is pure in proportion to its levity; such as that of the highest mountains of the Alps. Therefore, that the air may enter the lungs, they must make a less resistance to it than before; namely, the air, which is already in the cellular fabric of the lungs, must be rarified; but this effect will be produced, if the cavity of the breast, which is filled by the lungs, be dilated. The air, which is always in the lungs, expands into this increased space, by which, being weakened in its spring, it makes less resistance to the external air; consequently, a portion of external air descends into the lungs, sufficient to restore to the air, now contained in the lungs, the same density with that of the external air.

We must, therefore, describe the powers which dilate the breast. The breast or thorax is composed of bones, muscles, and cartilages; being almost of the shape of an elliptic barrel, somewhat compressed before, but behind divided by an eminence, whose hoops are the ribs, and of remarkable strength. In the lateral parts of this structure, the lungs are situated; the central and

lower parts contain first the pericardium, and then some of the abdominal viscera.

The basis of the thorax is formed by a column, a little curved, at the upper part gibbous backwards, so that its summit is situated most behind. To this twelve vertebræ are affixed. But they also coalesce, by the union of their bodies into a single column, which projects forwards between the two cavities of the breast; divides the right from the left; and is plain in the fore-part, and broad towards the sides. A slight sinuosity receives the ribs into that place where the arch separates from the body. They are bound together into one column, both by the elastic plate interposed between the bodies of every two, and coalescing with both; and by other ligaments and spines lying upon one another, and by the junction of the ribs; on which accounts they scarcely admit of motion amongst themselves. The sides of the breast are formed of twelve ribs. These are in general bent in the form of an irregular arch, having a considerable curvature laterally and backwards, but extending in their fore-part towards a right line. The bony parts of the ribs are, however, parallel with each other. The greatest part of the rib is bony; of which the posterior portion is round and thick, and the anterior thin and flat. The anterior remaining part of the rib consists of a cartilage; which in general preserves the figure of the rib, broad, flat, adhering to an irregular hollow of the bony part; and which does not change into bone, unless in extreme old age.

The posterior, bony, and thick part of each rib terminates in a head. These are inserted into pits scooped out of the bodies of the uppermost and two lowermost vertebræ, and in the contiguous margins of each of the other two. The vertebræ are tied to the ribs by strong ligaments, of which the principal is distributed upon each adjacent vertebræ, in a radiated manner from each rib; other ligaments tie the transverse process to the tubercle of the rib, and others connect the contiguous ribs, and also the transverse processes, with each other. Moreover, between the angle of incurvation and the articulation with the vertebræ, each of the ten upper ribs has a tubercle, which, being connected with the plain side of the transverse process of the corresponding vertebræ, are tied by short and strong ligaments to that process, in such a manner, that, while the juncture is very strong, the rib can ascend and descend for a short way.

Of the anterior cartilages, the seven uppermost reach to the sternum, and strengthened by short ligaments, they enter with a double head into lateral depressions in that bone, which are incrusted with cartilage. Of the five remaining ribs, the uppermost is agglutinated by strong cellular substance to the seventh, and each lower one to the one immediately above it, so that they form a continuous margin, which is itself fastened to the sternum. The cartilages are connected with each other, both by proper ligaments, and by cartilaginous appendages joined by cellular substance: the two lowermost are free, and connected only with the muscles. These inferior cartilages are united to one another, and to the sternum, by strong ligaments.

The first rib is the shortest and most solid. As they follow in succession to the seventh and eighth, every two of them form larger and more moveable circles. The eighth is the longest of all; and below it, they always become shorter, the lower they are.

The upper rib descends; the second joins the sternum almost at a right angle, while the others ascend both to the vertebræ and to the sternum, but more to the latter. The bony part of the ribs is placed in such a direction, that the uppermost have their anterior surface declined forwards, almost transversely. About the third rib it is placed almost perpendicularly; and below the middle ones, it projects a little forwards. Besides, the strength of the ribs is very different. The uppermost, being short, transverse, rather united than articulated with the sternum, and, lastly, often consolidated, make the greatest resistance. The mobility of the lower ribs increases successively to the lowest, which, adhering only to muscles, moves most freely of all.

The sternum, in general, is a thin spongy bone, in adults of a single piece, but in the fœtus variously multiplicate. Its upper part is broader, octagonal, and supported by the clavicles, which are united with it by a triangular head, and very strong articulation, and by the first rib on each side. The next part, which is longer and narrower, grows broader downwards, and its sides receive the ribs into proper angular cavities. The lower part, which is less and shorter, is obtusely shaped like a tongue. This is continued into a detached appendage, partly bony, and partly cartilaginous, which is called the ensiform cartilage; of various shapes, being sometimes obtuse like a little tongue, sometimes pointed, sometimes bifid, and sometimes perforated.

In order, therefore, to dilate the seat of the lungs, and thus to produce that condition which causes the external air to descend into the lungs, the thorax must be elevated. For thus all the sections of the thorax form right angles, and its capacity is increased. This motion is performed by various muscles, which either operate constantly, or only at certain times. The whole of the intercostal muscles always elevate the ribs. Under this name we comprehend 22 muscles; of which 11 are external, or subcutaneous; and as many internal, separated from the pleura only by fat and cellular substance. The origin of the external intercostal is at the posterior articulation of the ribs; their anterior termination is in the bony part of each rib, at some distance from the cartilage, so that the remaining space between the cartilages, all the way to the sternum, in place of the muscles, is filled with an aponeurosis. Their direction is such, that they descend obliquely forwards, from the lower edge of the upper rib to the upper edge of the lower rib. Almost all authors agree that they elevate the ribs; because they descend from the upper and more fixed, to the lower and more moveable rib, in such a manner, that their lower point lies more distant from the vertebral articulation, or fulcrum of the lever of the ribs.

But the internal intercostals arise at some distance from the vertebræ, near the outside of the tubercles. From thence they proceed as far as the sternum, into which the first of this kind are inserted above. Except the anterior part of the first internal muscles, their direction is contrary to that of the former; so that they descend backwards, from the lower margin of the upper rib, to the upper edge of the lower rib. Therefore their action is disputed, because their lower insertion is made into a point of the rib, nearer its articulation with the vertebræ, which, therefore, seems to be the least moveable: however, they elevate the ribs notwithstanding this; for the immobility of the upper rib, arising from its articulation, weight,

and ligaments, far exceeds the mobility produced by its greater distance from the fulcrum. This is proved by the dissection of living animals; in which it appears, that the internal muscles act during the elevation of the ribs, and rest when they are depressed; by threads fixed to a flexible human skeleton, and drawn in the direction of the internal intercostal muscles, which always and invariably raise the inferior rib towards the superior; and by the firmness of the upper ribs, which serve as a fixed point to the lower ones: for the first ribs are from eight to twelve times less moveable than the other true ribs; while the difference of distance from the centre of motion, is scarcely the twentieth part of the whole lever. And lastly, by experiment on the dead subject; for, on raising its thorax, the internal intercostals swell.

By the action, therefore, of these muscles, the thorax is elevated, not altogether as one machine, nor would respiration be assisted by such a motion; but the ribs, turning upon their articulations, behind are but little moved, while with their anterior extremities, they descend and form larger angles, both with the sternum and vertebræ; and in the middle of their arches, they ascend and raise their lower edges forwards. At the same time, the sternum is thrust forward from the vertebræ and from the junctures with the ribs. Thus the ribs are both farther from the vertebræ, and the right ribs recede from the left; and both diameters, from the right to the left, and from the sternum to the vertebræ, are increased by almost two lines each: and as this occurs in every imaginable section of the thorax, the cavity of the breast will be sufficiently dilated. This happens especially in women, and in men whose breathing is somewhat laborious. These effects are produced least of all by the first ribs, but more by the succeeding ones. In strong inspirations, the ribs descend both behind and before, and, along with these, the sternum; and the spaces between the cartilages are lessened. But this dilatation is neither sufficient for healthy respiration, nor is it almost observable in men; although, even then, the intercostal muscles, by retaining and elevating the ribs, very much assist the inspiration in a secondary way, by affording a fixed point to the diaphragm, so that the whole force of that muscle may be spent, not in depressing the ribs, but in lowering itself. The greater part, therefore, of the space which the thorax gains in inspiration, arises from the action of the diaphragm.

By the diaphragm we understand a muscle expanded in a curvilineal plate, which, in general, separates the pulmonary bags from the abdomen in such a manner, that the middle and tendinous part is the highest, and supports the pericardium; that the lateral portions, which arise from the solid parts of the thorax and loins, are every where lower; and that its posterior portions are lowest of all. The fleshy fibres of this muscle arise from the internal or posterior surface of the ensiform cartilage to the very point, and from the sixth, seventh, eighth, ninth, tenth, eleventh ribs, and apex of the twelfth; after which follows an interval, in which the naked pleura is contiguous to the peritonæum. Thereafter muscular appendages of the diaphragm, much stronger, collected into two, three, or four round muscles on each side, arise fleshy from the transverse process of the first lumbal vertebra, and from the side of the body of the second; and tendinous from the middle of the body of the second, third, and fourth, and from the cartilages placed between them, on the whole higher up in the left side, and lower down in the right.

All these fibres, becoming tendinous, form the centre of the diaphragm, which resembles, in figure, a trefoil leaf, and supports the pericardium with its middle and broader angle, while the lateral wings, of which the left is narrower, descend backwards. This central portion is more moveable than the rest; but in the middle tendinous part, and neighbouring muscular substance, it is resisted by the heart; the lateral wings and contiguous portions are the most moveable. The fibres of this tendon form a most beautiful web, principally indeed on the upper part; which stretches from each muscular portion, to the muscular portion opposite to it; and then they form remarkable inferior fasciculi, transverse, right, left, and posterior, which last portion is the uppermost.

There are two holes in the diaphragm; of which the right, in the right side of its tendon, is obtusely square, and circumscribed by four strong tendinous fasciculi; the left, which is elliptical, lies betwixt the right and left fleshy portions, arising from the middle of the bodies of the lumbal vertebræ; under this opening they decussate and cross each other once and again, but above they end in the tendon. Therefore it is probable that the latter is contracted during the action of the diaphragm, and that the former remains immoveable: for tendons are but little changed during muscular motion.

The structure of the parts, and the dissection of living animals, demonstrate, that the fleshy portions of the diaphragm, by ascending on all sides from fixed points to middle and moveable parts, depress these, and by that means draw downward the lateral bags of the thorax, which contain the lungs; and thus augment the perpendicular diameter of the breast. The muscular portions are more depressed; the tendon less, both because it is fixed to the pericardium, and because its own substance does not contract. The œsophagus, and even the vena cava, are compressed, while the diaphragm acts. The diaphragm almost alone performs the office of respiration in a healthy man who is at rest; and also in those whose ribs are fractured, or the sternum burst, or where the person will not make use of his ribs on account of pain. The force of the diaphragm also, in dilating the breast, is greater, according to calculation, than all the rest of the powers which contribute to respiration. The extent of an inspiration is thus far limited, because, during the extreme action of the diaphragm, the lower ribs are drawn inwards, and the breast is so far straitened. To oppose this, the intercostal muscles interfere in a moderate inspiration; in an excessive one they are not equal to the diaphragm. The phrenic nerve, when irritated, more evidently than in most other muscles, forces the diaphragm to perform its office. The lungs themselves are entirely governed by the air, ribs, and diaphragm; being in immediate contact with these, as appears through a large incision, or through the pleura, or pellucid part of the diaphragm, when the containing parts remain entire.

In violent inspirations, occasioned by an increased quantity of blood driven into the lungs, or by any obstacle occurring in them, several other powers elevating the thorax, assist in dilating the breast, which are inserted into the thorax, clavicles, or scapulæ; such as the scaleni muscles, mastoïdei, trapezii, cervicales descendentes, serrati

superiores, pectorales, and levatores parvi, for which anatomy must be consulted.

Thus, there are powers which increase the capacity of the thorax in all its three dimensions. By these the cavity of the breast is dilated, so that it compresses the lungs less than before: into that space the lungs strive to extend themselves, since they are never destitute of air, which, as soon as the pressure is taken off, becomes rarified, and expands itself. Independent of the action of the muscles, the lungs possess no peculiar inherent power of attracting air: and, even when they are most full of air, on closing the trachea, the animal, however, attempts to inspire, by the efforts of its intercostal muscles and diaphragm. It follows, that the air gravitating, and pressed on all sides by the incumbent columns of the atmosphere, must enter the thorax; and with greater force the less air is in the lungs; and with the greatest, if they contain no air: but air will not enter the thorax, if the air, being admitted to the lungs through a wound in the breast, compress their surface. In this action, therefore, which is called inspiration, the bronchia are every way increased, both in length and breadth; because all the diameters of the thorax are increased, and the inflated lungs remain immediately contiguous to the pleura. At the same time, the vessels, which are joined with the bronchia by a cellular sheath, become longer and are extended, and the small angles become larger; by which means, the circulation is facilitated. Besides, when the vesicular substance of the lungs is filled with air, the space through which the capillary vessels of the lungs run is increased, the branches of the arteries and veins are stretched out at greater angles, the lobes press less upon each other, the compression of the neighbouring parts is lessened, and, therefore, the blood sent from the heart will flow with greater ease and celerity through the large and small arteries of the lungs. Hence, by inflating the lungs, and by that means facilitating the passage of the blood to the left ventricle, moribund animals are resuscitated, and in the same way persons who are taken out of the water apparently drowned. But, on account of its great levity, the pressure of the air upon the blood does not deserve notice, as being three hundred times less than the force of the heart; and insufficient to force the air against the blood, which may easily be done by a syphon.

Is air contained between the lungs and the thorax? Is this air rarified in inspiration, and afterwards becoming condensed, and compressing the lungs, does it cause exspiration? Is this opinion confirmed by the analogy of birds, of which it is strictly true? Every thing concurs to confute this opinion: behind the pleura, in living quadrupeds, as well as in dead human bodies, the naked lungs are visible, without any intermediate space betwixt them: on perforating the pleura, the lungs retract themselves towards the vertebræ as soon as the air comes in contact with them. In birds, the lungs, being pervious, admit the air through large holes into the cavity of the thorax. But in these there is a manifest space betwixt the lungs and the pleura, which would be equally manifest in quadrupeds, if the lungs were not contiguous with the pleura. Large wounds, admitting the air into one cavity of the thorax only, diminish the respiration; but such wounds, as let the air into both cavities, suppress it. When the thorax is opened under water, it emits no bubbles of air through the said water; but in birds, in whose thorax there is air, it does. The imaginable space betwixt the lungs and the thorax is filled by vapour, or a very little water. Adhesions of the lungs injure the respiration but in a small degree; which ought entirely to cease, if any intermediate air betwixt the lungs and thorax were necessary to respiration. Finally, the external air, being admitted to any of the membranes of the human body, inflames them, if they be not defended by plentiful mucus, and of this the pleura is destitute.

Respiration, whether by the admixture of a subputrid vapour, or in some other way, certainly vitiates the air, and renders it unfit either for inflating the lungs or supporting flame; and lastly, it deprives that element of its elasticity. It is probable that this happens from putrefaction, since by a crowd of men the air is rendered pestilential, and fevers of the most malignant kind are generated in a few hours. In whatever way it happens, we are certain, that, in the lungs, the air is vitiated; loses its elasticity; and cannot keep the lungs distended, so as to transmit the quantity of blood now increased by the dilatation of the pulmonary arteries, into the veins. Nor can the will dilate the breast beyond certain bounds, or assist the passage of the blood. A state therefore will take place, in which the blood cannot pass through the lungs,

Thus a new resistance to the blood continually coming from the heart is generated: and in long retentions of the breath, as in making violent efforts, the venous blood, especially of the head, stagnates before the right ventricle of the heart, which is closed up, because it cannot evacuate itself into the lungs; and tumefies the face with redness, and sometimes bursts the veins of the brain, neck, intestines, kidneys, or lungs, and even the right auricle of the heart. This is the cause of excessive anxiety of mind; this is the cause of death in compressed air, in persons drowned or strangled, which is much more sudden than is commonly imagined with regard to drowned people. A living person, therefore, that he may remove those inconveniences which arise from the passage of the blood being obstructed, slackens the powers of inspiration, and excites to action those of expiration, in order to free the breast from the too greatly rarified air.

These powers are, first, the elasticity of the ribs, which being drawn upwards out of their natural situation, as soon as the elevating powers cease to act, spontaneously replace themselves at more acute angles with the sternum and vertebræ. There is also the elastic force of the bronchia and vesicles distended with air, by which they endeavour to contract. Hence exspiration is performed more easily and quickly than inspiration; and hence it is the last action of dying people.

These are assisted by the abdominal muscles; the oblique, straight, and transverse. The former of these are fastened by one part to the lower ribs; and by another part they are attached to the os pubis and ilium, which are immoveable, when compared with the breast. Therefore the straight muscles, being contracted, flatten the arch into which the abdominal viscera were protruded by the depression of the diaphragm, reduce the convexity of the abdomen nearer to a straight line; force the abdominal viscera upwards and backwards against the diaphragm, which alone can give way; and press it up into the thorax, which is thus rendered shorter. The oblique muscles, for the same reasons, compress the lateral parts of the abdomen, carry the liver and stomach backwards, and press

them towards that place where there is the least resistance. Lastly, all of them draw down the ribs which were elevated by the intercostals. The transverse muscles, indeed, do not draw down the ribs; but they pull the cartilages of the false ribs a little inwards, render the whole abdomen much narrower, and force the same viscera against the diaphragm. As accessory powers may be reckoned the sternocostal, and the long internal intercostal muscles, which are called depressors. By this joint force the elevated ribs descend; the middle ones more, the uppermost less, the lowest most of all; their margins are drawn inwards: the cartilages ascend, and return into acute angles with the sternum; and the sternum itself recedes backwards with the ribs. By these means the thorax is rendered narrower in every direction and shorter, and expels as much air out of the lungs as is sufficient to remove the uneasiness.

In violent respiration, when the inspirations are fuller, the more powerful exspirations derive assistance from some other causes, as the sacro-lumbalis, longissimus and quadratus muscles. By this force, leaden bullets, weighing above a drachm, may be blown to the distance of 363 feet; which force is equal to a third part of the pressure of the atmosphere. But, in a healthy person, the muscles of the abdomen alone suffice, and the lungs are not so much emptied as in blowing.

The effects of exspiration are the compression of the blood-vessels of the lungs; the diminution of the angles of the bronchia; the resting the weight of the adjacent vessels on the reticular vessels; the expulsion of the corrupted air from the lungs; the propulsion through the veins of that part of the blood, which is impacted in the capillary arteries, to the left side of the heart, and the impeding that part of the blood which is coming from the right ventricle. Exspiration, therefore, stops the ready entrance of the blood into the lungs; and as the whole thorax is compressed at the same time, it repels the venous blood into the veins of the head and fills the brain and its sinuses.

In this manner the necessity for respiration arises anew, as often as the collapsed vessels of the lungs resist the blood expelled from the right ventricle of the heart: this is one cause of death in those animals which expire in vessels exhausted of air. The lungs in those which have remained long in vacuo, from having the air drawn out from them, become dense, solid, and heavier than water; and, therefore, impervious to the blood. Of the same kind is the death of those who are killed by lightning, and perhaps by the noxious vapours of caverns. Therefore, in consequence of a most intelligent structure, at the first perception of the uneasiness arising from the opposition to the passage of the blood through the lungs, the exspiring powers become relaxed, the inspiring powers are excited into action, and the motion of the blood through the lungs is rendered free and accelerated.

Are there other causes of alternate respiration? Is any thing to be derived from the compression of the vena sine pari, of the phrenic nerve, or from the blood not being sent to the brain? But these are disproved by comparative anatomy; which, where there is no such nerve or vein, finds the same alternation in respiration every where. Does it proceed from the alternate contraction of antagonist muscles, among which, those of exspiration relax those of inspiration, and the reverse? But, according to this argument, all the muscles of the human body would be perpetually alternating in their motions.

From what has been said, it sufficiently appears, that respiration is absolutely necessary to a healthy adult; because, whether the lungs remain long in a state either of exspiration or of inspiration, death will be the consequence. Therefore no animal, that has lungs like ourselves, after it has breathed for some time, so that the air shall have penetrated into the inmost parts of the lungs, and the pulmonary artery shall have brought a new quantity of blood to that viscus, can subsist longer than a few minutes without the use of air, without perishing, or at least falling into a state which differs from death only in the possibility of recovery. In an animal recently born, this necessity for air does not take place very instantaneously.

But the use of respiration is different from this necessity; which nature might have avoided, either by forming no lungs at all, or by constructing them similar to those of the fetus. The use, therefore, of respiration must be very considerable, since all animals are furnished either with lungs, or with gills, or with a wind-pipe distributed through all parts of the body.

To investigate this utility, let us compare the blood of the adult with that of the fetus, and with the vital fluid in fishes. It appears, that in the fetus the blood is destitute of its florid redness and solid density; that the blood of fish is cold, and has less density, and a tender crassament. It is therefore probable, that the blood acquires both these properties in the lungs.

Is animal heat generated principally in the lungs? Does it arise from the alternate extension and contraction, relaxation and compression, of the vessels, by which the solid parts of the blood are perpetually rubbed together, and suffer attrition from their constriction? The lungs, therefore, will add to the office of the rest of the arteries, because in them the blood is alternately relaxed and compressed more than in any other part of the body. But when the lungs are obstructed, ulcerated, and almost destroyed, morbid heat is increased in the human body: and in the lungs, the cold air comes most nearly in contact with the blood.

The density is, indeed, promoted by the copious discharge of watery vapour from the vessels of the lungs, by which the rest of the mass becomes specifically heavier. In the same manner as in other arteries, the blood, being alternately retarded and accelerated, is figured by the moulds of the ultimate arteries, becomes spherical, and therefore denser, having more ponderous globules, and less light fluid. The pulmonary vein also being smaller than its corresponding artery, is of considerable use in compressing the globules, and in increasing their attraction. Nevertheless, cold animals, with very small lungs, have dense and coagulable blood; as also the chick in ovo. The course of the blood through the lungs is shorter: through the whole body the course is longer, and the artery weaker; the ventricle by which the blood is propelled, is also weaker.

Is the air itself received into the blood in the lungs, and does it there produce necessary vibrations? Is this demonstrated from the resistance of the body to the weight of the external air; from the air found in the blood-vessels, in the cellular substance, and in the cavities of the human body; from the cracking produced by extending the joint; from air being manifestly poured from the trachea into the hearts of many animals, as the

locust; from the escape of air from the blood and animal fluids in Mr. Boyle's vacuum; from the necessity of a vital oscillation in the blood; and from the increased redness of the pulmonary blood?

That no elastic air is here received into the blood, is demonstrated from its not being able to enter into the blood, if it retain its elasticity; from the inutility of its reception, if its elasticity be lost in the blood; from the perfect immutability of the blood by cold; from the minuteness of the inhaling vessels; from the sides of the vesicles being perpetually covered with mucus; from the elastic nature of air being unfit to pass through capillary vessels; and from its repulsion by water, that hinders it from passing through moistened paper, linen, or leather. Again, air thrown into the trachea never passes into the heart; or only when it is driven with excessive force. In the vessels and humours of the human body, air, from a state of inelasticity, becomes elastic in consequence of putrefaction, frost, or an external vacuum. But such air exists in every liquid, and is taken into our bodies with the aliments, and with vapours, mixing slowly and difficultly. There never were any elastic bubbles of air observed in the blood of a living animal, unless after wounds; air being inflated into the blood-vessels of any animal, kills it certainly and speedily. Nor is there any thing sufficiently certain in the increased redness of the blood in the pulmonary veins. Lastly, air indeed is absorbed by most fluids, and by water, but slowly, and only at the end of several days after the former air has been exhausted by the pump. It then likewise lays aside its elastic nature; and no reason has been advanced why the air should either be more speedily absorbed by the blood, or why it should retain its elasticity after its absorption.

Is the blood cooled in the lungs? Is this proved from the death of animals in air heated to the same degree with the animal, as is believed to have happened from very sultry summer weather, and scorching east winds? Are the pulmonary veins, therefore, less than the arteries? Does the desire of cold in hard-working people arise thence? That the blood is cooled in the lungs, is thus far true, that it warms the contiguous air, and therefore imparts to it something of its own heat. But that this was not the design of nature, is evident; since no one has said, that the venous blood is hotter than the arterial, although some assert that it is colder; and nobody ever observed the left ventricle of the heart colder than the right. But the venous blood enters the lungs. If it be cooled there, it follows that the arteries must receive it still colder. Therefore, the blood recovers that heat which it lost, and even more: and besides, a person may live in an air much hotter than the blood itself, of which we have a familiar example in baths, and warm climates. The size of the pulmonary artery in the fetus, which does not respire, is greater; and the larger area of the right auricle and ventricle of the heart, which is likewise much greater in the fetus, seems to be a receptacle subservient to frequently necessary retardations, and the narrowness of the vein contributes to the acceleration of the blood.

Does the blood derive its redness from the air? This is contradicted by what we see in cold animals, which though they make almost no use of the air, have blood equally red with that of warm animals; by the certain connection of redness in the blood of frogs, with their having plenty of food, and of paleness with want of food; and by the air, as we have just now said, having no access to the blood. Nevertheless, redness is produced, and restored to the blood by the contact of air, and is destroyed by its removal. Does some subtle element from the air penetrate the blood, and cause its colour, as light is required for the colours of plants?

Why do tortoises, frogs, lizards, snails, earwigs, and many other insects, live long without air? In them, the lungs are given, not so much for the preparation of the blood, of which they have but a small quantity, as for assisting them in swimming; hence their lungs are supplied with veins from the cava, and with arteries from the aorta. Insects inhale and exhale air, through points in the skin. Why do all animals, however small, such as little birds, perish in air that is not renewed? Because the air, which has once entered the lungs, is contaminated by inelastic, watery, and alkaline vapours, and therefore it becomes noxious: not because it becomes lighter; for the mercury falls but little in air, which has not been renewed, and which has killed an animal. Hence, on the other hand, animals survive longer in air which is more compressed than that of the atmosphere: for in that case, the proportion of the elastic element is greater, and therefore the air is more slowly contaminated. But, even in other cases, confined air becomes deleterious, and filled with vapours, by stagnation alone. Why do animals swell in an exhausted receiver? From the expansion of the air, which existed in an inelastic state in the blood.

There is a certain connection between the pulse and respiration. According to the common course of nature, three or four pulsations are reckoned to one respiration. If the quantity of blood sent to the heart be increased, the frequency both of the pulse and respiration, are increased also. This is the reason of the panting in a person taking exercise, which accelerates the motion of the venous blood. If the blood meet with much resistance in the lungs, and do not pass freely from the right into the left ventricle of the heart; to accelerate its course, both the number and magnitude of the respirations are increased. This is the cause of sighing, yawning, and panting; of which the first is a deep inspiration; the second slow, and very great; and the third, frequent and imperfect. The number of respirations, however, does not increase with the pulse; of which we have an example in fevers, in which the lungs are not affected.

The mucus, which lines the sensible membrane of the bronchia, may become troublesome, both by its quantity and acrimony; it has been even known to cause suffocation in a dropsy of the lungs. Therefore, its superabundance, adhesion, or acrimony, is removed by coughing; namely, by irritating the respirative system, the mucus or concretions are loosened and expelled by large inspirations, and exspirations, alternately following each other with rapidity, and by strokes of the abdominal muscles.

Laughter differs from coughing in its cause, which resides commonly in the mind, or at least, consists in the titillation of some of the cutaneous nerves; and also, because, after one deep inspiration, there are frequent but imperfect exspirations, through the contracted glottis, and the air is not totally evacuated from the lungs. Hence laughter, in a moderate degree, conduces to health; because, in place of one full inspiration, several inspirations and exspirations happen in the same

time, and thus the concussion is greater. Hecne its danger, from stagnation of the blood; because the exspiration is not full, and therefore the blood is admitted into the pulmonary artery, but is not suffered to pass through it. Weeping begins with a deep inspiration, after which follow short alternate inspirations and exspirations; and it is finished with a deep expiration, which is immediately followed by an inspiration; hence it has nearly the same good and bad effects: and when moderate, it relieves the distress arising from grief. Hiccough is a very great, sonorous, and sudden inspiration. Sneezing consists of one deep inspiration, succeeded by a singular powerful exspiration; and by the torrent excited, the acrid matter, irritating the nostrils, is blown away.

The secondary uses of respiration are very numerous. It exhales copiously, and removes from the blood something highly noxious; for by remaining in the air, it will cause suffocation; and the breath of many people, crowded in a close and small place, impregnates the air with a suffocating quality. On the other hand, it absorbs from the air a thin vapour, of which the use is perhaps not sufficiently known. It is also a force, which perpetually compresses the abdomen, and all its viscera; it evacuates the stomach, intestines, gall-bladder, receptacle of the chyle, urinary bladder, intestinum rectum, and the womb; it comminutes the aliments, and forces the blood through the liver, spleen, and mesentery. It causes a kind of flux and reflux in the blood, so that it is alternately pressed back towards the extremities of the veins, and a little after is propelled towards the heart by an accelerated velocity, as into an empty space. Moreover, inspiration attracts the odoriferous particles from the air, and conveys them to the sensorium. But even sucking, so necessary to the new-born infant, is effected by inspiration, and by forming a larger space, in which the air contained in the mouth is rarefied, so that the pressure of the external air forces the milk into that part where it is least resisted. Lastly, the voice itself depends upon the air, and seems to be the principal manifest effect of respiration. Such are the chief physiological facts connected with this important function: let us next attend to its chief chemical facts.

The fluid respired by animals is common atmospherical air; and it has been ascertained by experiment that no other gasseous body with which we are acquainted can be substituted for it. All the known gasses have been tried: but they all prove fatal to the animal which is made to breathe them. Gasseous bodies, as far as respiration is concerned, may be divided into two classes, *unrespirable* and *respirable*.

Unrespirable gasses are of such a nature that they cannot be drawn into the lungs of an animal at all; the epiglottis closing spasmodically whenever they are applied to it. To this class belongs carbonic acid, and probably all the other acid gasses, as has been ascertained by the experiments of Pilatre de Rozier. Ammoniacal gass belongs to the same class, for the lungs of animals suffocated by it were found by Pilatre not to give a green colour to vegetable blues.

This active chemist ventured into a brewer's tub while it was full of carbonic acid gass evolved by fermentation. A gentle heat manifested itself in all parts of his body, and occasioned a sensible perspiration. A slight itching sensation constrained him frequently to shut his eyes. When he attempted to breathe, a violent feeling of suffocation prevented him. He sought for the steps to get out; but not finding them readily, the necessity of breathing increased, he became giddy, and felt a tingling sensation in his ears. As soon as his mouth reached the air he breathed freely, but for some time he could not distinguish objects; his face was purple, his limbs weak, and he understood with difficulty what was said to him. But these symptoms soon left him. He repeated the experiments often; and always found that as long as he continued without breathing, he could speak and turn about without inconvenience, but whenever he attempted to breathe the feeling of suffocation came on.

Respirable gasses on the contrary may be drawn into the lungs and thrown out again without any opposition from the respiratory organs: of course the animal is capable of respiring them. They may be divided into four subordinate classes. 1. The first set of gasses occasion death immediately, but produce no visible change in the blood. They occasion the animal's death merely by depriving him of air in the same way as he would be suffocated by being kept under water. The only gasses which belong to this class are hydrogen and azote. 2. The second set of gasses occasion death immediately, but at the same time produce certain changes in the blood, and therefore kill not merely by depriving the animal of air, but by the action of certain specific properties. The gasses belonging to this class are carburetted hydrogen, sulphuretted hydrogen, carbonic oxyd, and perhaps also nitrous gass. 3. The third set of gasses may be breathed for some time without destroying the animal, but death ensues at last, provided their action be long enough continued. To this class belong the nitrous oxyd and oxygen gass. 4. The fourth set may be breathed any length of time without injuring the animal. Air is the only gasseous body belonging to this class.

It has been long known that an animal can only breathe a certain quantity of air for a limited time; after which the air becomes a deadly poison, and produces suffocation as effectually as the most noxious gass, or a total absence of air. It was suspected long ago that this change is owing to the absorption of a part of the air; and Mayo made a number of very ingenious experiments in order to prove the fact. In 1757 Dr. Black, by breathing through lime-water, ascertained that the air when thrown out of the lungs contains carbonic acid. This discovery was still farther confirmed by Lavoisier in his first dissertation on respiration, published in the memoirs of the French Academy for 1777. Priestley and Scheele demonstrated that the quantity of oxygen in atmospherical air is diminished by respiration. It was afterwards proved by Lavoisier, and many other philosophers, who confirmed and extended his facts, that no animal can live in air totally destitute of oxygen. Even fishes, which do not sensibly respire, die very soon if the water in which they live be deprived of oxygen gass. Frogs, which can suspend their respiration at pleasure, die in about forty minutes, if the water in which they are confined be covered over with oil. Insects and worms, as Vauquelin has proved, exhibit precisely the same phenomena. They require air as well as other animals, and die like them if they be deprived of it. They diminish the quantity of oxygen in the air in which they live, and give out by expiration the very same products as other animals. Worms, which are more retentive of life than most other animals, or at least

not so much affected by poisonous gasses, absorb every particle of the oxygen contained in the air in which they are contained before they die. M. Vauquelin's experiments were made on the gryllus viridissimus, the limax flavus, and helix pomatia.

The quantity of air respired differs very much in different animals. Man, and hot-blooded animals, are under the necessity of breathing constantly; whereas amphibious animals have a certain power over respiration, and can suspend the function altogether for a limited time. Dr. Barley has ascertained that these animals acquire a much greater command over their respiratory organs by habit. Fish do not breathe at all, and consume so little air, that the small portion of it, held in solution by the water in which they swim, is sufficient for them. It appears that the number of respirations made in a given time differ in different men. Dr. Hales reckons them at 20 in a minute. A man on whom Dr. Menzies made experiments breathed only 14 times in a minute. Mr. Davy informs us that he makes between 26 and 27 in a minute. I myself, says Dr. Thomson, make about 19 at an average. The average of all is 20. Now 20 in a minute makes 28,800 in 24 hours. The quantity of air drawn in and emitted at every respiration must differ considerably with the size of the man and the capacity of his lungs.

Dr. Menzies found that a man draws in at a medium 40 cubic inches of air at every inspiration. Dr. Goodwin has concluded from his experiments, that, after a complete expiration, the mean quantity of air which remains in the lungs amounts to 109 cubic inches; and Menzies has endeavoured to prove that after an ordinary respiration there remains 170. Mr. Davy has concluded that his lungs after a forced expiration still retain 41 cubic inches of air; after a natural expiration they contain 118 cubic inches.

After a natural inspiration -	135
After a forced inspiration -	254

By a full forced expiration, after a forced inspiration he threw out - - - 190 cubic inches.

After a natural inspiration -	78.5
After a natural expiration -	67.5

Dr. Menzies' estimate of an ordinary inspiration seems to approach nearest the average; but Dr. Bostock has shewn that his estimate of the capacity of the lungs is too low. Perhaps we shall not err very much if we suppose, with him, that the ordinary quantity of air contained in the lungs is 280 cubic inches; and that 40 inches, or $\frac{1}{7}$ of the whole is drawn in and thrown out at every ordinary respiration. This, supposing 20 respirations in a minute, will make the quantity of air drawn in and thrown out of the lungs every minute amount to 800 inches; to 48,000 inches in the hour, and to 1,152,000 inches in 24 hours, which amounts to rather more than 52½ lbs. avoirdupois.

Let us now endeavour to trace the changes produced by respiration. These are of two kinds, namely: I. The changes produced upon the air respired; II. Changes upon the blood exposed to this air. Each of these naturally claims our attention.

I. For our knowledge of the change produced upon the air by respiration we are chiefly indebted to Priestley, Cigna, Menzies, Lavoisier, Seguin, and Mr. Davy. These changes are the following: 1. Part of the oxygen of the air respired disappears; 2. Carbonic acid gass is found in its place; 3. It is loaded with water in the state of vapour.

1. A considerable number of experiments have been made to determine the change of bulk which air undergoes by being respired. According to Davy, by a single inspiration and expiration, it is diminished from $\frac{1}{70}$th to $\frac{1}{100}$th part of its bulk. If with Dr. Bostock, we take $\frac{1}{90}$th as the average diminution, and 40 inches as the quantity of air drawn into the lungs at each inspiration; then it will follow that half a cubic inch of the air disappears each time we respire. This in a day would amount to 14,400 cubic inches, which is rather more than eight cubic feet. When air is breathed the animal can support it no longer, the diminution which it undergoes is variously stated: Mr. Davy found it to amount to $\frac{1}{18}$th of the whole air; Lavoisier and Goodwin to $\frac{1}{20}$th; and Crawford, on the other hand, found no diminution at all. Their numbers vary so much, from each other, and from the estimate of a single respiration, that it is impossible to avoid concluding the diminution to be different at different times. I was induced, says Dr. Thomson, by a letter from Mr. Dalton in the summer of 1806, to make some experiments on the subject. In some cases I could perceive no diminution at all; in others it was perceptible. It was greatest when the animal was taken out repeatedly during the experiment, or when air was employed which was purer than that of the atmosphere. I am disposed to consider this diminution as accidental, and owing to some absorption of air altogether independant of respiration, and exceedingly various in different circumstances.

2. When the air drawn into the lungs is thrown out again, it is found deprived of a portion of its oxygen. Various experiments have been made to ascertain how this principle is lost by respiration in a given time; but they by no means correspond with one another. Indeed it is extremely probable, if not absolutely certain, that the degree of effect which the same animal produces upon the air respired differs materially at different times, and in consequence of different circumstances. Nothing, therefore, beyond an approximation can be expected from our experiments on this function. Dr. Menzies was the first who attempted to ascertain the quantity of oxygen consumed by a man in a day. According to him, 36 inches are consumed in a minute, and of course 51,840 inches in 24 hours. This estimate exceeds that obtained by Lavoisier and Davy from their experiments. Lavoisier and Seguin estimate the quantity of oxygen consumed by a man in 24 hours at 46,037 cubic inches, and this nearly coincides with the result which Lavoisier obtained from his last experiments, in which he was occupied when he was dragged to the place of execution. With this also the experiments of Davy coincide very well. He calculates that 31,6 inches of oxygen are consumed in a minute, which, in 24 hours, makes 45,504 inches. This coincidence would dispose us to embrace this result as affording a near approximation to the truth. We may conclude, then, that in a day a man consumes rather more than 25 cubic feet of oxygen. Now, since the oxygen amounts only to about one-fifth of the atmosphere, it follows that in a day a man destroys, or renders unfit for supporting combustion or respiration, no less than 125 cubic feet of air.

3. The air which is thrown out of the lungs contains in it a quantity of carbonic acid which did not exist in it previous to its being used for respiration. Dr. Menzies conceived that the bulk of this gass is precisely equivalent to that of the oxygen consumed. This also was the result of the experiments of Dr. Crawford. Lavoisier, in

his experiments on the Guinea pig, found it somewhat less. In his first experiment, he found the oxygen consumed, to the carbonic acid formed, as 20 to 16,5; in his second, as 20 to 173. In his experiments on Seguin, in 1789, the oxygen consumed was to the bulk of carbonic acid formed, nearly as 20 to 16,6; but in those that were made afterwards the proportion of carbonic acid is diminished by nearly one half. In Mr. Davy's experiments, the bulk of carbonic acid formed corresponded very nearly with that of the oxygen consumed, so that in this respect they coincided with those of Crawford and Menzies. I was informed by Mr. Dalton, observes Dr. Thomson, in the summer of 1806, that he had satisfied himself, by a variety of experiments, that the bulk of carbonic acid gass formed was exactly to that of the oxygen gass consumed. On repeating the experiment with that particular view, I found that in some cases this took place very nearly; but upon the whole the bulk of oxygen which disappeared was somewhat greater than that of the carbonic acid formed; but the difference varied considerably, and kept pace with the diminution of the bulk of air by respiration. Hence I consider it as owing to the abstraction of a part of the air by some other way than respiration. If this abstraction be allowed for, I have no doubt, from my own experiments, that the bulk of the carbonic acid formed by respiration is precisely equal to that of the oxygen which has disappeared. The absolute quantity it is difficult to state, as it depends upon a variety of circumstances. I am disposed to consider it, at an average, as approaching to 40,000 cubic inches in 24 hours, though probably somewhat under that quantity. Now, this quantity of carbonic acid contains little less than three quarters of a pound avoirdupois of carbon.

4. Dr. Priestley concluded from his experiments that not only the oxygen, but the azote also, of the air respired was diminished. This opinion was still farther confirmed by Davy, who found the consumption of azote to amount to about $\frac{1}{4}$th of that of the oxygen. Dr. Henderson has lately made experiments with the same result, though the proportion of azote absorbed was rather less. Upon repeating these experiments, says the above writer, I found likewise the loss of azote, but it was extremely inconstant, sometimes being scarcely perceptible, and at other times considerable. It keeps pace with the diminution of the bulk of the air respired, and with the difference between the bulk of the oxygen consumed and the carbonic acid formed. Hence I am disposed to ascribe all these differences to the same cause. I conceive that a portion of the air respired disappears without undergoing any change, and that this portion occasions the diminution of the azote, and the difference between the bulk of the carbonic acid formed and the oxygen consumed. What comes of this portion of air it is difficult to say; but I think it conceivable that the disappearing of such a portion may be confined to the unnatural circumstances occasioned by the experiment; that the difficulty of throwing out the air from the lungs in these circumstances may be such as to induce absorbents to act, and remove a portion, which in the ordinary situation of the lungs would have been thrown out by expiration.

5. It is not so easy to determine the portion of water emitted from the lungs mixed with the air expired, as it is that of the carbonic acid. According to the experiments of Dr. Hales, it amounts in a day to 20,4 oz.; but his method was not susceptible of great accuracy. Mr. Lavoisier, on the other hand, estimates it rather higher; but the proportion seems rather to have been the result of calculation than of any direct measurement. The result of a few trials which I made during the summer of 1806 gave me very nearly 19 ounces per day as the quantity emitted from my own lungs; but I do not lay much stress upon the results, as they were not sufficiently varied to give a fair average; but I think it worth while to mention the method I followed, on account of its simplicity. I filled a glass with water, and then by breathing on it, and gradually raising its temperature till the vapour of the breath just ceased to be condensed, I ascertained the force of the vapour contained in the air respired from Mr. Dalton's table. Then, ascertaining the force of the vapour in the atmosphere at the time, and substracting it from the force of the vapour in the breath, I obtained the force of the vapour actually emitted from the lungs. Supposing 40 inches of air to be drawn in at each inspiration, it was easy to calculate from Dalton's table the weight of the vapour which it contained when emitted.

II. Let us now endeavour to ascertain the changes produced on the blood by respiration. The whole of the blood is propelled from the heart to the lungs, and circulates through the vessels of that organ; and during that circulation it is exposed to the influence of the air which the animal is constantly drawing into the lungs. Now certain changes are produced upon it by this action, which have been partly traced by the experiments of Priestley, Cigna, Foureroy, Hassenfratz, Beddoes, Watt, and above all by those of Mr. Davy. These changes, as far as we are acquainted with them, are the following: 1. It acquires a florid red colour, and the chyle disappears; 2. It loses a portion of carbon; 3. It emits water.

It has been long known that the blood which flows in the veins is of a dark reddish purple colour. Lower observed that the colour of the venous blood was converted into that of arterial during its passage through the lungs.

No chyle can be distinguished by its white colour in the blood after it has passed through the lungs. The changes, then, which take place upon the appearance of the blood are two: 1. It acquires a florid red colour. 2. The chyle totally disappears. Lower himself knew that the change was produced by the air, and Mayow attempted to prove that it was by absorbing part of the air. But it was not till Dr. Priestley discovered that venous blood acquires a scarlet colour when put in contact with oxygen gass, and arterial blood a dark red colour when put in contact with hydrogen gass, or which is the same thing, that oxygen gass instantly gives venous blood the colour of arterial; and hydrogen, on the contrary, gives arterial blood the colour of venous blood—it was not till then that philosophers began to attempt any thing like an explanation of the phenomena of respiration.

The blood is a fluid of so complex a nature, that it is not easy to ascertain the changes produced in it by exposure to different gasses out of the body; and even if that could be done, we have no method of proving that the effect of those gasseous bodies upon coagulated blood are the same as they would be on the blood in its natural state, circulating in the vessels of a living animal.

The facts which have been ascertained are the following: 1st, It appears from the experiments of Priestley, Girtanner, and Hassenfratz, that when venous blood is exposed to oxygen gass con-

fined over it, the blood instantly assumes a scarlet colour. Mr. Davy could not perceive any sensible diminution of the bulk of the gass.

2d, The same change of colour takes place when blood is exposed to common air. In this case a quantity of carbonic acid gass is formed, and a quantity of oxygen gass, exactly equal to it in bulk, disappears; making allowance for the small quantity of carbonic acid, which we may suppose to be absorbed by the blood itself.

3d, Venous blood exposed to the action of azotic gass continues unaltered in colour, neither does any perceptible diminution of the gass ensue.

4th, Venous blood exposed to the action of nitrous gass, becomes of a deep purple, and about ¼th of the gass is absorbed.

5th, Venous blood exposed to nitrous oxyd becomes of a brighter purple, especially on the surface, and a considerable portion of the gass is absorbed.

6th, Venous blood exposed to carbonic acid gass becomes of a brownish red colour, much darker than usual, and the gass is slightly diminished in bulk.

7th, Carbureted hydrogen gass gives venous blood a fine red colour, a shade darker than oxygen gass does, was at first observed by Dr. Beddoes, and at the same time a small portion of the gass is absorbed. This gass has the property of preventing, or at least greatly retarding, the putrefaction of blood, as first observed by Mr. Watt.

8th, When arterial blood is put in contact with azotic gass, or carbonic acid gass, it gradually assumes the dark colour of venous blood, as Dr. Priestley found. The same philosopher also observed, that arterial blood acquired the colour of venous blood when placed in vacuo. Consequently this alteration of colour is owing to some change which takes place in the blood itself independent of any external agent. The arterial blood becomes much more rapidly and deeply dark coloured when it is left in contact with hydrogen gass placed above it. We must suppose therefore that the presence of this gass accelerates and increases the change, which would have taken place upon the blood without any external agent.

9th, If arterial blood be left in contact with oxygen gass, it gradually assumes the same dark colour which it would have acquired in vacuo, or in contact with hydrogen; and after this change oxygen can no longer restore its scarlet colour. Therefore it is only upon a part of the blood that oxygen acts; and after this part has undergone the change which occasions the dark colour, the blood loses the power of being affected byoxygen.

10th, Mr. Hassenfratz poured into venous blood a quantity of oxymuriatic acid; the blood was instantly decomposed, and assumed a deep and almost black colour. When he poured common muriatic acid into blood, the colour was not altered. Now oxymuriatic has the property of giving out its oxygen readily; consequently the black colour was owing to the instant combination of a part of the blood with oxygen.

Dr. Priestley, the first of the modern chemists who turned his attention to respiration, concluded from some of his earliest experiments, that the blood as it passed through the lungs gave out phlogiston to the air, which was expired loaded with substance; and of course that the purpose of respiration was to free the blood from phlogiston. Lavoisier soon after ascertained with more precision the changes which the air undergoes during respiration; and he formed a theory in order to explain that function, assuming as its basis that all the changes on the air inspired are produced in the lungs, and of course that all the new substances expired are formed in the lungs. According to him the blood absorbs no air in the lungs; but gives out hydrogen and carbon, which, combining with the oxygen of the air inspired, form water and carbonic acid. This theory was adopted by La Place, Crawford, Gren, and Girtanner, with a small variation. Indeed it does not differ, except in detail, from the original hypothesis of Dr. Priestley, that the use of respiration is to rid the blood of phlogiston; for if we substitute carbon and hydrogen for phlogiston, the two theories precisely agree. Mr. Lavoisier attempted not to prove its truth; he only tried to shew that the oxygen absorbed corresponds exactly with the quantity of oxygen contained in the carbonic acid and the water emitted. A different theory was afterwards proposed by Mr. De La Grange. According to this philosopher, the ogygen gass which disappears combines with the blood as it passes through the lungs; and at the instant of this combination there is set free from the blood a quantity of carbonic acid gass and water, which are thrown out along with the air expired. This theory was adopted and illustrated by Mr. Hassenfratz, and was embraced by Dr. Thomson in the last edition of his work, modified a little by the experiments of Davy. A letter which he received from Mr. Dalton in the summer of 1806, combating this theory, and defending that of Crawford, induced him to examine it more narrowly, and the result of a set of experiments which he immediately undertook, convinced him that Mr. Dalton's objections were well founded. The carbonic acid formed, he considered as exactly equal to the bulk of the oxygen which disappears. Hence this oxygen must be changed into carbonic acid in the lungs; for oxygen, when changed into carbonic acid, does not sensibly alter its bulk.

The blood then must emit carbon in the lungs to the extent of about ⅛ths of a pound in the day. This Dr. Thomson conceives is all that happens in the lungs. The watery vapour, indeed, is doubtless secreted from the blood to mix with the air inspired; but probably the secretion takes place in appropriate organs. By the loss of carbon the venous blood is changed into arterial. The very same thing happens when venous blood is presented to the air. The change of chyle into blood, he presumes, takes place in the blood vessels. Indeed the blood is a liquid which is constantly running through a suite of changes. Hence it is kept of a similar nature only by the constant influx of new matter, which is as constantly manufactured in the blood. It appears from the most accurate observations hitherto made, that neither chyle nor lymph contain fibrin, which forms a very conspicuous part of the blood. This fibrin is employed to supply the waste of muscles, the most active parts of the body, and therefore in all probability requiring the most frequent supply. Nor can it be doubted that it is employed for other useful purposes. The quantity of fibrin in the blood, then, must be constantly diminishing, and therefore new fibrin must be constantly formed. But the only substances out of which it can be formed are the chyle and lymph, neither of which contain it. There must therefore be a continual decomposition of the chyle and lymph going on in the blood-vessels, and a continual new formation of fibrin. Other substances also may be formed; but we are certain that this must be formed there, because it does not

exist previously. Now one great end of respiration must undoubtedly be to assist this decomposition of chyle and complete formation of blood.

It follows from the experiments of Fourcroy, formerly enumerated, that fibrin contains more azote and less carbon than any of the other ingredients of the blood, and consequently also than any of the ingredients of the chyle. In what manner the chyle, or part of it, is converted into fibrin, it is impossible to say: we are not sufficiently acquainted with the subject to be able to explain the process. But we can see, at least, that carbon must be abstracted from that part of the chyle which is to be converted into fibrin. Hence as the process of blood-making advances, there must be a greater and greater redundancy of carbon in the liquid. Unless this redundancy were removed, the process could not go on, and probably the whole would run into putrefaction. We may conclude then, that one great use of respiration is to abstract this carbon, by forming with it carbonic acid. How this is performed, indeed, it is impossible at present to explain; but the fact is undoubted.

But the abstraction of carbon is not the only advantage gained by respiration: the temperature of all animals depends upon it. It has been long known, that those animals which do not breathe have a temperature but very little superior to the medium in which they live. This is the case with fishes and many insects. Man, on the contrary, and quadrupeds which breathe have a temperature considerably higher than the atmosphere: that of man is 98°. Birds, who breathe in proportion a still greater quantity of air than man, have a temperature equal to 103° or 104°. It has been proved that the temperature of all animals is proportional to the quantity of air which they breathe in a given time. These facts are sufficient to demonstrate that the heat of animals depends upon respiration. But it was not till Dr. Black's doctrine of latent heat became known to the world, that any explanation of the cause of the temperature of breathing animals was attempted. That illustrious philosopher, whose discoveries form the basis upon which all the scientific part of chemistry has been reared, saw at once the light which his doctrine of latent heat threw upon this part of physiology, and he applied it very early to explain the temperature of animals.

According to him, part of the latent heat of the air inspired becomes sensible, and of course the temperature of the lungs, and the blood that passes through them, must be raised; and the blood thus heated, communicates its heat to the whole body. This opinion was ingenious, but it was liable to an unanswerable objection: for if it were true, the temperature of the body ought to be greatest in the lungs, and to diminish gradually as the distance from the lungs increases; which is not true. The theory in consequence was abandoned, even by Dr. Black himself; at least he made no attempt to support it.

Dr. Crawford, who considered all the changes operated by respiration as taking place in the lungs, accounted for the origin of animal heat almost precisely in the same manner with Dr. Black. According to him, the oxygen gass of the air combines in the lungs with carbon emitted by the blood. During this combination, the oxygen gives out a great quantity of caloric, with which it had been combined; and this caloric is not only sufficient to support the temperature of the body, but also to carry off the new-formed water in the state of vapour, and to raise considerably the temperature of the air inspired. According to this philosopher, then, the whole of the calorie which supports the temperature of the body is evolved in the lungs. His theory accordingly was liable to the same objection with Dr. Black's; but Dr. Crawford obviated it in the following manner: he found that the specific caloric of arterial blood was 1.0300, while that of venous blood was only 0.8928. Hence he concluded, that the instant venous blood is changed into arterial blood its specific caloric increases; consequently it requires an additional quantity of caloric to keep its temperature as high as it had been while venous blood. This is so great, that the whole new caloric evolved is employed; therefore the temperature of the lungs must necessarily remain the same as the rest of the body. During the circulation arterial blood is gradually converted into venous; consequently its specific caloric diminishes, and it must give out heat. This is the reason that the temperature of the extreme parts of the body does not diminish. This theory is extremely ingenious, and accounts for the whole phænomena in a much more satisfactory manner than any other which has been proposed.

To RESPI'RE. *v. n.* (*respiro*, Latin.) 1. To breathe (*Dryden*). 2. To catch breath (*Milton*). 3. To rest; to take rest from toil (*Pope*).

RESPI'TE. *s.* (*respit*, French.) 1. Reprieve; suspension of a capital sentence (*Prior*). 2. Pause; interval (*Raleigh*).

To RESPI'TE. *v. a.* (from the noun.) 1. To relieve by a pause (*Milton*). 2. (*respiter*, old French.) To suspend; to delay (*Clarendon*).

RESPLE'NDENCE. RESPLE'NDENCY. *s.* (from *resplendent.*) Lustre; brightness; splendour (*Boyle*).

RESPLE'NDENT. *a.* (*resplendens*, Lat.) Bright; shining; having a beautiful lustre (*Newton*).

RESPLE'NDENTLY. *ad.* (from *resplendent.*) With lustre; brightly; splendidly.

To RESPO'ND. *v. n.* (*respondeo*, Latin.) 1. To answer. 2. To correspond; to suit (*Broome*).

RESPO'NDENT. *s.* (*respondens*, Latin.) 1. An answer in a suit (*Ayliffe*). 2. One whose province, in a set disputation, is to refute objections (*Watts*).

RESPO'NSE. *s.* (*responsum*, Latin.) 1. An answer (*Hammond*). 2. (*respons*, French.) Answer made by the congregation in public worship (*Addison*). 3. Reply to an objection in a formal disputation (*Watts*).

RESPO'NSIBLE. *a.* (from *responsus*, Lat.) 1. Answerable; accountable (*Hammond*). 2. Capable of discharging an obligation (*Locke*).

RESPO'NSIBLENESS. *s.* State of being obliged or qualified to answer.

RESPO'NSION. *s.* (*responsio*, Latin.) The act of answering.

RESPO'NSIVE. *a.* (*responsif*, French.) 1. Answering; making answer (*Ayliffe*). 2. Correspondent; suited to something else (*Fenton*).

RESPO'NSORY. *a.* (*responsorius*, Latin.) Containing answer.

RESSIUS (Rutger), a learned professor of

Greek at Louvaine, of whom Erasmus gives a high character. He published among other works the aphorisms of Hippocrates, and died in 1545.

RESSORT, a French word, sometimes used by English authors to signify the jurisdiction of a court, and particularly one from which there is no appeal. Thus it is said that the house of lords judge *en dernier ressort*, or in the last ressort.

REST. *s.* (nert, Saxon; *ruste*, Dutch.) 1. Sleep; repose (*Pope*). 2. The final sleep; the quietness of death (*Dryden*). 3. Stillness; cessation or absence of motion (*Bacon*). 4. Quiet; peace; cessation from disturbance (*Daniel*). 5. Cessation from bodily labour (*Job*). 6. Support; that on which any thing leans or rests (*Fairfax*). 7. Place of repose (*Milton*). 8. Final hope (*Clarendon*). 9. (*reste*, Fr.) Remainder; what remains (*Dryden*).

REST, in music. See MUSIC.

REST HARROW, in botany. See ONONIS.

REST. *a.* (*restes*, French.) Others; those not included in any proposition (*Stillingfleet*).

To REST. *v. n.* (from the noun.) 1. To sleep; to be asleep; to slumber (*Milton*). 2. To sleep the final sleep; to die (*Milton*). 3. To be at quiet; to be at peace; to be without disturbance (*Milton*). 4. To be without motion; to be still (*Milton*). 5. To be fixed in any state or opinion (*Dryden*). 6. To cease from labour (*Taylor*). 7. To be satisfied; to acquiesce (*Addison*). 8. To lean; to recline for support (*Waller*). 9. (*rester*, French.) To be left; to remain (*Bacon*).

To REST. *v. a.* 1. To lay to rest (*Dryden*). 2. To place as on a support (*Waller*).

RESTA BOVIS. The rest harrow is so called because it hinders the plough; hence resta bovis. See ONONIS.

RESTA'GNANT. *a.* (*restagnans*, Latin.) Remaining without flow or motion (*Boyle*).

To RESTA'GNATE. *v. n.* (*re* and *stagnate*.) To stand without flow (*Wiseman*).

RESTAGNA'TION. *s.* (from *restagnate*.) The state of standing without flow, course, or motion.

RESTAURA'TION. *s.* (*restauro*, Latin.) The act of recovering to the former state.

To RESTE'M. *v. a.* (*re* and *stem*.) To force back against the current (*Shakspeare*).

RE'STFUL. *a.* (*rest* and *full*.) Quiet; being at rest (*Shakspeare*).

RE'STIFF. *a.* (*restif*, Fr. *restivo*, Ital.) 1. Unwilling to stir; resolute against going forward; obstinate; stubborn (*Dryden*). 2. Being at rest; being less in motion: not used.

RE'STIFNESS. *s.* (from *restiff*.) Obstinate reluctance (*K. Charles*).

RESTI'NCTION. *s.* (*restinctus*, Latin.) The act of distinguishing.

RESTIO, in botany, a genus of the class diœcia, order triandria. Calyx three-leaved, two of them boat-shaped; corol of three lanceolate leaves, one of them broader. Female: germ three-sided; style one, rarely two or three; stigmas from one to three, feathered. Twenty-eight species, all natives of the Cape, several resembling rushes, and used in making brooms, thatching outhouses, &c.

RESTITU'TION. *s.* (*restitutio*, Latin.) 1. The act of restoring what is lost or taken away (*Arbuthnot*). 2. The act of recovering its former state or posture (*Grew*).

RE'STLESLY. *ad.* (from *restless*.) Without rest; unquietly (*South*).

RE'STLESNESS. *s.* (from *restless*.) 1. Want of sleep (*Harvey*). 2. Want of rest; unquietness (*Herbert*). 3. Motion; agitation (*Boyle*).

RE'STLESS. *a.* (from *rest*.) 1. Being without sleep (*Dryden*). 2. Unquiet; without peace (*Prior*). 3. Unconstant; unsettled (*Dryden*). 4. Not still; in continued motion (*Milton*).

RESTO'RABLE. *a.* (from *restore*.) What may be restored (*Swift*).

RESTORA'TION. *s.* (from *restore; restauration*, French.) 1. The act of replacing in a former state: properly *restauration* (*Dryden*). 2. Recovery (*Rogers*).

RESTO'RATIVE. *a.* (from *restore*.) That has the power to recruit life (*Milton*).

RESTO'RATIVE. *s.* (from *restore*.) A medicine that has the power of recruiting life (*South*).

To RESTO'RE. *v. a.* (*restaurer*, Fr.) 1. To give back what has been lost or taken away (*Dryden*). 2. To bring back (*Dryden*). 3. To retrieve; to bring back from degeneration, declension, or ruin, to its former state (*Prior*). 4. To recover passages in books from corruption.

RESTO'RER. *s.* (from *restore*.) One that restores.

To RESTRAI'N. *v. a.* (*restreindre*, French.) 1. To withhold; to keep in (*Shakspeare*). 2. To repress; to keep in awe (*Locke*). 3. To suppress; to hinder; to repress (*Milt.*). 4. To abridge (*Clarendon*). 5. To hold in (*Shaks.*). 6. To limit; to confine (*South*).

RESTRAI'NABLE. *a.* (from *restrain*.) Capable to be restrained (*Brown*).

RESTRAI'NEDLY. *ad.* (from *restrained*.) With restraint; without latitude (*Hammond*).

RESTRAI'NER. *s.* (from *restrain*.) One that restrains; one that withholds (*Brown*).

RESTRAI'NT. *s.* (from *restrain; restreint*, French). 1. Abridgment of liberty (*Shaks.*) 2. Prohibition (*Milton*). 3. Limitation; restriction (*Brown*). 4. Repression; hinderance of will; act of withholding; state of being withheld (*South*).

To RESTRI'CT. *v. a.* (*restrictus*, Latin.) To limit; to confine (*Arbuthnot*).

RESTRI'CTION. *s.* (*restriction*, French.) Confinement; limitation (*Temple*).

RESTRI'CTIVE. *a.* (from *restrict*.) 1. Expressing limitation (*Stillingfleet*). 2. (*restrictif*, French.) Styptic; astringent (*Wiseman*).

RESTRI'CTIVELY. *ad.* (from *restrictive*.) With limitation (*Gov. of the Tongue*).

To RESTRI'NGE. *v. a.* (*restringo*, Latin.) To confine; to contract; to astringe.

RESTRI'NGENT. *s.* (*restringens*, Lat.) That which hath the power of contracting; styptic (*Harvey*).

RE'STY. *a.* (*restif*, French.) Obstinate in standing still; restiff (*Swift*).

To RESUBLI'ME. *v. a.* (*re* and *sublime*.) To sublime another time (*Newton*).

To RESU'LT. *v. a.* (*resulto*, Latin.) 1. To fly back (*Pope*). 2. (*resulter*, Fr.) To rise as a consequence; to be produced as the effect of causes jointly concurring (*Bacon*). 3. To arise as a conclusion from premises.

RESUL'T. *s.* (from the verb.) 1. Resilience; act of flying back (*Bacon*). 2. Consequence; effect produced by the concurrence of co-operating causes (*K. Charles*). 3. Inference from premises (*South*). 4. Resolve; decision. Improper (*Swift*).

RESU'LTANCE. *s.* (*resultance*, French.) The act of resulting.

RESU'MABLE. *a.* (from *resume*.) What may be taken back (*Hale*).

To RESU'ME. *v. a.* (*resumo*, Latin.) 1. To take back what has been given (*Waller*). 2. To take back what has been taken away (*Shaks.*). 3. To take again (*Dryden*). 4. To begin again what was broken off: as, *to* resume *a discourse*.

RESU'MPTION. *s.* (*resomption*, French; *resumptus*, Lat.) The act of resuming (*Denham*).

RESU'MPTIVE. *a.* (*resumptus*, Lat.) Taking back.

RESUPINATE COROL, in botany. Cum labium superius terram, inferius cœlum spectat. When the upper lip faces the ground, and the lower lip the sky. Or, when that which is usually the upper lip (in a labiate corol) becomes the lower; and the contrary: so that the flower is, as it were, turned upside down; or, in vulgar language, topsy-turvy. This is exemplified in scrophularia, ocymum, ajuga orientalis, the European violets, and some species of satyrium.

RESUPINATE LEAF, in botany. Pagina superiore inferiore, et contra inferiore superiore facta. A leaf is said to be resupinate, or turned upside down, when that which is commonly the upper surface becomes the lower; and the contrary.

RESUPINA'TION. *s.* (*resupino*, Latin.) The act of lying on the back.

To RESURVE'Y. *v. a.* (*re* and *survey*.) To review; to survey again (*Shakspeare*).

RESURRE'CTION. *s.* (*resurrection*, Fr. *resurrectum*, Latin.) Revival from the dead; return from the grave (*Watts*).

RESURRECTION. (*resurrectio*.) Resuscitation, the act of returning to a new, or second life, after having been dead.

The great argument for the truth of Christianity, and that urged with the most force and conviction for the same, is drawn from the resurrection of our Saviour. The circumstances thereof are such as almost admit of a demonstration, which has accordingly been attempted on the strict principles of geometricians. Without going so far as this, however, it may be safely affirmed, that no fact, equally remote, is confirmed by such variety and such force of evidence. On this great fact hangs the correspondent doctrine, that dead saints shall be raised in the same body at the last day. Many philosophical objections have been urged against this latter doctrine; for a recapitulation of which, and an attempt at refuting the principal, see Gregory's Letters on the Christian Religion, vol. ii. The fact of Christ's resurrection is established among the *evidences* of christianity in the first vol. of that work.

To RESU'SCITATE. *v. a.* (*resuscito*, Lat.) To stir up anew; to revive (*Bacon*).

RESUSCITA'TION. *s.* (from *resuscitate*.) The act of stirring up anew; the act of reviving, or state of being revived (*Pope*).

RESUSCITATION. The restoring of persons, apparently dead, to life. Under this head, strictly speaking, is considered the restoring of those who faint, or have breathed noxious and irrespirable air; yet it is chiefly confined to the restoring of those who are apparently dead from being immersed in a fluid, or by hanging. Dr. Curry, of Guy's hospital, has written a very valuable book on this subject; and such is its importance, that we have thought proper to insert the following account:

"From considering," he observes, "that a drowned person is surrounded with water instead of air, and that in this situation he makes strong and repeated efforts to breathe, we should expect that the water would enter and completely fill the lungs. This opinion, indeed, was once very general, and it still continues to prevail among the common people. Experience, however, has shewn, that unless the body lie so long in the water as to have its living principle entirely destroyed, the quantity of fluid present in the lungs is inconsiderable; and it would seem that some of this is the natural moisture of the part accumulated; for, upon drowning kittens, puppies, &c. in ink, or other coloured liquors, and afterwards examining the lungs, it is found that very little of the coloured liquor has gained admittance to them.—To explain the reason why the lungs of drowned animals are so free from water, it is necessary to observe, that the muscles which form the opening into the wind-pipe are exquisitely sensible, and contract violently upon the least irritation, as we frequently experience when any part of the food or drink happens to touch them. In the efforts made by a drowning person, or animal, to draw in air, the water rushes into the mouth and throat, and is applied to these muscles, which immediately contract in such a manner as to shut up the passage into the lungs. This contracted state continues as long as the muscles retain the principle of life, upon which the power of muscular contraction depends; when that is gone, they become relaxed, and the water enters the wind-pipe, and completely fills it. On dissecting the body of a recently drowned animal, no particular fulness of the vessels within the skull, nor any disease of the brain or its membranes, are visible. The lungs also are

sound, and the branches of the wind-pipe generally contain more or less of a frothy matter, consisting chiefly of air, mixed with a small quantity of colourless fluid. The right cavity of the heart, and the trunks of the large internal veins which open into it, and also the trunk and larger branches of the artery which carries the blood from this cavity through the lungs, are all distended with dark-coloured blood, approaching almost to blackness. The left cavity of the heart, on the contrary, is nearly or entirely empty, as are likewise the large veins of the lungs which supply it with blood, and the trunk and principal branches of the great artery which conveys the blood from hence to the various parts of the body. The external blood-vessels are empty; and the fleshy parts are as pale as if the animal had been bled to death. When a body has lain in the water for some time, other appearances will also be observable; such as, the skin livid, the eyes blood-shot, and the countenance bloated and swoln; but these appearances, though certainly unfavourable, do not absolutely prove that life is irrecoverably gone. It is now known, that in the case of drowning, no injury is done to any of the parts essential to life; but that the right cavity of the heart, together with the veins and arteries leading to and from that cavity, are turgid with blood, whilst every other part is almost drained of this fluid. The practice of holding up the bodies of drowned persons by the heels, or rolling them over a cask, is unnecessary; the lungs not being filled with any thing that can be evacuated in this way. Therefore such a practice is highly dangerous, as the violence attending it may readily burst some of those vessels which are already overcharged with blood, and thus convert what was only suspended animation into absolute and permanent death. The operation of inflating the lungs is a perfectly safe and much more effectual method of removing any frothy matter they may contain; and whilst it promotes the passage of the blood through them, also renders it capable of stimulating the left cavity of the heart, and exciting it to contraction. As soon as the body is taken out of the water, it should be stripped of any clothes it may have on, and be immediately well dried. It should then be wrapped in dry warm blankets, or in the spare clothes taken from some of the by-standers, and be removed as quickly as possible to the nearest house that can be got convenient for the purpose. The fittest will be one that has a tolerably large apartment, in which a fire is ready, or can be made. The body may be carried in men's arms, or laid upon a door; or, in case the house be at a distance from the place, if a cart can be procured, let the body be placed in it, on one side, upon some straw, with the head and upper parts somewhat raised; and in this position a brisk motion will do no harm. Whatever be the mode of conveyance adopted, particular care should be taken that the head be neither suffered to hang backwards, nor to bend down with the chin upon the breast. When arrived at the house, lay the body on a mattress, or a double blanket, spread upon a low table, or upon a door supported by stools; the head and chest being elevated by pillows. As the air of a room is very soon rendered impure by a number of people breathing in it, for this reason, as well as to avoid the confusion and embarrassment attending a crowd, no more persons should be admitted into the apartment where the body is placed than are necessary to assist immediately in the recovery: in general, six will be found sufficient for this purpose, and these should be the most active and intelligent of the bystanders. It will be found most convenient to divide the assistants into two sets; one set being employed in restoring the heat of the body, while the other institutes an artificial breathing in the best manner they are able. Every skilful person should be provided with a flexible tube made of elastic gum, half a yard in length, to introduce into the wind-pipe, and also with a similar tube to which a syringe can be affixed, to be put into the œsophagus. Should these not be at hand, air should be thrown into the lungs in the best manner that can be suggested at the time. Should it still be found that the air does not pass readily into the lungs, immediate recourse must be had to another and more effectual method for attaining that object. As this method, however, requires address, and also some knowledge of the parts about the throat, we would recommend that when there is not a medical gentleman present, the mode already described be tried repeatedly before this be attempted. As a quantity of frothy matter occupying the branches of the wind-pipe and preventing the entrance of the air into the lungs, is generally the circumstance which renders this mode of inflation necessary, the mouth should be opened from time to time to remove this matter as it is discharged. While one set of the assistants are engaged in performing artificial respiration, the other should be employed in communicating heat to the body. The warm bath has been usually recommended for this purpose; but wrapping the body in blankets, or woollen cloths, strongly wrung out of warm water, and renewing them as they grow cool, besides being a speedier and more practicable method of imparting heat, has this great advantage, that it admits of the operation of inflating the lungs being carried on without interruption. Until a sufficient quantity of warm water can be got ready, other methods of restoring warmth may be employed; such as the application of dry warm blankets round the body and limbs; bags of warm grains or sand, bladders or bottles of hot water, or hot bricks applied to the hands, feet, and under the armpits, the bottles and bricks being covered with flannel: or the body may be placed before the fire, or in the sunshine if strong at the time, and be gently rubbed by the assistants with their warm hands, or with cloths heated at the fire, or by a warming-pan. The restoration of heat should always be gradual, and the warmth applied ought never to be greater than can be comfortably borne by the assistants. If the weather happen to be cold, and especially if

the body has been exposed to it for some time, heat should be applied in a very low degree at first: and if the weather be under the freezing point, and the body, when stripped, feel cold and nearly in the same condition with one that is frozen, it will be necessary at first to rub it well with snow, or wash it with cold water; the sudden application of heat in such cases having been found very pernicious. In a short time, however, warmth must be gradually applied. To assist in rousing the activity of the vital principle, it has been customary to apply various stimulating matters to different parts of the body. But as some of these applications are in themselves hurtful, and the others serviceable only according to the time and manner of their employment, it will be proper to consider them particularly. The application of all such matters in cases of apparent death, is founded upon the supposition that the skin still retains sensibility enough to be affected by them. It is well known, however, that even during life, the skin loses sensibility in proportion as it is deprived of heat, and does not recover it again until the natural degree of warmth be restored. Previous to the restoration of heat, therefore, to a drowned body, all stimulating applications are useless, and so far as they interfere with the other measures, are also prejudicial. The practice of rubbing the body with salt or spirits is now justly condemned. The salt quickly frets the skin, and has in some cases produced sores, which were very painful and difficult to heal after recovery. Spirits of all kinds evaporate fast, and thereby, instead of creating warmth, as they are expected to do, carry off a great deal of heat from the body. Spirit of hartshorn, or of sal volatile, are liable to the same objection as brandy or other distilled spirits, and are besides very distressing to the eyes of the assistants. When there is reason to think the skin has in any degree recovered its sensibility, let an assistant moisten his hand with spirit of hartshorn, or *eau de luce*, and hold it closely applied to one part: in this way evaporation is prevented, and the full stimulant effect of the application obtained. A liniment composed of equal parts of spirit of hartshorn and salad oil, well shaken together, would appear to be sufficiently stimulating for the purpose, and as it evaporates very slowly, will admit of being rubbed on without producing cold. The places to which such remedies are usually applied are, the wrists, ancles, temples, and the parts opposite the stomach and heart. The intestines, from their internal situation and peculiar constitution, retain their irritability longer than the other parts of the body, and accordingly, various means have been proposed for increasing the action of their fibres, in order to restore the activity of the whole system. Tobacco-smoke, injected by way of glyster, is what has been generally employed with this view, and the fumigator, or instrument for administering it, makes a part of the apparatus which is at present distributed by the different societies established for the recovery of drowned persons. Of late, however, the use of tobacco-smoke has been objected to, and upon very strong grounds; for when we consider that the same remedy is successfully employed with the very opposite intention, namely, that of lessening the power of contraction in the muscles, and occasioning the greatest relaxation consistent with life, it must be acknowledged to be a very doubtful, if not dangerous remedy, where the powers of life are already nearly exhausted. Instead of tobacco-smoke then, we would recommend a glyster, consisting of a pint or more of water, moderately warmed, with the addition of one or two table spoonsful of spirit of hartshorn, a heaped tea spoonful of strong mustard, or a table spoonful of essence of peppermint; in defect of one or other of these, half a gill or more of rum, brandy, or gin may be added, or the warm water given alone. This step, however, need not be taken, until artificial respiration has been begun; for it will answer but little purpose to stimulate the heart through the medium of the intestines, unless we, at the same time, supply the left cavity with blood fitted to act upon it; which we cannot do without first removing the collapsed state of the lungs, and promoting the passage of the blood through them by a regular inflation. As the stomach is a highly sensible part, and intimately connected with the heart and brain, the introduction of some moderately warm and stimulating liquor into it seems well calculated to rouse the dormant powers of life. This is very conveniently done by means of the syringe and flexible tube. The quantity of fluid thrown in ought not to exceed half a pint, and may be either warm negus, or water with the addition of one or other of the stimulating matters recommended above, using, however, only half the quantities mentioned there. As soon as the pulse or beating of the heart can be felt, the inside of the nostrils may be occasionally touched with a feather dipt in spirit of hartshorn, or sharp mustard; it being found by experience, that any irritation given to the nose has considerable influence in exciting the action of the muscles concerned in respiration. When the natural breathing commences, the flexible tube and canula should be withdrawn, and any farther inflation that may be necessary, performed by blowing into the nostril. Letting blood has been generally thought requisite in every case of suspended animation. The practice, however, does not appear to have been founded upon any rational principle at first, and it has been continued from the force of custom, rather than from any experience of its good effects. In the case of drowned persons there is not, as in those who suffer from hanging or apoplexy, any unusual fulness of the vessels of the brain; and the quantity of blood that can be drawn from the external veins will not sensibly diminish the accumulation of it in those near the heart. Besides, blood-letting, which always tends to lessen the action of the heart and arteries in the living body, cannot be supposed to have a directly opposite effect in cases of apparent death; on the contrary, if employed here, it will hazard the entire destruc-

tion of those feeble powers which yet remain, and to increase and support which all our endeavours should be directed. When the several measures recommended above have been steadily pursued for an hour or more, without any appearance of returning life, electricity should be tried; experience having shewn it to be one of the most powerful stimuli yet known, and capable of exciting contraction in the heart and other muscles of the body, after every other stimulus had ceased to produce the least effect. Moderate shocks are found to answer best, and these should, at intervals, be passed through the chest in different directions, in order, if possible, to rouse the heart to act. Shocks may likewise be sent through the limbs, and along the spine; but we are doubtful how far it is safe or useful to pass them through the brain, as some have recommended. The body may be conveniently insulated, by placing it on a door, supported by a number of quart bottles, whose sides are previously wiped with a towel, to remove any moisture they may have contracted. By experiments made on different animals, it is found that the blood passes through the lungs most readily when they are fully distended with air; consequently, that if the lungs of a drowned person are inflated, and kept in the expanded state whilst the electric shock is passed through the chest, the blood accumulated in the right cavity of the heart and its vessels will move forward without any resistance, should the heart be brought to contract upon it. As soon as the shock is given, let the lungs be emptied of the air they contain, and filled again with fresh air; then pass another shock, and repeat this until the heart is brought into action, or until it appear that all farther attempts are useless. In order more certainly to pass the shock through the heart, place the knob of one discharging rod above the collar-bone of the right side, and the knob of the other above the short ribs of the left: the position of the discharging rods, however, may be changed occasionally, so as to vary the direction of the shock. Two thick brass wires, each about eighteen inches long, passed through the two glass tubes, or wooden cases well varnished, and having at one end a knob, and at the other a ring to fasten the brass chain to, form very convenient discharging rods; and by means of them the shock may be administered without the risque of its being communicated to the assistants, or carried off by the skin being wet. When the patient is so far recovered as to be able to swallow, he should be put into a warm bed, with his head and shoulders somewhat raised by means of pillows. Plenty of warm wine-whey, ale-posset, or other light and moderately nourishing drink, should now be given, and gentle sweating promoted, by wrapping the feet and legs in flannels well wrung out of hot water. If the stomach and bowels feel distended and uneasy, a glyster, consisting of a pint of warm water, with a table spoonful of common salt, or an ounce or more of Glauber's or Epsom salt, dissolved in it, may be administered. The general practice, in this case, is to give an emetic; but considering that the powers of the machine are still very weak, the agitation of vomiting is certainly hazardous. The patient should on no account be left alone, until the senses are perfectly restored, and he be able to assist himself; several persons having relapsed and been lost, from want of proper attention to them, after the vital functions were, to all appearance, completely established. Either from the distention which the arteries of the lungs have suffered, or from the sudden change from great coldness to considerable warmth, it now and then happens, that the patient is attacked, soon after recovery, with inflammation of some of the parts within the chest. This occurrence is pointed out by pain in the breast or side, increased on inspiration, and accompanied with frequent, and full or hard pulse, and sometimes with cough. Here the taking away some blood from the arm, or the application of cupping glasses, leeches, or a blister, over the seat of the pain will be very proper; but the necessity for these measures, as well as the time for putting them in practice, should be left to the judgment and discretion of a medical person. Dull pain in the head, lasting sometimes for two or three days, is by no means an unfrequent complaint in those who are recovered from this and from the other states of suspended animation; and here also a moderate bleeding from the neck, either with the lancet or with cupping-glasses, may prove serviceable.

In hanging, the external veins of the neck are compressed by the cord, and the return of the blood from the head thereby impeded, from the moment that suspension takes place; but as the heart continues to act for a few seconds after the windpipe is closed, the blood which is sent to the head during this interval is necessarily accumulated there. Hence it is, that in hanged persons the face is greatly swoln, and of a dark red or purple colour: the eyes are commonly suffused with blood, enlarged, and prominent. On dissection, the blood-vessels of the brain are found considerably distended; but, in general, no further marks of disease appear within the scull. The lungs are found generally quite collapsed, and free from frothy matter. The heart and the large blood-vessels adjoining to it exhibit the same appearances as in the bodies of drowned persons. From the great accumulation of blood in the vessels of the head, many have been of opinion, that hanging kills chiefly by inducing apoplexy; but the following experiment made at Edinburgh several years ago, by an eminent medical professor there, clearly proves, that in hanging, as well as in drowning, the exclusion of air from the lungs is the immediate cause of death. A dog was suspended by the neck with a cord, an opening having been previously made in the wind-pipe, below the place where the cord was applied, so as to admit air into the lungs. In this state he was allowed to hang for three quarters of an hour, during which time the circulation and breathing went on. He was then cut down, without appearing to have suffered much from the experiment. The

The cord was now shifted below the opening into the wind-pipe, so as to prevent the ingress of air to the lungs; and the animal being again suspended, he was completely dead in a few minutes. Upon the whole then, it appears, that the same measures recommended for drowned persons, are also necessary here; with this addition, that opening the jugular veins, or applying cupping-glasses to the neck, will tend considerably to facilitate the restoration of life, by lessening the quantity of blood contained in the vessels of the head, and thereby taking off the pressure from the brain. Except in persons who are very full of blood, the quantity taken away need seldom exceed an ordinary tea cupful, which will in general be sufficient to unload the vessels of the head, without weakening the powers of life."

To RETAI'L. *v. a.* (*retailler*, Fr.) 1. To sell in small quantities, in consequence of selling at second hand (*Locke*). 2. To sell at second hand (*Pope*). 3. To sell in broken parts.

RETAI'L. *s.* (from the verb.) Sale by small quantities, or second hand (*Swift*).

RETAI'LER. *s.* (from *retail.*) One who sells by small quantities (*Hakewill*).

To RETAI'N. *v. a.* (*retineo*, Latin.) 1. To keep; not to lose (*Locke*). 2. To keep; not to lay aside (*Brown*). 3. To keep; not to dismiss (*Milton*). 4. To keep in pay; to hire (*Add.*).

To RETAI'N. *v. n.* 1. To belong to; to depend on (*Boyle*). 2. To keep; to continue: not used (*Donne*).

To RETAIN, in the manage, to hold in or preserve the male semen. This is said of mares that conceive, and *hold* after covering.

RETAI'NER. *s.* (from *retain.*) 1. An adherent; a dependant; a hanger-on (*Swift*). 2. In common law, *retainer* signifies a servant not menial nor familiar, that is not dwelling in his house; but only using or bearing his name or livery (*Cowell*). 3. The act of keeping dependants, or being in dependance (*Bacon*).

RETAINING-FEE, is the first fee given in any cause to a serjeant or counsellor at law, whereby to make him sure, that he shall not be on the contrary side.

To RETA'KE. *v. a.* (*re* and *take.*) To take again (*Clarendon*).

To RETA'LIATE. *v. a.* (*re* and *talio*, Latin.) To return by giving like for like; to repay; to requite (*Swift*).

RETALIA'TION. *s.* (from *retaliate.*) Requital; return of like for like (*Calamy*).

To RETA'RD. *v. a.* (*retardo*, Lat. *retarder*, French.) 1. To hinder; to obstruct in swiftness of course (*Denham*). 2. To delay; to put off (*Dryden*).

To RETA'RD. *v. n.* To stay back (*Brown*).

RETARDA'TION. *s.* (*retardation*, Fr.) Hinderance; the act of delaying (*Bacon*).

RETARDATION, in physics, the act of retarding, that is, of delaying the motion or progress of a body, or of diminishing its velocity.

The retardation of moving bodies arises from two great causes, the resistance of the medium, and the force of gravity.

The retardation from the resistance is often confounded with the resistance itself; because, with respect to the same moving body, they are in the same proportion.

But with respect to different bodies, the same resistance often generates different retardations. For if bodies of equal bulk, but different densities, be moved through the same fluid with equal velocity, the fluid will act equally on each; so that they will have equal resistances, but different retardations; and the retardations will be to each other, as the velocities which might be generated by the same forces in the bodies proposed; that is, they are inversely as the quantities of matter in the bodies, or inversely as the densities.

Suppose then bodies of equal density, but of unequal bulk, to move equally fast through the same fluid; then their resistances increase according to their superficies, that is as the squares of their diameters; but the quantities of matter are increased according to their mass or magnitude, that is as the cubes of their diameters: the resistances are the quantities of motion; the retardations are the celerities arising from them; and dividing the quantities of motion by the quantities of matter, we shall have the celerities; therefore the retardations are directly as the squares of the diameters, and inversely as the cubes of the diameters, that is inversely as the diameters themselves.

If the bodies be of equal magnitude and density, and moved through different fluids, with equal celerity, their retardations are as the densities of the fluids. And when equal bodies are carried through the same fluid with different velocities, the retardations are as the squares of the velocities.

So that, if s denote the superficies of a body, w its weight, d its diameter, v the velocity, and n the density of the fluid medium, and N that of the body; then, in similar bodies, the resistance is as nsv^2 or as nd^2v^2, and the retardation, or retarding force,

as $\frac{nsv^2}{w}$, or as $\frac{nd^2v^2}{\mathrm{N}d^3} = \frac{nv^2}{\mathrm{N}d}$.

The retardation from gravity is peculiar to bodies projected upwards. A body thrown upwards is retarded after the same manner as a falling body is accelerated; only in the one case the force of gravity conspires with the motion acquired, and in the other it acts contrary to it.

As the force of gravity is uniform, the retardation from that cause will be equal in equal times. Hence, as it is the same force which generates motion in the falling body, and diminishes it in the rising one, a body rises till it loses all its motion; which it does in the same time in which a body falling would have acquired a velocity equal to that with which the body was thrown up.

Also, a body thrown up will rise to the same height from which, in falling, it would acquire the same velocity with which it was thrown up: therefore the heights to which bodies can rise, when thrown up with different velocities, are to each other as the squares of the velocities.

Retardations are, therefore, 1st. As the squares of the velocities. 2dly. As the densities of the fluids through which the bodies are moved. 3dly. Inversely as the diameter of those bodies. 4thly. Inversely as the densities of the bodies themselves. All of which is evidently expressed in the preceding theorem $\frac{nv^2}{Nd}$.

RETA'RDER. *s.* (from *retard.*) Hinderer; obstructer (*Glanville*).

To RETCH. *v. n.* (hnæcan, Saxon.) To force up something from the stomach.

RETCHLESS. *a.* Careless; reckless (*Dryden*).

RETE. (from *reskta*, Heb.) A net; a congeries of vessels, or any animal or vegetable substance resembling a net.

RETE MIRABILE, in anatomy, a small plexus or net-work of vessels in the brain, surrounding the pituitary gland.

RETE MUCOSUM. (*rete*, a net.) Corpus reticulare. Corpus mucosum. Mucus Malphigii. A mucous substance, deposited, in a net-like form, between the epidermis and cutis, which covers the sensible cutaneous papillæ, connects the epidermis with the cutis, and gives the colour to the body: in Europeans it is of a white colour, in Ethiopians black. See SKIN.

RETE'CTION. *s.* (*retectus*, Latin.) The act of discovering to the view (*Boyle*).

RETEL, a town of France, in the department of Ardennes. Before the revolution, it was the capital of a country called the Retelois. It is seated on a hill, near the river Aisne, 26 miles N.E. of Rheims. Lon. 4. 24 E. Lat. 49. 32 N.

RETE'NTION. *s.* (*retention*, French.) 1. The act of retaining (*Bacon*). 2. *Retention* and retentive faculty is that state of contraction in the solid parts, which makes them hold fast their proper contents (*Quincy*). 3. Memory (*South*). 4. The act of withholding any thing (*Shakspeare*). 5. Custody; confinement; restraint (*Shakspeare*).

RETE'NTIVE. *a.* (*retentif*, French.) 1. Having the power of retention (*Philips*). 2. Having memory (*Glanville*).

RETE'NTIVENESS. *s.* (from *retentive.*) The quality of retention.

RETFORD (East), a borough in Nottinghamshire, with a market on Saturday, seated on the Idle, 30 miles N. by E. of Nottingham, and 141 N. by W. of London.

RETHEM, a town of Lower Saxony, in the duchy of Zell, seated in a very fertile country, on the Aller, 35 miles N.N.W. of Hanover.

RETICENCE. *s.* (*reticence*, French; *reticentia*, Latin.) Concealment by silence.

RETICLE. *s.* (*reticulum*, Latin.) A small net.

RETI'CULAR. *a.* (from *reticulum*, Lat.) Having the form of a small net.

RETICULARIA, in botany, a genus of the class cryptogamia, order fungi. Fungus roundish; case rigid, filled with seeds dispersed among reticulate filaments. Thirteen species; a few possessing a stem, the greater part stemless; four common to our own country: one or two resembling the lycoperdon.

RETICULATE. (from *rete*, a net.) Corolla, petalla. A netted corol. Netted petals. Having distinct veins crossing like net-work.—Beautifully exemplified in geranium striatum.

RETI'CULATED. *a.* (*reticulatus*, Latin.) Made of network; formed with interstitial vacuities (*Woodward*).

RE'TIFORM. *a.* (*retiformis*, Lat.) Having the form of a net (*Ray*).

RETIMO, a seaport of Candia, and a bishop's see, with a citadel, where the pacha resides. It was taken, in 1645, by the Turks, who have kept it ever since. The silk, wool, honey, wax, laudanum, and oil, are preferred to all others. It is seated on the N. coast of the island, 42 miles W. of Candia. Lon. 24. 38 E. Lat. 35. 20 N.

RETINA. (from *rete*, a net.) The third or innermost membrane of the eye expanded round the choroid coat, to the ciliary ligament. It is by most regarded as the true organ of vision, and is formed by an expansion of the pulp of the optic nerve. But a philosopher of the present day, Mr. Andrew Horn, has called this in question. See VISION.

RETI'NUE. *s.* (*retenue*, French.) A number attending upon a principal person; a train; a meiny (*Rogers*).

To RETI'RE. *v. n.* (*retirer*, French.) 1. To retreat; to withdraw; to go to a place of privacy (*Davies*). 2. To retreat from danger (*Milton*). 3. To go from a public station (*Addison*). 4. To go off from company (*Arbuthnot*). 5. To withdraw for safety (*Maccabees*).

To RETI'RE. *v. a.* To withdraw; to take away (*Clarendon*).

RETI'RE. *s.* (from the verb.) Not in use. 1. Retreat; recession (*Shakspeare*). 2. Retirement; place of privacy (*Milton*).

RETI'RED. *part. a.* (from *retire.*) 1. Secret; private (*Ben Jonson*). 2. Withdrawn.

RETI'REDNESS. *s.* (from *retired.*) Solitude; privacy; secrecy (*Donne*).

RETI'REMENT. *s.* (from *retire.*) 1. Private abode; secret habitation (*Denham*). 2. Private way of life (*Thomson*). 3. Act of withdrawing (*Milton*). 4. State of being withdrawn (*Locke*).

RETO'LD. part. pass. of *retell.* Related or told again (*Shakspeare*).

To RETO'RT. *v. a.* (*retortus*, Latin.) 1. To throw back; to rebound (*Milton*). 2. To return any argument, censure, or incivility (*Hammond*). 3. To curve back (*Bacon*).

RETO'RT. *s.* (*retortum*, Latin.) 1. A censure or incivility returned (*Shakspeare*).

RETORT. (from *retorqueo*, to bend back again.) In chemistry, a crooked matrass, conducting the substance introduced into it, and sublimated or evaporated over the heat to which it is exposed, into a recipient, into the neck of which its own neck is inserted, and if necessary, luted. It is the most common and most useful instrument in distillation.

It derives its name from its curved or twisted form. The swell or most capacious part is called its belly; the upper part its arch or roof; and the bent part, which compared with the belly usually forms an angle of about sixty, its neck, which should be free and wide, but gradually diminish in diameter to the extremity of its neck or mouth. The belly of the retort is more usually round; though frequently oblong, and shaped like a cucurbit. These last are called English retorts, and are preferable in the distillation of substances that are apt to swell, and pass into the receiver anterior to decomposition.

A vessel of this kind which has a little hole pierced in its roof is called a tubulated retort. This hole must be capable of being exactly closed with a stopple of proper materials. Tubulated retorts are employed in distilling substances which it is necessary to introduce after the receiver is joined on, as in operating for marine acid.

Retorts employed in processes for gasses have usually very long necks; for here no width of diameter is wanted for the condensation of vapours, and the narrowness of the neck allows but little admixture of the external air. Retorts are made of glass, earthenware, and sometimes of iron or silver: a leaden retort, moreover, is occasionally used, as in the process for fluoric acid.

RETO'RTER. *s.* (from *retort.*) One that retorts.

RETO'RTION. *s.* (from *retort.*) The act of retorting.

To RETO'SS. *v. a.* (*re* and *toss.*) To toss back (*Pope*).

To RETOU'CH. *v. a.* (*retoucher,* Fr.) To improve by new touches (*Pope*).

To RETRA'CE. *v. a.* (*retracer,* Fr.) To trace back; to trace again (*Dryden*).

To RETRA'CT. *v. a.* (*retractus,* Latin.) 1. To recall; to recant (*Shakspeare*). 2. To take back; to resume (*Woodward*).

To RETRA'CT. *v. n.* To unsay; to withdraw concession (*Granville*).

RETRACTA'TION. *s.* (*retractatio,* Lat.) Recantation; change of opinion declared.

RETRA'CTION. *s.* (from *retract.*) 1. Act of withdrawing something advanced; or changing something done (*Woodward*). 2. Recantation; declaration of change of opinion (*Sidney*). 3. Act of withdrawing a claim (*King Charles*).

RETRACTOR ANGULI ORIS, in myology. Albinus calls the buccinator thus. See BUCCINATOR.

RETRAHENTES AURIS. In myology. Posterior auris of Winslow. Two small bundles of muscular fibres which arise from the external and posterior part of the mastoid process of the temporal bone immediately above the insertion of the sterno-cleido-mastoideus muscle. They are inserted into that part of the back of the ear which is opposite to the septum which divides the concha and scapha. Their use is to draw the ear backwards, and stretch the concha.

RETRAITS, in the manage, pricks or injuries to a horse from nails or similar instruments. If a prick with a nail be neglected, it may occasion a very dangerous sore, and fester so that the foot cannot be saved without extreme difficulty; and therefore great care ought to be taken to avoid such fatal consequences. See PRICKING.

When a farrier in shoeing a horse, perceives that he complains and shrinks at every blow upon the nail, it should be immediately pulled out, and, if the blood follow, there is no danger, only he must not drive another nail in the same place; such an accident seldom makes a horse halt, and he may be ridden immediately after it. When a horse halts immediately after he is shod, we may reasonably conclude, that some of the nails press the soft parts, or touch him in the quick.

To know where the mischief lies, farriers take up the lame foot, and knock with a shoeing hammer. If they perceive that the horse shrinks when any particular nail is struck, they conclude him to be pricked in that place. See the articles FOOT, SHOEING, &c.

RETREA'T. *s.* (*retraitte,* French.) 1. Act of retiring (*Pope*). 2. State of privacy; retirement (*Pope*). 3. Place of privacy; retirement (*L'Estrange*). 4. Place of security (*Milton*). 5. Act of retiring before a superior force. Retreat is less than flight (*Bacon*).

To RETREA'T. *v. n.* (from the noun.) 1. To go to a private abode (*Milton*). 2. To take shelter; to go to a place of security. 3. To retire from a superior enemy. 4. To go out of the former place (*Woodward*).

RETREA'TED. *part. a.* (from *retreat.*) Retired, gone to privacy (*Milton*).

To RETRE'NCH. *v. a.* (*retrancher,* French.) 1. To cut off; to pare away (*Dryden*). 2. To confine: improper (*Addison*).

To RETRE'NCH. *v. n.* To live with less magnificence or expence (*Pope*).

RETRE'NCHMENT. *s.* (*retranchement,* Fr.) The act of lopping away (*Atterbury*).

RETRENCHMENT, in the art of war, any kind of work raised to cover a post, and fortify it against the enemy, such as fascines loaded with earth, gambions, barrels of earth, sandbags, and generally all things that can cover the men and stop the enemy. See FORTIFICATION.

To RETRIBUTE. *v. a.* (*retribuo,* Latin.) To pay back: to make repayment of (*Locke*).

RETRIBU'TION. *s.* (*retribution,* French.) Repayment; return accommodated to the action (*South*).

RETRI'BUTIVE. RETRI'BUTORY. *a.* (from *retribute.*) Repaying; making repayment.

RETRIE'VABLE. *a.* (from *retrieve.*) That may be retrieved.

To RETRIE'VE. *v. a.* (*retrouver,* French.) 1. To recover; to restore (*Rogers*). 2. To repair (*Prior*). 3. To regain (*Dryden*). 4. To recall; to bring back (*Berkeley*).

RETROA'CTION. *s.* Action backward.

RETROCE'SSION. *s.* (*retrocessum,* Lat.) The act of going back.

RETROCESSION OF THE EQUINOX. See PRECESSION.

RETROCO'PULATION. *s.* (*retro* and *copulation.*) Postcoition (*Brown*).

RETROFLEX, in botany, applied to the branches. Rami retroflexi: horsum vorsum divaricati. Bending this way and that, in different directions, usually in a distorted manner. Thus it seems to differ from reflex, which is only simply bent back at an angle. Dr. Berkenhout explains it to be three times bent, or bent in three different directions. But for this we know not that he has any warrant, either from the sense of the term, or the explanation. It does not occur in Philosophia Botanica.

RETROFRACT. In botany. Retrofracted. Applied to the peduncle.—Vi quasi ad dependentiam redactus. Delin. Pl.—Reduced to hang down as it were by force. So that it appears as if it had been broken.—We do not discover any reason why this and the foregoing term should have a different signification from reflexus and refractus.

RETROGRADA'TION. *s.* (*retrogradation*, French.) The act of going backward (*Ray*).

RE'TROGRADE. *a.* (*retrograde*, French.) 1. Going backward (*Bacon*). 2. Contrary; opposite (*Shakspeare*).

To RE'TROGRADE. *v. n.* (*retrograder*, Fr.) To go backward (*Bacon*).

RETROGRE'SSION. *s.* (*retro* and *gressus*, Lat.) The act of going backward (*Brown*).

RETROMI'NGENCY. *s.* (*retro* and *mingo*, Latin.) The quality of staling backward.

RETROMI'NGENT. *a.* (*retro* and *mingens*, Latin.) Staling backward (*Brown*).

RE'TROSPECT. *s.* (*retro* and *specio*, Lat.) Look thrown upon things behind or things past (*Addison*).

RETROSPE'CTION. *s.* (from *retrospect.*) Act or faculty of looking backward (*Swift*).

RETROSPE'CTIVE. *a.* (from *retrospect.*) Looking backward (*Pope*).

RETROVERSION. See UTERUS (Retroversion of).

To RETU'ND. *v. a.* (*retundo*, Latin.) To blunt; to turn (*Ray*).

To RETU'RN. *v. n.* (*retourner*, French.) 1. To come again to the same place (*Milton*). 2. To come back to the same state (*Locke*). 3. To go back (*Locke*). 4. To make answer (*Pope*). 5. To come back; to come again; to revisit (*Milton*). 6. After a periodical revolution, to begin the same again (*Milton*). 7. To retort; to recriminate (*Dryden*).

To RETU'RN. *v. a.* 1. To repay; to give in requital (*Milton*). 2. To give back (*Chron.*). 3. To send back (*Milton*). 4. To give account of (*Graunt*). 5. To transmit (*Clarendon*).

RETU'RN. *s.* (from the verb.) 1. Act of coming back to the same place (*Dryden*). 2. Retrogression. 3. Act of coming back to the same state (*Kings*). 4. Revolution; vicissitude (*Bacon*). 5. Repayment of money laid out in commodities for sale (*Bacon*). 6. Profit; advantage (*Taylor*). 7. Remittance; payment from a distant place (*Shakspeare*). 8. Repayment; retribution; requital (*Dryden*). 9. Act of restoring or giving back; restitution (*South*). 10. Relapse (*Swift*). 11. Report; account: *the sheriffs'* return.

RETURN (*returna* or *retorna*), in law, is used in divers senses. 1. Return of writs by sheriffs and bailiffs is a certificate made by them to the court, of what they have done in relation to the execution of the writ directed to them. This is written on the back of the writ by the officer, who thus sends the writ back to the court from whence it issued, in order that it may be filed. 2. Return of a commission, is a certificate or answer sent to the court from whence the commission issues, concerning what has been done by the commissioners. 3. Returns, or days in bank, are certain days in each term, appointed for the return of writs, &c. Thus Hilary term has four returns, viz. in the king's-bench, on the day next after the octave, or eighth day after Hilary day; on the day next after the fifteenth day from St. Hilary; on the day after the purification; and on the next after the octave of the purification. In the common pleas, in eight days of St. Hilary: from the day of St. Hilary, in fifteen days: on the day after the purification: in eight days of the purification. Easter term has five returns, viz. in the king's bench, on the day next after the fifteenth day from Easter: on the day next after the three weeks from Easter: on the day next after one month from Easter: on the day next after five weeks from Easter: and on the day next after the day following ascension day. In the common pleas, in fifteen days from the feast of Easter: in three weeks from the feast of Easter: in one month from Easter day: in five weeks from Easter day: on the day after the ascension day. Trinity term has four returns, viz. on the day following the second day after Trinity: on the day following the eighth day after Trinity: on the day next after the fifteenth day from Trinity: on the day next after three weeks from Trinity. In the common pleas, on the day after Trinity: in eight days of Trinity: in fifteen days from Trinity: in three weeks from Trinity. Michaelmas term has six returns, viz. on the day next after three weeks from St. Michael: on the day next after one month of St. Michael: on the day following the second day after All-souls: on the day next after the second day after St. Martin: on the day following the octave of St. Martin: on the day next after fifteen days of St. Martin. In the common pleas, in three weeks from St. Michael: in one month from St. Michael: on the day after All-souls: on the day after St. Martin: on the octave of St. Martin: in fifteen days from St. Martin. It is to be observed, that, as in the king's bench, all returns are to be made on some particular day of the week in each term, care must be taken not to make the writs out of that court returnable on a non-judicial day; such as Sunday, and All-saints, in Michaelmas term, the purification in Hilary, the ascension in Easter, and Midsummer day, except it should fall on the first day of Trinity term.

RETURNABLE. *a.* Allowed to be reported back (*Hale*).

RETU'RNER. *s.* (from *return.*) One who pays or remits money (*Locke*).

RETURNING STROKE. See ELECTRICITY.

RETUSE LEAF. Retusum folium. In botany. Quod terminatur sinu obtuso. Ending in a blunt sinus: as in Frankenia pulverulenta, Crotalaria retusa.—Applied also to the seed in lycopus.

RETZ, a town of the palatinate of Bavaria, on the river Schwarza, 28 miles E.S.E. of Amberg.

RETZIA, in botany, a genus of the class pentandria, order monogynia. Calyx cylindrical, villous on the outside; stigma bifid; capsule two-celled, many-seeded. One species; a Cape shrub, slightly branched with lateral flowers.

REUCHLIN (John), a German, who contributed to the revival of literature, born at Psorzheim 1455. He studied at Paris and Basil, and acquired great reputation as professor of Greek and Latin. At Rome he was persuaded by the learned of that place to alter his German name, which signifies *smoke*, into the more dignified corresponding Greek word Capnion. He was sent by the court of Wirtemburg as ambassador to the emperor Frederic III. After the death of his patron, he retired to Worms, till again employed at Rome by the elector Palatine. He died at Ingoldstadt 1522, respected as the first scholar who introduced the study of the Hebrew among modern christians. He wrote de arte cabalisticâ, folio, 1517, and the celebrated "epistolæ obscurorum virorum," according to some.

REVE. *s.* The bailiff of a franchise or manor (*Dryden*).

To REVEA'L. *v. a.* (*revelo*, Latin.) 1. To show; to discover; to lay open; to disclose a secret (*Waller*). 2. To impart from heaven (*Romans*).

REVEA'LER. *s.* (from *reveal.*) 1. Discoverer; one that shows or makes known (*Atterbury*). 2. One that discovers to view (*Dryden*).

REVEILLE, formed of the verb *reveiller*, to awake, a beat of a drum in the morning, intended to give notice that it is day-break; and that the soldiers are to arise, and the sentinels forbear challenging.

To RE'VEL. *v. n.* (*raveelen*, Dutch.) To feast with loose and clamorous merriment (*Shakspeare*).

RE'VEL. *s.* (from the verb.) A feast with loose and noisy jollity (*Shakspeare*).

REVEL, a town of France, in the department of Upper Garonne, near the grand basin of the Canal Royal, 27 miles S.E. of Toulouse.

REVEL, a government of Russia. See ESTHONIA.

REVEL, a seaport of Russia, capital of the government of Esthonia, and a bishop's see. It is surrounded by high walls and deep ditches, and defended by a castle and good bastions. The houses are well built, and have fine gardens. Here is a college, with four professors; and, in 1773, two churches were allowed to the Protestants. Since the Russians have had possession of it, it has been a place of great trade. It is seated on the gulf of Finland, partly in a pleasant plain, and partly on a mountain, 85 miles S.E. of Abo, and 133 W. by S. of Petersburgh. Lon. 23. 57 E. Lat. 59. 20 N.

To RE'VEL. *v. a.* (*revello*, Lat.) To retract; to draw back (*Harvey*).

RE'VEL-ROUT. *s.* 1. A mob; an unlawful assembly (*Ainsworth*). 2. Tumultuous festivity (*Rowe*).

REVELATION, *revelatio*, formed from *revelo*, of *re*, and *velum*, q. d. to unveil, the act of revealing, or making a thing public, which before was a secret, or unknown.

The revelation of a confession, made by the confessor, is adjudged, in the Romish church, to deserve the most exemplary punishment.

Revelation is used, by way of eminence, for the discoveries made by God to his prophets, &c. and by them to the world.

Revelation is more particularly used for the discovery which God has made to the world, by the mouths of his prophets, of certain points of faith and duty, which they could not learn from natural reason.

Religion is divided into natural religion, and revelation or revealed religion.

The christian revelation is that made by Christ and his apostles, in the New Testament. The Jewish revelation is that made by Moses and the prophets, in the old Testament. See CHRISTIANITY, JUDAISM, MIRACLE, THEOLOGY, &c.

The principal tests of the truth of any revelation are, the tendency of its practical doctrines; its consistency with itself, and with the known attributes of God; and some satisfactory evidence that it cannot have been derived from a human source.

Before any man can receive a written book as a revelation from God, he must be convinced that God exists, and that he is possessed of almighty power, infinite wisdom, and perfect justice. Now, should a book teaching absurd or immoral doctrines (as many chapters of the Koran do, and as all the traditionary systems of Paganism did) pretend to be revealed by a God of wisdom and justice, we may safely reject its pretensions, without further examination than what is necessary to satisfy us that we have not misunderstood its doctrine. Should a book claiming this high origin, enjoin in one part of it, and forbid in another, the same thing to be done under the same circumstances, we may reject it with contempt and indignation; because a being of infinite wisdom can never act capriciously or absurdly. Still, however, as it is impossible for us to know how far the powers of men may reach in the investigation or discovery of useful truth, some further evidence is necessary to prove a doctrine of divine origin, than its mere consistency with itself, and with the principles of

morality; and this evidence can be nothing but the power of working miracles exhibited by him by whom it was originally revealed. In every revelation confirmed by this evidence, many doctrines are to be looked for which human reason cannot fully comprehend; and these are to be believed on the testimony of God, and suffered to produce their practical consequences. At this kind of belief the shallow infidel may smile contemptuously; but it has place in arts and sciences as well as in religion. Whoever avails himself of the demonstrations of Newton, Bernoulli, and others, respecting the resistance of fluids, and applies their conclusions to the art of ship-building, is as implicit a believer, if he understand not the principles of fluxions, as any Christian; and yet no man will say that his faith is not productive of important practical consequences. He believes, however, in man, while the Christian believes in God; and therefore, he cannot pretend that his faith rests on a surer foundation.

Mr. Locke, in laying down the distinct provinces of reason and faith, observes, 1. That the same truths may be discovered by revelation which are discoverable to us by reason. 2. That no revelation can be admitted *against* the clear evidence of reason. 3. That there are many things of which we have but imperfect notions, or none at all; and others, of whose past, present or future existence, by the natural use of our faculties we cannot have the least knowledge: and these, being beyond the discovery of our faculties, and above reason, when revealed, become the *proper object of our faith.* He then adds, that our reason is not injured or disturbed, but assisted and improved, by new discoveries of truth coming from the fountain of knowledge. Whatever God has revealed is certainly true; but whether it be a divine revelation or not, reason must judge, which can never permit the mind to reject a greater evidence to embrace what is less evident. There can be no evidence that any traditional revelation is of divine original, in the words we receive it, and the sense we understand it, so clear and so certain as that of the principles of reason; and, therefore, nothing that is *contrary* to the clear and self-evident dictates of reason, has a right to be urged or assented to as a matter of faith, wherein reason has nothing to do. Yet it by no means follows (we reiterate the position) that a revelation is to be called in question because it contains doctrines that are *above* reason: because, a revelation would be useless if it only made known to us truths which could have been discovered by our unassisted reasoning capacities.

REVELATION OF ST. JOHN. See APOCALYPSE.

RE'VELLER. *s.* (from *revel.*) One who feasts with noisy jollity (*Pope*).

RE'VELRY. *s.* (from *revel.*) Loose jollity; festive mirth (*Milton*).

To REVE'NGE. *v. n.* (*revancher*, French.) 1. To return an injury (*Pope*). 2. To vindicate by punishment of an enemy (*Dryden*). 3. To wreak one's wrongs on him that inflicted them (*Shakspeare*).

REVE'NGE. *s.* (*revanche*, Fr.) 1. Return of an injury (*Bacon*). 2. The passion of vengeance; desire of hurting one from whom hurt has been received (*Shakspeare*).

REVE'NGEFUL. *a.* (from *revenge.*) Vindictive; full of revenge; full of vengeance (*Shakspeare*).

REVE'NGEFULLY. *ad.* Vindictively (*Dryden*).

REVE'NGEMENT. *s.* (from *revenge.*) Vengeance; return of an injury (*Raleigh*).

REVE'NGER. *s.* (from *revenge.*) 1. One who revenges; one who wreaks his own or another's injuries (*Sandys*). 2. One who punishes crimes (*Bentley*).

REVE'NGINGLY. *ad.* With vengeance; vindictively (*Shakspeare*).

REVE'NUE. *s.* (*revenu*, Fr.) Income; annual profits received from lands or other funds (*Spenser*).

REVENUE (Public), the portion of the general income of a state, which is appropriated to the payment of national expenses. Different nations have adopted different modes of raising a public revenue, but the rent derived from land being obviously a fund of a more permanent nature than most others, has usually been one of the earliest resources, and has sometimes been the principal source of public revenue, particularly in ancient times. From the produce or rent of the public lands, the republics of Greece and Italy derived, for a long time, the greater part of the revenue which defrayed the necessary expenses of the commonwealth; and the rent of the crown-lands constituted the greater part of the revenue of the ancient sovereigns of Europe. The introduction of a different mode of warfare, and the greater duration of modern wars, increased considerably the public expenditure, and rendered it necessary to raise a much greater revenue. In the ancient republics of Greece and Italy, every citizen was a soldier, who both prepared himself for service, and served at his own expense; and in the ancient monarchies of Europe, the people, when they served in the field, were, by the condition of their feudal tenures, to be maintained either at their own expense or at that of their immediate lords, without bringing any new charge upon the sovereign. The other necessary expenses of government were very moderate. The administration of justice, instead of being a cause of expense, was a source of revenue. The labour of the country people, for three days before and after harvest, was thought a sufficient provision for maintaining all the bridges, highways, and other public works, which the commerce of the country was supposed to require. In those days, the principal expense of the sovereign seems to have consisted in the maintenance of his own family and household. The officers of his household, accordingly, were then the great officers of state. The lord treasurer received his rents; the lord steward and lord chamberlain looked

after the expenses of his family; the care of his stables was committed to the lord constable and the lord marshal; his houses were all built in the form of castles, and the keepers of those houses or castles might be considered as a sort of military governors, who seem to have been the only military officers it was necessary to maintain in time of peace. In these circumstances, the rent of a considerable landed estate might, upon ordinary occasions, very well defray all the usual expenses of government, and whenever extraordinary circumstances caused a greater expense, the sum necessary to make it good was drawn from the people by some arbitrary and often very unequal imposition.

The ordinary revenue of the early kings of England consisted of the following branches:

1. Rents and profits of the crown-lands. This must have been considerable, as it appears from Domesday-book, that there were appropriated to the use of the crown 1422 manors, besides other lands and quit-rents. This ancient branch of the king's revenue has, however, of late years become of very small amount, as the lands originally reserved by the crown, or which came to it afterwards by forfeiture, have been almost entirely granted away.

2. Profits from military tenures. As a great part of the lands in England were subject to knight-service, the profits incident to this tenure were very great, besides the extraordinary contributions to which they were liable, for making the king's eldest son a knight, and for marrying his eldest daughter.

3. The custody of the lay-revenues, lands, and tenements of bishoprics, during their vacancy; and, before the dissolution of abbeys, the custody of the temporalities of such as were of royal foundation. Many of the kings were induced to keep the see a long time vacant in order to enjoy their temporalities.

4. First-fruits and tenths of all spiritual preferments. The former was the whole of the first year's produce of the preferment, according to a valuation made in 38 Henry III. and afterwards increased in 20 Edward II. The tenths were the tenth part of the whole annual profit of each living, by the same valuation. These revenues were paid to the Pope, till annexed to the crown by 26 Henry VIII. c. 3, when a new valuation was made, by which the clergy are at present rated, and which forms what is commonly called the king's books. These revenues are now vested in trustees for ever, as a fund for the augmentation of poor livings, and form what is usually called queen Ann's bounty.

5. Purveyance and pre-emption, or a right of buying up provisions and other necessaries, for the use of the royal household, at an appraised valuation, in preference to all other persons, and even without the consent of the owner; also of forcibly impressing carriages and horses for the king's use, at a settled price. The purveyors greatly abused their authority, and were of little advantage to the crown; Charles II. therefore, at his restoration, agreed to resign this prerogative, with the military tenures; and the parliament, in lieu thereof, settled on him and his successors for ever a tax on beer and ale, afterwards commonly called the hereditary excise.

6. Fines and forfeitures of various descriptions; also fees to the crown, in a variety of legal matters.

7. The right to all shipwrecks; to treasure-trove; to royal fish, that is, whales and sturgeons, when thrown ashore, or caught near the coast; to all mines of silver or gold; to waifs, or goods stolen and thrown away by the thief in his flight; and estrays, or animals found wandering, and the owner unknown; and to deodands, and forfeitures of lands and goods for offences. These rights producing little profit, have since been mostly granted away to the lords of manors and other liberties.

8. Escheats of lands, upon the defect of heirs to succeed to the inheritance, in which case they reverted to the king.

9. The custody of idiots, and lunatics, the profits of whose lands were received by the king, an allowance being made to them for necessaries.

From these sources, the produce of the remaining branches of which is now very insignificant, the kings of England derived the whole of their ordinary revenue, till commerce raised the produce of the customs into importance, and the parliament ventured to grant the principal part of their produce to the king, for life. Upon extraordinary occasions, Henry II. and some of his successors had recourse chiefly to scutages, which were a composition by those who held knight's fees, in lieu of the military service to which they were bound, and seem to have been at first mere arbitrary compositions, as the king and the persons liable could agree: hydage, and talliage, were taxes of the same nature, upon other lands, and upon cities and boroughs. Tenths and fifteenths were originally the real tenth or fifteenth of all the moveables belonging to the subject; the amount was uncertain, being levied by new assessments on every fresh grant, till the 8 Edward III. when a new assessment was made and recorded in the exchequer, which was the real value at that period of every city, borough, and town in the kingdom, and by this the fifteenths were afterwards levied, according to the specific sums therein stated, which were usually raised in the different places by a common rate on all the inhabitants. Subsidies were a grant introduced about the time of Richard II. and Henry IV.; they were a tax not immediately imposed upon property, but upon persons in respect to their reputed estates, after the nominal rate of four shillings in the pound for lands, and two shillings and eight pence for goods; aliens paid in a double proportion. This assessment was made according to an ancient valuation, which was so low, that one subsidy, according to sir Edward Coke, did not amount to more than

70,000*l.* It was the rule, never to grant more than one subsidy and two-fifteenths at a time; but this rule was broken through on the Spanish invasion in 1588, when the parliament gave two subsidies and four fifteenths. This mode of taxation fell into disuse during the civil wars in the reign of Charles I. when the parliament introduced weekly and monthly assessments, at a fixed sum upon each county, which was levied by a pound rate, both upon lands and personal estates. The commonwealth afterward introduced excise duties, and derived some profit from the establishment of the post-office, both of which have been since improved into very productive sources of revenue.

At the period of the revolution, most of the ancient branches of the king's revenue had either been formally relinquished, or had greatly declined in their produce, and the parliamentary grants had for some years past consisted almost entirely of custom and excise-duties, with occasional poll-taxes and hearth-money. The total amount of the several branches of which the public revenue then consisted will appear by the following statement, which was formed upon the average produce of four years.

Amount of the public revenue in 1688.

	L.	*s.*	*d.*
Subsidy of tonnage and poundage	577,507	12	10½
Hereditary and temporary excise	610,486	10	9
Hearth-money, about	200,000	0	0
Post-office, about	55,000	0	0
Duties on wines and vinegar	172,900	11	8½
Duties on tobacco and sugar	148,861	8	0
Duties on French linens, brandies, &c.	93,710	8	1
Wine licences, seizures, &c.	56,969	4	4
Total	*L*1,915,435	15	9

This was the whole of the public revenue, except the small duties of ten shillings per ton on wine, &c. first granted in 1666, and appropriated for defraying the expenses of coinage; and a duty of eighteen-pence per chaldron on coals, appropriated for completing St. Paul's church. This revenue, small as it now appears, must have been at least fully adequate to all the national expenses, if an account laid before the parliament is to be depended upon, according to which the annual expenditure of James II. amounted at a medium to only 1,609,365*l.* 2*s.* 9*d.*

The heavy expenses incurred during the reign of William III. and the introduction of the funding system, caused a variety of new taxes to be imposed, and considerable additions to be made to those which previously existed. The hearth-tax was abolished, and the land-tax was levied by a new assessment, which has continued ever since. The malt-tax, the tax on hawkers and pedlars, on hackney-coaches, with many other new taxes, were introduced, which, with the augmentation of the customs and excise, raised the total amount of the public revenue, at the death of king William, to about double its amount at his accession. During the succeeding reigns, an almost infinite number of taxes have been imposed, in order to render the revenue adequate to the payment of the interest on the great accumulation of public debt, and to support a constantly increasing expenditure. The produce of different duties formerly constituted separate funds, appropriated to specific purposes; thus the several taxes which were rendered perpetual by 3 George I. c. 7, formed a fund called the general fund, distinct from the aggregate fund, and South Sea fund, before established; but of late years, the whole produce of all the branches of the public revenue has been brought into one fund, called the consolidated fund.

The various duties constituting the total public revenue of Great Britain are arranged under the following heads:

1. The Customs, which consist of duties on goods imported, on goods exported, on goods carried coastways, and a tonnage duty. The total gross produce of this branch of the revenue, in the year ending 5th January 1808, was 12,638,985*l.* 0*s.* 5½*d.* which being subject to various deductions for drawbacks, bounties, charges of management, &c. rendered the net produce, applicable to national purposes, 10,193,172*l.* 19*s.* 5½*d.*

2. The Excise, which consists principally of duties on malt, and malt-liquors of every kind, including the distillery; many other articles are, however, likewise included, as candles, leather, soap, starch, tea, coffee, wine, tobacco, salt, glass, printed goods, and bricks and tiles. The total gross amount of this productive source of revenue, in the year ending 5th January, 1808, was 25,941,630*l.* 13*s.* 8¾*d.* which was reduced, by allowances, drawbacks, and charges of management, to 24,169,716*l.* 13*s.* 0½*d.*

3. Stamp Duties, laid on deeds and documents of almost every description. This mode of taxation was introduced into England in the year 1671, and revived in 1694, when a particular set of commissioners were first appointed for managing these duties; the produce was at first of small amount, but new duties being imposed, to which numerous additions have been since made, it has gradually increased, and, in the year ending 5th January, 1808,

the gross amount was 4,543,971*l.* 17*s.* 5½*d.* This amount is subject to various deductions, as, the charges of management, discounts, and other parliamentary allowances, the cost of parchment and paper for the country distributors, an allowance to the two universities on almanacks and other incidental expenses, which reduced the net produce to 4,458,738*l.* 14*s.* 0¾*d.*

4. Land and Assessed Taxes. The land tax for many years differed from all other branches of the public revenue (except the old malt duty) in being granted annually; it was however regularly continued from year to year, never being wholly taken off, but it varied with respect to the rate at which it was imposed, having been usually reduced during peace and increased again in time of war, to answer in part the increased expenditure. From 1776 to 1798 it was regularly continued at 4*s.* in the pound, at which rate it was supposed to produce 1,989,673*l.* 7*s.* 10¾*d.* for England, and 47,954*l.* 1*s.* 2*d.* for Scotland, making in the whole 2,037,627*l.* 9*s.* 0¾*d.*; there was however a constant deficiency, to the amount, at an average, of about 235,000*l.* per annum, varying according to the regularity with which the tax was collected, and the amount of the different charges to which it was liable. In 1799, a scheme was adopted for the redemption of the land tax, for which purpose an act was passed, making the tax perpetual; it was then offered for sale to the proprietors of the lands upon which it was charged, or, if they declined it, to any other person who chose to become a purchaser. The consideration to be given in either case was not to be in money, but in three per cent. stock; the object of the scheme being to absorb a large quantity of floating stock, and thus facilitate the raising of new loans. It was estimated that this measure would transfer about eighty millions of stock to government, but the terms offered were by no means such as to induce a general approval of it, and the total amount of stock transferred for land-tax redeemed on the first February 1808 was only 22,976,829*l.* 10*s.* 4*d.* of course a very considerable portion of the tax still remained unredeemed. The assessed taxes consist of the duties on houses, windows, servants, carriages, horses, and horse-dealers, dogs, hair powder, and armorial bearings. The gross produce of the land and assessed taxes, in the year ending January 5th, 1808, was 6,909,190*l.* 12*s.* 9¾*d.* and as the balances in the hand at the beginning of the year exceeded the charges of management and other payments, the total net amount applicable to national purposes was 7,073,530*l.* 10*s.* 8¾*d.*

5. The Post Office. King James I. originally erected a post office for the conveyance of letters to foreign parts, and previously to which an establishment of this kind had existed for the conveyance of inland letters. Some improvements were made in the management of it during the time of the commonwealth, and soon after the restoration a new general post office was established, the revenue derived from which was at first of small amount, but has since gradually increased, both from the increase of commercial intercourse, and the additional rates of postage which have since been imposed. In 1715, the gross produce of the inland office was 145,227*l.* in the year 1744 it amounted to 198,226*l.* and the gross amount of both the inland and foreign offices to 235,492*l.* In 1764 it amounted to 281,535*l.* at which time an act was passed for preventing abuses of the privilege of franking, which, with a further restriction at a subsequent period, has considerably improved this source of revenue. The total gross produce for the year ending January 5th, 1808, was 1,493,490*l.* 11*s.* 9*d.* and the net produce 1,277,538*l.* 11*s.* 4½*d.*

6. Sixpence in the pound on pensions and salaries. This deduction originated from a debt of the civil list in the reign of George I. To satisfy this debt an act was passed for raising half a million at five per cent. interest to be charged upon a deduction of sixpence in the pound on all salaries, fees, and wages, payable in respect of offices of profit granted or derived from the crown. About three years after it was found necessary to raise half a million more for the same purpose, and the former sum bearing five per cent. interest was then paid off, the whole sum of 1,000,000*l.* being raised by way of lottery at an interest of three per cent. per annum. This debt is now charged on the consolidated fund, and consequently the duty established for the payment of its interest forms part of the income of the fund. The gross produce for the year ending the 5th of January 1808, was 72,207*l.* 12*s.* 2¾*d.* and the net produce 71,353*l.* 0*s.* 5¾*d.*

7. One shilling in the pound on pensions and salaries. This is a duty of a similar nature with the foregoing, and was first imposed by 31 George II. c. 22. It extends to all salaries, fees, and perquisites, pensions, or gratuities payable out of any revenue belonging to his majesty in Great Britain, exceeding the value of 100*l.* a year. Its gross amount in the year ending the fifth of January 1808, was 61,057*l.* 2*s.* 1*d.* and including a balance in hand at the beginning of the year, the net amount wa 62,685*l.* 5*s.* 8*d.*

8. Hackney coaches. In 1694 the licence of hackney coaches first became a branch of the public revenue. It has increased, both from the number licensed being greater than formerly, and from the duty imposed upon them having been raised very considerably, but it can never become of much importance; it produced in the year ending the 5th of January 1808, 28,751*l.* 15*s.* gross, and 26,455*l.* 2*s.* 5½*d.* net.

9. Hawkers and pedlars. In the year 1697 these itinerant merchants were first made subject to a particular tax, which could never be of much consequence as an object of revenue, and will probably fall off as new towns and villages are built in different parts of the country. The gross amount in the year ending

the 5th of January, 1808, was 13,231*l.* 0*s.* 4d. the net produce 10,325*l.* 9*s.* 5*d.*

In addition to these several branches of the public revenue, there are some small branches of the old hereditary revenue still remaining. These consist chiefly of alienation fines, post fines, seizures of uncustomed and prohibited goods, compositions, proffers, and the crown lands, of which the last is by far the most important.

Abstract of the ordinary revenues and extraordinary resources constituting the public income of Great-Britain, for the year ending the 5th of January 1808.

Ordinary revenues.

	L.	*s.*	*d.*
Net produce of the Customs	7,462,380	4	10¾
Excise (including annual malt duty)	17,896,145	14	2
Stamps	4,458,738	14	0¾
Land and assessed taxes	7,073,530	10	8¾
Post-office	1,277,538	11	4½
Shilling in the pound on pensions, &c.	62,685	5	8
Sixpence in the pound on ditto	71,353	0	5½
Hackney coaches	26,455	2	5½
Hawkers and pedlars	10,325	9	5
Small branches of the Hereditary revenue	91,422	14	7½

Extraordinary resources.

War taxes, viz.-------Customs	2,730,792	14	6½
Excise	6,273,570	18	10½
Property tax	9,864,189	4	10
Arrears of income duty	23,072	19	0
Arrears of taxes under aid and contribution act	2,888	11	2¾
Received for interest of loans raised for Ireland	1,967,677	14	0
Interest on stock transferred for redemption of land tax	5,000	0	0
From the commissioners for issuing Exchequer bills to the merchants of Grenada	33,800	0	0
Imprest money repaid by sundry accountants	33,442	7	8¾
Fees of regulated exchequer offices	40,545	0	2
Lottery net profit, part of 1806 and 1807	774,694	11	0
Surplus of revenue of the Isle of Man	2,210	11	0
Sundry small articles	6,954	12	2
Sum paid into the exchequer on account of public loans, including the last instalment on the loan of 1806	15,257,211	19	3
Total	*L* 75,446,626	11	6½

Expense of collecting the revenues.

	Rate per cent. *L.*	*s.*	*d.*
Customs	6	2	8
Excise	3	2	0
Stamps	2	15	1
Land and assessed taxes	3	17	3
Post-office	22	5	8
One shilling in the pound on pensions	0	13	9
Sixpence in the pound on ditto	0	12	7
Hackney coaches	9	1	3
Hawkers and pedlars	23	0	2
Total average	4	10	5

The net produce of the several branches, after the payment of certain bounties, pensions, and other charges, is paid into the exchequer to be applied to the services to which it is appropriated. The public accounts at the exchequer, both of the revenue and expenditure, were, till within a few years, kept in a peculiar character in use no where else, and which, in the course of time, had become so unintelligible, even to the officers themselves, that it was usual to write all high numbers in common figures under the characters. It is a curious circumstance, that this obscure species of arithmetic was defective in having no characters to express high numbers, as millions, so far were the framers of it from having any idea of the amount to which the public revenue was to be extended.

Sir John Sinclair, in his History of the Public Revenue, gives the following view of its amount at the commencement of each reign:

	Year.	Annual income.
William the Conqueror	1066	£400,000
William Rufus	1087	350,000
Henry I.	1100	300,000
Stephen	1135	250,000
Henry II.	1154	200,000
Richard I.	1189	150,000
John	1199	100,000
Henry III.	1214	80,000
Edward I.	1272	150,000
Edward II.	1307	100,000
Edward III.	1347	154,139
Richard II.	1377	130,000
Henry IV.	1399	100,000
Henry V.	1413	76,643
Henry VI.	1422	64,976
Edward IV.	1460	
Edward V.	1483	100,000
Richard III.	1483	
Henry VII.	1485	400,000
Henry VIII.	1509	800,000
Edward VI.	1547	400,000
Mary	1553	450,000
Elizabeth	1558	500,000
James I.	1602	600,000
Charles I.	1625	895,819
The Commonwealth	1648	1,517,247
Charles II.		1,800,000
James II.	1684	2,001,855
William III.	1688	3,895,205
Queen Anne	1706	5,691,803
George I.	1714	6,762,643
George II.	1727	8,522,540
George III.	1760	8,800,000

The above statement shews a vast increase of the public revenue, particularly from the time of Charles I. but its progress since the year 1760 has been much more remarkable. In 1773 it amounted to 10,066,661*l.*; in 1780 it had advanced to 12,255,214*l.*; and in 1786, when the debts incurred by the American war had been fully provided for, it amounted to 15,096,112*l.* The increase of commerce during the peace naturally improved such branches of the revenue as depended thereon; so that in 1791, its total produce was 16,712,000*l.* In 1808, its amount was as above stated. (*British Encylopædia, Sinclair's History*, &c.).

To REVE'RB. *v. a.* (*reverbero*, Latin.) To resound; to reverberate: not in use (*Shakspeare*).

REVE'RBERANT. *a.* (*reverberans*, Lat.) Resounding; beating back.

To REVE'RBERATE. *v. n.* (*reverbero*, Lat.) 1. To beat back (*Shakspeare*). 2. To heat in an intense furnace, where the flame is reverberated upon the matter to be melted or cleaned (*Brown*).

To REVE'RBERATE. *v. n.* 1. To be driven back; to bound back (*Howel*). 2. To resound (*Shakspeare*).

REVERBERA'TION. *s.* (*reverberation*, French.) The act of beating or driving back (*Addison*).

REVERBERATION, in chemistry, denotes a kind of circulation of the flame by means of a reverberatory, or the return of the flame from the top of the furnace back to the bottom, chiefly used in calcination. Reverberation is of two kinds: the first with a close fire, that is, a reverberatory furnace, where the flame has no vent at top, being covered with a dome or capital, which repels its action back on the matter or the vessel that contains it, with increased vehemence. After this manner is refining, the distillation of acids, spirits, &c. performed. Reverberation with an open fire is that performed in a furnace or reverberatory, whose registers are all open, used in calcination, &c.

REVERBERATORY, in chemistry, a reverberating furnace, or furnace built close all round, and covered at the top with a capital of brick or tiles, so as not to give any vent to the heat or flame, but to determine it to reverberate, or turn back from the brick work with new force upon the matter placed at bottom. When the fire has no vent or passage at top, it is called a whole reverberatory; when the middle of the capital is open, and only the sides close, so that that there is only half a circulation of the flame, it is called a half reverberatory.

This kind of furnace is chiefly used in the fusion and assay of metals and minerals, and on similar occasions where an intense heat is required. See the article FURNACE.

REVERBERA'TORY. *a.* (*reverberatoire*, French.) Returning; beating back (*Moxon*).

To REVE'RE. *v. a.* (*revereor*, Latin.) To reverence; to honour; to venerate; to regard with awe (*Prior*).

RE'VERENCE. *s.* (*reverentia*, Latin.) 1. Veneration; respect; awful regard (*Bacon*). 2. Act of obeisance; bow; courtesy (*Dryden*). 3. Title of the clergy (*Shakspeare*). 4. Poetical title of a father (*Shakspeare*).

To RE'VERENCE. *v. a.* (from the noun.) To regard with reverence; to regard with awful respect (*Rogers*).

RE'VERENCER. *s.* (from *reverence*.) One who regards with reverence (*Swift*).

RE'VEREND. *a.* (*reverend*, French.) 1. Venerable; deserving reverence; exacting respect by his appearance (*Pope*). 2. The honorary epithet of the clergy.

The religious abroad are called reverend fathers, and abbesses, prioresses, &c. reverend mothers. In England, bishops are right reverend, and archbishops most reverend. In France, before the revolution, their bishops, archbishops, and abbots, were all alike most reverend. In Scotland, the clergy individually are reverend, a synod is very reverend, and the general assembly is venerable.

RE'VERENT. *a.* (*reverens*, Lat.) Humble; expressing submission; testifying veneration (*Pope*).

REVERE'NTIAL. *a.* (*reverentielle*, Fr.) Expressing reverence; proceeding from awe and veneration (*Donne*).

REVERE'NTIALLY. *ad.* (from *reverential.*) With show of reverence (*Brown*).

REVERENTLY. *ad.* (from *reverent.*) Respectfully; with awe; with reverence (*Shakspeare*).

REVE'RER. *s.* (from *revere.*) One who venerates; one who reveres (*Government of the Tongue*).

REVERIE, the same with delirium, raving, or distraction. It is used also for any ridiculous, extravagant imagination, action, or proposition, a chimæra, or vision. But the most ordinary use of the word among English writers, is for a deep disorderly musing or meditation.

REVERO, a strong town of Italy, in the Mantuan, seated on the Po, opposite Ostiglia, 10 miles N.E. of Mirandola, and 20 S.E. of Mantua. Lon. 1. 9 E. Lat. 44. 58 N.

REVE'RSAL. *s.* (from *reverse.*) Change of sentence (*Bacon*).

To REVE'RSE. *v. a.* (*reversus*, Latin.) 1. To turn upside down (*Temple*). 2. To overturn; to subvert (*Pope*). 3. To turn back (*Milton*). 4. To contradict; to repeal (*Hooker*). 5. To turn to the contrary (*Pope*). 6. To put each in the case of the other (*Rogers*). 7. To recall; to renew: obsolete (*Spenser*).

To REVE'RSE. *v. n.* (*revertere*, *reversus*, Latin.) To return (*Spenser*).

REVE'RSE. *s.* (from the verb.) 1. Change; vicissitude (*Dryden*). 2. A contrary; an opposite (*Rogers*). 3. (*revers*, French.) The side of the coin on which the head is not impressed (*Camden*).

REVE'RSIBLE. *a.* (*reversible*, Fr. from *reverse.*) Capable of being reversed.

REVE'RSION. *s.* (*reversion*, French.) 1. The state of being to be possessed after the death of the present possessor (*Hammond*). 2. Succession; right of succession (*South*).

REVERSION, in law, is defined to be returning of lands, &c. into the possession of the donor, or his heirs. Reversion, in the law of England, has two significations; the one of which is an estate left, which continues during a particular estate in being; and the other is the returning of the land, &c. after the particular estate is ended; and it is further said to be an interest in lands, when the possession of it fails; or where the estate which was for a time parted with, returns to the grantors, or their heirs. But, according to the usual definition of a reversion, it is the residue of an estate left in the grantor, after a particular estate granted away ceases, continuing in the grantor of such an estate.

The difference between a remainder and a reversion, consists in this: that the remainder may belong to any man except the grantor; whereas the reversion returns to him who conveyed the lands, &c.

REVERSION OF SERIES, in algebra, is the finding the value of the root, or unknown quantity, whose powers enter the terms of an infinite series, by means of another infinite series in which it is not contained. As, in the infinite series $z = ax + bx^2 + cx^3 + dx^4$ &c.; then if there be found $x = Az + Bz^2 + Cz^3$ &c. that series is inverted, or its root x is found in an infinite series of other terms.

This was one of Newton's improvements in analysis, the first specimen of which was given in his Analysis per Æquationes Numero Terminorum Infinitas; and it is of great use in resolving many problems in various parts of the mathematics.

The most usual and general way of reversion is to assume a series, of a proper form, for the value of the required unknown quantity; then substitute the powers of this value instead of those of that quantity into the given series; lastly compare the resulting terms with the said given series, and the values of the assumed coefficients will thus be obtained. So, to revert the series $z = ax + bx^2 + cx^3$, &c. or to find the value of x in terms of z; assume it thus, $x = Az + Bz^2 + Cz^3$, &c.; then by involving this series, for the several powers of x, and multiplying the corresponding powers by a, b, c, &c. there results

$$\begin{aligned} z = aAz &+ aBz^2 &+ aCz^3 &+ aDz^4, \text{ &c.} \\ &+ bA^2z^2 + 2bABz^3 &+ 2bACz^4 \\ & &+ bB^2z^4 \\ & + cA^3z^3 &+ 3cA^2Bz^4 \\ & &+ dA^4z^4 \end{aligned}$$

Then by comparing the corresponding terms of this last series, or making their coefficients equal, there are obtained these equations, viz.

$aA - 1$, and $aB + bA^2 = 0$, and $aC + 2bAB + cA^3 = 0$, &c. which give these values of the assumed coefficients, viz.

$$A = \frac{1}{a}; \quad B = -\frac{bA^2}{a} = -\frac{b}{a^3};$$

$$C = -\frac{2bAB + cA^3}{a} = \frac{2bb - ac}{a^5};$$

$$D = -\frac{2bAC + bB^2 + 3cA^2B + dA^4}{a}$$

$$= -\frac{5abc - 5b^3 - a^2d}{a^7}; \text{ &c.}$$

and consequently

$$x = \frac{1}{a}z - \frac{b}{a^3}z^2 + \frac{2bb - ac}{a^5}z^3 - \frac{5abc - 5b^3 - a^2d}{a^7}z^4, \text{ &c.}$$

which is therefore a general formula or theorem for every series of the same kind, as to the powers of the quantity x. Thus, for

Ex. Suppose it were required to revert the series $z = x - x^2 + x^3 - x^4$, &c.

Here $a = 1$, $b = -1$, $c = 1$, $d = -1$, &c; which values of these letters being substituted in the theorem, there results

$x = z + z^2 + z^3 + z^4$, &c. which is that series reverted, or the value of x in it.

In the same way it will be found that the theorem for reverting the series $z = ax + bx^3 + cx^5 + dx^7$ &c. is

$$x = \frac{1}{a} z - \frac{b}{a^4} z^3 + \frac{3bb - ac}{a^7} z^5 - \frac{a^2 d + 12b^3 - 8abc}{a^{10}}, \text{ &c.}$$

And if $z = ax^m + bx^{m+n} + cx^{m+2n} +$ &c. then is

$$x = y^{\frac{1}{m}} - \frac{b}{ma} y^{\frac{1+n}{m}} + \frac{(1 + 2n + m)\, bb - 2mac}{2mmaa} \times y^{\frac{1+2n}{m}} \text{ &c.}$$

where y is $= \frac{z}{a}$.

Various methods of reversion may be seen as given by De Moivre in the Philosophical Transactions, number 240; or Maclaurin's Algebra, pa. 263; or Stuart's Explanation of Newton's Analysis, &c. pa. 455; or Coulson's Comment on Newton's Flux. pa. 219; or Horsley's ed. of Newton's works, vol. 1. pa. 291; or Simpson's Flux. vol. 2. pa. 302: or most authors on algebra. (*Hutton's Dictionary*).

REVE'RSIONARY. *a.* (from *reversion.*) To be enjoyed in succession (*Arbuthnot*).

REVERSIS. (from *revertir*, Spanish, to change.) In playing-cards, a Spanish game played by four persons, with every one a box, containing six contracts, reckoned as 48 fishes each, twenty counters 6 fishes each, and 32 fishes, making the fishes in all 400; likewise with two pools, called the great and the little quinola pools, (the great one to be under the little) which are always to be placed on the dealer's right hand. For this game the tens must be taken out from a pack of cards; the deal is to the right; three cards are given to each player the first round, and four to the dealer, afterwards always four, so that the non-dealers will have eleven cards each, and the dealer twelve, with three remaining, to be placed singly in the middle of the table opposite to each non-dealer, who is to put out a card, under the pools, and replace it with the card that is opposite to him on the table: the dealer likewise puts out one, but does not take in: should there, however, be three remises or stakes in the pools, then it is in any player's option to take a card; if he do not, he may see the card, before the same is placed to the discard; then, previous to playing any card, the opposite parties exchange one with each other. The cards rank as at whist, and the points in the tricks are forty, each ace reckoned 4, king 3, queen 2, and knave 1.

The points in the discard, which form the party, reckon as in the tricks, except the ace of diamonds, and the knave of hearts, as great quinola; the former reckoning 5, and the latter 4. The player having the fewest points wins the party. If two have the same number of points, then he who has the fewest tricks has the preference; if points and tricks be equal, then he who dealt last wins; but he who has not a trick has the preference over a trick without points; and the espagnolette played and won, gains the party in preference to the last dealer. When every trick is made by the same person, there is no party; and this is called making the reversis.

The great quinola pool is to consist of twenty-six fishes at the commencement, and to be renewed every time the same is cleared, or has fewer in it than the twenty-six; this stake is attached to the knave of hearts, or great quinola, which cannot be put to the discard, unless there are three stakes, or a hundred fishes in the pool. The little quinola pool, consisting of thirteen fishes, attached to the queen of hearts, as little quinola, is to be renewed in the same manner, in proportion as the other, and the little quinola cannot be put to the discard, unless there are three stakes, or fifty fishes in the pool. Each time either or both of the quinolas are placed, or played on a renounce, they are entitled to the stakes attached to them, except when there are three stakes in the pool, then the great quinola is to receive a hundred fishes and the little quinola fifty: on the contrary, each time the quinolas are forced, gergi or led out, the stakes are to be paid in the same proportion as they would have been received, except in the single instance of the person who played the quinolas making the reversis, when the quinola, to be entitled to any benefit, must be played before the two last tricks.

Every trick must be made by one person to make the reversis, which is undertaken when the first nine tricks are gained by the same person; there is then an end of the party, and of the quinolas if held by him, except he has played both or either of them before the two last tricks; but, on the contrary, should his reversis be broken, he then is not only to pay the reversis broken, but the stakes to the pools, for the quinolas he may have played before the reversis was undertaken. All consolations paid for aces or quinolas, by the person undertaking the reversis, are to be returned on winning it.

The espagnolette is either simply four aces, three aces and one quinola, or two aces and two quinolas. The player having the same, has a right to renounce in every suit, during the whole game, and if he can avoid winning any trick, and there is no reversis, he of course wins the party in preference to him who is better placed; but if obliged to win a trick, he then pays the party to the other, and returns the consolations he may have received for aces or quinolas; and if he has a quinola, he must pay the stake to the pool instead of receiving it. The player having the espagnolette is at liberty to wave his privilege, and play his game as a common one, but loses that privilege the moment he has renounced playing in suit. The player of the espagnolette receives consolation

in any part of the game, if he forces the quinola.

If the reversis be won or broken, the espagnolette pays singly for all the company. When the person holding the espagnolette can break the reversis, he is payed, as before mentioned, by the person whose reversis he broke; he can likewise undertake the reversis, but then his hand must be played as a common game. If the espagnolette have placed his quinola, and there is a reversis either made or broken, he is not to receive the stake; for when the reversis is attempted, the stakes are neither received or paid, except by him who undertakes the same. If, by another player having the ace or king of hearts, the espagnolette have in any part of the game either of his quinolas forced, he pays the stake and his consolation to him that forces, except there is a reversis.

The dealer always puts two fishes into the great quinola pool, and one into the little; besides which, every player, at the commencement, puts into the former six fishes, and into the latter three; and each time the stakes are drawn, or when there are fewer fishes in the pool than the original stake, the pool must be replenished as at first. To the points in the discard, 4 are to be added for the party. The person who gives an ace upon a renounce, receives a fish from the person who wins a trick; and if it be the ace of diamonds, he will receive two. The person who forces an ace receives the same payments from all the players. The great quinola placed upon a renounce, receives six fishes; the little quinola three; and if either of them be forced, the person who forces receives the same payment from each player: and these payments should be made immediately, without being asked for. One or more aces, or either of the quinolas played, or gergi, that is, led out, pay the same, as if they had been forced to the person that wins the party, but it is for him to recollect and demand them. When either ace or quinola are placed, played, or gergi the last card, it is called *à la bonne*, and are paid double, and all payments whatever are double to the person who sits opposite. The payment for the reversis made or broke, is eighty fishes; each player paying twenty, and the opposite party forty, when the reversis is made; but when broken, the whole is paid by the person whose reversis is broken: that is, he pays the person breaking it exactly the same number of fish he would have received had he won it.

Laws of the game.—The person who misdeals, loses his deal.

If any player take his card without having put out to the discard, the deal is void.

The eldest hand ought to take care that all the players have put their stakes into the pools; if not, he must make good the deficiency.

The discard when put out is not to be changed.

The eldest hand should not play a card till the discard is complete; should he have played, he is permitted, if nobody have played to it, to take up the same, and play another.

No person must play before his turn.

If at the end of the game it be perceived there is an error in the discard, the deal must be made again.

When the cards are cut, it is too late to ask for any payments.

To REVE'RT. *v. a.* (*reverto*, Latin.) 1. To change; to turn to the contrary (*Prior*). 2. To reverberate (*Thomson*).

To REVE'RT. *v. n.* (*revertir*, old French.) To return; to fall back (*Bacon*).

REVE'RT. *s.* (from the verb.) Return; recurrence. A musical term (*Peacham*).

REVE'RTIBLE. *a.* (from *revert.*) Returnable.

REVERY'. *s.* (*resverie*, Fr.) Loose musing; irregular thought (*Addison*).

To REVE'ST. *v. a.* (*revestir*, *revêtir*, Fr.) 1. To clothe again (*Spenser*). 2. To reinvest; to vest again in a possession or office.

REVE'STIARY. *s.* (*revestiare*, French.) Place where dresses are reposited (*Camden*).

REVI'CTION. *s.* (*revictum*, Lat.) Return to life (*Brown*).

To REVI'CTUAL. *v. a.* (*re* and *victual.*) To stock with victuals again (*Raleigh*).

To REVI'EW. *v. a.* (*re* and *view.*) 1. To look back (*Denham*). 2. To see again, (*Shakspeare.*) 3. To consider over again; to re-examine (*Dryden*). 4. To retrace (*Pope*). 5. To survey; to overlook; to examine.

REVIE'W. *s.* (*reveue*, French, from the verb.) Survey; re-examination (*Atterbury*).

REVIEW. In the military acceptation of the term, an inspection of the appearance, and regular disposition of a body of troops, assembled for that purpose. At all reviews, the officers should be properly armed, ready in their exercise, salute well, in good time, and with a good air; their uniform genteel, &c. the men should be clean and well-dressed; their accoutrements well put on; very well sized in the ranks; the serjeants expert in their duty, drummers perfect at their beatings, and the fifers play correct. The manual exercise must be performed in good time, and with life; and the men carry their arms well; march, wheel, and form with exactness. All manœuvres must be performed with the utmost regularity, both in quick and slow time. The intention of a review is, to know the condition of the troops, to see that they are complete, and perform their exercise and evolutions well.

REVIEW (Bill of), in chancery, is where a cause has been heard, and the decree signed and enrolled; and some error in law appears upon the decree, or new matter is discovered in time after the decree made, a bill of review is then had.

REVIEW, in literature, a periodical publication which gives analyses and criticisms of the principal new works as they issue from the press. There are several reviews of this kind published in England and Scotland; as the

Monthly Review, the Critical Review, the British Critic, the Eclectic Review, the Edinburgh Review, the Quarterly Review, the British Review, the Edinburgh Quarterly Review, &c. See CRITICISM.

To REVI'LE. *v. a.* (*re* and *vile.*) To reproach; to vilify; to treat with contumely (*Spenser*).

REVI'LE. *s.* (from the verb.) Reproach; contumely; exprobration (*Milton*).

REVI'LER. *s.* (from *revile.*) One who reviles; one who treats another with contumelious terms (*Government of the Tongue*).

REVI'LINGLY. *ad.* (from *revile.*) In an opprobrious manner; with contumely (*Maine*).

REVI'SAL. *s.* (from *revise.*) Review; re-examination (*Pope*).

To REVI'SE. *v. a.* (*revisus*, Latin.) To review; to overlook (*Pope*).

REVI'SE. *s.* (from the verb.) 1. Review; re-examination (*Boyle*). 2. Among printers, a second proof of a sheet corrected (*Felt*).

REVI'SER. *s.* (*reviseur*, Fr.) Examiner; superintendent.

REVI'SION. *s.* (*revision*, French.) Review.

To REVI'SIT. *v. a.* (*revisito*, Latin.) To visit again (*Milton*).

REVI'VAL. *s.* (from *revive.*) Recall from a state of languor, oblivion, or obscurity.

To REVI'VE. *v. n.* (*revivre*, French.) 1. To return to life (*Kings*). 2. To return to vigour or fame; to rise from languor, oblivion, or obscurity (*Milton*).

To REVI'VE. *v. a.* 1. To bring to life again (*Milton*). 2. To raise from languor, insensibility, or oblivion (*Spenser*). 3. To renew; to recollect; to bring back to the memory (*Locke*). 4. To quicken; to rouse (*Shakspeare*). 5. To recomfort; to restore to hope (*Ezra*). 6. To bring again into notice (*Swift*). 7. [In chemistry.] To recover from a mixed state.

REVI'VER. *s.* (from *revive.*) That which invigorates or revives.

To REVIVI'FICATE. *v. a.* (*revivifier*, French.) To recall to life.

REVIVIFICA'TION. *s.* (from *revivificate.*) The act of recalling to life (*Spectator*).

REVIVI'SCENCY. *s.* (*revivisco*, *reviviscentia*, Lat.) Renewal of life (*Burnet*).

REU'NION. *s.* (*reunion*, French.) Return to a state of juncture, cohesion, or concord.

To REUNI'TE. *v. a.* (*re* and *unite.*) 1. To join again; to make one whole a second time; to join what is divided (*Shakspeare*). 2. To reconcile; to make those at variance one.

To REUNI'TE. *v. n.* To cohere again.

RE'VOCABLE. *a.* (*revocable*, French.) 1. That may be recalled (*Bacon*). 2. That may be repealed.

RE'VOCABLENESS. *s.* (from *revocable.*) the quality of being revocable.

To RE'VOCATE. *v. a.* (*revoco*, Latin.) To recall; to call back (*Daniel*).

REVOCA'TION. *s.* (*revocatio*, Lat.) Act of recalling (*Hooker*). 2. State of being recalled (*Howel*). 3. Repeal; reversal (*Ayliffe*).

To REVO'KE. *v. a.* (*revoquer*, Fr. *revoco*, Lat.) 1. To repeal; to reverse (*Dryden*). 2. To check; to repress (*Spenser*). 3. To draw back (*Davis*).

REVO'KEMENT. *s.* (from *revoke.*) Revocation; repeal; recall (*Shakspeare*).

To REVO'LT. *v. n.* (*revolter*, Fr.) 1. To fall off from one to another (*Shakspeare*). 2. To change: not in use (*Shakspeare*).

REVO'LT. *s.* (*revolte*, Fr.) 1. Desertion; change of sides (*Raleigh*). 2. A revolter; one who changes sides: not in use (*Shakspeare*). 3. Gross departure from duty (*Shakspeare*).

REVO'LTED. *part. adj.* (from *revolt.*) Having swerved from duty (*Milton*).

REVO'LTER. *s.* (from *revolt.*) One who changes sides; a deserter; a renegade (*Milton*).

To REVO'LVE. *v. n.* (*revolvo*, Latin.) 1. To roll in a circle; to perform a revolution (*Watts*). 2. To fall back (*Ayliffe*).

To REVO'LVE. *v. a.* 1. To roll any thing round (*Milton*). 2. To consider; to meditate on (*Shakspeare*).

REVOLUTE, in botany, rolled back or downwards.—Revoluta vernatio s. folatio. Applied to the foliation or leafing. Quorum margines laterales utrinque retrorsum, s. versus paginam inferiorem spiraliter convolvunter. When the sides of the leaves (in the bud) are rolled spirally back, or towards the lower surface.—Revolutum folium. A revolute leaf. Quod deorsum revolvitur.—Having the edges rolled back or towards the lower surface: as in rosemary, teucrium fruticans. Revolutus cirrus. A revolute tendril. Spira dimidio itinere retorta. When a spire of the screw, having made half a revolution, turns back in a contrary direction.—Revoluta corolla. A revolute corol: having the petals rolled back, as in asparagus, medeola, lilium chalcedonicum.—Revoluta valvula. A revolute valve. Turned back after it opens: as in the siliqua of cardamine.—This term is opposed to involute or rolled inwards.

REVOLU'TION. *s.* (*revolution*, French; *revolutus*, Latin.) 1. Course of any thing which turns to the point at which it began to move (*Milton*). 2. Space measured by some revolution (*Milton*). 3. Change in the state of a government or country (*Davenant*). 4. Rotation; circular motion. 5. Motion backward (*Milton*).

REVOLUTION, formed from *revolvo*, to roll backwards, in politics, denotes a grand turn or change of government.

There are no states in the world but have undergone frequent revolutions. The abbot de Vertot has furnished us with two or three good histories of the revolutions of Sweden, the revolutions of Rome, &c. There has also recently been a revolution in France, the principal events of which must be too fresh in the

minds of most of our readers to need detailing here.

The REVOLUTION, used with us by way of eminence, denotes the great turn of affairs in England in 1688, when king James II. abdicating, the prince and princess of Orange were declared king and queen of England, &c. See RIGHT OF CROWN.

The true ground and principle upon which that memorable event proceeded was an entirely new case in politics, which had never before happened in our history; the abdication of the reigning monarch, and the vacancy of the throne thereupon. Accordingly, in a full assembly of the lords and commons, met in convention on occasion of this vacancy, both houses came to this resolution: "That king James the Second, having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between king and people; and, by the advice of Jesuits, and other wicked persons, having violated the fundamental laws; and having withdrawn himself out of this kingdom, has abdicated the government, and that the throne is thereby vacant." The lords and commons having determined this fundamental article, that there was a vacancy of the throne, proceeded to fill up that vacancy in such manner as they judged the most proper. And this was done by their declaration of 12 February, 1688, in the following manner: "That William and Mary, prince and princess of Orange, be, and be declared king and queen, to hold the crown and royal dignity during their lives, and the life of the survivor of them; and that the sole and full exercise of the regal power be only in, and executed by, the said prince of Orange, in the names of the said prince and princess, during their joint lives; and after their deceases the said crown and royal dignity to be to the heirs of the body of the said princess; and for default of such issue to the princess Anne of Denmark, and the heirs of her body; and for default of such issue to the heirs of the body of the said prince of Orange." This transaction, founded in equity, and strictly agreeable to the spirit of our constitution, and the rights of human nature, formed a new era in the history of our country, in which the bounds of prerogative and liberty have been better defined, the principles of government more thoroughly examined and understood, and the rights of the subject more explicitly guarded by legal provisions, than in any other period of the English history. Blackst. Comm. book i. p. 211, &c. book iv. p. 433.

REVOLUTION, in geometry. The motion of any figure quite round a fixed line, as an axis, is called the revolution of that figure; and the figure so moving is said to revolve.

Thus, a right-angled triangle, revolving round one of its legs, as an axis, generates, by that revolution, a cone.

REVOLUTION, in astronomy, denotes the period of a star, planet, comet, or other phænomenon; or its course from any point of its orbit, till it return to the same.

The planets have a twofold revolution. The one about their own axis, usually called their diurnal rotation, which constitutes what we call their day.

The other about the sun, called their annual revolution or period, or year. See ASTRONOMY.

To REVO'MIT. *v. a.* (*re* and *vomit.*) To vomit; to vomit again (*Hakewill*).

REVU'LSION. *s.* (*revulsus*, Lat.) The act of revelling or drawing humours from a remote part of the body (*Bacon*).

REVU'LSIVE. *a.* Having the power of revulsion (*Fell*).

REUS, a town of Spain, in Catalonia. It has a considerable trade in wine, brandy, and nuts, which are carted down to Salo, an open but safe road, five miles off. About 20,000 pipes of brandy are annually exported. It is seated in the middle of a most fruitful plain, 35 miles N.E. of Tortosa, and 60 W.S.W. of Barcelona.

REUSS, a river of Swisserland, which rises in the lake of Locendro, between the mountains of Petina and Locendro, flows through the lake of Lucern and the town of that name, and joining the Aar, falls into the Rhine, below Zurzach.

REUTLINGEN, a free imperial town of Suabia, in the duchy of Wirtemburg. It is adorned with handsome public buildings, and has a well frequented college. It is seated on the Echetz, near the Neckar, 10 miles E. of Tubingen, and 37 S. of Stutgard. Lon. 9. 10 E. Lat. 48. 31 N.

REWAH, a town of Hindustan Proper, in the province of Allahabad, 57 miles S.S.W. of Allahabad. Lon. 81. 36 E. Lat. 24. 35 N.

To REWA'RD. *v. a.* (*re* and *award.*) 1. To give in return (*Samuel*). 2. To repay; to recompense for something good (*Milton*).

REWA'RD. *s.* (from the verb) 1. Recompense given for good performed (*Dryden*). 2. It is sometimes used with a mixture of irony, for punishment or recompense of evil.

REWA'RDABLE. *a.* (from *reward.*) Worthy of reward (*Taylor*).

REWA'RDER. *s.* (from *reward.*) One that rewards; one that recompenses (*Swift*).

To REWO'RD. *v. a.* (*re* and *word.*) To repeat in the same words (*Shakspeare*).

REYHER (Samuel), of Schleusingen in Henneberg, professor of mathematics and jurisprudence at Kiel, wrote mathesis biblica—a dissertation on the inscription on the cross of J. C. and on the hour of his crucifixion—and translated Euclid into German. He died at Kiel 1714, aged 79.

REYLOF (Oliver), of Ghent, was eminent as a Latin poet, and wrote poematum libri. 3. et dissertationes de piscibus—opera poetica, &c. and died 1742, aged 72.

REYNA, an ancient town of Spain, in Andalusia, seated in a plain, with a castle built upon an eminence, three miles from Lerna, and in a territory abounding in wine and cattle.

REYNEAU (Charles René), of Brissac in Anjou, taught philosophy at Pezenas and Toulon, and in 1683 was promoted to the mathematical chair at Angers. He published analysis demonstrated, 2 vols. 4to. a popular work, in which he reduced to a body the theories of Newton, Descartes, Leibnitz, &c. He published science du calcul des grandeurs, 2 vols. 4to. and a tract on logic, 12mo. and died 1728, aged 78.

REYNER (Edward), author of precepts of christian practice—vindication of human learning and universities, was a native of Yorkshire, and educated at Cambridge. He settled at Lincoln 1627, but was ejected for nonconformity at the restoration, and died soon after. His son John was fellow of Emanuel college, Cambridge. He took orders, but was deprived for nonconformity, after which he studied physic, and practised at Nottingham, where he died young. He wrote some things of considerable merit.

REYNOLDS (Edward), of Southampton, was educated at Merton college, Oxford, and appointed rector of Braynton, Northamptonshire, and preacher of Lincoln's Inn. He was a member of the Westminster assembly, and one of the ministers at the Savoy conference, yet he became bishop of Norwich, to the great offence of his dissenting brethren. He died 1676, aged 81. He was a strong calvinist. His works are on theological subjects.

REYNOLDS (Sir Joshua), was born 16th July, 1723, at Plympton in Devonshire. His father was a clergyman, who intended his son Joshua for the church, and sent him to Oxford with that view; but having a turn for drawing, and accidentally meeting with Richardson's Theory, he was resolved to cultivate the profession of a painter. His first master was Mr. Hudson, who had the reputation of making good painters, though not one of the number himself. About 1749 Mr. Reynolds visited Italy, and had for companion and patron the late lord Keppel. He returned to England after two years, highly improved by travel and study, and his first portrait which attracted public attention was that of the above nobleman. His historical pieces afterwards were not less admired, and he was the first promoter of the literary club, of which Johnson, Burke, and other great men, were members. In 1769, the academy of painting, sculpture, and architecture, was established, when the honourable office of president was conferred on Mr. Reynolds, as also the dignity of knighthood. His infirmities, however, obliged him in 1791 to resign his chair. Sir Joshua was fellow of the royal and antiquary societies, and Doctor of Laws, of both Oxford and Dublin, as also member of the company of Painter-stainers in London. He died February 23d, 1792, and was buried in St. Paul's cathedral. Sir Joshua chiefly applied himself to portrait paintings, though he sometimes painted historical subjects in a style of uncommon excellence. His greatest performances in this way were, The infant Hercules, and Count Ugolino. He also shone respectably as an author in the line of his profession, and his works have been published since his death, in 2 vols. 4to.

The following character of him is said to be the production of Mr. Burke:

"His illness was long, but borne with a mild and cheerful fortitude, without the least mixture of any thing irritable or querulous, agreeably to the placid and even tenor of his whole life. He had from the beginning of his malady a distinct view of his dissolution, which he contemplated with that entire composure which nothing but the innocence, integrity, and usefulness of his life, and an unaffected submission to the will of Providence, could bestow. In this situation he had every consolation from family tenderness, which his tenderness to his family had always merited.

"Sir Joshua Reynolds was, on very many accounts, one of the most memorable of men of his time. He was the first Englishman who added the praise of the elegant arts to the other glories of his country. In taste, in grace, in facility, in happy invention, and in the richness and harmony of colouring, he was equal to the great masters of the renowned ages. In portrait he went beyond them; for he communicated to that description of the art in which English artists are the most engaged, a variety, a fancy, and a dignity, derived from the higher branches, which even those who professed them in a superior manner did not always preserve when they delineated individual nature. His portraits remind the spectator of the invention of history and the amenity of landscape. In painting portraits, he appears not to be raised upon that platform, but to descend to it from a higher sphere. His paintings illustrate his lessons, and his lessons seem to be derived from his paintings.

"He possessed the theory as perfectly as the practice of his art. To be such a painter, he was a profound and penetrating philosopher.

"In full happiness of foreign and domestic fame, admired by the expert in the art, and by the learned in science, courted by the great, caressed by sovereign powers, and celebrated by distinguished poets, his native humility, modesty, and candour, never forsook him, even on surprise or provocation; nor was the least degree of arrogance or assumption visible to the most scrutinizing eye in any part of his conduct or discourse.

"His talents of every kind—powerful from nature, and not meanly cultivated in letters—his social virtues in all the relations and all the habitudes of life, rendered him the centre of a very great and unparalleled variety of agreeable societies, which will be dissipated by his death. He had too much merit not to excite some jealousy, too much innocence to provoke any enmity. The loss of no man of his time can be felt with more sincere, general, and unmixed sorrow."

For a complete and very interesting list of plates from paintings by sir Joshua Reynolds,

their dates, and the original prices of many of them, see Selection of curious Articles from the Gentleman's Magazine, vol. iv. pp. 603—633.

REYRAC (François Philippe de St. Laurent de), a French writer, born at Longeville, in Limousin, in 1734. He was bred to the church, and became canon-regular of Chancelade, and died in 1782. He wrote sacred odes, a letter on the eloquence of the pulpit, and several other pieces in poetry and theology.

REZAN, a government of Russia, formerly a province of the government of Moscow. It is fertile in corn, and populous; and had anciently its own princes.

REZAN, a city of Russia, capital of a government of the same name, with an archbishop's see. It was formerly considerable for its extent and riches, but was almost ruined by the Tartars, in 1568. It is seated at the confluence of the Trubesh and Occa, 100 miles S.E. of Moscow. Lon. 40. 37 E. Lat. 54. 55 N.

RHABARBARUM. (from *rha*, and *barbarus*, wild; so called because it was brought from the banks of the Rha in Russia.) Rhabarbarum verum. Rhabarbarum tartaricum. Rheum. Rhubarb. It was not until the year 1732 that naturalists became acquainted with any plant which seemed to afford the rhabarbarum officinale, when some plants received from Russia by Jussieu at Paris, and Raud at Chelsea, were said to supply this important desideratum, and as such were adopted by Linnéus in his first edition of the Species Plantarum, under the name of rheum rhabarbarum. This, however, was not generally received as the genuine rhubarb plant; and with a view to ascertain this matter more completely, Kaun Boerhaave procured from a Tartarian rhubarb merchant the seeds of those plants whose roots he annually sold, and which were admitted at Petersburgh to be the true rhubarb. These seeds were soon propagated, and were discovered by De Gorter to produce two distinct species, viz. the R. rhabarbarum of Linnéus, or as it has since been called, the R. undulatum, and another species, a specimen of which was presented to Linnéus, who declared it to be a new one, and was first mentioned in the second edition of the Sp. Plantarum, in 1762, by the name of R. palmatum. Previous to this time De Gorter had repeatedly sent its seeds to Linnéus, but the young plants which they produced constantly perished; at length he obtained the fresh root, which succeeded very well at Upsall, and afterwards enabled the younger Linnéus to describe this plant, ann. 1767. But two years antecedent to this Dr. Hope's account of the rheum palmatum, as it grew in the botanic garden near Edinburgh, had been read before the Royal Society at London; and of the great estimation in which this plant was held by him we have the following proof; "From the perfect similarity of this root with the best foreign rhubarb, in taste, smell, colour, and purgative qualities, we cannot doubt of our being at last possessed of the plant which produces the true rhubarb, and may reasonably entertain the agreeable expectation of its proving a very important acquisition to Britain."

But from the relation we have given, it appears that both the seeds of the R. palmatum, and the R. undulatum, were transmitted to Petersburgh, as those of the true rhubarb; we are therefore to conclude, that the former species has an equal claim to this importance with the latter; and from further enquiries made in Russia, there is the best authority for believing that the R. compactum also affords this very useful drug. The seeds of the R. palmatum were first introduced into Britain in 1762, by Dr. Hounsy (who sent them from Russia), and were supposed to be a part of that already mentioned; and since their prosperous cultivation by the late professor of botany at Edinburgh, the propagation of this plant has been gradually extended to most of our English gardens, and with a degree of success which promises in time to supersede the importation of the foreign root. Two sorts of rhubarb roots are usually imported into this country for medical use, viz. the Chinese, and the Tartary rhubarb; the first is in oblong pieces, flattish on one side, and convex on the other; compact, hard, heavy, internally of a dull red colour, variegated with yellow and white, and when recently powdered, appears yellow, but on being kept becomes gradually redder. The second is the most valuable, and is brought to us in roundish pieces, with a large hole through the middle of each; it is more soft and friable than the former sort, and exhibits, when broken, many streaks of a bright red colour. "The marks of the goodness of rhubarb are, the liveliness of its colour when cut; its being firm and solid, but not flinty or hard; its being easily pulverable, and appearing when powdered of a fine bright yellow colour; its imparting to the spittle when chewed a deep saffron tinge, and not proving slimy or mucilaginous in the mouth; its taste is subacrid, bitterish, and somewhat styptic; the smell lightly aromatic."

The purgative qualities of rhubarb are extracted more perfectly by water than by rectified spirit: the root remaining after the action of water is almost if not wholly inactive; whereas after repeated digestion in spirit, it proves still very considerably purgative. The virtue of a watery infusion, on being inspissated by a gentle heat is so much diminished, that a dram of the extract is said to have scarcely any greater effect than a scruple of the root in substance. The spirituous tincture loses less; half a dram of this extract proving moderately purgative. The qualities of this root are that of a gentle purgative, and so gentle that it is often inconvenient on account of the bulk of the dose required, which in adults must be from ʒss to ʒj. When given in a large dose it will occasion some griping, as other purgatives do; but it is hardly ever heating to the system, or shows the other effects of the more drastic purgatives. The purgative quality is accompanied with a bitterness, which is often useful in restoring the tone of the stomach when it has been

lost; and, for the most part, its bitterness makes it sit better on the stomach than many other purgatives do. Its operation joins well with neutral laxatives; and both together operate in a lesser dose than either of them would singly. Some degree of stipticity is always evident in this medicine; and as this quality acts when that of the purgative has ceased, so, in cases of diarrhœa, when any evacuation is proper, rhubarb has been considered as the most proper remedy to be employed. It must, however, be remarked here, that in many cases of diarrhœa, no further evacuation than what is occasioned by the disease is necessary or proper. The use of rhubarb, in substance, for keeping the belly regular, for which it is frequently employed, is by no means proper, as the astringent quality is ready to undo what the purgative has done; but it is found that the purpose mentioned may be obtained by it, if the rhubarb is chewed in the mouth, and no more is swallowed than what the saliva has dissolved. And it must be remarked, that in this way employed it is very useful to dyspeptic persons. Analagous to this, is the use of rhubarb in solution, in which it appears, that the astringent quality is not so largely extracted as to operate so powerfully as when the rhubarb was employed in substance.

The officinal preparations of this drug are, a watery and a vinous infusion, a simple and a compound tincture. It is also an ingredient in different compositions; as, the elixir ex aloe et rheo, pilulæ stomachicæ, and some others.

RHABARBARUM ALBUM. See MECHOACANNA.

RHABARBARUM ANTIQUORUM. See RHAPONTICUM.

RHABARBARUM MONACHORUM. Hippolapathum. Patientia. Monks rhubarb. Garden patience. This root, which is supposed to possess the virtues of rhubarb, but in an inferior degree, is obtained from the rumex patientia of Linnéus, and, according to professor Murray, from the rumex alpinus of Linnéus. It is obviously more adstringent than rhubarb, but comes very far short of its purgative virtue.

RHABARBARUM SIBIRICUM. The plant directed for medicinal purposes by this name is the rheum undulatum; foliis subvillosis undulatis petiolis æqualibus of Linnéus. It possesses similar virtues to those of the palmate species, and is in common use in Russia. See RHEUM.

RHABARBARATE. *n.* (from *rhabarbara*, Latin.) Impregnated or tinctured with rhubarb (*Floyer*).

RHABDOIDES. (Ραβδοειδης, formed from ραβδος, rod, or staff, and ειδος, form.) In anatomy, a name given the second true suture of the skull, called also the sagittal suture.

RHABDOLOGY, or RABDOLOGY, in arithmetic, a name sometimes given to the method of performing the two most difficult and operose rules, viz. multiplication and division, by the two easiest, viz. addition and subtraction, by means of two little rods or laminæ, whereon are inscribed the simple numbers, and which are to be shifted according to certain rules.

These rods are what we popularly call Neper's bones, from their inventor, a Scottish baron, who likewise invented logarithms. For their description and use, see NEPER'S BONES.

RHABDOMANCY, an ancient method of divination, performed by means of rods or staves. Whence its name, from the Greek ραβδος, rod, and μαντεια, divination.

St. Jerom makes mention of this kind of divination, in his commentary on Hosea, chap. iv. 12. The same he finds again in Ezekiel xxi. 21, 22.

If it be the same kind of divination that is mentioned in the two passages, rhabdomancy must have been also the same superstition with belomancy.

In effect, the two are ordinarily confounded. The seventy themselves translate the חצים of Ezekiel, by ραβδος, a rod; though in strictness it signifies an arrow.

This, however, is certain; the instruments of divination mentioned by Hosea are different from those of Ezekiel. In the former it is עצו *etso*, מקלו *maklo*, his wood, his staff; in the latter, חצים *hhitsim*, arrows. Though it is possible they might use rods or arrows indifferently; or the military men might use arrows, and the rest rods.

RHACHIS. (Ραχις, the spine of the back.) See SPINE.

RHACHITIS. See RACHITIS.

RHACIA, a promontory in the Mediterranean sea, projecting from the Pyrenean mountains.

RHADAMANTHUS, a son of Jupiter and Europa, was born in Crete, which he abandoned about the 30th year of his age. He passed into some of the Cyclades, where he reigned with so much justice, that the ancients have said he became one of the judges of hell, and that he was employed in the infernal regions in obliging the dead to confess their crimes, and in punishing them for their offences.

RHAGADES. (ραγας, from ρηγνυω, to break or bruise.) Malignant, dry, and deep cutaneous fissures.

RHAGADIOLUS, in botany, a genus of the class syngenesia, order polyandria æqualis. Receptacle naked; seeds bowed, spreading; downless; calyx invested with scales. Three species—Montpelier; Levant; Siberia.

RHAGIO. In the entomology of Fabricius, a tribe of the genus MUSCA, which see.

RHAGIUM. In the entomology of Fabricius, a tribe of the coleopterous genus CERAMBYX, which see.

RHAMA, or RAMA, an incarnate deity of the first rank, in Indian mythology. Sir William Jones believes he was the Dionysos of the Greeks, whom they named Bromius, without knowing why; and Bugenes, when they represented him horned, as well as Lyaios and

Eleutherios the deliverer, and Triambos or Dithyrambos the triumphant.

There are three Rhamas mentioned in the Indian mythology, who together with Crishna, the darling god of the Indian women, are described as youths of perfect beauty. The third Rhama is Crishna's elder brother, and is considered as the eighth Avatar, invested with an emanation of his divine radiance.

RHAMNUS. Buckthorn. In botany, a genus of the class pentandria, order monogynia. Calyx tubular; petals five; scales opposite the stamens; berry superior. Thirty-two species, scattered over the globe; two indigenous to our own country. Of these some are spinous, some prickly, some unarmed. The following are cultivated.

1. R. catharticus. Purging buckthorn. Stem strong, wood, twelve or fourteen feet high; bark of the young shoots a smooth grayish-brown, of the older, darker and rougher; spines terminal; leaves ovate; flowers four-cleft, dicœcous; berry round, pulpy, four-seeded. Found wild in our own hedges; flowers from April to June; berries ripe towards the end of September.

The juice of the berry is a strong purgative, and has for this purpose long formed an article in the pharmacopœias under the name of SPINA CERVINA, which see. The bark is emetic; the juice of the unripe berries mixed with alum forms a yellow dye. The French miniature painters obtain also a delicate and highly prized green from the berries, which they call verdevissa. There is another variety which is a lower shrub, and hence denominated dwarf buckthorn.

2. R. frangula. Alder buckthorn; black alder. An upright tree, branchy, about twelve feet high: unarmed; flowers one-styled, hermaphrodite; leaves very entire, glabrous; berry two-seeded. Flowers appear in June; berries ripe in September. A native of our own woods.

3. R. colubrinus. Pubescent buckthorn. Tree upright; branches horizontal: unarmed; flowers one-styled, hermaphrodite, erect; capsules three-grained; branchlets, petioles, peduncles, and nerves ferruginous-downy. A native of America and the West Indies.

4. R. alaternus. Common alaternus. A shrub, unarmed, with dicœcous flowers; stigma triple; leaves deeply serrate, lanceolate; flowers small, numerous, axillary.

There is a variety with alternate, shining, evergreen leaves. A native of the south of Europe. The fresh branches or young shoots, like the berries of R. catharticus, produce a good yellow dye.

There are also other varieties with variegated leaves or striped, in the former case called bloached phyllyrea by the nurserymen, and in the latter gold or silver striped alaternus, according to the colour.

5. R. infectorius. Narrow-leaved buckthorn. An evergreen plant; spines terminal; flowers four-cleft, dicœcous; leaves ovate-lanceolate, repand, villous underneath; stem procumbent. Indigenous to the south of Europe. There are various other species enumerated by many botanists as belonging to this genus, and especially palmyrus (Christ's thorn), lotus, jujuba, spina Christi, but as these have a drupe with a one or two-celled nut instead of a berry, it is obvious they ought to constitute a distinct genus, and will be found under zizyphus, being jujubes rather than buckthorns. See ZIZYPHUS.

These may be all increased by seeds, layers, or cuttings.

RHANTERIUM, in botany, a genus of the class syngenesia, order polyandria superflua. Receptacle chaffy; down consisting of four or six bristles, thickish, or feathery at top; calyx cylindrical; seeds of the margin naked and without down. A shrub of Barbary with downy branchlets; leaves lanceolate, serrate; flowers terminal, solitary

RHAPIS. Ground rattan. In botany, a genus of the class polygamia, order triœcia. Calyx three-cleft; corol three-cleft; stamens six; pistil one. Two species—one rhapis flabelliformis, common ground rattan, a native of China; the other rhapis arundinacea, simple-leaved rhapis, a native of Carolina.

RHAPONTIC, RHUBARB. See RHAPONTICUM.

RHAPONTICUM. The Rha of Pontus, i. e. the Rha, in Russia, a river on whose banks it grew. Rhabarbarum Dioscoridis. Rhabarbarum antiquorum. The root of this plant, rheum rhaponticum of Linnéus, appears to have been the true rhubarb of the ancients. By some it is confounded with the modern rhubarb, though considerably different from that root in appearance, as well as in quality. The rhapontic is of a dusky colour on its surface, and a loose spongy texture; is more adstringent than rhubarb, and less purgative; in this last intention, two or three drachms are required for a dose. See RHEUM.

RHAPONTICUM VULGARE OFFICINARUM. Centaurium majus. Greater centaury. The root of this plant, centaurea centaureum of Linnéus, was formerly used as an aperient and corroborant in alvine fluxes. It is now totally discarded from the materia medica of this country.

RHA'PSODIST. *s.* (from *rhapsody*.) One who writes without regular dependence of one part upon another (*Watts*).

RHA'PSODY. *s.* (ῥαψῳδια.) Any number of parts joined together without necessary dependence or natural connection (*Hammond*).

RHAPSODY, in antiquity, a discourse in verse sung or rehearsed by a rhapsodist. Others will have rhapsody to signify a collection of verses, especially those of Homer, which having been a long time dispersed in pieces and fragments, were at length by Pisistratus's order digested into books called rhapsodies, from ῥαπτω, *suo*, and ωδη, *canticum*. Hence, among moderns, rhapsody is also used for an assemblage of passages, thoughts, and authorities, raked together from divers authors, to compose some new piece.

RHE, an island on the W. coast of France, in the department of Lower Charente. It is four leagues long and two broad, and very populous. Its products are bitter wine, abundance of salt, excellent brandy, and the liquor called aniseseed. It is defended by four forts, and is eight miles W. of Rochelle. St. Martin is the capital.

RHEA, a daughter of Cœlus and Terra, who married Saturn, by whom she had Vesta, Ceres, Juno, Pluto, Neptune, &c. Her husband, however, devoured them all as soon as born, because he had been informed by an oracle that one of his sons would dethrone him. To stop the cruelty of her husband, Rhea at length, when she brought forth, immediately concealed the child, and Saturn devoured a stone given him as his own child. A year after, the child, whose name was Jupiter, became so powerful, that he drove his father from his throne. Rhea, after the expulsion of her husband, followed him to Italy, where he established a kingdom Her benevolence in this part of Europe was so great, that the golden age of Saturn is often called the age of Rhea. (See SATURNUS.)

RHEGIUM, a town of Italy, in the country of the Brutii, opposite Messana in Sicily, where a colony of Messenians, under Alcidamidas settled, B. C. 723. This town has always been subject to earthquakes, by which it has often been destroyed. See REGGIO.

RHEIMS, an ancient city of France, in the department of Marne, with an archbishop's see. The inhabitants are computed to be 30,000. The principal church, built before the year 406, is a very beautiful gothic structure. That of St. Nicaise is remarkable for its fine architecture. Behind the high altar of the church of St. Remy, the corpse of that archbishop is preserved in a magnificent shrine. In this church was lately La Sainte Ampoule, which is a small phial filled with a reddish and congealed liquor, which the French of former ages thought to have been brought from heaven; and this holy liquor was used in the coronation of the kings of France, who have been successively crowned at Rheims; probably, because Clovis, the founder of the French monarchy, when converted from paganism, was baptized in the cathedral here, in the year 496. The remains of an amphitheatre, a castle, and a triumphal arch, are among the ancient monuments of the Romans. Rheims is long and narrow, and the houses are low. Here are manufactures of flannel, coverlets, and other woollen stuffs: and the gingerbread is famous. Rheims is seated in a plain, surrounded by hills that produce excellent wine, on the river Vesle, 62 miles N. of Troyes, and 75 N.E. of Paris. Lon. 4. 8 E. Lat. 49. 15 N.

RHEINAU, a town of Swisserland, in Thurgau, with an abbey, on an island formed by the Rhine, between Schaffhausen and Eglisau.

RHEINBACH, a town of Germany, in the electorate of Cologne, 19 miles S. of Cologne, and 53 E. of Liege. Lon. 6. 9 E. Lat. 51. 39 N.

RHEINBERG, a town of Germany, in the electorate of Cologne, seated on the Rhine, 40 miles N.W. of Cologne. Lon. 6. 39 E. Lat. 51. 29 W.

RHEINECK, a town of France, in the department of Rhine and Moselle, lately of Germany, in the circle of Lower Rhine; seated on the Rhine, 16 miles N.W. of Coblentz.

RHEINECK, a town of Franconia, capital of a county of the same name, with a castle, on the river Sinn, 25 miles N. by W. of Wurtzburg.

RHEINECK, a town of Swisserland, capital of the Rheinthal, with a castle, seated on the Rhine, near its entrance into the lake of Constance, 25 miles S.E. of Constance. Lon. 9. 35 E. Lat. 47. 21 N.

RHEINFELDEN, a town of Suabia, the best of the four Forest-towns; seated on the Rhine, over which is a bridge, eight miles E. of Basel.

RHEINFELS, a strong fortress of France, in the department of Rhine and Moselle, lately of Germany, in the lower county of Catzenellenbogen. It is one of the most important places on the Rhine, and stands on a stupendous craggy rock, at the foot of which is the fortified town of St. Goar. It was taken by the French in 1794, and is 16 miles S. of Coblentz.

RHEINMAGEN, a town of France, in the department of Roer, lately of Germany, in the duchy of Juliers; situate on the Rhine, 19 miles N.W. of Coblentz.

RHEINTHAL, a district of Swisserland, lying along the Rhine, which divides it from a territory of Austria, till it reaches the lake of Constance. The protestant inhabitants are the most numerous. It is a fertile valley, 30 miles long and from three to eight broad, and produces excellent wine. Rheineck is the capital.

RHETICUS (George Joachim), in biography, a noted German astronomer and mathematician, was born at Feldkirk, in Tyrol, the 15th of February, 1514. After imbibing the elements of the mathematics at Tiguri, with Oswald Mycone, he went to Wittemberg, where he diligently cultivated that science. Here he was made master of philosophy in 1535, and professor in 1537. He quitted this situation, however, two years after, and went to Fruenberg to put himself under the assistance of the celebrated Copernicus, being induced to this step by his zeal for astronomical pursuits, and the great fame which Copernicus had then acquired. Rheticus assisted this astronomer for some years, and constantly exhorted him to perfect his work, De Revolutionibus, which he published after the death of Copernicus, viz. in 1543, folio, at Norimberg, together with an illustration of the same in a narration, dedicated to Schoner. Here too, to render astronomical calculations more accurate, he began his very elaborate canon of sines, tangents, and secants, to fifteen places of figures,

and to every ten seconds of the quadrant, a design which he did not live quite to complete. The canon of sines, however, to that radius, for every ten seconds, and for every single second in the first and last degree of the quadrant, computed by him, was published in folio, at Frankfort, 1613, by Pitiscus, who himself added a few of the first sines computed to twenty-two places of figures. But the larger work, or canon of sines, tangents, and secants, to every ten seconds, was perfected and published after his death, viz. in 1596, by his disciple, Valentine Otho, mathematician to the Electoral Prince Palatine.

After the death of Copernicus, Rheticus returned to Wittemberg, viz. in 1541 or 1542, and was again admitted to his office of professor of mathematics. The same year, by the recommendation of Melancthon, he went to Norimberg, where he found certain manuscripts of Werner and Regiomontanus. He afterwards taught mathematics at Leipsic. From Saxony he departed a second time, for what reason is not known, and went to Poland; and from thence to Cassovia, in Hungary, where he died December the 4th, 1516, near sixty-three years of age.

His Narratio de libris Revolutionum Copernici was first published at Gedunum, in quarto, 1540, and afterwards added to the editions of Copernicus's work. He also composed and published Ephemerides, according to the doctrine of Copernicus, till the year 1551.

Rheticus also projected other works, and partly executed them, though they were never published, of various kinds, astronomical, astrological, geographical, chemical, &c. as they are more particularly mentioned in his letter to Peter Ramus, in the year 1568, which Adrian Romanus inserted in the preface to the first part of his idea of mathematics.

RHETORES, amongst the Athenians, were ten in number, elected by lot to plead public causes in the senate-house or assembly. For every cause in which they were retained, they received a drachm out of the public money. They were sometimes called Συνηγοροι, and their fee το Συνηγορικον. No man was admitted to this office before he was 40 years of age, though others say 30. Valour in war, piety to their parents, prudence in their affairs, frugality, and temperance, were necessary qualifications for this office, and every candidate underwent an examination concerning these virtues previous to the election. The orators at Rome were not unlike the Athenian rhetores. See ORATOR.

RHETORIANS, a sect of heretics in Egypt, so denominated from Rhetorius their leader. The distinguishing tenet of this heresiarch, as represented by Philastrius, was, that he approved of all the heresies before him, and taught that they were all in the right.

RHETORIC, the art of speaking copiously on any subject, with all the advantages of beauty and force. See ORATORY.

RHETO'RICAL. *a.* (*rhetoricus*, Latin.) Pertaining to rhetoric; oratorical; figurative (*Brown*).

RHETO'RICALLY. *ad.* Like an orator; figuratively; with intent to move the passions.

To RHETO'RICATE. *v. n.* (*rhetoricor*, low Latin.) To play the orator; to attack the passions (*Decay of Piety*).

RHETORI'CIAN. *s.* (*rhetoricien*, Fr.) 1. One who teaches the science of rhetoric. 2. An orator (*Dryden*).

RHETORI'CIAN. *a.* Suiting a master of rhetoric (*Blackmore*).

RHEUM. *s.* (ρευμα.) See RHEUMA.

RHEUM. Rhubarb. In botany, a genus of the class ennecandria, order monogynia. Calyx-less; corol six-cleft, permanent; seed one, three-sided. Eight species, as follow.

1. R. rhaponticum. Common rhubarb. Large, thick, fleshy, branchy, deeply striking roots, yellowish within; stem strong, upright, two or three feet high; leaves obtuse, heart-shaped, glabrous, with the veins a little hairy underneath; petioles grooved above and rounded at the edge; flowers white on spikes. A native of Thrace.

2. R. palmatum. Palmated-leaved, or true Chinese rhubarb. Root thick, fleshy, yellow within; leaves palmate, pointed, roughish, with the cavity at the base dilated; petioles obsoletely grooved above, and rounded at the edge; stems upright, five or six feet high, terminated by large spikes of flowers; buds a dull red. A native of Tartary. The root furnishes the genuine officinal rhubarb; and is usually known in the pharmacopœias by the name of RHABARBARUM, which see for its medicinal properties. There are various other species of this genus, however, that possess the same properties to a less extent; and especially the preceding and two succeeding species.

3. R. undulatum. Wave-leaved Chinese rhubarb. Root thick, branchy, deep-striking, yellow within; leaves somewhat villous, undulate, with the cavity at the base dilated; petioles flat above and acute at the edge. A native of China and Siberia.

4. R. compactum. Thick-leaved, or compact rhubarb. Root as the last; leaves slightly lobed, very obtuse, lucid, sharply denticulate, quite glabrous; panicles nodding. A native of Tartary.

5. R. ribes. Warted-leaved Persian rhubarb. Root full of protuberances; leaves very obtuse, slightly warted, with the veins a little spinous underneath; petioles flat above and rounded at the edge; stem upright, firm, three or four feet high, succeeded by berry-like seeds surrounded by a purple pulp; a very singular plant; indigenous to Persia.

6. R. Tartaricum. Tartarian or heart-leaved rhubarb. Root fleshy; leaves heart-ovate, entire, flat, quite glabrous; petioles half round, angular, panicle grooved. A native of Tartary.

7. R. hybridum. Hybrid rhubarb. Leaves glabrous above, a little hairy beneath, slightly lobed, acute, with the cavity at the base nar-

rowed; petioles obsoletely grooved above, and rounded at the edge. A native of Asia.

8. R. leucorrhizum. Leaves transversely oval, depressed; panicle half inferior, divaricate; two of the leaflets of the calyx much larger than the rest. A native of Siberia.

These plants, which have all perennial roots, are propagated by seeds, which should be sown in autumn, soon after they are ripe, in the places where the plants are designed to remain. When the plants appear in the spring, the ground should be hoed over to cut up the weeds, and they should be thinned so as to stand at the distance of six or eight inches asunder. Let them be hoed a second time, and thinned to the distance of a foot and a half, or more, after which they will require no other culture but to be kept clean from weeds.

RHEUMA. (ῥευμα, from ῥεω, to flow.) The discharge from the nostrils or lungs arising from cold; hence the following lines of the school of Salernum:

Si fluit ad pectus, dicatur rheuma catarrhus,
Ad fauces branchus, ad nares esto coryza.

RHEU'MATIC. *a.* Pertaining to rheum; afflicted with rheumatism.

RHEUMATISM. (ῥευμαλισμος; from ῥευματιζω, to be afflicted with defluxions.) This term is so called from its being formerly used in the same sense as rheuma; but, in the present day, the meaning of this word is applied to a genus of diseases in the class pyrexiæ and order phlegmasiæ of Cullen; characterized by pyrexia, pains in the joints, increased by the action of the muscles belonging to the joint, and heat on the part. The blood, after venæsection, exhibits an inflammatory crust. Rheumatism terminates in arthrodynia, lumbago, and ischias. Rheumatism is distinguished into acute and chronic. The acute is preceded by shivering, heat, thirst, and frequent pulse; after which the pain commences, and soon fixes on the joints. The chronic rheumatism is distinguished by pain in the joints, without pyrexia, and is divided into three species; lumbago, affecting the loins; and ischias, or schiatica, affecting the hip, and arthrodynia, or pains in the joints. The acute species mostly terminates in one of these species.

RHEU'MY. *a.* (from *rheum.*) Full of sharp moisture.

RHEXIA, in botany, a genus of the class octandria, order monogynia. Calyx five-cleft; petals four inserted on the calyx; anthers declining; capsule four-celled, within the body of the calyx. Seven species; natives of America or the West Indies; some with leaves sessile, others with leaves petioled. The two following are cultivated.

1. R. Virginica. Virginian rhexia. Stem shrubby, with four membranaceous angles; leaves sessile, lanceolate, opposite; calyxes fringed with glands; flowers solitary, from the fork, red, with the petals heartshaped, spreading open in the form of a cross. A native of Virginia.

2. R. Mariana. Maryland rhexia. Stalk erect, ten inches high; leaves sessile, lanceolate; calyxes sprinkled with stellate hairs; flowers reddish, with heartshaped petals, as in the last. A native of Maryland.

Both are propagated by seeds from their native climates: they flower the second year, and with care continue for three or four years.

RHIANUS, a Greek poet of Thrace, originally a slave. He wrote an account of the war between Sparta and Messenia, as also an history of the principal revolutions and events which had taken place in Thessaly. He flourished about 200 years before the Christian era.

RHIBESIA. (from *ribes*, a currant.) See RIBES NIGRUM, RIBES RUBRUM, and FRUITS (Summer).

RHINÆUS. (from ῥις, the nose.) In myology. See COMPRESSOR NARIS.

RHINANTHUS. Rattle-grass. In botany, a genus of the class didynamia, order angiospermia. Calyx four-cleft, inflated; upper lip of the corol compressed; capsule two-celled, obtuse, compressed; seeds imbricate, flattish. Ten species, chiefly of the Cape, Levant, and Egypt; one, rhinanthus crista galli, common yellow rattle, a well-known weed indigenous to our own meadows.

RHINE, a great and remarkable river of Europe, which rises in Swisserland, in the canton of Grisons. It is formed of three streams; the Further Rhine from the head of the valley of Disentis; the Middle Rhine from the valley of Medelo, an appendage of St. Gothard; and the Hither or Upper Rhine from the mount Avicula. The first two torrents united is called the Lower Rhine, which receives the Upper Rhine, at Richenau; and the height is here about 6180 feet above the sea. Flowing by Coire, at the distance of a mile, the Rhine here becomes navigable for rafts. It is soon after the boundary between the Rheinthal and a territory of Austria, and passes through the lake of Constance from E. to W. Leaving this lake, it becomes the boundary between Swisserland and Suabia, flowing by Schaffhausen (below which it forms a celebrated cataract) to Basel. At Basel the river turns to the N. and flows thence to Holland; in which course it becomes the barrier between France and Germany, gives name to the two German circles of the Upper and Lower Rhine, waters many considerable cities and towns, and receives some large rivers. Below Emmerick, in the duchy of Cleve, it divides into two streams. That which bends to the W. and flows by Nimeguen, is called the Waal, but loses that name on its junction with the Meuse, at Worcum. Below Gorcum, it divides into four principal branches, forming the isles of Ysselmonde, Voorn, and Overflackee: the most northern branch is called the Merwe, and passing by Rotterdam and Schiedam, is joined by the branch from the S. side of Ysselmonde, and enters the German ocean, below Briel: the other two branches make their exit at Helvoetsluys and Goree;

The other stream which had branched off to the N.W. below Emmerick, retains its name; but below Huessen another branches off to the N. takes the name of Yssel, and enters the Zuider Zee, below Campen. The old river proceeds W. by Arnheim to Duerstede, when it again divides into two streams; that to the left is called the Leck, and enters the Merwe above Rotterdam. The branch to the right, which retains its name, passes on to Utrecht, where it divides once more, into two streams: the smaller one is called the Vecht, which runs N. into the Zuider Zee, at Muyden; and the other, the remains of the noble Rhine, flows W. by Woerden to Leyden, where it divides into several channels, and afterwards is lost among hills of sand near the village of Catwyck.

RHINE (Lower), a circle of Germany. It extended on both sides the Rhine, from the circle of Suabia, on the S. to that of Westphalia, on the N. containing the electorates of Mentz, Treves, and Cologne, the palatinate of the Rhine, the duchy of Westphalia, and the county of Lower Isenburg. But in 1801, the territories of this circle to the W. of the Rhine were ceded to France, and are included in the departments of Roer, Rhine and Moselle, Sarre, and Mont Tonnerre.

RHINE (Lower), a department of France, containing the late province of Lower Alsace. Strasburg is the capital.

RHINE (Upper), a department of France, containing the late province of Upper Alsace. Colmar is the capital.

RHINE (Upper), a circle of Germany. It extended across the Rhine, from the province of Loraine in France, on the S. to the circle of Lower Saxony, on the N. and was nearly intersected by the palatinate to the Rhine. It included the langravate of Hesse, Wetteravia, the counties of Catzenellenbogen and Waldeck; the imperial town of Frankfort, the bishoprics of Fulda, Spire, and Worms, and the duchy of Deux Ponts. But the territories of this circle on the W. side of the Rhine were ceded to France in 1801, and are included in the departments of Sarre and Mont Tonnerre.

RHINE (Palatinate of the), a late electorate of Germany, in the circle of Lower Rhine; bounded on the N. by the archbishoprics of Mentz and Treves, E. by Franconia, S. by Suabia, and W. by France. It was also called the Lower Palatinate, to distinguish it from the Palatinate of Bavaria, sometimes called the Upper Palatinate. But this electorate was suppressed in 1801; the French annexing the part W. of the Rhine to their own territory, and giving the remainder to the electors of Baden and Hesse.

RHINE AND MOSELLE, a new department of France, including part of the late electorates of Cologne and Treves, and of the late palatinate of the Rhine. The capital is Coblentz.

RHINEBERG, a town of Germany, in the circle of the Lower Rhine, and diocese of Cologne. It was in the possession of the French, but restored to the archbishop of Cologne by the treaty of Utrecht. It is seated on the Rhine. Lon. 6. 39 E. Lat. 51. 30 N.

RHINECK, a town of Germany, in the archbishopric of Cologne, seated on the Rhine, Lon. 7. 53 E. Lat. 50. 27 N.—There is another town of the same name in Swisserland, capital of Rhinthal, seated on the Rhine, near the lake of Constance, with a good castle. Lon. 9. 53 E. Lat. 47. 38 N.

RHINFELD, a small but strong town of Germany, in the circle of Suabia, and the best of the four Forest-towns belonging to the house of Austria. It has been often taken and retaken in the German wars; and is seated on the Rhine, over which there is a handsome bridge. Lon. 7. 53 E. Lat 47. 40 N.

RHINEGAU, a beautiful district of the electorate of Mentz, is situated on the Rhine, about three miles from the city of Mentz, and is so populous that it looks like one entire town intermixed with gardens and vineyards. The Rhine here grows astonishingly wide, and forms a kind of sea, near a mile broad, in which are several well-wooded little islands. The Rhinegau forms an amphitheatre, the beauties of which are beyond all description. See Riesbach's Travels through Germany, vol. iii. p. 226.

RHINFELS, a castle of Germany, in the circle of the Lower Rhine, in a county of the same name. It is looked upon as one of the most important places seated on the Rhine, as well in regard to its strength as situation. It is near St. Goar, and built on a craggy rock. This fortress commands the whole breadth of the Rhine, and those who pass are always obliged to pay a considerable toll. In the time of war it is of great importance to be masters of this place. Lon. 7. 43 E. Lat. 50. 3 N.

RHINLAND, a name given to a part of South Holland, which lies on both sides the Rhine, and of which Leyden is the capital town.

RHINGIA. In the entomology of Fabricius, a tribe of the dipterous genus CONOPS, which see.

RHINOCEROS. In zoology, a genus of the class mammalia, order bruta. Horn solid, perennial, conic, placed on the nose, not adhering to the bone. Two species, as follow.

1. R. unicornis. One-horned rhinoceros. This animal is among the largest of quadrupeds. His body equals the bulk of the elephant but not his sagacity: were his legs however less short, he would exhibit a no less stately figure. The single, black, smooth horn, sometimes three feet and a half long, which is situated near the extremity of the nose, constitutes his specific character. The upper lip is disproportionately large; hanging over the lower, and terminating in a point. It is furnished with muscles, which enable the animal to move it with great dexterity in collecting his food, and introducing it into the mouth. The nostrils are in a transverse direction. The ears

are large, erect, and pointed. The skin is naked, rough, and extremely thick. About the neck it is gathered into enormous folds: a fold extends between the shoulders and the fore legs, and another from the hinder part of the back to the thighs. The tail is slender, flat at the end, and covered on the sides with very stiff, black hairs. In consequence of the vast bulk of the body, and the disproportionate shortness of the legs, the belly hangs low. The breadth of the feet does not exceed the circumference of the legs.

This animal was perhaps known to the ancients. Several of the sacred writers make frequent allusions to the ראם or רים, *reem*, sometimes translated unicorn, sometimes rhinoceros, as familiarly known. They have not indeed condescended to a minute description; but the terms in which they have mentioned it, indicate this rather than any other animal. Pliny mentions the rhinoceros, as an animal that appeared in the Roman circus, in games exhibited by Pompey. He was opposed to the elephant, and shewed himself no unequal antagonist. In addition to this information, the Roman natural historian fables, that the elephant and the rhinoceros are natural enemies; and that the latter carefully whets his horn upon stones, to tear up the belly of the former. Though not described by Aristotle, the rhinoceros is mentioned by the historians of Alexander, as one of the strange animals discovered by his army in their progress into India.

But from the time when they ceased to be exhibited on the Roman amphitheatres, till within the sixteenth century, no animals of this species appeared in Europe. It was forgotten that any had ever been seen. Those who were acquainted with what the ancients relate concerning the rhinoceros concluded, or at least suspected, either that no such species of animals had ever existed; or, that though they might have existed once, they had become extinct.

In the sixteenth century, the reality of this animal was fully ascertained. A number of individuals have since been, at different times, introduced into Europe. Many figures have been drawn; and the form of the rhinoceros is no longer strange. His character and manners are also tolerably known.

He is a native inhabitant of Bengal, Siam, Cochinchina, Quangsi in China, and the isles of Java and Sumatra. He is a solitary, stupid animal. Shady forests adjoining to rivers, and miry, marshy plains, are his favourite haunts. Unless provoked by injuries, he is commonly mild and inoffensive. His rage is desperate and dangerous, and when violent he will overturn trees. He urines and copulates backwards. The female produces only one at a birth. During the first month of its age, the young rhinoceros does not rise above the size of a large dog. The horn is at first almost imperceptible, and increases by slow gradations. The bulk of the animal is indeed but very slowly enlarged. At the age of two years he has scarce attained half his full height. His eyes are small, and his sight dull. But he possesses the senses both of hearing and smelling in high perfection. Thorns and prickly shrubs are his chief food. His tongue was once said to be rough and hard; but from later and more accurate observation, we learn, that it is as smooth and soft as the tongue of any animal. It has been conjectured, that sixty or seventy years may be the natural term of the life of the rhinoceros. His skin has been represented as impenetrable, even by balls; but we now find that this vast animal is liable to be mortally wounded by missile weapons of all kinds, though extremely hard and resisting.

The flesh is not unlike pork; but of a coarser grain, and a stronger taste: in his voice he also resembles the hog, as well as in his general manners. The horn is hairy at the base, acute, fibrous, frequently three feet long; teeth while young straggling, remain solitary; when old completely shed: tail tapering, shorter than the feet.

2. R. bicornis. Two-horned rhinoceros. Horns two. In size, form, manners, and almost all other characteristics, this species appears nearly allied to the former. The only, or at least the chief distinction is in the additional horn: the second standing straight behind the first. We know not whether the unicorn and the bicorn copulate and breed together indifferently. It has even been doubted, whether all animals of the rhinoceros character may not naturally possess two horns; and an unicorn appear only in consequence of an accidental loss.

The anterior horn is always larger than the posterior. Both are of a conical shape, with the tips somewhat reclining. The posterior horn of an old rhinoceros has always the appearance of being worn away. Sparrman relates from the information of the Hottentots and Dutch colonists at the Cape, that the horns are remarkably loose on the nose of the living rhinoceros; that the animal moves them backwards and forwards at pleasure; that as he walks carelessly, they shake and clatter against each other; and in digging roots, which he eats, as well as prickly shrubs, that he reclines the anterior horn, and employing only the posterior, thus wearing the latter by degrees to a stump, while the former remains entirely uninjured. The tips of both horns are slightly bent backward. Their texture seems composed of parallel horny fibres. Near the root, the surface of the horn is rough and unequal; towards the point smooth and plain like the horns of oxen. The anterior horn of a bicorn rhinoceros of moderate size shot by Dr. Sparrman was a foot in length, and five inches in circumference at the base. The anterior horn of a larger rhinoceros was a foot and an half in circumference, and seven inches in circumference at the base. The posterior horn stands rather on the forehead than on the snout.

Dissecting the smaller rhinoceros, Sparrman found its stomach filled with masticated roots

and branches of trees, and succulent plants, several of which seemed to be prickly. It had no fore-teeth; but the lips were of so hard a texture, that they might easily serve to perform all the functions of the fore-teeth of other animals. The jaws of a full grown rhinoceros were furnished with four and twenty grinders. The anterior part of the os palati exhibited a tooth-like process; but so distant from the lower jaw, that it could scarcely serve any of the purposes of a tooth. The skin is hard, and thick in proportion to the bulk of the animal; but not proof against pointed or missile weapons. On the feet, the skin is thicker, and more callous than on the other parts. The skin is not gathered into folds, as that of the former species. It is smooth and flesh-coloured between the legs: a few stiff bristles are thinly scattered over the other parts of the body; they are most numerous about the ears and the end of the tail. The skin is of a deep cinereous grey colour, embossed with numerous warts that appear all over the body. The foot is divided into three parts, the hoofs of which project but a little beyond the leg. The Abyssinian bicorn appears to be in some respects different from this of the Cape. Bruce represents him as having his skin gathered into folds, on the neck, the shoulders, the buttocks, and some other parts of his body. His mouth he describes as furnished with twenty-eight teeth. The upper lip he allows to be remarkably large. The skin is always smooth, except when flies and other troublesome insects have broken it, so as to produce pustules; a distress to which the animal is very liable. The tongue of the young rhinoceros is smooth; but, as he grows old, it becomes very rough. The anterior horn is round, and bends slightly back at the point; behind it appears the second, which is flat and straight.

It is only in Africa that this animal has been discovered alive in modern times. In the southern parts of the African continent, the species are well known. The Europeans who have penetrated into Abyssinia represent them as not less numerous in that country. From an epigram of Martial, and some coins of Domitian, we learn that the rhinoceros with two horns was not unknown to the Romans.

The manners and œconomy of this species differ but little from those of the last. But the bicorn has been more accurately observed than the unicorn. He resides almost constantly in deep forests. He never eats hay or grass. Large succulent plants, prickly shrubs, the branches, and even the trunks of trees, are the articles of food which he prefers. The strength of his jaws and teeth enables him to break off and masticate the thickest branches of the hardest and toughest trees. But the forests of Abyssinia afford trees of a softer consistency, and peculiarly succulent; which he eats in preference to others. His upper lip is his chief instrument in collecting his food. He extends and twists it, so as to perform with it many of the functions which the elephant performs with his proboscis. After stripping a tree of its branches, a rhinoceros often applies his horn to the trunk, and splitting it into so many lathes, devours it with as much ease and avidity, as an ox would eat up a bunch of celery. In the forests inhabited by animals of this species, there appear not unfrequently trees divested of their leaves and branches,—sometimes a trunk divided into lathes, a part of which has been eaten, and another part left for a future repast,—and sometimes short stumps, of which the leaves, branches, and trunks have been devoured. The horns of the rhinoceros suffer greatly however at times in procuring his food; he often leaves a part of a horn either fixed in a tree, which he has in vain attempted to tear, or lying beside it on the ground. The sensibility of the rhinoceros in this part must render such an accident as the breaking of a horn, if not fatal, at least extremely painful and dangerous. Bruce relates that he saw a rhinoceros so affected, on having the point of his foremost horn broken off by a musket ball, as to appear, for an instant, absolutely incapable of sense and motion.

However unwieldy his form, the rhinoceros displays astonishing swiftness. He moves with a sort of trot; quickening his pace by degrees, as he runs. His speed is not equal to that of a swift and vigorous horse; but, between speed and cunning, he seldom suffers a hunter, mounted on horseback, to overtake him. The Hottentot and Caffrarian hunters are accustomed to steal upon the rhinoceros when asleep, and gore him with several deep wounds. After which, they follow his footsteps, even for several days, till he drops down of weakness, or dies of his wounds. But according to Sparrman they commonly poison their darts immediately before the enterprize: and in this case, the animal does not long survive. As he moves through the forest, the trees are crushed under his weight, like so many dry reeds. His eyes are so small, and his sight so feeble, that he sees only a very short way before him. The Abyssinians pursue him, two on a horse; and, as he seldom looks behind him, commonly overtake him before he is aware. The one, armed with a sword, then drops down; and cutting the hams of the rhinoceros, the vast animal falls to the ground, alike incapable of flight and of resistance. Although naturally peaceable, he is disposed, like the unicorn, to defend himself with great fury when attacked. His rage is impetuous, but generally ill directed; he injures himself as readily as his antagonist; and knocks his head against a wall or manger, or strikes against a tree with as much satisfaction as against the hunter who attacks him.

It may be naturally conceived, that so large an animal as the rhinoceros must require a considerable quantity of water to macerate his food. The tracts of country which he inhabits are interspersed with marshes, lakes, and rivers. The district of the Shangalla, the favourite abode of this species, in Abyssinia, is, for six months in the year, deluged by constant rains, and overspread with woods which prevent evaporation. This species of rhino-

ceros is peculiarly pestered by flies, in consequence of being destitute of hair. Nature has taught him, however, to roll occasionally in the mire, till he acquire a crust of dirt, which may for a time at least protect him from their stings. But this dries, cracks, and falls off in pieces. The flies then renew their attacks, and often pierce his skin; so that his body is at length covered over with pustules. It is in the night chiefly, that he rolls in the mire; and the hunters often steal on him at that period, while he is enjoying one of his favourite pleasures, and stab him with mortal wounds in the belly, before he is aware of their approach. By wallowing in the mire, though he loses the flies, he often gathers worms and other insects upon his body; such as millepedes, scolopendræ, worms and snails.

The rhinoceros, though next in size, yet in docility and ingenuity is greatly inferior to the elephant, and has never been tamed, so as to assist the labours of mankind, or to appear in the ranks of war. The Romans introduced him on the amphitheatre, and opposed him to the elephant; it is even pretended, that he appeared no unequal match. The bear was a contemptible antagonist to the rhinoceros. The flesh of this animal, though by no means a delicate dish, is with the Shangalla, and a great part of the inhabitants of Lower Abyssinia, a principal article of food. The soles of his feet, consisting of a gristly substance, soft like the soles of a camel, are the most delicate part. The rest of the flesh is said to taste like pork; but is much coarser, and smells of musk. The negro hunters of Abyssinia eat it without salt. The hairs about the tail are so thick and strong, that with ten of them a whip may be made, which will draw blood at every stroke. The skin cut into thongs forms excellent whips. The horns are made into cups, which have been fancied to act as antidotes against poison. In Abyssinia, the handles of daggers are always made of the horn of the rhinoceros. The second horn is scarce ever applied to any use. The surface is susceptible of a perfect polish; and beautiful snuff-boxes might be formed of this material, were it not that it is a substance easily scratched, and extremely liable to crack or splinter.

This animal has been sometimes found with a third horn, the last being probably nothing more than an excrescence on one of the others.

Pallas affirms that the bones of the rhinoceros have been often found buried in the north of Russia. But neither species have been discovered there in a living state.

RHINOCEROS BIRD. See BUCEROS.

RHINOMACER, in zoology, a genus of the class insecta, order coleoptera. Antennas setaceous, seated on the snout; feelers four, growing thicker towards the end, the last joint truncate. Three species; natives of Europe; two of them resembling the curculio; one probably a species of attelabus.

RHIPHÆI, large mountains merely supposed to exist at the north of Scythia, where the Gorgons had fixed their residence. The name of Rhiphæan was applied to any cold mountain in a northern country.

RHIZOBOLUS, in botany, a genus of the polyandria tetragynia class and order. Essential character: calyx, half five-cleft; petals five; germ four-lobed, superior; nuts four, one-celled, one-seeded. There are two species, viz. rhizobolus butyrosus, and rhizobolus tuberculosus, both natives of Guiana.

RHIZOMORPHA, in botany, a genus of the class cryptogamia, order algæ. Frond much branched, creeping, horny or woody, concealing the fructification. Five species, all indigenous plants, black, blackish brown, dark chesnut brown, or dull saffron brown.

RHIZOPHORA. Indian kandel tree. Mangrove. Mangle. In botany, a genus of the class dodecandria, order monogynia. Calyx four-parted; corol four-parted; seed one, very long, fleshy at the base. Five species. All these grow only in water or the muddy rivers of Asia, Africa, and America, under the tropics, bending their branches perpendicularly to the ground, and changing them into stems penetrating into the soil and giving forth rootlets.

The most curious of the tribe is rhizophora mangle. Proper mangrove or mangle-tree. A native of the Indies, with acute leaves, and fruit subulate and clavate. The rootlets from the branches of this tree are so productive of new suckers which bend down constantly after they have reached a certain height, that a single tree is often found to cover more than a mile of ground with a forest consisting of innumerable stems, which at the top have the appearance of a close clipped bower, and in its various intervals forms a multiplicity of natural arcades from five to ten feet high; while the horizontal branches are so closely interwoven as to form a kind of natural and transparent terrace, raised with such solidity over the water, that were it not for the prodigious quantity of leaves, a man might readily walk upon them.

The bark of this tree is brown and smooth, pliant when green, and often used for tanning leather. The wood is used chiefly for fuel, and affords a brighter and more ardent fire than wood of any other kind.

The timber is extremely close-grained, and consequently enormously heavy, which prevents it from being generally employed for mechanical purposes, which it otherwise would be to a very great extent, since it never splinters, and is almost incorruptible. Oysters very generally attach themselves to the branches of these trees as they hang over and plunge into the water; so that they may often be said with great truth to be gathered upon trees.

There are two other varieties of this tree, the red-mangle, which grows on the sea-side, but does not advance into the water; and the white-mangle, denominated like the last from the colour of its wood; and like the last also fond of the sea-side, but not of the water itself. The bark of this last is twisted into ropes of all sizes, which are exceedingly strong, and not apt to rot in the water.

RHODE ISLAND, one of the United

States of America, bounded on the N. and E. by Massachusets, on the S. by the Atlantic, and on the W. by Connecticut. These limits comprehend what has been called Rhode Island and Providence Plantations. It contains five counties, and 29 townships. It is as healthful as any part of N. America, and is principally a country for pasture. Providence and Newport are the chief towns.

RHODE ISLAND, an island of N. America, in a state of the same name. It is 13 miles long and four broad, and divided into three townships. This island is a noted resort of invalids from the southern climates, being exceedingly pleasant and healthful, and is called with propriety the Eden of America.

RHODES, an island of the Mediterranean, on the S. side of Natolia, 40 miles long and 15 broad. The air is good, and the soil pretty fertile, but badly cultivated. The principal town, of the same name, is an archbishop's see, and has a good harbour, with a narrow entrance between two rocks, on which are two towers to defend the passage. Here, in all probability, stood the famous Colossus, a statue of bronze, 70 cubits high, reckoned one of the seven wonders of the world: it was thrown down by an earthquake; and when the Saracens became masters of this island in 665, they knocked it to pieces, with which they loaded 900 camels. The knights of Jerusalem took Rhodes from the Saracens in 1309, and kept it till it was taken from them by the Turks, in 1623. It is looked upon as an impregnable fortress, being surrounded by triple walls and double ditches. It is inhabited by Turks and Jews; for the Christians are obliged to live in the suburbs, they not being suffered to be within the walls in the night-time. Lon. 28. 25 E. Lat. 36. 24 N.

RHODEZ. See RODEZ.

RHODIA. (ῥοδία; from ῥοδον, a rose; so called because its root smells like the damask rose.) The radix rhodiæ of some pharmacopæias, is the produce of the rhodiola rosea of Linnæus, called rose-wort. When dry, it has a very pleasant smell, resembling that of the damask rose. In this odorous matter the medical virtue of the root resides. Poultices in which this root enters as a chief ingredient, are said to allay violent pains of the head.

RHODIOLA. Rose-root. Rose-wort. In botany, a genus of the class dicœcia, order octandria. Calyx four-parted; petals four; nectaries four, emarginate. Female: pistils four; capsules four, many-seeded. One species, with a thick, fleshy root, which when cut emits an odour like that of roses; the root has many heads, whence in the spring issue a multitude of stalks about nine inches long, succulent, and surrounded with fleshy leaves, alternate and indented on the edge; flowers in clusters, terminal, yellowish; appear in May; of an agreeable scent, but of short continuance. It is found wild on the Alpine rocks; and is cultivated, and increased by planting cuttings of the stalks in the beginning of April; or by parting the roots in the autumn.

RHODIUM, in mineralogy, one of the metals lately discovered by Dr. Wollaston in crude platina: for the mode by which it may be procured, see the article PLATINUM.

It is of a white colour: specific gravity something more than 11. No degree of heat hitherto applied is capable of fusing it. We do not know therefore whether it be malleable: but as it forms malleable alloys with other metals, it is probable that it would not be destitute of malleability if it could be fused into a button.

The following are the results of the experiments made by Dr. Wollaston to alloy rhodium with other metals.

"It unites readily with all the metals that have been tried, except mercury; and with gold and silver it forms very malleable alloys, that are not oxydated by a high degree of heat, but become incrusted with a black oxyd when very slowly cooled.

"When four parts of gold are united with one of rhodium, although the alloy may assume a rounded form under the blowpipe, yet it seems to be more in the state of an amalgam than in complete fusion. When six parts of gold are alloyed with one of rhodium the compound may be perfectly fused, but requires far more heat than fine gold. There is no circumstance in which rhodium differs more from platina than in the colour of this alloy, which might be taken for fine gold by any one who is not very much accustomed to discriminate the different qualities of gold. On the contrary, the colour of an alloy containing the same proportion of platina differs but little from that of platina.

"When I endeavoured," continues Dr. Wollaston, "to dissolve an alloy of silver or of gold with rhodium, the rhodium remained untouched by either nitric or nitro-muriatic acids; and when rhodium had been fused with arsenic or with sulphur, or when merely heated by itself, it was reduced to the same state of insolubility. But when one part of rhodium had been fused with three parts of bismuth, of copper or of lead, each of these alloys could be dissolved completely in a mixture of two parts, by measure, of muriatic acid with one of nitric. With the two former metals the proportion of the acids to each other seemed not to be of so much consequence as with lead; but the lead appeared on another account preferable, as it was most easily separated when reduced to an insoluble muriat by evaporation. The muriat of rhodium had then the same colour and properties as when formed from the yellow oxyd precipitated from the original salt."

RHODIUM LIGNUM. (ῥοδιον; from ῥοδον, a rose, a wood which smells like roses.) Rhodium, or rose wood. The wood or root of a tree supposed to be the genista canariensis; foliis ternatis, utrinque pubescentibus; ramis angulatis of Linnæus. It is brought from the Canary islands in long crooked pieces, full of knots, externally of a whitish colour, internally of a deep yellow, with a red cast. The largest, smoothest, heaviest, and deepest co-

loured pieces should be chosen. Rose wood has a slightly bitterish, somewhat pungent, balsamic taste, and a fragrant smell, especially when scraped or rubbed, resembling that of roses. An essential oil is obtained from it, which is used principally as a perfume, but possesses cordial and corroborant virtues.

RHODODENDRON, in botany, a genus of the class decandria, order monogynia. Calyx five-parted; corol somewhat funnel-form; stamens declined; capsule five-celled. Ten species; chiefly natives of the Alps or of Siberia; one or two indigenous to America. The following are cultivated.

1. R. ferrugineum. Rusty-leaved rhododendron. Stalk shrubby, three feet high; branches irregular; bark purple; leaves glabrous, beneath leprous, ferruginous; umbels terminal; corol funnel-form, declined, the two lower petals narrower; of a pale rose-colour. A native of Swisserland; flowers from May to July.

2. R. hirsutum. Hairy rhododendron. Two feet high; branches woody, short, covered with a light brown bark; leaves elliptic, rather acute, ciliate, dotted underneath; corols funnel-form.

3. R. chamæcistus. Dwarf rhododendron, or rose-bay. Small shrub, very ramous, extreme branches leafy; leaves elliptic, rather acute, glandular-ciliate, naked: corols wheel-shaped; petals obtuse, of a purple hue. A native of Austria.

4. R. ponticum. Purple rhododendron. Trunk upright, shrubby, about the height of a man, sometimes less, irregularly ramous from the bottom; wood white; bark ash-colour; leaves oblong, glabrous, uniform in colour; corymbs terminal; corols campanulate, wheel-shaped; petals lanceolate. A native of the Levant: flowers in May and June.

5. R. maximum. Broad-leaved rhododendron. Shrub fifteen or sixteen feet high in its native soil; branchy towards the top; leaves oblong, glabrous, differently coloured underneath; umbels terminal; corols wheel-shaped; petals roundish. A native of North America.

6. R. chrysanthemum. Shrub less tall than the preceding; leaves oblong, rough, differently coloured and glabrous underneath; corols wheel-shaped; petals obovate, irregular. A native of Siberia. This was first recommended by Koelpin as an efficacious medicine, not only in rheumatism and gout, but even in venereal cases; and it is now very generally employed in chronic rheumatisms. The leaves, which are the part directed for medicinal use, have a bitterish subadstringent taste. Taken in a large dose, they prove a narcotic poison; and, in moderate doses, they are said to occasion heat, thirst, a degree of delirium, and a peculiar sensation of the parts affected.

All these are propagable by seeds, which should be sown soon after they are ripe, in pots filled with fresh loamy earth. The pots should be covered in hard frost with bell or hand glasses. They may also be propagated by cuttings or partings of the roots, and should have a loamy soil. See Nat. Hist. Pl. CXLII.

RHODIUS (John), an eminent physician, born at Copenhagen in 1587. He published Notes on Scribonius Largus, and other works, and died at Padua in 1659.

RHODOMAN (Laurentius), born at Sassowerf, in Upper Saxony, in 1546. He translated into Latin Diodorus Siculus, and some other works. He died in 1606, while professor of history in the university of Wittemberg.

RHODOPE, a high mountain of Thrace, extending as far as the Euxine sea. Rhodope, according to the poets, was the wife of Hæmus, king of Thrace, who was changed into this mountain, because she preferred herself to Juno in beauty.

RHODORA, in botany, a genus of the class decandria, order monogynia. Calyx five-toothed; corol three-petalled; stamens declined; capsule five-celled. A Canadian shrub, with elliptic, entire leaves, and umbelled flowers.

RHŒA. See Rhea.

RHOEADEÆ, in botany, the name of the twenty-seventh order in Linnéus's Fragments of a Natural Method, consisting of the poppy, and a few genera which resemble it in habit and structure. The plants, in this order, upon being cut, yield plentifully a juice which is white in the poppy, and yellow in others. See Poppy.

RHOMB SPAR, in mineralogy, a species of the calx genus, of a greyish colour passing to yellow: it is never massive, but always in regular, middle-sized rhombs; the lustre is splendent, and between vitreous and pearly; it is brittle, easily frangible; specific gravity 2.5; it is infusible, without addition. With acids, it produces very little effervescence, even when pulverized. Constituent parts:

Carbonate of lime.....	52
Carbonate of magnesia.....	45
Oxyd of iron and manganese....	3
	100

It is found in Swisserland, Sweden, and in chlorite rocks, on the banks of Loch Lomond in Scotland.

RHOMBOIDES, in geometry, a quadrilateral figure, whose opposite sides and angles are equal, but is neither equilateral nor equiangular.

RHOMBOIDEUS. (from ῥομβος, a geometrical figure whose sides are equal, but not right-angled, and εἶδος, resemblance.) In myology. Rhomboideus major and minor. This muscle, which is so named from its shape, is situated immediately under the trapezius. We find it usually, though not always, divided into two portions, which Albinus describes as two distinct muscles. The uppermost of these, or rhomboideus minor, arises tendinous from the spinous process of the three inferior vertebræ of the neck, and from the ligamentum colli; the lowermost, or rhomboideus major, arises ten-

Rhododendron Caucasicum.

Caucasian Rhododendron.

Smilacina Borealis.

Northern Borealis.

London, Published by Sherwood & Co. Paternoster Row, Feb.ry 1.st 1820.

dinous from the spinous processes of the back: the former is inserted into the basis of the scapula, opposite to its spine; the latter into all the basis of the scapula, below its spine. Its use is to draw the scapula obliquely upwards, and directly backwards.

RHOMBUS, in geometry, an oblique-angled parallelogram, or a quadrilateral figure, whose sides are equal and parallel, but the angles unequal, two of the opposite ones being obtuse, and the other two acute. To find the area of a rhombus, upon the base, let fall the perpendicular, which is the altitude of the figure; then multiply the base by the altitude, the product will be the area.

RHONE, a large river of Europe, which rises in Swisserland, from the glacier of Furca, between the two rocky mountains of Gletcherberg and Satzberg. Crossing the Vallais, it runs through the lake and city of Geneva, and separating France from Savoy, it flows to Lyons, Vienne, Tournon, Valence, Viviers, Pont St. Esprit, Avignon, Beaucaire, Tarascon, and Arles, and falls into the Mediterranean, by several mouths.

RHONE (Mouths of the), a department of France, containing part of the late province of Provence. Aix is the capital.

RHONE AND LOIRE, a department of France, including the late provinces of Forez and Lyonois. The capital is Lyons.

RHOPALA. See RUPALA.

RHUBARB. See RHEUM, and RHABARBARUM.

RHUMB, in navigation, a vertical circle of any given place, or intersection of such a circle with the horizon; in which last sense rhumb is the same with a point of the compass.

RHUMB-LINE is also used for the line which a ship describes when sailing in the same collateral point of the compass, or oblique to the meridians. See NAVIGATION.

RHUS. Sumach. In botany, a genus of the class pentandria, order trigynia: calyx five-parted, inferior; corol five-petalled; berry one-seeded. Thirty-four species scattered over the globe, but chiefly plants of the Cape. They may be thus subdivided:

A. Leaves pinnate.

B. Leaflets three together.

C. Leaves simple.

The following are cultivated:

1 R. coriaria. Elm-leaved sumach. Stem strong and woody, eight or ten feet high; bark hairy, and of an herbaceous brown while young; leaves pinnate; leaflets elliptic, obtusely toothed, villous underneath; flowers whitish, in large, branched spikes. A native of the south of Europe.

The branches are used instead of oak-bark for tanning leather, and it is said that the Turkey leather is uniformly tanned with this shrub. The leaves and seeds are used as styptics and astringents in medicine.

2. R. Typhinum. Stag's horn. Virginian sumach. Leaves pinnate, leaflets lanceolate, pointed, sharply serrate, downy beneath: the young branches covered with a velvet down, resembling a young stag's horn in colour and texture, whence its specific name: flowers of a beautiful purple, in close tufts at the end of the branches. A native of Virginia.

Vinegar is often made from the germs of the fruit; and its ripe berries afford an agreeable acid that may be used as a substitute for the citric: whence it is sometimes named vinegar plant.

Like the last, it is powerfully astringent; and hence, boiled with alum it makes a good dye for hats; with other ingredients it will give a good green or yellow; and with copperas will yield ink. The milky juice that flows from incisions in the trunk or branches makes, when dried, the basis of a varnish little inferior to the Chinese. The Americans use the dried leaves as tobacco.

3. R. glabrum. Scarlet sumach. Less lofty than the last: branches spreading and smooth; leaves pinnate, lanceolate, serrate, naked on both sides; flowers hermaphrodite, of an herbaceous colour. A native of North America.

4. R. elegans. Carolina sumach. Seven or eight feet high, branching irregularly; leaves pinnate, lanceolate, serrate, naked both sides; flowers dicœcous, of a bright red hue, in large, close, thick panicles. A native of South Carolina.

5. R. copallinum. Lentiscus-leaved sumach. Four or five feet high, branchy; leaves pinnate, very entire; petiole membranaceous, jointed; flowers panicled at the end of the branches, of a yellowish herbaceous colour. North America.

6. R. Cotinus. Venice sumach. A branchy shrub, four or five feet high; leaves simple, obovate; leaflets rounded on long footstalks; flowers in purplish bunches. A native of the Appenines.

The root is used for dyeing; the leaves and young branches dye a good black, and the bark is employed for tanning Spanish leather.

7. R. Toxicodendron. Trailing poison oak, or sumach. Branches slender, but woody; bark brown; leaves ternate; leaflets petioled, angular, pubescent; stem rooting; flowers dicœcous. North America.

8. R. vernix. Varnish sumach. Trunk straight; leaves pinnate, very entire, annual, opake; petioles entire, equal; flowers in a racemed spike, small, herbaceous; fruit juiceless drupe. A native of the swamps of North America.

This shrub distils by incision a juice employed in the Japan varnish; it is also extremely poisonous, but has been employed medicinally in paralysis and herpetic affections. Dr. Fresnoi was the first who attempted its use in these diseases; and in order that others should not suffer by his experiments, he began upon himself by taking an infusion of one of the three leaflets of which each leaf consists; and as this dose produced no sensible effect, he increased the number to twelve. His urine and perspiration were increased in quantity, and he had some pains in his belly. He relates seven cases, in which he thinks he can remove

all doubts of the efficacy of this infusion, in herpetic affections. From these the following are selected:

"A country woman, (says Dr. Fresnoi), came to me in the month of July 1780, to consult me about the herpes farinosa, with which her face had been covered for more than a year. She was ordered to make an infusion of this plant; and in six weeks was entirely free from the disease."

He likewise relates five cases of paralysis, which were cured by the use of this plant.

The leaves of this plant are to be cut when in the greatest vigour, about the month of June. "Those who cut this plant (observes Dr. F.), wear leathern gloves, on account of its poisonous qualities." The same gentleman observes, he saw one case in which inflammation of the eye-lids was produced by the vapour from the plant. Four pounds of the leaves being distilled with thirty-two pounds of water, gives it a slight odour, although the plant is entirely free from it. Its taste is pungent, and inflames the mouth. The dedoction which remains in the still is brown, and is generally covered with a light brown pellicle. When strained and evaporated, it gives a shining black extract. The leaves inflame and swell the hands and arms of those who take them out of the still, and brings on an itching, which remains for several days. Forty-two pounds of the leaves afford twenty ounces of extract, of a proper consistence for pills.

"A girl, in Flanders, (says Dr. Fresnoi), already subject to fits, laid down some flowers in her bed-room. Next day she told me, that she had undergone a great change; that she had had no fits, and slept much better. It occurred to me, (says Dr. F.), that the flowers occasioned this change. Next day, the flowers being removed, and the window opened, the convulsions reappeared; on their being again introduced, the fits disappeared; which proved plainly it was the effect of the flowers. The success of the extract in tussis convulsiva exceeded my hopes; forty-two children being cured of this disorder in Valenciennes during the end of the year 1786. Four grains of extract dissolved in four ounces of syrup, of which one table-spoonful given to the child every third hour, generally abates the cough, and mostly leaves them."

9. R. radicans. Rooting poison oak. A trailing shrub, with leaves ternate, ovate-heart-shaped; leaflets petioled, ovate, naked, very entire; stem rooting; flowers dicœous, small, herbaceous. North America. Sometimes called creeping ivy.

When the stem is cut, it emits a pale brown juice of a disagreeable scent, and so acrid that letters or marks made with it upon linen cannot be got out, but grows blacker the more it is washed.

It is poisonous like the preceding, but in a less degree.

10. R. tomentosum. Woolly-leaved sumach. Stalk woody, seven or eight feet high; leaves ternate; leaflets slightly petioled, rhombic, angular, downy beneath; flowers in slender bunches, of a whitish herbaceous hue. A native of the Cape.

11. R. angustifolium. Narrow-leaved sumach. Leaves lanceolate; in other respects very nearly resembling the preceding. A native of the Cape.

12. R. lucidum. Shining sumach. Stalk woody, branchy; leaves ternate; leaflets lucid, green, sessile, wedge-form, even. A native of the Cape.

The first nine may be raised by seeds or layers, and some of them by suckers, or by their rooting branches; the seeds should be procured from abroad. The seventh and ninth may be propagated by their trailing branches which have stricken root as they trail on the ground.

RHUS BELGICA. The Dutch myrtle is sometimes so termed. See MYRTUS BRABANTICA.

RHUS COBBE, in botany. See SCHMIDELIA.

RHYAIDERGOWY, a town in Radnorshire, with a market on Wednesday. Its name signifies the Fall of the Wye, that river being here precipitated in a cataract. It is 20 miles W.N.W. of New Radnor, and 177 of London. Lon. 3. 27 W. Lat. 52. 17 N.

RHYAS. (ῥοιας or ῥυας, a disease of the eye.) A decrease or defect of the lachrymal caruncle. The proximate cause is a native defect; or it may originate from excision, erosion, or acrimony. This disorder is commonly incurable, and it induces an incurable epiphora, or a continual weeping.

RHYME, RHIME, RYME, or RIME, in poetry, the similar sound or cadence and termination of two words which end two verses, &c. Or rhyme is a similitude of sound between the last syllable or syllables of a verse, succeeding either immediately or at a distance of two or three lines. See POETRY.

RHYMER (Thomas the), was a native of the parish of Earlstown, in the county of Berwick. His real name and title was sir Thomas Lermont. He lived at the west end of Earlstown, where part of his house is still standing, called Rhymer's Tower; and there is a stone built in the fore wall of the church with this inscription on it "Auld Rhymer's race lies in this place." He lived in the 13th century, and was contemporary with one of the earls of March, who lived in the same place.

RHYME *or reason*. Number or sense (*Spenser*).

To RHYME. *v. n.* 1. To agree in sound (*Dryden*). 2. To make verses (*Shakspeare*).

RHY'MER. RHY'MSTER. *s.* (from *rhyme*.) One who makes rhymes; a versifier; a poet in contempt (*Shakspeare*).

RHYPTICS. (ῥυπτικα, from ῥυπτω, to cleanse.) Medicines which cleanse foulnesses.

RHYTHM, RHYTHMUS, Ῥυθμος, in music, the variety in the movement, as to the quickness or slowness, and length and shortness, of the notes.

Or the rhythmus may be defined, more generally, the proportion which the parts of a motion bear to each other.

Aristides, among the ancient musicians, applies the word rhythmus three ways; viz. either to immoveable bodies, when their parts are rightly proportioned to each other, as a well-made statue, &c. or to things that move regularly, as in handsome walking, in dancing, in the dumb shews of the pantomimes, &c. or, thirdly, to the motion of sound, or the voice; in which, the rhythmus consists of long and short syllables, or notes, joined together in succession in some kind of order, so that their cadence on the ear may be agreeable.

This, in oratory, constitutes what we call a numerous style; and when the tones of the voice are well chosen, a harmonious style.

In effect, rhythmus, in the general, is perceived either by the eye or ear, and may be either with or without metre: but the strict musical rhythm is only perceived by the ear, and cannot exist without it. The first either exists without sound, as in dancing; or with sounds: it may be either without any difference of acute and grave, as in a drum, or with a variety of these, as in a song.

The rhythmus of the ancients, Mr. Malcolm observes, was very different from that of the moderns. The former was only that of the long and short syllables of the words and verses; it depended altogether on the poetry, and had no other forms or varieties than what the metrical art afforded. The changes therein are none but those made from one kind of metre to another, as from iambic to choraic, &c.

In the modern music, the constitution of the rythmus differs from that of the verse, so far, that in setting music to words, the thing chiefly regarded is to accommodate the long and short notes to the syllables in such manner, as that the words be well separated, and the accented syllable of each word so conspicuous, that what is sung may be distinctly understood.

Vossius, in his book De Poematum Cantu & Viribus Rhythmi, extols the ancient rhythmus. Though he owns it was confined to the metrical feet; yet so well did they cultivate their language, especially in what relates to the rhythmus, that the whole effect of the music was ascribed to it, as appears by that saying of theirs, το παν παρα μουσικοις ρυθμος. See, on this subject, Burney's General History of Music, vol. i. sect. 6. See also Calcott's Musical Grammar, Part iv.

RHYTHM, RHYTHMUS, in the ancient poetry, denotes the measure of the feet, or the number and combination of long and short syllables; called also metre and quantity.

Vossius attributes the whole force of the ancient music to their happy rythmus: but this is somewhat inconceivable. Mr. Malcolm rather takes it, that the words and sense of what was sung had the chief effect; and that hence it was that in all ancient music the greatest care was taken that not a syllable of the words should be lost, lest the music should be spoiled.

Pancirollus seems of this opinion: and the reason he gives why the modern music is less perfect than the ancient is, that we usually hear sounds without words.

RHYTHMICA, RHYTHMICE, Ρυθμικη, in the ancient music, that branch of music which regulated the rhythmus. The rhythmica considered the motions; and regulated their measure, order, mixture, &c. so as to excite the passions, keep them up, augment, diminish, or allay them.

Aristides, and other ancient musical writers, divided artificial music into harmonica, rhythmica, and metrica.

But the rhythmica, with them, likewise comprehended dumb motions, and, in effect, all rhythmical, i. e. all regular motions.

Porphyry divides music into harmonica, rhythmica, metrica, organica, poetica, and hypocritica.

RHYTHMICAL. (ρυθμικος.) Harmonical; having one sound proportioned to another.

RHYTHMOPŒIA, one of the musical faculties, as they are called, which prescribes rules for the motions, or rhythm.

The ancient rhythmopœia is very defective. We find nothing of it in the books of the ancients, but some general hints, which can scarce be called rules. In their explications there appears nothing but what belongs to the words and verses of their songs, which is a strong presumption they had no other. See RHYTHMICA.

RHYTIDOSIS. See RUTIDOSIS.

RIAL, or RYAL, a Spanish coin. See MONEY-TABLE.

RIAL, or ROYAL, is also the name of a piece of gold anciently current among us for 10*s*.

RIALEXA, a town of New Spain, in Nicaragua, seated on a small river, five miles from the Pacific Ocean, where there is a good harbour. The air is unwholesome, on account of the morasses. It is 60 miles W. of Leon de Nicaragua. Lon. 89. 10 W. Lat. 12. 25 N.

RIB. (*costodiendo*, because they guard the vital viscera.) The ribs are the long curved bones which are placed in an oblique direction at the sides of the chest. Their number is generally twelve on each side; but, in some subjects, it has been found to be thirteen, and in others, though more rarely, only eleven. They are distinguished into true and false ribs. The seven upper ribs, which are articulated to the sternum, are called true ribs; and the five lower ones, which are not immediately attached to that bone, are called false ribs. At the posterior extremity of each rib we observe a small head, divided by a middle ridge into two articulating surfaces, covered with cartilage, which are received into two cavities contiguous to each other, and formed in the upper and lower part of each dorsal vertebra, as is observed in our description of the spine. This articulation, which is secured by a capsular ligament, is a species of ginglimus, and allows

only of motion upwards and downwards. The head of each rib is supported by a short neck, and immediately beyond this we find a flattened tubercle, affording an oblong, and slightly convex surface, which is articulated with the transverse process of the lowest of the two dorsal vertebræ, with which its head is articulated. At some little distance from this tuberosity, the rib makes a considerable curve, which is usually called its angle. From the tubercle to the angle the ribs are of considerable thickness, and approaching to a cylindrical shape; but, from the angle to their anterior extremity, they become thinner and flatter. To this anterior extremity is fixed a long, broad, and strong cartilage, which, in each of the true ribs, reaches to the sternum, where its articulation is secured by a capsular ligament, and by other ligamentous fibres. The cartilages of the sixth and seventh ribs being longer than the rest, are extended upwards, in order to reach the sternum, the inferior portion of which is about on a level with the fifth rib. The cartilages of these two ribs are usually united into one, so as to leave no space between them. The false ribs are supported in a different manner; their cartilages terminate in an acute point before they reach the sternum, the eighth rib being attached by its cartilage to the lower edge of the cartilage of the seventh, or last of the true ribs; the ninth in the same manner to the eighth; and the tenth to the ninth; the cartilages of each rib being shorter than that of the rib above it. The eleventh and twelfth, which are the two lowermost ribs, are not fixed at their anterior extremities like the other ribs, but hang loose, and are supported only by their ligamentous fibres, and by muscles and other soft parts.

The external surface of each rib is somewhat convex, and its internal surface slightly concave. On the inferior and interior surface of these bones we observe a long fossa, for the lodgment of the intercostal vessels and nerves. This channel, however, does not extend through the whole length of the rib, being observable neither at the posterior extremity, where the vessels have not yet reached the bone, nor at the fore end, where they are distributed to the parts between the ribs. We seldom see any marks of it in the short ribs, as in the first, second, eleventh, and twelfth.

Thus far we have given a description, which is applicable to the ribs in general; but, as we find them differing from each other in shape, length, situation, and other respects, it will be right to speak of each rib in particular.

The first rib, which is the shortest of any, is likewise the most curved. It is broader than the other ribs, and, instead of being placed, as they are, obliquely and with its edges upwards and downwards, it is situated nearly in a transverse direction, one of its edges being placed inwards, or nearly so. Of these edges, the inner one is sharp, and the outer one somewhat rounded. Its inner surface is smooth, and its superior surface is sometimes slightly depressed anteriorly by the clavicle. The head of this rib, instead of being angular, is flattened, and slightly convex, being received into a cavity, which is formed wholly in the first vertebra, and not by two vertebræ, as in the case with the other ribs.

The second rib is longer than the first, but shorter than the ribs below it. Its angle is placed at a small distance from its tuberosity, and its head is articulated with two vertebræ, like the other ribs. The other ten ribs, the two last only excepted, differ from the general description we have given, chiefly in the difference of their length, which goes on gradually increasing, from the first or uppermost, to the seventh or last of the true ribs, and as gradually diminishing from that to the twelfth. Their obliquity, in respect to the spine, likewise increases as they descend, as does the distance between the head and angle of each rib, from the first rib to the ninth. The two lowest ribs differ from all the rest, in the following particulars: Their heads, like that of the first rib, are rounded, and received into a cavity formed entirely in the body of one vertebra; they have no tubercle for their articulation with the transverse processes, to which they are only loosely fixed by ligaments, and in this respect the tenth rib is sometimes found to agree with them; they are much shorter than the rest of the false ribs, and the twelfth is still shorter than the eleventh. The length of the latter, however, is different in different subjects, and is not always found to be the same on both sides in the same skeleton. Anteriorly, as we have already observed, their cartilages are short and loose, not being attached to the cartilages of the other ribs; and this seems to be, because the most considerable motions of the trunk are not performed on the lumbar vertebræ alone, but likewise on the lower vertebræ of the back; so that if these two ribs had been confined anteriorly, like the rest, and likewise united to the bodies of two vertebræ, and to the transverse process, this disposition would have impeded the motion of the two last vertebræ of the back, and consequently would have affected the motion of the trunk in general.

RIB, in botany. Costa. The continuation of the petiole along the middle of a leaf, and from which the veins take their rise.

RI'BALD. *s.* (*ribauld*, French; *ribaldo*, Italian.) A loose, rough, mean, brutal wretch (*Spenser*).

RI'BALDRY. *s.* (from *ribald.*) Mean, lewd, brutal language (*Dryden*).

RIBADENEIRA (Peter), a Spanish Jesuit, who wrote with purity in his native tongue, but his works are so puerile and superstitious as not to be worth mentioning, except his Account of the Writers among the Jesuits. He died at Madrid in 1611, aged 84.

RI'BAND. *s.* (*rubande, ruban*, Fr.) A fillet of silk; a narrow web of silk, which is worn for ornament (*Granville*).

RI'BBED. *a.* (from *rib.*) 1. Furnished with ribs (*Sandys*). 2. Inclosed as the body by ribs (*Shakspeare*).

RIBBED. In botany. See COSTATE.

RIBBLE, a river which rises in the W. riding of Yorkshire, runs across Lancashire, and falls into the Irish Sea, below Preston.

RIBBON. See RIBAND.

RIBEIRA GRANDE, a town of St. Jago, the principal of the Cape de Verd Islands, with a good harbour. It is seated between two high mountains. Lon. 23. 24 W. Lat. 15. 0 N.

RIBEMONT, a town of France, in the department of Aisne, seated on an eminence, near the river Oise, 10 miles W. by S. of St. Quentin. Lon. 3. 21 E. Lat. 49. 48 N.

RIBERA (Anastasius Pantaleon de), the Scarron of Spain, was born at Madrid, and became a great favourite at the court of Philip IV. His poems were all on ludicrous subjects, and appeared at Madrid 1648.—A jesuit of that name died professor at Salamanca 1591. He wrote commentaries on the minor prophets, fol.—on St. John's gospel, &c.

RIBES. Currant and gooseberry bush. In botany, a genus of the class pentandria, order monogynia. Petals five, calyx superior, bell-shaped, five-cleft, bearing the petals and stamens; style cloven; berry many-seeded. Seventeen species, natives of Europe or America; seven of our own country. They may be thus subdivided:

A. Unarmed—*Currants*.

B. Armed—*Gooseberries*.

The following are cultivated:

1. R. rubrum. Common currant. Unarmed; racemes glabrous, pendulous; flowers flattish; petals inversely heart-shaped. Common to our own woods.

It yields numerous varieties, as common currant with small red fruit; the same with white fruit; with pale fruit, usually called champaign currant: but since the white and red Dutch currants have been introduced, the older sorts have been almost banished, and are now rarely to be found.

2. R. nigrum. Common black currant. Unarmed; racemes hairy, pendulous, with a simple peduncle at the base; flowers oblong. Common to our hedges.

Of this there are also several varieties, and especially an American currant which has a taste like cranberries. The juice is frequently boiled down to an extract with a certain quantity of sugar, and constitutes a rob very useful and pleasant in sore throats.

3. R. grossularia. Rough-fruited gooseberry. Its colours and varieties are numerous. It is found wild in our hedges.

4. R. uva crispa. Smooth-fruited gooseberry. The varieties of this are also numerous from differences of colour; and like the last it grows wild in our hedges.

5. R. reclinatum. Procumbent gooseberry. When ripe the fruit is usually of a dark purple, but sometimes red, or even yellow. A native of Germany.

6. R. oxycanthoides. Hawthorn-leaved currant. Branches every where prickly, colour at first simple purple; but when ripe dark purple with a blue bloom. A native of Canada.

7. R. cynosbati. Prickly-fruited currant. Prickles mostly axillary; fruit prickly, racemed; germ in the flower prickly; berries armed with prickles. A native of Canada.

Currants are propagable easily by planting their cuttings any time from September to March, watering the young plants in dry weather. When they have stood about two years in this place, they will be fit to transplant to the places where they are to remain; and this should be done when the leaves are just decayed, that they may have time to have rooted before winter. If they are for standards, they should be planted in rows of ten feet distance from one another, and the trees in each row four feet from each other; but the much better way is to train them in espaliers, in which state they take up much less room, and their fruit is much the finer. They should be placed at ten or twelve feet distant in espaliers, and all their branches trained horizontally. They are to be allowed the same distance when set against walls or pales. Those against a south wall ripen their fruit near three weeks sooner than those in the open air; and those against a north wall near as much later; so that, by a little management of this kind, they may be kept a long time in season. Currant trees produce their fruit on the former years wood, and also on small snags that come out of the old wood. This may give a caution as to the manner in which they are to be pruned. They will thrive in any soil, or situation; but this fruit is always best tasted when they grow in a dry soil, and an open spot of ground.

The *gooseberry* is propagated either by suckers or cuttings, but the latter way is preferable, as the roots are less subject to shoot out suckers afterwards. The best season for planting the cuttings is in February, just before the buds begin to open; observing always to take the handsomest shoots, and to pick them from such branches as produce the greatest quantity of fruit. The cuttings should be about eight inches long, and should be planted in a bed of light earth, exposed to the morning sun; they must be planted about three inches deep, and watered to help their taking root. The shoots should all be rubbed off from these plants as they put out, except those at the top, that there may be a regular stem. In the September following, they should be removed to a bed of fine light earth, and planted at two feet distance. They should remain here two years, and the cross branches at times be cut off, as also the lower ones, so as to keep a clean stem about a foot above the ground. They will be then fit to plant out where they are to stand; which should be in a light sandy loam. They should be kept from the shade of other trees; and, to have the fruit in its utmost perfection, should be set in an exposed place in rows of eight feet asunder, and each of the shrubs, six feet from the others in the rows. The best time for transplanting them is in October, after the leaves are fallen.

To RI'BROAST. *v. n.* (*rib* and *roast.*) To beat soundly. A burlesque word (*Butler*).

RIBWORT. See PLANTAGO.

RIC, denotes a powerful, rich, or valiant man; thus *Alfric* is altogether strong; *Æthelric*, nobly powerful (*Gibson*).

RICAUT or RYCAUT (Sir Paul), the time of whose birth is not known, but in 1661 he went as secretary to the earl of Winchelsea, then appointed ambassador to the Ottoman Porte. While at Constantinople he wrote The present State of the Ottoman Empire. The earl of Clarendon made him his principal secretary for the provinces of Leinster and Connaught; and James II. knighted him, and made him one of the privy counsel for Ireland, and judge of the high court of admiralty; which he enjoyed till the revolution in 1688. King William made him his resident with the Hanse towns. He died in 1700. He translated Platina's lives of the popes.

RICCATI (Vincent), a Jesuit, born at Castel-Franco, in the territory of Trevisa. He became professor of mathematics at Bologna, and published a learned work on the Integral Calculus, 3 vols. 4to. He died in 1775, aged 68.

RICCI (Sabastian), a painter, born at Belluno in 1659. The imperial court employed him to adorn the palace of Shoenbrun, after which he came to London, where he enriched himself, and then went to Venice, in which city he died in 1734.

RICCIA, in botany, a genus of the class cryptogamia, order hepaticæ. Calyxless; corolless: anthers cylindrical, sessile on the germ, perforated by the style; capsule globular, crowned with the withered anthers; seeds hemispherical, pedicelled. Eleven species, five indigenous to our own country.

RICCIOLI (Joannes Baptista), a learned Italian astronomer, philosopher, and mathematician, was born in 1598, at Ferrara, a city in Italy, in the dominions of the pope. At 16 years of age he was admitted into the society of the Jesuits. He was endowed with uncommon talents, which he cultivated with extraordinary application; so that the progress he made in every branch of literature and science was surprising. He was first appointed to teach rhetoric, poetry, philosophy, and scholastic divinity, in the Jesuits' colleges at Parma and Bologna; yet applied himself in the mean time to making observations in geography, chronology, and astronomy. This was his natural bent, and at length he obtained leave from his superiors to quit all other employment, that he might devote himself entirely to those sciences.

He projected a large work, to be divided into three parts, and to contain as it were a complete system of philosophical, mathematical, and astronomical knowledge. The first of these parts, which regards astronomy, came out at Bologna in 1651, 2 vols. folio, with this title, J. B. Riccioli Almagestum Novum, Astronomiam veterem novamque complectens, observationibus aliorum et propriis, novisque theorematibus, problematibus ac tabulis promotam. Riccioli imitated Ptolemy in this work, by collecting and digesting into proper order, with observations, every thing ancient and modern, which related to his subject; so that Gassendus very justly called his work, Promptuarium et thesaurum ingentem Astronomiæ.

In the first volume of this work, he treats of the sphere of the world, of the sun and moon, with their eclipses; of the fixed stars, of the planets, of the comets and new stars, of the several mundane systems, and six sections of general problems serving to astronomy, &c.—In the second volume, he treats of trigonometry, or the doctrine of plane and spherical triangles; proposes to give a treatise of astronomical instruments, and the optical part of astronomy (which part was never published); treats of geography, hydrography, with an epitome of chronology.—The third comprehends observations of the sun, moon, eclipses, fixed stars and planets, with precepts and tables of the primary and secondary motions, and other astronomical tables.

Riccioli printed also two other works, in folio, at Bologna, viz.

2. Astronomia Reformata, 1665: the design of which was, that of considering the various hypotheses of several astronomers, and the difficulty thence arising of concluding any thing certain, by comparing together all the best observations, and examining what is most certain in them, thence to reform the principles of astronomy.

3. Chronologia Reformata, 1669.

Riccioli died in 1671, at 73 years of age.

RICE. In botany. See ORYZA.

RICE BIRD. In ornithology. See ORYZIVORA.

RICE BUNTING. See EMBERIZA.

RICERCARI. (Ital.) The name formerly given to solfeggi for the voice, as also to original compositions, or exercises, for instruments. This term in the early times of counterpoint was used instead of the word fantasia, which afterwards supplied its place; and to this succeeded the terms concento, concerto, sinfonia, sonata, &c.

RICH. *a.* (*riche*, French; ric, Saxon.) 1. Wealthy; abounding in wealth; abounding in money or possessions; opulent (*Seed*). 2. Valuable; estimable; precious; splendid; sumptuous (*Milton*). 3. Having any ingredients or qualities in a great quantity or degree (*Waller*). 4. Fertile; fruitful (*Philips*). 5. Abundant; plentiful (*Milton*). 6. Abounding; plentifully stocked; as, *pastures* rich *in flocks*. 7. Having something precious.

RICHARD I. king of England, surnamed Cœur de Lion, or Lion-hearted, succeeded his father Henry II. the 6th of July 1189, at which time he was count of Poitou, and duke of Normandy. He commenced his reign by selling the crown-lands, and exacting money on various pretences in order to go to the holy war. He undertook this expedition in 1190,

when he embarked with his whole army for France, where he joined the forces of the French king; and they having ratified their alliances, marched together with their combined forces, which consisted of an hundred thousand men, as far as Lyons, where they separated, and Richard continuing his march to Marseilles, reimbarked there for Sicily, where the two kings spent the winter; and the next spring, continuing their voyage, Richard with his fleet was driven on shore in the island of Cyprus, where Isaac, the king of the island, treating the English with inhumanity, Richard took him and his daughters prisoners, loaded the Cyprian monarch with silver chains, and having thus conquered the isle of Cyprus, exchanged it with Guy Lusignan for the titular kingdom of Jerusalem. Richard afterwards gained a complete victory over Saladin, took the city of Acre, and made himself master of Ascalon, Joppa, and Cesarea; but being deserted by Philip Augustus, king of France, and the dukes of Burgundy and Austria, he could not continue his conquests; and therefore on hearing that his brother John was aspiring to the throne of England, he concluded a truce of three years with Saladin, and embarked in order to return to his dominions; but having the misfortune to be shipwrecked near Aquileia, he resolved to pursue his journey in disguise through Germany; but after several difficulties, was taken when he was asleep, in a mean lodging near Vienna, by order of Leopold duke of Austria, whom he had disobliged at the siege of Acre; and that duke delivered him up, the following year, to the emperor Henry VI. who, after treating him with great indignities, obliged him to pay 150,000 marks for his ransom, which his loyal subjects cheerfully raised by a voluntary tax. He then returned to England, after an absence of four years, of which he had passed fifteen months in prison. He soon suppressed the party raised by his brother John, confiscated his lands, and then raising a numerous army, invaded France, and afterwards, at the battle of Blois, took all the archives of the kingdom, and continued the war against Philip, with various success, for five years, after which a truce was concluded. but a gentleman of Limosin having discovered a treasure upon his estate, Richard laid claim to it as sovereign of Guienne, and besieging the gentleman in the castle of Chaluz, was wounded by an arrow in the shoulder, of which he died eleven days after, on the 6th of April 1199. Richard had a tall, graceful, fair, and well-proportioned person. His eyes were blue and sparkling, and his hair of a bright yellow, inclining to red. He had prodigious strength of body, amazing courage and intrepidity, and was an illustrious warrior, but exceedingly ambitious, proud and avaricious, and his love of glory made him neglect the happiness of his people. The reverend Mr. Granger observes, that the saint-errantry of Richard, who sacrificed all other views for the glory of the crusades, is an instance, among a thousand others, that offensive and enterprizing valour may be a worse quality than cowardice itself; and that he was but eight months in his kingdom during a reign of ten years.

RICHARD II. king of England, was the son of Edward the Black Prince, and succeeded his grandfather, Edward III. the 21st of June 1377, at eleven years of age; when the parliament appointed several governors to the king, and ordered that his three uncles, with some of the nobility, should be regents of the kingdom. A truce which had been agreed to with France being now expired, the French sent a fleet to ravage the coasts of England, and the regents ordered out a fleet to oppose them. The king of France also prevailed on Robert II. king of Scotland to invade England; but the French king dying, the military preparations were suspended. In 1380, a poll-tax being raised on all persons above fifteen years of age, for the assistance of Ferdinand, king of Portugal, against John, king of Castile, it was levied with the greatest rigour and brutality by the collectors, on which a rebellion was raised, and an hundred thousand men appeared in arms, headed by Watt Tyler, a tyler of Deptford, and Jack Straw, who committed innumerable disorders, and entered London without opposition; but William Walworth, the mayor, killing Watt Tyler with a blow of his sword, this great army was easily dispersed. The kingdom soon after becoming greatly exasperated at the fondness shewn by the king for his new favourites, Robert de Vere, earl of Oxford, and Michael de la Poole, a merchant's son, whom he had created earl of Suffolk, the parliament refused to grant the supplies, unless he dismissed them from his service; but though the king said, that "to please the parliament he would not discharge the meanest scullion in his kitchen," and sent his chancellor to order them to grant the desired subsidy, he was obliged to part with his favourites, and to admit of fourteen commissioners to take care of the public affairs jointly with himself. The parliament were, however, no sooner dissolved, than they were recalled, and the king sent orders to the sheriffs to let no representatives be chosen but what were in his list. He also endeavoured to raise an army, to chastise his uncle the duke of Gloucester, and the earls of Arundel, Warwick, Derby, and Nottingham, who were enemies to his favourites, and were considered as the protectors of the people: but these lords speedily levying forces, defeated the earl of Oxford, who had been made duke of Ireland; when the king took refuge in the Tower, where, the next year, he answered the complaints of the lords with a shower of tears, consented to the banishment of his favourites, who were accordingly sent into exile, and repeated his coronation oath. In 1392, the Londoners refusing to lend the king a sum of money, he took away their charter, and removed the courts of justice to York. Anne of Luxemburgh, the emperor's daughter, and the king's first wife, dying in 1394, he, in 1396, married Isabella, the daughter of Charles VI. king of France, who was only seven years of age, when a truce was concluded for twenty-eight years. Richard, however, extorted

money from his subjects, and, for inconsiderable sums, yielded Cherburg to the king of Navarre, and Brest to the duke of Britanny: he ordered the duke of Gloucester to be seized and conveyed to Calais, where he was privately strangled, and some of the nobility were beheaded, and others banished. The Scots ravaged the borders of England, the Irish revolted, and the merchant ships were plundered with impunity by the corsairs of Holland. Seventeen counties were condemned as guilty of treason, and the estates of all the inhabitants adjudged to the king, for granting assistance to the duke of Gloucester; but the king landing in Ireland, in 1399, with a powerful army, in order to chastise the rebels, a rebellion was raised in his absence; when the king, at his return, finding that the revolt was general, shut himself up in Conway castle, and soon after submitted to Henry duke of Lancaster, and was sent to the Tower; when a parliament being called, he was solemnly deposed, and Henry proclaimed king, on the 30th of September 1399; after which he was removed to Pontefract castle in Yorkshire; but on the 14th of February 1400, sir Pierce Exton, with eight ruffians, undertook to murder him, hoping thereby to please king Henry IV. and rushed into the room where he was, when Richard bravely wrested a pole-ax from one of the assassins, with which he slew four of them; but Exton mounting on a chair behind him, struck him on the head with such violence, that Richard dropped down dead, in the thirty-third year of his age, after a reign of twenty-two years, and was interred at King's Langley in Hertfordshire; but his body was afterwards removed to Westminster-abbey, by order of king Henry V. King Richard II. had a very graceful person, and was of a sprightly disposition. He was particularly remarkable for his tyranny, and the numerous breaches of his oaths, and most solemn engagements.

Richard III. king of England, surnamed Crook-backed Richard, was the brother of Edward IV. and raised himself to the throne by a series of inhuman murders. Henry VI. and the young prince his son, with several noblemen of the first rank, died while he was duke of Gloucester, to prepare the way for his usurping the throne from Edward IV. He was proclaimed king the 20th of June 1483, in the thirty-second year of his age, but delayed the ceremony of his coronation till the 6th of July; and soon after caused Edward V. and his brother, whom he had before declared to be bastards, to be smothered in the Tower. The same year, having broke his promise to the duke of Buckingham, who had been greatly instrumental in raising him to the throne, that nobleman took up arms against him, in order to assist Henry earl of Richmond, the last branch of the house of Lancaster, to obtain the crown; but Buckingham being betrayed by a fellow who had been his servant, for the sake of a reward of a thousand pounds offered for taking him, he was beheaded at Salisbury, without any legal process. However, the earl of Richmond obtaining assistance from the duke of Brittany, sailed from St. Maloes, on the 12th of October, with five thousand men, and forty ships; but his fleet being dispersed, he returned to Brittany, and afterwards to France. Richard, in the mean time, sacrificed many persons to his revenge, and sent sir Ralph Ashton into the western counties, with power to execute upon the spot all such persons whom he even suspected to be guilty of high treason; and finding that the earl of Richmond founded his projects on the hopes of marrying Elizabeth, the daughter of Edward IV. he resolved to marry that princess himself, though he was already married to the widow of the prince of Wales, the son of Henry VI. whom he had himself murdered: and therefore now, in order to obtain Elizabeth, he is said to have poisoned his queen. The earl of Richmond, however, landed in Wales, with two thousand men, which increased to five thousand, and with this small army engaged the king's forces, which consisted of thirteen thousand men, at Bosworth: but the earl being joined by the lord Stanley and his brother with fresh troops, he gained a complete victory, when Richard, finding that the day was lost, rushed into the midst of his enemies, and died with his sword in his hand. The crown being found after the battle, was placed on the head of Henry earl of Richmond; and Richard's body was taken up entirely naked, and covered with blood and dirt, in which condition it was thrown across a horse, carried to Leicester, and interred without the least ceremony. Thus perished Richard on the 22d of August 1485, in the thirty-fourth year of his age, after an infamous reign of two years. Thus Richard III. if any regard is to be paid to the generality of our historians, was, through the whole course of his life, restrained by no principle of justice or humanity: and it appears that he endeavoured to maintain the crown by the same fraud and violence by which he obtained it. Though Mr. Walpole has struck new light into the darkest passages of English history, and has brought many presumptive proofs, that Richard was neither that deformed person, nor that monster of cruelty and impiety which he was represented by historians, yet though Mr. Walpole has done much towards clearing up the character of Richard, he has left the matter still problematical.

RICHARDIA, in botany, a genus of the class hexandria, order monogynia. Calyx six-parted; corol one-petalled, somewhat cylindrical; seeds three. One species, a herb of Vera Cruz.

RICHARDSON (Jonathan), a portrait painter. He was apprenticed to a scrivener, but afterwards became the pupil of Riley, whose niece he married. He acquired reputation, though some speak of him with indifference, and died 1745, aged 80. He published, in 1719, an essay on the whole art of criticism, as it relates to painting, and an account of some statues, bas reliefs, &c. He afterwards with his son produced notes and remarks on

Milton's Paradise Lost. As the father had observed, that in classical literature, he had looked at it through his son, the sportive pencil of Hogarth represented him as peeping at a Virgil on a shelf, through a telescope, with which his son was perforated.

RICHARDSON (Joseph), of Hexham, Northumberland, entered at St. John's college, Cambridge, in 1774, and afterwards studied at the Middle Temple. He wrote criticisms on the Rolliad, and probationary odes for the laureatship, in which he censured with broad satire the great public characters of the times —the Fugitive, a comedy, performed with some applause, &c. He was for some time in parliament, but did not distinguish himself as an orator. He died 1803.

RICHARDSON (Samuel), an eminent novel writer, son of a farmer in Derbyshire, born 1689. Though he imbibed in his youth no knowledge of the learned languages, his good sense and reflection supplied the deficiencies of art. In 1706 he was bound apprentice to Mr. Wilde, of Stationers' hall, and afterwards worked as compositor, and corrector of the press; then he hired a house in one of the courts of Fleet-street, from which he removed to Salisbury-square. He was in 1723 engaged with the duke of Wharton in the publication of the True Briton; but as the work was severe against the government, he stopped at the sixth number. He next was concerned with the daily Journal, and afterwards with the daily Gazetteer, and at last, by the friendship of Onslow, the speaker, he obtained the lucrative office of printer of the journals of the commons. In 1760 he purchased a moiety of the patent of law printer to the king, which he conducted with Miss Lintot, afterwards the wife of sir H. Fletcher. In 1740 he published Pamela, or Virtue rewarded, a novel, universally read, and universally approved; and afterwards he produced Clarissa Harlowe, and Sir Charles Grandison. Of these two last performances, the former is regarded by critics as superior to the other; but in all his works the author has presented to his reader a most interesting and accurate picture of human nature. His wish was to benefit mankind, and with all the treasures of a benevolent heart, he drew scenes which gave virtue the noblest of her attractions, and vice the most disgusting of its deformities. By the creative faculties of his mind, Richardson thus raised himself to celebrity and opulence; but his elevation was still adorned by all the humble virtues which rejoice in the opportunity of doing good. He generally retired from his town house on the Saturday, to his villa, at North End, Hammersmith, and afterwards to Parsons' Green, where he resided till the Monday, and was visited by persons of rank, literary fame, and splendid talents. Sedulous in business, he acquired independence; but in the midst of wealth, and the flattery of admiring friends, he was the kind master and the hospitable friend, and never forgot to add exemplary conduct to religious appearances. He was afflicted in the last part of his life with a paralytic disorder, which proved fatal, 4th July 1761, in his 72d year. He was twice married: by his first wife he had five sons and one daughter, who all died young; and by the second, who survived him, daughter of Mr. Leake, bookseller of Bath, he had a son and five daughters, of whom only four daughters survived him. Besides his excellent novels, he published a volume of familiar letters, for the use of young people—Æsop's fables, with reflections—a paper, No. 97, in the Rambler—Negotiations of sir Thomas Roe, embassador to the Porte, &c. A well-written account of his life has appeared in 1804, by Mrs. Barbauld, prefixed to an edition of his correspondence with eminent persons. (*Lempriere*).

RI'CHED. *a.* (from *rich.*) Enriched.

RICHELIEU (John Armand Du Plessis de), a famous cardinal, and prime minister of France, born in 1585. He took his degrees at the Sorbonne, and going to Rome, had interest enough to obtain from pope Paul V. a dispensation to be bishop of Lucon, at twenty-two years of age. His reputation for preaching procured him the place of almoner to the queen, Mary de Medicis, and in 1616 the king made him secretary of state. A revolution in state affairs happening by the death of the Marquis d'Ancre, he retired to Avignon, and composed several theological works. His ambition and vast capacity kept him in perpetual agitation and inquietude. He had by turns to combat with the nobles of the kingdom, the royal family, and even Louis XIII. himself. He was not free from those little passions which too often fall to the share of men of letters. Being a poet himself, he envied Corneille the glory of his Cid, and in 1637 instigated the French academy to publish a criticism upon it to its disadvantage. He owed his cardinalship to Gregory XV. He was created a duke and peer of France, and died in 1642, before he had time to complete any of his grand designs.

RICHERIA, in botany, a genus of the class dioecia, order pentandria. Calyx four or five-cleft; petals four or five; nectaries four or five; glands at the base of the germ. Male: stamens between the glands of the nectary. Female: styles three-cleft; capsule covered with a bark, three-celled, six-valved; seeds solitary, pendulous. One species, a large tree of Montserrat.

RI'CHES. *s.* (*richesses*, Fr.) 1. Wealth; money or possessions (*Locke*). 2. Splendid sumptuous appearance (*Milton*).

RI'CHLY. *ad.* (from *rich.*) 1. With riches; wealthily; splendidly; magnificently (*Milton*). 2. Plenteously; abundantly (*Brown*). 3. Truly; abundantly (*Addison*).

RICHMAN (George William), an able philosopher, was born July 11th, 1711, at Pernau. He was the son of William Richman, treasurer of the king of Sweden, who was carried off by the plague at the close of 1714. Having laid the foundation of his learning at the Gymnasium at Revel, he prosecuted his

studies at the universities of Halle and Jena, where he always made mathematics and philosophy his principal objects. He was made a member of the Imperial Academy of Sciences at Petersburg, in 1735; extraordinary professor in 1741; and ordinary professor of experimental philosophy in 1745. Among his other scientific enquiries, he pursued with great ardour the subject of electricity, and was one of the first that drew lightning from the clouds. In repeating this most interesting but bold experiment, July 26th 1753, he was struck dead. An account of this lamentable event, with the appearances after death, &c. may be seen in the Philosophical Transactions for 1755; or in the New Abridgment, vol. x. pa. 574.

RICHMOND, a borough in N. Yorkshire, governed by a mayor, with a market on Saturday. It was inclosed by a wall, with three gates, now in ruins; and has a castle, on an inaccessible mount, and two churches. It is the capital of a district called Richmondshire, which abounds in lead mines, and was formerly a county of itself. Richmond has a manufacture of woollen stockings, caps, &c. It is seated on the Swale, over which is a bridge, 40 miles N.W. of York, and 230 N.N.W. of London. Lon. 1. 35 W. Lat. 54. 28 N.

RICHMOND, a village in Surry, with a stone bridge over the Thames, nine miles W.S.W. of London. It was anciently called Sheen; but Henry VII. called it Richmond, on account of his having been earl of Richmond in Yorkshire. Here was a palace, in which Edward III. Henry VII. and queen Elizabeth expired. Richmond is still distinguished by its beautiful royal gardens, which, in summer, are open to the public; and in these is a noble observatory. Here is an extensive royal park, called Richmond, or the New Park; surrounded by a brick wall built by Charles I.

RI'CHNESS. *s.* (from *rich.*) 1. Opulence; wealth (*Sidney*). 2. Finery; splendour. 3. Fertility; fecundity; fruitfulness (*Addison*). 4. Abundance or perfection of any quality. 5. Pampering qualities (*Dryden*).

RICINUS. Mexico seed: palma christi. Cataputia major. In botany, a genus of the class monœcia, order monadelphia. Male: calyx five-parted; corolless; filaments very numerous, filiform. Female: calyx five-parted; corolless; styles three, cloven; capsule three-celled, three-valved; seeds solitary. Six species. Natives of both the Indies.

The species most worthy of notice, and which alone is cultivated, is R. communis, common palma christi, or castor oil tree. Twenty feet high, which it reaches in a single year's growth: trunk woody, pith large; leaves peltate, somewhat palmate; flower spiked; spike thickly beset with blossoms of a yellow hue and conic form; capsules prickly, containing three smooth, grey, mottled seeds, which as soon as the spikes turn black, and are gathered and dried in the sun, are picked out and collected for use. It is a native of the Indies.

The tree affords several varieties, as the great American palma christi, the green-stalked American palma christi, the wrinkled-capsuled palma christi, the red-stalked palma christi, small American palma christi, and livid-leaved palma christi. They are all propagable by seeds sown upon a hot-bed in spring, the plants being afterwards transplanted into separate pots. They have a fine ornamental effect from their leaves among other potted green-house plants, as well as in clumps when cultivated as annuals, but they require considerable space.

R. communis appears to be the Κικι or Κροτων of Dioscorides, who observes, that the seeds are powerfully cathartic; it is also mentioned by Ætius, Paulus Ægineta, and Pliny. The ricinus was first cultivated in England in the time of Turner, and is now annually reared in many gardens in the neighbourhood of London; and in that of Dr. Saunders, at Highbury, the plant grew to a state of great perfection. An oil extracted from the seeds of this plant, and known by the name of oleum ricini, palma christi, or castor oil, is the drug to which the pharmacopœias refer, and which has lately come into frequent use, as a quick but gentle purgative.

The London college directs this oil to be expressed from the seeds in the same way as that of the oil of almonds, and without the assistance of heat, by which the oil would seem to be obtained in the purest state. However, we have some reason to believe that this method is seldom practised, and that the oil usually employed here is imported from the West Indies, where it is commonly prepared in the following manner. "The seeds being freed from the husks or pods, which are gathered upon their turning brown, and when beginning to burst open, are first bruised in a mortar, afterwards tied up in a linen bag, and then thrown into a large pot, with a sufficient quantity of water (about eight gallons to one gallon of the seeds), and boiled till the oil is risen to the surface, when it is carefully skimmed off, strained, and kept for use. Thus prepared, the oil is entirely free from acrimony, and will stay upon the stomach when it rejects all other medicines." Mr. Long remarks, that the oil intended for medicinal use is more frequently cold drawn, or extracted from the bruised seeds by means of a hand-press. But this is thought more acrimonious than that prepared by coction. Dr. Browne is also of this opinion, and prefers the oil procured by coction to that by expression: he attributes its greater mildness to the action of the fire, observing, that the expressed oil, as well as the mixed juices of the seeds, are far more active and violent in their operation.

Dr. Cullen observes, that "this oil, when the stomach can be reconciled to it, is one of the most agreeable purgatives we can employ. It has this particular advantage, that it operates sooner after its exhibition than any other purgative I know of, as it commonly operates in two or three hours. It seldom gives any griping, and its operation is generally moderate,

to one, two, or three stools only. It is particularly suited to cases of costiveness, and even to cases of spasmodic cholic."

In the West Indies it is found to be one of the most certain remedies in the dry belly-ach, or colica pictonum. It is seldom found heating or irritating to the rectum; and therefore is sufficiently well suited to hæmorrhoidal persons.

The only inconvenience attending the use of this medicine is, that as an oil it is nauseous to some persons; and that when the dose is large, it occasions sickness at the stomach for some time after it is taken. To obviate these inconveniences, several means have been tried; and it is found that the most effectual means is the addition of a little ardent spirit.

For this, in the West Indies, they employ rum; but that we may not withdraw any part of the purgative, it is better to employ the tinct. sennæ comp. This added in the proportion of one to three parts of the oil, and very intimately mixed, by being shaken together in a phial, both makes the oil less nauseous to the taste, and makes it sit more easy on the stomach. The common dose of this oil is a table spoonful, or half an ounce; but many persons require a double quantity.

Castor oil however is frequently found to produce very violent pain, and extreme sickness. Dr. Stone conceives this to arise from the improper mode in which it is prepared. He inclines to believe that the cathartic matter is a substance distinct from the oil itself, and results from the capsule or husk of the seed, whose purgative property is more or less combined with the oil during expression: and he adds that when entirely freed from this purgative matter of the husk castor oil is not more purgative than any other expressed oil. This subject seems to require further consideration.

Castor oil is now used very generally for lamps in America; and in sugar plantations, where a great quantity of it is wanted for this purpose, it has altogether superseded the use of train-oil, being equally cheap in purchase, and affording a far clearer light, without any offensive smell.

RICINUS MAJOR. Ricinoides. Pineus purgans. Pinhones indici. Faba cathartica. Nux cathartica americana. Nux harbadensis. An oblong black seed, the produce of the jatropha curcas; foliis cordatis angulatis of Linnéus. It affords a quantity of oil, which is given in many places as the castor oil is in this country, to which it is very nearly allied. The seeds of the jatropha multifida are of an oval and triangular shape, of a pale brown colour, are called purging nuts, and give out a similar oil.

RICK. *s.* See REEK. 1. A pile of corn or hay regularly heaped up in the open field, and sheltered from wet (*Swift*). 2. A heap of corn or hay piled by the gatherer (*Mortimer*).

RICKETS, in sheep, a disease produced by an internal worm, denominated by Linnéus tænia cerebralis, of the same genus as the tape-worm, found in vast numbers in the brain of sheep, or spinal marrow immediately beneath the brain. These animals are aggregate, or rather consist of numerous animalcules united by their base to a large common vesicle, distributed about the surface, and retractile within it. The disease is chiefly distinguished by the symptoms of giddiness and staggering, and is not unfrequently called the *dunt*. If the vesicle producing this disease, and containing these noxious animalcules be broken, the morbid affection is rendered incurable; for these minute worms, in size not larger than a grain of sand, are each of them furnished with from thirty-two to thirty-six hooks on the head, by which they fix themselves firmly to the substance of the brain or its coats. They chiefly attack yearling lambs.

RICKETY. *a.* Diseased with the rickets (*Arbuthnot*).

RICKMANSWORTH, a town in Hertfordshire, with a market on Saturday, seated on the Coln, eight miles S.W. of St. Alban, and 18 W.N.W. of London.

RICOBONI (Anthony), born at Rovigo, in 1541, professor of eloquence at Padua, at which place he died in 1599, after having written Historical Commentaries, and Commentaries on Aristotle, and some parts of Cicero's works.

RICOCHET FIRING, in the military art, is a method of firing with small charges, and pieces elevated but in a small measure, as from 3 to 6 degrees. The word signifies duck and drake, or rebounding, because the ball or shot, thus discharged, goes bounding and rolling along, and killing or destroying every thing in its way, like the bounding of a flat stone along the surface of water when thrown almost horizontally.

RICOTIA, in botany, a genus of the class tetradynamia, order siliquosa. Silique one-celled, oblong, compressed, with flat valves. One species; a branching herb of Egypt with purple flowers.

RI'CTURE. *s.* (*rictura*, Lat.) A gaping.

RID. The preterit of *ride*.

To RID. *v. a.* (from hpiðdan, Saxon.) 1. To set free; to redeem (*Exodus*). 2. To clear; to disencumber (*Addison*). 3. To despatch (*Shakspeare*). 4. To drive away; to remove by violence; to destroy (*Shakspeare*).

RI'DDANCE. *s.* (from *rid.*) 1. Deliverance (*Hooker*). 2. Disencumbrance; loss of something one is glad to lose (*Shakspeare*). 3. Act of clearing away any encumbrances (*Milton*).

RI'DDEN. The participle of *ride*.

RI'DDLE. *s.* (ꝛæðelꝛ, Saxon.) 1. An enigma; a puzzling question; a dark problem (*Milton*). 2. Any thing puzzling (*Hudibras*). 3. (hpiddle, Saxon.) A coarse or open sieve (*Mortimer*).

To RI'DDLE. *v. a.* (from the noun.) 1. To solve; to unriddle (*Dryden*). 2. To separate by a coarse sieve (*Mortimer*).

To RI'DDLE. *v. n.* To speak ambiguously or obscurely (*Shakspeare*).

RI'DDLINGLY. *ad.* (from *riddle.*) In the manner of a riddle; secretly (*Donne*).

To RIDE. *v. n.* pret. *rid* or *rode*; part. *rid* or *ridden.* (ꝛıꝺan, Saxon; *rijden*, Dutch.) 1. To travel on horseback (*Shakspeare*). 2. To travel in a vehicle; to be born; not to walk (*Burnet*). 3. To be supported in motion (*Shakspeare*). 4. To manage a horse (*Dryden*). 5. To be on the water (*Hayward*). 6. To be supported by something subservient (*Shakspeare*).

To RIDE. *v. a.* 1. To sit on so as to be carried (*Milton*). 2. To manage insolently at will (*Swift*).

RIDE, in the sea language, is a term variously applied: thus a ship is said to ride, when her anchors hold her fast, so that she does not drive by the force either of the wind or tide. A ship is said to ride across, when she rides with her fore and main yards hoisted up to the hounds, and both yards and arms topped alike. She is said to ride well, when she is built so as not to overbeat herself in a head-sea, the waves over raking her from stem to stern. To ride athwart, is to ride with her side to the tide. To ride betwixt wind and tide, is to ride so that the wind has equal force over her one way, and the tide the contrary way. If the wind has more power over the ship than the tide, she is said to ride wind-road, or to ride a great wind.

RIDE, a town in Hampshire, on the N.E. coast of the Isle of Wight. It has a daily intercourse by packet-boats with Portsmouth, and sends to that place abundance of butter, eggs, and poultry. It is five miles S.S.W. of Portsmouth, and six E.N.E. of Newport.

RIDEAU, in fortification, is a small elevation of earth, extending lengthwise on a plain, and serving to cover a camp, or to give an advantage to a post. Rideaus are also convenient for those who would besiege a place, and serve to secure the workmen in their approaches to the foot of a fortress.

RI'DER. *s.* (from *ride.*) 1. One who is carried on a horse or in a vehicle (*Prior*). 2. One who manages or breaks horses (*Shaks.*). 3. An inserted leaf.

RIDGE. *s.* (hꝛıꝛʒ, Saxon; *rig*, Danish; *rugge*, Dutch, the back.) 1. The top of the back (*Hudibras*). 2. The rough top of any thing, resembling the vertebres of the back (*Milton*). 3. A steep protuberance (*Dryden*). 4. The ground thrown up by the plough (*Mortimer*). 5. The top of the roof rising to an acute angle (*Moxon*). 6. *Ridges* of a horse's mouth are wrinkles or risings of the flesh in the roof of the mouth, running across from one side of the jaw to the other (*Farrier's Dictionary*).

To RIDGE. *v. a.* (from the noun.) To form a ridge (*Milton*).

RIDGELY (Thomas), born in London in 1670, was elected minister of a congregation of protestant dissenters. He wrote a Commentary on the Assembly's larger Catechism, and died in 1737.

RIDGES, or WRINKLES, of a horse's mouth, the risings of the flesh in the roof of a horse's mouth, which run across from one side of the jaw to the other, having interjacent furrows. Upon the third or fourth ridge, the stroke is given with the horn, in order to bleed a horse in the mouth. See HORN.

RI'DGIL. RI'DGLING. *s.* (*ovis rejicula*, Latin. *Ainsworth.*) A ram half castrated (*Dryden*).

RI'DGY. *a.* (from *ridge.*) Rising in a ridge (*Dryden*).

RI'DICULE. *s.* (*ridiculum*, Latin.) Wit of that species that provokes laughter (*Swift*).

To RI'DICULE. *v. a.* (from the noun.) To expose to laughter; to treat with contemptuous merriment (*Temple*).

RIDICU'LER. *s.* One that ridicules.

RIDI'CULOUS. *a.* (*ridiculus*, Lat.) Worthy of laughter; exciting contemptuous merriment (*South*).

RIDI'CULOUSLY. *ad.* In a manner worthy of laughter or contempt (*South*).

RIDI'CULOUSNESS. *s.* (from *ridicule.*) The quality of being ridiculous (*Stillingfleet*).

RI'DING. *particip. a.* Employed to travel on any occasion (*Ayliffe*).

RIDING. See HORSEMANSHIP.

RIDING, signifies also a district visited by an officer. Yorkshire is divided into three ridings, each of which has a lord lieutenant, viz. the east, west, and north ridings. In all indictments in that county, both the town and the riding must be expressed.

RI'DINGCOAT. *s.* (*riding* and *coat.*) A coat made to keep out weather (*Swift*).

RI'DINGHOOD. *s.* (*riding* and *hood.*) A hood used by women, when they travel, to bear off the rain (*Arbuthnot*).

RIDLEY (Nicholas), bishop of London, and a martyr to the reformation, was descended of an ancient family, and born in the beginning of the 16th century, at Wilmontswick in Northumberland. From the grammar-school at Newcastle upon Tyne, he was sent to Pembroke-hall in Cambridge, in the year 1518, where he was supported by his uncle Dr. Robert Ridley, fellow of Queeen's college. In 1522 he took his first degree in arts; two years after, was elected fellow; and, in 1525, he commenced master of arts. In 1527, having taken orders, he was sent by his uncle, for further improvement, to the Sorbonne at Paris; from thence he went to Louvain, and continued abroad till the year 1529. On his return to Cambridge, he was chosen under-treasurer of the university; and, in 1533, was elected senior proctor. He afterwards proceeded bachelor of divinity, and was chosen chaplain of the university, orator, and *magister glomeriæ*. At this time he was much admired as a preacher and disputant. He lost his kind uncle in 1536; but was soon after patronised by Dr. Cranmer, archbishop of Canterbury, who made him his domestic chaplain, and presented him to the vicarage of Herne in East Kent; where, we are told, he preached the doctrine of the reformation. In 1540, hav-

ing commenced doctor of divinity, he was made king's chaplain; and, in the same year, was elected master of his college in Cambridge. Soon after, Ridley was collated to a prebend in the church of Canterbury; and it was not long before he was accused in the bishop's court, at the instigation of bishop Gardiner, of preaching against the doctrine of the Six Articles. The matter being referred to Cranmer, Ridley was acquitted. In 1545, he was made a prebendary of Westminster abbey; in 1547 was presented by the fellows of Pembroke-hall to the living of Soham, in the diocese of Norwich; and the same year was consecrated bishop of Rochester. In 1550 he was translated to the see of London; in which year he was one of the commissioners for examining bishop Gardiner, and concurred in his deprivation. In the year 1552, our prelate returning from Cambridge, unfortunately for himself, paid a visit to the princess, afterwards queen Mary; to whom, prompted by his zeal for reformation, he expressed himself with too much freedom: for she was scarcely seated on the throne when Ridley was doomed a victim to her revenge. With Cranmer and Latimer he was burnt alive at Oxford, on the 16th October 1555. He wrote, 1. A treatise concerning images in churches. 2. Brief declaration of the Lord's Supper. 3. Certain godly and comfortable conferences between bishop Ridley and Mr. Hugh Latimer, during their imprisonment. 4. A comparison between the comfortable doctrine of the Gospel and the traditions of the Popish religion; and other works.

RIDLEY (Dr. Gloster), an English divine, born on board the Gloster Indiaman at sea, in 1702. He received his education at Winchester school, from whence he was sent to New-college, Oxford, where he was chosen fellow in 1729. For a long time he had no other ecclesiastical preferment than the living of Westow in Norfolk, and the donative of Poplar in Middlesex; but at length archbishop Secker gave him a prebend in the cathedral of Salisbury. He died in 1774. Dr. Ridley wrote the life of bishop Ridley, an answer to the Confessional, a Review of Philip's Life of Pole, and several poems. His son James wrote the Tales of the Genii, in 2 vols. 12mo.

RIDOTTO. A species of entertainment consisting of singing and dancing, in the latter of which the whole company joins. The ridotto was first introduced in this country in the year 1722, at the Opera-house in the Haymarket, and has since been repeated at Vauxhall, and other places of public resort, with considerable success.

RIE, in botany. See SECALE.

RIETI, a town of Italy, in the duchy of Spoleto, and a bishop's see. Beside the cathedral, it contains three collegiate and six parish churches, and twelve convents. It is seated on the river Velino, near the lake Rieti, 37 miles N.E. of Rome. Lon. 13. 5 E. Lat. 42. 23 N.

RIFE. *a.* (ꝛyꝑe, Saxon; *riif*, Dutch.) Prevalent; abounding. It is now only used of epidemical distempers (*Arbuthnot*).

RI'FELY. *ad.* (from *rife.*) Prevalently; abundantly (*Knolles*).

RI'FENESS. *s.* (from *rife.*) Prevalence; abundance (*Arbuthnot*).

To RI'FLE. *v. a.* (*riffer*, *rifler*, Fr.) 1. To rob; to pillage; to plunder (*South*). 2. To take away; to seize as pillage (*Pope*).

RIFLE, a fire-arm which has the inside of its barrel cut with from three to nine or ten spiral grooves, so as to make it resemble a female screw, varying from a common screw only in this, that its grooves or rifles are less deflected, and approach more to a right line; it being now usual for the grooves with which the best rifled barrels are cut, to take about one whole turn in a length of thirty inches. The number of these grooves differs according to the size of the barrel and fancy of the workman; and their depth and width are not regulated by any invariable rule. See GUN, GUNNERY, and FOWLING-PIECE.

RI'FLER. *s.* (from *rifle.*) Robber; plunderer; pillager.

RIFT. *s.* (from *rive.*) A cleft; a breach; an opening (*Dryden*).

To RIFT. *v. a.* (from the noun.) To cleave; to split (*Pope*).

To RIFT. *v. n.* 1. To burst; to open (*Ba.*). 2. (*raver*, Danish.) To belch; to break wind.

RIG. *s.* *Rig*, ridge, seems to signify the top of a hill falling on each side; from the Saxon, hꝛiꝛ; and the Islandic, *hriggur*, both signifying a back (*Gibson*).

To RIG. *v. a.* (from *rig*, or *ridge*, the back.) 1. To dress; to accoutre (*L'Estrange*). 2. To fit with tackling (*South*).

RIGA, a government of Russia. See LIVONIA.

RIGA, a strong town of Russia, capital of the government of Livonia, and next to Petersburg the most commercial place in the empire. It stands on the river Dwina, five miles from its mouth, in a gulf of the Baltic, called the Gulf of Riga, or Livonia. The trade is chiefly carried on by foreign merchants, who are resident here, and those belonging to an English factory enjoy the greatest share of the commerce. The principal exports are corn, hemp, flax, iron, timber, masts, leather, and tallow. Within the fortifications are 9000 inhabitants, and in the suburbs 15,000, beside a garrison of 1000 men. Here is a floating wooden bridge, over the Dwina, 2600 feet long and 40 broad: in winter, when the ice sets in, it is removed; and in spring it is replaced. Riga is 220 miles N.E. of Konigsberg, and 310 S.W. of Petersburg. Lon. 24. 15 E. Lat. 56. 50 N.

RIGADOON. A lively kind of dance performed in figure by a man and woman, and the tune of which is always written in triple time. The rigadoon was borrowed originally from Provence. The word is formed from the French word *rigadon*, signifying the same thing.

RIGATION. *s.* (*rigatio*, Latin.) The act of watering.

RI'GGER. *s.* (from *rig*.) One that rigs or dresses.

RIGGING OF A SHIP, is all her cordage and ropes, belonging to her masts, yards, &c. A ship is said to be well rigged, when all her ropes are of a fit size and proportion: and she is said to be over-rigged, when her ropes are too large, which is of great prejudice to her sailing, and is apt to make her heel.

RI'GGISH. *a.* (from *rig*, an old word for a whore.) Wanton; whorish (*Shakspeare*).

To RI'GGLE. *v. a.* (properly to *wriggle*.) To move backward and forward, as shrinking from pain.

RIGHT. *a.* (ɲiȝt, Sax. *recht*, Dutch.) 1. Fit; proper; becoming; suitable (*Atterbury*). 2. Rightful; justly claiming (*Locke*). 3. True; not erroneous; not wrong (*Locke*). 4. Not mistaken; passing a true judgment (*Shaks.*). 5. Just; honest; equitable (*Psalms*). 6. Happy; convenient (*Addison*). 7. Not left (*Brown*). 8. Straight; not crooked (*Locke*). 9. Perpendicular; direct.

RIGHT. *interj.* An expression of approbation (*Pope*).

RIGHT. *ad.* 1. Properly; justly; exactly; according to truth or justice (*Locke*). 2. According to art or rule (*Roscommon*). 3. In a direct line (*Bacon*). 4. In a great degree; very: obsolete (*Shakspeare*). 5. It is still used in titles: as, right *honourable*; right *reverend* (*Peacham*).

RIGHT. *s.* 1. Not wrong (*Milton*). 2. Justice; not injury (*Tillotson*). 3. Freedom from guilt; goodness (*Cowley*). 4. Freedom from errour (*Prior*). 5. Just claim (*Milton*). 6. That which justly belongs to one (*Temple*). 7. Property; interest (*Dryden*). 8. Power; prerogative (*Tillotson*). 9. Immunity; privilege (*Clarendon*). 10. The side not left (*Milton*). 11. *To* RIGHTS. In a direct line; straight (*Woodward*). 12. *To* RIGHTS. With deliverance from errour (*Woodward*).

To RIGHT. *v. a.* To do justice to; to establish in possessions justly claimed; to relieve from wrong (*Waller*).

RIGHT, in geometry, signifies the same with straight; thus, a straight line is called a right one. As for right angle, right ascension, right cone, right descension, right sine, right sphere, &c. they are explained under the articles ANGLE, ASCENSION, &c.

RIGHT is a title conferred, 1. Together with reverend, upon all bishops. 2. Together with honourable, upon earls, viscounts, and barons. 3. By courtesy, together with honourable, upon the sons of dukes, marquisses, and the eldest sons of earls. 4. Together with honourable, to the speaker of the house of commons; but to no other commoner excepting those who are members of his majesty's most honourable privy-council; and the three lord mayors of London, York, and Dublin, and the lord provost of Edinburgh, during their office. See HONOURABLE and PROVOST.

RIGHT (Hereditary). See HEREDITARY.

RIGHT is a word which, in the propriety of the English language, is used sometimes as an adjective and sometimes as a substantive. As an adjective it is nearly of the same import with *fit*, *suitable*, *becoming*, *proper*; and whilst it expresses a quality, it indicates a relation. Thus, when we say that an action is *right*, we must not only know the nature of the action, but, if we speak intelligibly, must also perceive its relation to the end for which it was performed; for an action may be right with one end in view which would be wrong with another. The conduct of that general would be right, who, to save an army that could not be otherwise saved, should place a small detachment in a station where he knew they would all be inevitably cut off; but his conduct would be very wrong were he to throw away the life of a single individual for any purpose, however important, which he knew how to accomplish without such a sacrifice.

Many philosophers have talked of actions being right and wrong in the abstract without regard to their natural consequences; and converting the word into a substantive, they have fancied an eternal rule of right, by which the morality of human conduct is in every particular case to be tried. But in these phrases we can discover no meaning. Whatever is right must be so on some account or other; and whatever is fit, must be fit for some purpose. When he who rests the foundation of virtue on the moral sense, speaks of an action being right, he must mean that it is such as, through the medium of that sense, will excite complacency in the mind of the agent, and gain to him the general approbation of mankind. When he who rests moral obligation on the will of God, speaks of some actions as right and others as wrong, he must mean that the former are agreeable to the divine will, however made known to men, and the latter disagreeable to it; and the man who deduces the law of virtue from what he calls the fitness of things, must have some end in view, for which things are fit, and denominate actions right or wrong as they tend to promote or counteract that end.

But the word right, used as a substantive, has in common as well as in philosophical language a signification which at first view appears to be very different from this. It denotes a just claim or an honest possession. Thus we say, a father has a right to reverence from his children, a husband to the love and fidelity of his wife, and a king to the allegiance of his subjects. But if we trace these rights to their source, we shall find that they are all laws of moral obligation, and that they are called rights only because it is agreeable to the will of God, to the instinctive dictates of the moral sense, or to the fitness of things, if such a phrase has any meaning, that children reverence their parents, wives love their husbands, &c.

RIGHT, *jus*, in law, signifies not only a property, for which a writ of right lies, but also any title or claim, either by virtue of a condition, mortgage, or the like, for which no action is given by law, but only an entry.

Such are *jus proprietatis*, a right of property; *jus possessionis*, a right of possession; and *jus*

proprietatis et possessionis, a right both of property and possession.

This last was formerly called *jus duplicatum*. As, if a man be disseised of an acre of land, the disseisee has jus proprietatis; the disseisor hath jus possessionis; and, if the disseisee release to the disseisor, he hath jus proprietatis et possessionis.

RIGHTS (Bill of), in law, is a declaration, delivered by the lords and commons to the prince and princess of Orange, 13 February, 1688; and afterwards enacted in parliament, when they became king and queen. This declaration sets forth, that king James II. did, by the assistance of divers evil counsellors, endeavour to subvert the laws and liberties of this kingdom, by exercising a power of dispensing with and suspending of laws; by levying money for the use of the crown, by pretence of prerogative, without consent of parliament; by prosecuting those who petitioned the king, and discouraging petitions; by raising and keeping a standing army, in time of peace; by violating the freedom of election of members to serve in parliament; by violent prosecutions in the court of king's bench; and causing partial and corrupt jurors to be returned on trials, excessive bail to be taken, excessive fines to be imposed, and cruel punishments inflicted; all which were declared to be illegal. And the declaration concludes in these remarkable words: "And they do claim, demand, and insist upon, all and singular the premises, as their undoubted rights and liberties." And the act of parliament itself (1 W. & M. stat. 2. cap. 2.) recognizes "all and singular the rights and liberties asserted and claimed in the said declaration to be the true, ancient, and indubitable rights of the people of this kingdom."

RI'GHT-HAND. *s.* The hand chiefly made use of by mankind (*Shakspeare*).

RI'GHTEOUS. *a.* (ꝛihtpiꝛe, Saxon.) 1. Just; honest; virtuous; uncorrupt (*Gen.*). 2. Equitable; agreeing with right (*Dryden*).

RI'GHTEOUSLY. *ad.* (from *righteous.*) Honestly; virtuously (*Dryden*).

RI'GHTEOUSNESS. *s.* (from *righteous.*) Justice; honesty; virtue; goodness (*Hooker*).

RI'GHTFUL. *a.* (*right* and *full.*) 1. Having the right; having the just claim (*Sh.*). 2. Honest; just; agreeable to justice (*Prior*).

RI'GHTFULLY. *ad.* According to right; according to justice (*Dryden*).

RI'GHTFULNESS. *s.* (from *rightful.*) Moral rectitude (*Sidney*).

RI'GHTLY. *ad.* (from *right.*) 1. According to truth or justice; properly; suitably; not erroneously (*Milton*). 2. Honestly; uprightly (*Shakspeare*). 3. Exactly (*Dryden*). 4. Straightly; directly (*Ascham*).

RI'GHTNESS. *s.* (from *right.*) 1. Conformity to truth; exemption from being wrong; rectitude (*Rogers*). 2. Straightness (*Bacon*).

RI'GID. *a.* (*rigide*, French; *rigidus*, Lat.) 1. Stiff; not to be bent; unpliant (*Ray*). 2. Severe; inflexible (*Denham*). 3. Unremitted; unmitigated (*Milton*). 4. Sharp; cruel (*Philips*).

RIGI'DITY. *s.* (*rigidité*, French.) 1. Stiffness (*Arbuthnot*). 2. Stiffness of appearance; want of easy or airy elegance (*Wotton*).

RI'GIDLY. *ad.* (from *rigid.*) 1. Stiffly; unpliantly. 2. Severely; inflexibly; without remission; without mitigation.

RI'GIDNESS. *s.* (from *rigid.*) Stiffness; severity; inflexibility.

RI'GLET. *s.* (*regulet*, French.) A flat thin square piece of wood (*Moxon*).

RI'GOL. *s.* A circle. In *Shakspeare*, a diadem.

RIGOLL, or REGALS, a kind of musical instrument, consisting of several sticks bound together, only separated by beads. It is tolerably harmonious, being well struck with a ball at the end of a stick. Such is the account which Grassineau gives of this instrument. Skinner, upon the authority of an old English dictionary, represents it as a clavichord, or clarichord; possibly founding his opinion on the nature of the office of the tuner of the regals, who still subsists in the establishment of the king's chapel at St. James's, and whose business is to keep the organ of the chapel royal in tune; and not knowing that such wind instruments as the organ need frequent tuning, as well as the clavichord and other stringed instruments. Sir Henry Spelman derives the word rigoll from the Italian *rigabello*, a musical instrument, anciently used in churches instead of the organ. Walther, in his description of the regal, makes it to be a reed-work in an organ, with metal and also wooden pipes and bellows adapted to it. And he adds, that the name of it is supposed to be owing to its having been presented by the inventor to some king.—From an account of the regal used in Germany, and other parts of Europe, it appears to consist of pipes and keys on one side, and the bellows and wind-chest on the other. We may add, that lord Bacon (Nat. Hist. cent. ii. § 102.) distinguishes between the regal and organ, in a manner which shows them to be instruments of the same class. Upon the whole there is reason to conclude, that the regal or rigoll was a pneumatic, and not a stringed instrument.

Mersennus relates, that the Flemings invented an instrument, *les regales de bois*, consisting of 17 cylindrical pieces of wood, decreasing gradually in length, so as to produce a succession of tones and semitones in the diatonic series, which had keys, and was played on as a spinet; the hint of which, he says, was taken from an instrument in use among the Turks, consisting of 12 wooden cylinders, of different lengths, strung together, which being suspended and struck with a stick, having a ball at the end, produced music. Hawkins's Hist. Mus. vol. ii. p. 449.

RI'GOUR. *s.* (*rigor*, Lat.) 1. Cold; stiffness (*Milton*). 2. A convulsive shuddering with sense of cold (*Arbuthnot*). 3. Severity; sternness; want of condescension to others (*Den.*). 4. Severity of life; voluntary pain; austerity

(*Sprat*). 5. Strictness; unabated exactness (*Glanville*). 6. Rage; cruelty; fury (*Spens.*). 7. Hardness; not flexibility; solidity; not softness (*Dryden*).

RI'GOROUS. *a.* (from *rigour.*) 1. Severe; allowing no abatement (*Rogers*). 2. Exact; scrupulously nice.

RI'GOROUSLY. *ad.* 1. Severely; without tenderness or mitigation (*Milton*). 2. Exactly; scrupulously; nicely.

RILL. *s.* (*rivulus*, Lat.) A small brook; a little streamlet (*Milton*).

To RILL. *v. n.* (from the noun.) To run in small streams (*Prior*).

RI'LLET. *s.* (corrupted from *rivulet.*) A small stream (*Carew*).

RIM. *s.* (rima, Saxon.) 1. A border; a margin (*Carew*). 2. That which encircles something else (*Brown*).

RIMA. A fissure or opening; as the rima laryngis, rima vulvæ.

RIMA GLOTTIDIS. The opening of the glottis, through which the air passes in and out of the lungs.

RIME. *s.* (hrim, Saxon.) 1. Hoar frost (*Bacon*). 2. (*rima*, Lat.) A hole; a chink: not used (*Brown*).

To RIME. *v. n.* To freeze with hoar frost.

RIMINI, a town of Italy, in Romagna, with an old castle, a strong tower, and many remains of antiquity. The sea having receded from this city for some centuries, its harbour now will admit only small vessels. It is seated in a fertile plain, at the mouth of the Marrechia, on the gulf of Venice, 28 miles S.E. of Ravenna, and 145 N. by E. of Rome. Lon. 12. 34 E. Lat. 4. 4 N.

To RI'MPLE. *v. a.* To rumple; to pucker; to contract into corrugations (*Wiseman*).

RIMOUS, in botany. Chinked. Abounding in cracks, clefts, or chinks; as the outer bark of some trees.

RIMULA. (*rima*, a fissure.) A small fissure.

RI'MY. *a.* (from *rime.*) Steamy; foggy; full of frozen mist (*Harvey*).

RINÆUS. See COMPRESSOR NARIS.

RIND. *s.* (rind, Saxon; *rinde*, Dutch.) Bark; husk (*Dryden*).

To RIND. *v. n.* (from the noun.) To decorticate; to bark; to husk.

RING. *s.* (hring, Saxon.) 1. A circle; an orbicular line (*Newton*). 2. A circle of gold or some other matter worn as an ornament (*Addison*). 3. A circle of metal to be held by (*Swift*). 4. A circular course (*Smith*). 5. A circle made by persons standing round (*Hayward*). 6. A number of bells harmonically tuned (*Prior*). 7. The sound of bells or any other sonorous body (*Milton*). 8. A sound of any kind (*Bacon*).

RING, an ornament of gold or silver, of a circular figure, and usually worn on the finger. The episcopal ring (which makes a part of the pontifical apparatus, and is esteemed a pledge of the spiritual marriage between the bishop and his church) is of very ancient standing. The fourth council of Toledo, held in 633, appoints, that a bishop condemned by one council, and found afterwards innocent by a second, shall be restored, by giving him the ring, staff, &c. From bishops, the custom of the ring has passed to cardinals, who are to pay a very great sum *pro jure annuli cardinalitii.*

RINGS. The antiquity of rings is known from Scripture and profane authors. Judah left his ring or signet with Tamar (Gen. xxxviii. 18.) When Pharaoh committed the government of all Egypt to Joseph, he took his ring from his finger, and gave it to Joseph (Gen. xli. 42.) After the victory that the Israelites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the ear-rings, that they had taken from the enemy (Numb. xxxi. 50.) The Israelitish women wore rings not only on their fingers, but also in their nostrils and their ears. St. James distinguishes a man of wealth and dignity by the ring of gold that he wore on his finger (James ii. 2.). At the return of the prodigal son, his father orders him to be dressed in a new suit of clothes, and to have a ring put upon his finger (Luke xv. 22.). When the Lord threatened king Jeconiah with the utmost effects of his anger, he tells him, that though he wore the signet or ring upon his finger, yet he should be torn off (Jer. xxii. 24.).

The ring was used chiefly to seal with; and the Scripture generally puts it in the hands of princes and great persons; as the king of Egypt, Joseph, Ahaz, Jezebel, king Ahasuerus, his favourite Haman, Mordecai, who succeeded Haman in his dignity, king Darius (1 Kings xxi. 8.; Esther iii. 10, &c.; Dan. vi. 17.) The patents and orders of these princes were sealed with their rings or signets; and it was this that secured to them their authority and respect. See the article SEAL.

Some of our readers will perhaps be pleased with the following motto for a ring presented as a token of affection, in nine languages.

1. Γλυκαινω Απουσιαν, - - - - Greek.
2. Edulco absentiam, - - - - Latin.
3. Adulzo la ausencia, - - - Spanish.
4. Adoço a ausencia, - - - - Portuguese.
5. Addolisco l'assenza, - - - Italian.
6. I'adoucis l'absence, - - - French.
7. Ich verüsse die abwesenheit - German.
8. Ize versoet (*verzaot*) d'afwezigheyt, - - - - - Dutch.
9. I soften (*sweeten*) absence, - English.

RING, in astronomy and navigation, an instrument used for taking the sun's altitude, &c. It is usually of brass, about nine inches diameter, suspended by a little swivel, at the distance of 45° from the point of which is a perforation, which is the centre of a quadrant of 90° divided in the inner concave surface.

To use it, let it be held up by the swivel, and turned round to the sun, till his rays, falling through the hole, make a spot among the degrees, which marks the altitude required.

This instrument is preferred before the astro-

labe, because the divisions are here larger than on that instrument.

RING OF SATURN, is a thin, broad, opaque circular arch, encompassing the body of that planet, like the wooden horizon of an artificial globe, without touching it, and appearing double, when seen through a good telescope.

This ring was first discovered by Huygens, who, after frequent observation of the planet, perceived two lucid points, like ansæ or handles, arising out from the body in a right line. Hence as in subsequent observations he always found the same appearance, he concluded that Saturn was encompassed with a permanent ring; and accordingly produced his New System of Saturn, in 1659. However, Galileo first discovered that the figure of Saturn was not round.

Huygens makes the space between the globe of Saturn and the ring equal to the breadth of the ring, or rather more, being about 22000 miles broad; and the greatest diameter of the ring, in proportion to that of the globe, as 9 to 4. But Mr. Pound, by an excellent micrometer applied to the Huygenian glass of 123 feet, determined this proportion, more exactly, to be as 7 to 3.

Observations have also determined, that the plane of the ring is inclined to the plane of the ecliptic in an angle of 30 degrees; that the ring probably turns, in the direction of its plane, round its axis, because when it is almost edgewise to us, it appears rather thicker on one side of the planet than on the other; and the thickest edge has been seen on different sides at different times: the sun shines almost 15 of our years together on one side of Saturn's ring without setting, and as long on the other in its turn; so that the ring is visible to the inhabitants of that planet for almost 15 of our years, and as long invisible, by turns, if its axis has no inclination to its ring; but if the axis of the planet be inclined to the ring, ex. gr. about 30 degrees, the ring will appear and disappear once every natural day to all the inhabitants within 30 degrees of the equator, on both sides, frequently eclipsing the sun in a Saturnian day. Moreover, if Saturn's axis be so inclined to his ring, it is perpendicular to his orbit; by which the inconvenience of different seasons to that planet is avoided.

Later observations have thrown much more light upon this curious phænomenon, especially respecting its dimensions, and rotation, and division into two or more parts. De la Lande and De la Place say, that Cassini saw the breadth of the ring divided into two separate parts that are equal, or nearly so. Mr. Short assured M. De la Lande, that he had seen many divisions upon the ring, with his 12 feet telescope. And Mr. Hadley, with an excellent 5½ feet reflector, saw the ring divided into two parts. Several excellent theories have been given in the French memoirs, particularly by De la Place, contending for the division of the ring into many parts. But finally the observations of Dr. Herschel, in several volumes of the Philos. Trans seem to confirm the division into two concentric parts only. The dimensions of these two rings, and the space between them, he states in the following proportion to each other.

	Miles.
Inner diam. of smaller ring - -	146345
Outside diam. of ditto - - -	184393
Inner diam. of larger ring - -	190248
Outside diam. of ditto - - -	204883
Breadth of the inner ring - - -	20000
Breadth of the outer ring - - -	7200
Breadth of the vacant space - -	2839

Ring revolves in its own plane, in 10h 32′15″ ·4.

So that the outside diameter of the larger ring is almost 26 times the diameter of the earth.

Dr. Herschel adds, Some theories and observations, of other persons, "lead us to consider the question, whether the construction of this ring is of a nature so as permanently to remain in its present state? or whether it be liable to continual and frequent changes, in such a manner as in the course of not many years, to be seen subdivided into narrow slips, and then again as united into one or two circular planes only. Now, without entering into a discussion, the mind seems to revolt, even at first sight, against an idea of the chaotic state in which so large a mass as the ring of Saturn must needs be, if phænomena like these can be admitted. Nor ought we to indulge a suspicion of this being a reality, unless repeated and well-confirmed observations had proved, beyond a doubt, that this ring was actually in so fluctuating a condition." But from his own observations he concludes, "It does not appear to me that there is a sufficient ground for admitting the ring of Saturn to be of a very changeable nature, and I guess that its phænomena will hereafter be so fully explained, as to reconcile all observations. In the mean while, we must withhold a final judgment of its construction, till we can have more observations. Its division however into two very unequal parts, can admit of no doubt." See Philos. Trans. vol. 80, pa. 4, 481, &c. and the vol. for 1792, pa. 1, &c. also Hist. de l'Acad. des Scienc. de Paris, 1787, pa. 249, &c. See also our article ASTRONOMY.

RINGS OF COLOURS, in optics, a phænomenon first observed in thin plates of various substances, by Boyle, and Hook, but afterwards more fully explained by sir Isaac Newton. Mr. Boyle having exhibited a variety of colours in colourless liquors, by shaking them till they rose in bubbles, as well as in bubbles of soap and water, and also in turpentine, procured glass blown so thin as to exhibit similar colours; and he observes, that a feather of a proper shape and size, and also a black ribband, held at a proper distance between his eye and the sun, showed a variety of little rainbows, as he calls them, with very vivid colours. Dr. Hook, about nine years after the publication of Mr. Boyle's Treatise on Colours, exhibited the coloured bubbles of soap and water, and observed, that though at first it appeared white

and clear, yet as the film of water became thinner, there appeared upon it all the colours of the rainbow. He also described the beautiful colours that appear in thin plates of Muscovy glass; which appeared, through the microscope, to be ranged in rings surrounding the white specks or flaws in them, and with the same order of colours as those of the rainbow, and which were often repeated ten times. He likewise took two thin pieces of glass, ground plane and polished, and putting them one upon another, pressed them till there began to appear a red coloured spot in the middle; and pressing them closer, he observed several rings of colours encompassing the first place, till, at last, all the colours disappeared out of the middle of the circles, and the central spot appeared white. The first colour that appeared was red, then yellow, then green, then blue, then purple; then again red, yellow, green, blue, and purple; and again in the same order; so that he sometimes counted nine or ten of these circles, the red immediately next to the purple; and the last colour that appeared before the white was blue; so that it began with red, and ended with purple. These rings, he says, would change their places, by changing the position of the eye, so that the glasses remaining the same, that part which was red in one position of the eye, was blue in a second, green in the third, &c.

Sir Isaac Newton, having demonstrated that every different colour consists of rays which have a different and specific degree of refrangibility, and that natural bodies appear of this or that colour, according to their disposition to reflect this or that species of rays, pursued the hint suggested by the experiments of Dr. Hook, with regard to thin transparent substances. Upon compressing two prisms hard together, in order to make their sides touch one another, he observed, that in the place of contact they were perfectly transparent, which appeared like a dark spot, and when it was looked through, it seemed like a hole in that air, which was formed into a thin plate, by being impressed between the glasses. When this plate of air, by turning the prisms about their common axis, became so little inclined to the incident rays, that some of them began to be transmitted, there arose in it many slender arcs of colours, which increased, as the motion of the prisms was continued, and bended more and more about the transparent spot, till they were completed into circles, or rings, surrounding it; and afterwards they became continually more and more contracted. He then took two object-glasses of a telescope, the one plano-convex, the other a little convex on both sides; he placed one of the faces of this upon the plane face of the former, and pressed the two glasses at first gently, and then, by degrees, more closely against one another. The effect of this gradual pressure was an appearance in the plate of air between the glasses of different coloured circles, which had the point of contact for the common centre, and which increased in number according to the greater degree of pressure, in such a manner that the circle which appeared last always surrounded the point of contact, and on a still further pressure extended in circumference while it contracted itself breadthwise, to form a kind of ring round a new circle that arose near its middle. The pressure having been carried to a certain term, Newton stopped and observed as follows. At the point of contact was a black spot that was encompassed by several series of colours. The order of the colours from the centre to the borders of the two glasses was this: in the first series, blue, white, yellow, and red; in the second, violet, blue, green, yellow, and red; in the third, purple, blue, green, yellow, and red; in the fourth, green and red; in the fifth, greenish blue and red; in the sixth, greenish blue, and pale red; in the seventh, greenish blue, and reddish white. Beyond this number, the tints of which were regularly paler, the colour became white. Newton measured the diameters of the annular bands, formed of these different colours, by taking the points where they had most lustre; and he found that the squares of those diameters were to one another as the terms of the ascending progression, 1, 3, 5, 7, 9, 11, &c.; from which it results, that the intervals between the two glasses, relatively to the corresponding points, followed the same progression. From these proportions, it was merely necessary to ascertain the absolute length of a single diameter, to know the lengths of all the others, as well as the different thickness of the plates of air at the points where the different colours were seen. He drew up a table of these degrees of thickness, by which it appears, that the most intense blue, for example, that of the first series, is expressed by a thickness of 0.000024 of an inch, supposing the visual ray to be nearly perpendicular to the two glasses. Sir Isaac Newton having measured also the diameters of the rings at the intermediate places where the colours were obscure, found that their squares were to one another as the even numbers, 2, 4, 6, 8, 10, 12, &c.; and hence the intervals between the glasses, at the corresponding points, observed a similar progression. The diameters of the rings increased or diminished, as the visual ray was more or less inclined to the surface of the two glasses, so that the greatest contraction took place when the eye was situated perpendicularly above the glasses. The diameters also retained the same proportions to one another.

From other curious observations on these rings, made by different kinds of light thrown upon them, he inferred, that the thicknesses of the air between the glasses, where the rings are successively made, by the limits of the seven colours, red, orange, yellow, green, blue, indigo, and violet, in order, are one to another as the cube roots of the squares of the eight lengths of a chord, which sound the notes in an octave, sol, la, fa, sol, la, mi, fa, sol; that is, as the cube roots of the squares of the numbers 1, $\frac{8}{9}$, $\frac{5}{6}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{3}{5}$, $\frac{9}{16}$, $\frac{1}{2}$. These rings appeared of that prismatic colour, with which they were illumi-

nated, and by projecting the prismatic colours immediately upon the glasses, he found that the light, which fell on the dark spaces between the coloured rings, was transmitted through the glasses without any change of colour. From this circumstance he thought that the origin of these rings is manifest; because the air between the glasses is disposed according to its various thickness, in some places to reflect, and in others to transmit the light of any particular colour, and in the same place to reflect that of one colour, where it transmits that of another.

In examining the phænomena of colours made by a denser medium surrounded by a rarer, such as those which appear in plates of Muscovy glass, bubbles of soap and water, &c. the colours were found to be much more vivid than the others, which were made with a rarer medium surrounded by a denser. From the preceding phænomena it is an obvious deduction, that the transparent parts of bodies, according to their several series, reflect rays of one colour and transmit those of another; on the same account that thin plates, or bubbles, reflect or transmit those rays; and this sir Isaac Newton supposed to be the reason of all their colours. Another inference is, that the particles even of those bodies which we call opaque are in reality transparent, which persons who are in the habit of using the microscope must continually perceive. See NEWTON'S OPTICS: see also COLOUR, &c.

To RING. *v. a.* pret. and part. pass. *rung*. (hpinzan, Saxon.) 1. To strike a bell or any other sonorous body, so as to make it sound (*Shakspeare*). 2. (from *ring*.) To encircle (*Shakspeare*). 3. To fit with rings (*Shaksp.*). 4. To restrain a hog by a ring in his nose.

To RING. *v. n.* 1. To sound as a bell or sonorous metal (*Shakspeare*). 2. To practise the art of making music with bells (*Holder*). 3. To sound; to resound (*Locke*). 4. To utter as a bell (*Shakspeare*). 5. To tinkle (*Dryden*). 6. To be filled with a bruit or report (*South*).

RING-BONE, a large swelling on the lower part of the pastern, which generally reaches half way round the fore-part, and, from its resemblance to a ring, has this denomination. A ring-bone has an affinity to a bone-spavin; and, for the most part, proceeds from the same cause. The external cause of a ring-bone is often a strain in the pastern, from hard riding on dry roads; or owing to the pastern having been wrung in deep clayey roads, either in travelling or at grass. These often produce ring-bones. Yet some horses are naturally subject to ring-bones, especially those that are large and bony about the pasterns. When a ring-bone appears upon a clean-limbed horse, it is seldom so dangerous as when it happens to horses that have large bones, and are fleshy in those parts; for when the swelling is removed, the stiffness often remains.

A ring-bone is always easier to cure when it appears distinct round the pastern, than when it spreads downwards towards the coronet; for then it is apt to affect the coffin-joint, if it does not derive its origin from some strain or defect in that joint originally; in which case the cure will be uncertain, and sometimes impracticable, when a callosity is produced under the round ligament that covers that joint, and even when it happens more externally; it proves also dangerous, when it unites with or spreads the ligamentous substance that joins the hoof to the flesh; it is apt to turn to a quittor, and in the end to form an ulcer under the hoof. A ring-bone that rises on the pastern is easily cured when it does not run down towards the coronet.

Gibson says, the ring-bones that appear on colts and young horses will often insensibly wear off of themselves, without the help of any application; but when the substance remains, there needs no other remedy besides blistering, unless when, by long continuance, it is grown to an obstinate hardness, and then it may require both blistering and firing. The swelling may proceed only from the tendons, which sometimes is not easy to be distinguished from a true ring-bone, except only that a true ring-bone is less painful, unless it proceed from the coffin-joint. In this case, blistering alone generally proves successful; and it is to be renewed two or three times, according to the urgency of the symptoms. But in a true ring-bone, where the substance is hard, like a piece of flint, and altogether insensible, and without pain, firing is the only thing to remove it.

RING-DOVE. See COLUMBA.

RING-OUZEL. See TURDUS.

RING-TAIL (Cayenne). See FALCO.

RING-WORM, species of herpes. See HERPES.

RI'NGER. *s.* (from *ring*.) He who rings.

RINGLEA'DER. *s.* (*ring* and *leader*.) The head of a riotous body (*Bacon*).

RI'NGLET. *s.* (diminutive of *ring*.) 1. A small ring (*Pope*). 2. A circle (*Shakspeare*). 3. A curl (*Milton*).

RI'NGSTREAKED. *a.* (*ring* and *streaked*.) Circularly streaked (*Genesis*).

RINGKIOPING, a seaport of Denmark, in N. Jutland. It has a considerable trade with Holland and Norway, and is seated on a gulf of the German ocean, 43 miles S.W. of Wiburg, and 55 N.N.W. of Ripen. Lon. 8. 15 E. Lat. 56. 8 N.

RINGLEBEN, a town of Upper Saxony, in the principality of Eisenach, six miles N. of Erfurt, and 26 E.N.E. of Eisenach.

RINGSTED, a town of Denmark, in the isle of Zealand. It was formerly a city; and in the great church are interred several kings, and other persons of distinction. It is 30 miles S.W. of Copenhagen.

RINGWOOD, a town in Hampshire, with a market on Wednesday. It has a manufacture of worsted hose; and is famous for its strong beer and ale. It is seated on the Avon, 30 miles S.W. of Winchester, and 91 W. by S. of London.

To RINSE. *v. a.* (from *rein*, German, pure.) 1. To wash; to cleanse by washing

(*Shakspeare*). 2. To wash the soap out of clothes (*King*).

RI'NSER. *s.* (from *rinse.*) One that washes or rinses; a washer.

RINTLEN, or RINTELN, a town of Westphalia, in the county of Schawenburg, with a university. It is subject to the landgrave of Hesse-Cassel, and seated on the Weser, 15 miles S.E. of Minden, and 35 S.W. of Hanover. Lon. 9. 20 E. Lat. 52. 13 N.

RIO-DE-LA-HACHA, a small province of Terra Firma, in the form of a peninsula, between the gulf of Venezuela on the E. and a bay of the Caribbean Sea on the W. Rio-de-la-Hacha, the capital, is seated at the mouth of a river of the same name, 100 miles E. of St. Martha. Lon. 72. 34 W. Lat. 11. 30 N.

RIO-DE-LA-MADALENA, a river in Terra Firma, which rises in the mountains N. of Popayan, and running north, falls into the Caribbean sea, between Carthagena and St. Martha. It is also called Rio Grande.

RIO-DE-LA-PLATA. See PLATA.

RIO-DE-MIRANDO, a river of Spain, which rises in the mountains of Asturias, and separating that province from Galicia, enters the bay of Biscay, at Rivadeo.

RIO-GRANDE, a river of Africa, which runs from E. to W. through Negroland, and falls into the Atlantic Ocean, in 11° N. latitude.

RIO-GRANDE, a river in Brasil, which rises near the Atlantic Ocean, and runs W. into the Parana, being the principal branch of that river.

RIO-JANEIRO, a river which rises in the W. mountains of Brasil, and running E. through that country, falls into the Atlantic Ocean, at St. Sebastian.

RIO-JANEIRO, one of the richest provinces of Brasil, lying near the tropic of Capricorn, on a river of the same name. It produces cotton, sugar, coffee, cocoa, wheat, rice, pepper, and tobacco in great abundance. Vines grow in great perfection, but the grapes are not suffered to be pressed for wine. The Portuguese annually export hence gold, silver, and precious stones. St. Sebastian is the capital.

RIOM, an ancient town of France, in the department of Puy de Dome, seated on a hill, in a pleasant country, eight miles N.E. of Clermont, and 115 S. of Paris. Lon. 3. 13 E. Lat. 45. 54 N.

RIONS, a town of France, in the department of Gironne, seated on the Garonne, 18 miles S.E. of Bourdeaux.

RIOT, in law, the forcible doing of an unlawful thing, of a private nature, by three or more persons assembled together for that purpose; either with or without a common cause or quarrel: as if they beat a man, or hunt and kill game in another's park, chase, warren, or liberty; or do any other unlawful act with force and violence, or even do a lawful act, as removing a nuisance, in a violent and tumultuous manner.

The word is formed from the Latin *riota*, of *arietare*, to run at each other as rams do. Though, from an ancient Gaulish version of the Bible, quoted by Skinner, riot should rather seem originally to signify luxury and excess; whence our law riot might proceed; because these are frequently attended with quarrels.

The punishment of riots and routs, where a number of persons from three to eleven are concerned, is, by the common law, fine and imprisonment only; to which, in very enormous cases, the pillory has been sometimes superadded. And by the stat. 13 Hen. IV. cap. 7. any two justices, together with the sheriff or under-sheriff of the county, may come with the posse comitatus, if need be, and suppress any such riot, assembly, or rout, and arrest the rioters, and record upon the spot the nature and circumstances of the whole transaction, which record alone shall be a sufficient conviction of the offenders; and it is held that any battery, wounding, or killing the rioters, that may happen in suppressing the riot, is justifiable. The riotous assembling of twelve persons or more, and not dispersing upon proclamation, was first made high treason by stat. 3 & 4 Edw. VI. cap. 5. but repealed by stat. 1 Mar. cap. 1. Nevertheless the offence was made a single felony by 1 Mar. stat. 2. cap. 12. and by 1 Eliz. cap. 16. with whom the law expired. However, it was revived, in order to support the execution of the act of settlement, and made perpetual by 1 Geo. I. cap. 5. which enacts, that if any twelve persons are unlawfully assembled to the disturbance of the peace, and any one justice of the peace, sheriff, under-sheriff, or mayor of a town, shall think proper to command them by proclamation to disperse, if they contemn his orders, and continue together for one hour afterwards, such contempt shall be felony without benefit of clergy. And farther, if the reading of the proclamation be by force opposed, or the reader be in any manner wilfully hindered from the reading of it, such opposers and hinderers are felons, without benefit of clergy; and all persons to whom such proclamation ought to have been made, and knowing of such hindrance, and not dispersing, are felons, without benefit of clergy. And the act indemnifies the peace officers, and their assistants, if they kill any of the mob in endeavouring to disperse them. Moreover, if any persons, so riotously assembled, begin, even before proclamation, to pull down any church, chapel, meeting-house, dwelling-house, or out-houses, they shall be felons, without benefit of clergy. Blackst. Comm. book iv. chap. xi.

To run RIOT. To move or act without control or restraint (*Swift*).

To RI'OT. *v. n.* (*riotter*, old French.) 1. To revel; to be dissipated in luxurious enjoyments (*Daniel*). 2. To luxuriate; to be tumultuous (*Pope*). 3. To banquet luxuriously. 4. To raise a sedition or uproar.

RI'OTER. *s.* (from *riot.*) 1. One who is dissipated in luxury. 2. One who raises an uproar or sedition.

RI'OTISE. *s.* (from *riot.*) Dissoluteness; luxury: obsolete (*Spenser*).

RI'OTOUS. *a.* (*riotteux*, French.) 1. Luxurious; wanton; licentiously festive (*Brown*). 2. Seditious; turbulent.

RI'OTOUSLY. *ad.* 1. Luxuriously; with licentious luxury (*Eccles.*). 2. Seditiously; turbulently.

RI'OTOUSNESS. *s.* (from *riotous.*) The state of being riotous.

To RIP. *v. a.* (hrýpan, Saxon.) 1. To tear; to lacerate; to cut asunder by a continued act of the knife, or of other force (*Dryden*). 2. To take away by laceration or cutting (*Shak.*). 3. To disclose; to search out; to tear up; to bring to view (*Clarendon*).

RIPA TRANSONE, a populous and strong town of Italy, in the marquisate of Ancona, with a bishop's see, five miles W. of the gulf of Venice, and eight S. of Fermo. Lon. 13. 50 E. Lat. 42. 59 N.

RIPE. *a.* (ripe, Saxon; *rijp*, Dutch.) 1. Brought to perfection in growth; mature (*Milton*). 2. Resembling the richness of fruit (*Shakspeare*). 3. Complete; proper for use (*Shakspeare*). 4. Advanced to the perfection of any quality (*Dryden*). 5. Finished; consummate (*Hooker*). 6. Brought to the point of taking effect; fully matured (*Addison*). 7. Fully qualified by gradual improvement.

To RIPE. *v. n.* (from the adj.) To ripen; to grow ripe. *Ripen* is now used (*Donne*).

To RIPE. *v. a.* To mature; to make ripe (*Shakspeare*).

RI'PELY. *ad.* (from *ripe.*) Maturely; at the fit time (*Shakspeare*).

To RI'PEN. *v. n.* (from *ripe.*) To grow ripe; to be matured (*Bacon*).

To RI'PEN. *v. a.* To mature; to make ripe.

RIPEN, a seaport of Denmark, in N. Jutland, capital of a diocese of the same name, with a bishop's see, a castle, two colleges, and a public library. The tombs of several kings of Denmark are in the cathedral, which is a very handsome structure. The harbour is at a small distance, at the mouth of the river Nipsaa, in a country which supplies the best beeves in Denmark. It is 55 miles N.W. of Sleswick, and 60 S. by W. of Wiburg. Lon. 9. 0 E. Lat. 55. 25 N.

RI'PENESS. *s.* (from *ripe.*) 1. The state of being ripe; maturity (*Sharp*). 2. Full growth (*Denham*). 3. Perfection; completion (*Hooker*). 4. Fitness; qualification (*Shaks.*).

RIPHEUS, a Trojan who joined Æneas the night that Troy was reduced to ashes, and was at last killed after making a great carnage of the Greeks. He is commended for his love of justice and equity.

RIPIENO. (Ital.) Full. This word is used by musicians in orchestral compositions, to distinguish those parts which are only occasionally introduced, to fill up and supply the chorus.

RIPIPHORA. In the entomology of Fabricius, a tribe of the coleopterous genus MORDELLA, which see.

RIPLEY, a town in the W. riding of Yorkshire, with a market on Monday, seated on the Nyd, 23 miles W.N.W. of York, and 221 N. by W. of London. Lon. 1. 30 W. Lat. 54. 4 N.

RI'PPER. *s.* (from *rip.*) One who rips; one who tears; one who lacerates.

To RI'PPLE. *v. n.* To fret on the surface, as water swiftly running.

RIPPON, an ancient borough in the W. riding of Yorkshire, with a market on Thursday. In its neighbourhood is the celebrated park of Studley, including the venerable remains of Fountain's Abbey. Rippon was once famous for its religious houses, and has now a collegiate church, adorned with three lofty spires. It is noted for its manufacture of hardwares, particularly spurs, and the market-place is one of the finest squares of the kind in England. It is governed by a mayor, sends two members to parliament, and is seated on the Ure, 28 miles N.W. of York, and 218 N.N.W. of London. Lon. 1. 29 W. Lat. 54. 11 N.

RI'PTOWEL. *s.* A gratuity, or reward given to tenants, after they had reaped their lord's corn (*Bailey*).

RIQUIER, an ancient town of France, in the department of Somme, seated on the Cardon, five miles N.E. of Abbeville, and 95 N. of Paris. Lon. 1. 59 E. Lat. 50. 10 N.

RISAGON. See CASSUMUNIAR.

RISBOROUGH, a town in Buckinghamshire, with a market on Saturday, 20 miles S. of Aylesbury, and 37 W.N.W. of London.

To RISE. *v. n.* pret. *rose*; part. *risen.* (risan, Saxon; *reisen*, Dutch.) 1. To change a jacent or recumbent, to an erect posture (*Shakspeare*). 2. To get up from rest (*Dan.*). 3. To get up from a fall (*Milton*). 4. To spring; to grow up (*Milton*). 5. To gain elevation of rank or fortune (*Shakspeare*). 6. To swell (*Leviticus*). 7. To ascend; to move upward (*Newton*). 8. To break out from below the horizon, as the sun (*Milton*). 9. To take beginning; to come into existence or notice (*Cowley*). 10. To begin to act (*Dryden*). 11. To appear in view (*Addison*). 12. To change a station; to quit a siege (*Knolles*). 13. To be excited; to be produced (*Otway*). 14. To break into military commotions; to make insurrections (*Pope*). 15. To be roused; to be excited to action (*Psalms*). 16. To make hostile attack (*Deuteronomy*). 17. To grow more or greater in any respect (*Milton*). 18. To increase in price (*Locke*). 19. To be improved (*Tatler*). 20. To elevate the style (*Roscommon*). 21. To be revived from death (*Matthew*). 22. To come by chance (*Spenser*). 23. To be elevated in situation (*Dryden*).

RISE. *s.* (from the verb.) 1. The act of rising, locally or figuratively. 2. The act of mounting from the ground (*Bacon*). 3. Eruption; ascent (*Dryden*). 4. Place that favours the act of mounting aloft (*Locke*). 5. Elevated place (*Denham*). 6. Appearance as of the sun in the east (*Waller*). 7. Increase in any respect. 8. Increase of price (*Temple*).

9. Beginning; original (*Locke*). 10. Elevation; increase of sound (*Bacon*).

RI'SEN. The participle of *To rise.*

RI'SER. *s.* (from *rise.*) One that rises (*Chapman*).

RISIBI'LITY. *s.* (from *risible.*) The quality of laughing (*Arbuthnot*).

RI'SIBLE. *a.* (*risibilis,* Latin.) 1. Having the faculty or power of laughing (*Government of the Tongue*). 2. Ridiculous; exciting laughter.

RISING LEAF, or PETIOLE, in botany. See ASSURGENT.

RISK. *s.* (*risque,* Fr.) Hazard; danger; chance of harm (*South*).

To RISK. *v. a.* (*risquer,* French.) To hazard; to put to chance; to endanger (*Addison*).

RI'SKER. *s.* (from *risk.*) He who risks (*Butler*).

RITE. *s.* (*rit,* French; *ritus,* Latin.) Solemn act of oblivion; external observance (*Hammond*).

RITORNELLO. (Ital.) In music, a term formerly much in use, and applied to the short introductory symphony to an air; that which was introduced between the strains to relieve the voice and improve the general effect, as also to that which succeeded the melody, and ascertained its conclusion. It appears from several passages in the Greek authors, that these ritornelli, or symphonies, were introduced in the ancient as well as in the modern music. The name by which the Greeks distinguished them was that of mesaulici, a figurative expression in the singular number, implying an entry or passage, leading to something else. Meibomius, speaking of the mesaulion, or symphony, calls it an interpiping, which clearly indicates that ritornelli, or intermediate symphonies, were anciently in use.

RITTENHOUSE (David), an eminent American. He received only a common education, and was bred a watchmaker, to which profession he united that of a farmer. In 1769 his astronomical talents recommended him to the notice of the American philosophical society, who desired him to observe the transit of Venus, which he did with surprising accuracy. Since the American war he successively filled the offices of treasurer of the state of Pennsylvania, and director of the national mint. Rittenhouse succeeded the venerable Franklin as president of the American philosophical society, which office he filled with high reputation. He died in 1796, aged 64.

RITTERSHUSIUS (Conrad), a German civilian, born in 1560, at Brunswick. He was profoundly learned in the Latin and Greek languages, and is said to have had both Hesiod and Homer by heart. He wrote several books on civil law, and edited the works of Oppian. He died in 1613.

RI'TUAL. *a.* (*rituel,* Fr.) Solemnly ceremonious; done according to some religious institution (*Prior*).

RI'TUAL. *s.* (from the adj.) A book in which the rites and observances of religion are set down (*Addison*).

RITUALIST. *s.* (from *ritual.*) One skilled in the ritual.

RI'VAGE. *s.* (French.) A bank; a coast: not in use (*Shakspeare*).

RI'VAL. *s.* (*rivalis,* Latin.) 1. One who is in pursuit of the same thing which another man pursues; a competitor (*Dryden*). 2. A competitor in love (*Sidney*).

RI'VAL. *a.* Standing in competition; making the same claim; emulous (*Shakspeare*).

To RI'VAL. *v. a.* (from the noun.) 1. To stand in competition with another; to oppose (*South*). 2. To emulate; to endeavour to equal or excel (*Dryden*).

To RI'VAL. *v. n.* To be competitors (*Shakspeare*).

RIVA'LITY. RI'VALRY. *s.* (*rivalitas,* Latin.) Competition; emulation (*Addison*).

RI'VALSHIP. *s.* (from *rival.*) The state or character of a rival.

To RIVE. *v. a.* pret. *rived*; part *riven.* (ꝛyꝛꝛ, broken, Saxon; *river,* French, to drive.) To split; to cleave; to divide by a blunt instrument; to force in disruption (*Howel*).

To RIVE. *v. n.* To be split; to be divided by violence (*Woodward*).

To RIVE, for *derive* or *direct* (*Shakspeare*).

To RI'VEL. *v. a.* (ȝeꝛuꝛleꝺ, Saxon.) To contract into wrinkles and corrugations (*Dryden*).

RI'VEN. The participle of *rive.*

RI'VER. *s.* (*riviere,* Fr. *rivus,* Latin.) A land current of water bigger than a brook (*Addison*).

RIVER, an inland current of water, formed by the confluence of brooks, small streams, or mountain torrents.

There are few parts of physical philosophy involved in more darkness than the origin of rivers, or rather of the water that constitutes them. It is perhaps most obvious, and certainly most usual in the present day to derive them from the descent of rain; and consequently to regard evaporation as their principal source. But is the process of evaporation equal to so prodigious an effect? and are those countries or places most remarkable for the number and extent of their rivers where there is the greatest proportion of evaporation?

If we may credit Mr. Williams, the evaporation from the surface of land covered with trees and other vegetables is one-third greater than from the surface of water; but this has not been confirmed by other philosophers. From his experiments it appears that in Bradford in New England the evaporation during 1772 amounted to 42.65 inches. But from the way that his experiments were conducted, the amount was probably too great. From an experiment of Dr. Watson made June 2, 1779, after a month's drought, it appears that the evaporation, from a square inch of a grass plat, amounted to 1.2 grains in an hour, or 28.8 in twenty-four hours, which is 0.061 of an inch. In another experiment, after there had been no rain for a week, the heat of the earth being 110°, the evaporation was found almost twice as great, or = 0.108 of an inch in the day: the mean of which two experiments is 0.084 inches,

amounting for the whole month of June to 2.62 inches. If we suppose this to bear the same proportion to the whole year, that the evaporation in Dr. Dobson's experiments for June do to the annual evaporation, we shall obtain an annual evaporation amounting to about 22 inches: which is much smaller than the average obtained by Mr. Williams.

Mr. Dalton and Mr. Hoyle have offered us experiments still more correctly conducted. They took place in the vicinity of Manchester during 1796, and the two succeeding years: and according to these experiments the quantity of vapour raised in that quarter annually is about 25 inches; and if to this we add five inches for the dew, it will make the average evaporation for the year 30 inches. Now if we consider the situation of England, and the greater quantity of vapour usually admitted to be raised from water, it will not surely be considered as too great an allowance if we estimate the mean annual evaporation over the whole surface of the globe at 35 inches. But 35 inches from every square inch on the superficies of the earth make 94.450 cubic miles, equal to the water annually evaporated over the whole globe.

This may be a quantity altogether sufficient for the formation and supply of those immense masses of water which constitute the largest of those rivers which we shall presently notice in their order. But by what means is this prodigious expanse of vapour converted into rain, in which form alone it can generate rivers, if it generate them at all?

Rain never begins to fall while the air is transparent: the invisible vapours first pass their maximum, and are changed into vesicular vapours; clouds are formed, and these clouds are gradually dissolved in rain. But clouds are not formed in all parts of the horizon at once; the formation begins at one particular spot, while the rest of the air remains clear as before: the first cloud rapidly increases till it overspreads the whole horizon, and the rain then commences. Now it is remarkable, that though the greatest quantity of vapour exists in the lower strata of the atmosphere, clouds never begin to form there, but always at some considerable height. It is remarkable too, that the part of the atmosphere at which they form has not arrived at the point of extreme moisture, nor near that point, even a moment before their formation. They are not formed then, because a greater quantity of vapour had reached the atmosphere than could remain there without passing its maximum. It is still more remarkable, that when the clouds are formed, the temperature of the spot in which they are formed is not always lowered, though this is sometimes the case. On the contrary, the heat of the clouds themselves is sometimes greater than that of the surrounding air. Neither then is the formation of clouds owing to the capacity of air for combining with moisture being lessened by cold: so far from this, indeed, we often see clouds which had remained in the atmosphere during the heat of the day disappear in the night after the heat of the air has diminished. And hence the formation of clouds and rain, from which rivers are so generally supposed to proceed, are themselves not to be accounted for upon any principles with which we are acquainted.

It is a very remarkable fact, that evaporation often goes on for a month together in hot weather without any rain. This occasionally occurs in our own country; and takes place every year in the torrid zone. Thus at Calcutta, during January 1785, it never rained at all: the mean of the thermometer for the whole month was 66½ degrees: there was no high wind, and indeed during great part of the month little wind at all. And this is also a fact that it is impossible for us to account for. The enquiry therefore is involved in great difficulty. In the beginning of the present century, the philosophical world was agitated by a variety of opinions upon the subject. One party contended strongly for the existence of a large mass of water within the bowels of the earth, which supplied not only the rivers but the ocean itself; at the head of these we may place the ingenious but fanciful Burnet. The French philosophers, on the contrary, asserted, that the waters of the ocean were conveyed back by some subterraneous passages to the land, and being filtrated in their passage, returned again to the sea in the course of the rivers; but this opinion appears contrary to all the known principle of hydrostatics.

It was in opposition to these hypotheses, that our illustrious countryman Halley contended for the process of evaporation, and maintained that the immense deposition of water in consequence of it, is fully adequate to the whole supply. It is highly probable, however, that by some means or other, a kind of circulation is carried on through all nature; and that the sea receives back again, through the channel of the rivers, that water which it parts with to the atmosphere.

All rivers have their source either in mountains, or elevated lakes; and it is in their descent from these, that they acquire that velocity which maintains their future current. At first their course is generally rapid and headlong; but it is retarded in its journey by the continual friction against its banks, by the many obstacles it meets to divert its stream, and by the plane's generally becoming more level as it approaches towards the sea.

Rivers, as every body has seen, are always broadest at the mouth, and narrower towards their source. But what is less known, and probably more deserving curiosity, is, that they run in a more direct channel as they immediately leave their sources; and that their sinuosities and turnings become more numerous as they proceed. It is a certain sign among the savages of North America, that they are near the sea, when they find the rivers winding, and every now and then changing their direction. And this is even now become an indication to the Europeans themselves, in their journeys through those trackless forests. As those sinuosities, therefore, increase as the river approaches the sea, it is not to be wondered at, that they sometimes divide, and thus disembogue by different channels. The Danube disembogues into the Euxine by seven mouths; the Nile, by the same number; and the Wolga, by seventy.

The largest rivers of Europe are, first, the Wolga, which is about six hundred and fifty leagues in length, extending from Reschow to Astrachan. It is remarkable of this river, that it abounds with water during the summer months of May and June; but all the rest of the year is so shallow as scarcely to cover its bottom, or allow a passage for loaded vessels that trade up its stream. The next in order is the Danube. The course of this is about four hundred and fifty leagues, from the mountains of Switzerland to the Black Sea. The Don, or Tanais, which is four hundred leagues from the source of that branch

of it called the Softna, to its mouth in the Euxine Sea. In one part of its course it approaches near the Wolga; and Peter the Great had actually begun a canal, by which he intended joining those two rivers; but this he did not live to finish. The Nieper, or Borysthenes, which rises in the middle of Muscovy, and runs the course of three hundred and fifty leagues, to empty itself into the Black Sea. The Old Cossacks inhabit the banks and islands of this river; and frequently cross the Black Sea, to plunder the maritime places on the coasts of Turkey. The Dwina, which takes its rise in a province of the same name in Russia, that runs a course of three hundred leagues, and disembogues into the White Sea, a little below Archangel.

The largest rivers of Asia are: the Hoanho, in China, which is eight hundred and fifty leagues in length, computed from its source at Raja Ribron, to its mouth in the Gulph of Changi. The Jenisca of Tartary, about eight hundred leagues in length, from the lake Selinga to the Icy Sea. This river is, by some, supposed to supply most of that great quantity of drift-wood which is seen floating in the seas, near the Arctic circle. The Oby, of five hundred leagues, running from the lake of Kila into the Northern Sea. The Amour, in Eastern Tartary, whose course is about five hundred and seventy-five leagues, from its source to its entrance into the sea of Kamtschatka. The Kiam, in China, five hundred and fifty leagues in length. The Ganges, one of the most noted rivers in the world, and about as long as the former. It rises in the mountains which separate India from Tartary; and running through the dominions of the Great Mogul, discharges itself by several mouths into the bay of Bengal. It is not only esteemed by the Indians for the depth and pureness of its stream, but for a supposed sanctity which they believe to be in its waters. It is visited annually by several hundred thousand pilgrims, who pay their devotions to the river as to a god; for savage simplicity is always known to mistake the blessings of the Deity for the Deity himself. They carry their dying friends, from distant countries, to expire on its banks, and to be buried in its stream. The water is lowest in April or May; but the rains beginning to fall soon after, the flat country is overflowed for several miles, till about the end of September; the waters then begin to retire, leaving a prolific sediment behind, that enriches the soil, and, in a few days time, gives a luxuriance to vegetation, beyond what can be conceived by an European. Next to this may be reckoned the still more celebrated river Euphrates. This rises from two sources, northward of the city Erzerum, in Turcomania; and unites about three days journey below the same, whence, after performing a course of five hundred leagues, it falls into the Gulph of Persia, fifty miles below the city of Bassora in Arabia. The river Indus is extended, from its source to its discharge into the Arabian sea, four hundred leagues.

The largest rivers of Africa are: the Senegal, which runs a course of not less than eleven hundred leagues, comprehending the Niger, which some have supposed to fall into it. Later accounts, however, seem to affirm that the Niger is lost in the sands, about three hundred miles up from the western coasts of Africa. Be this as it may, the Senegal is well known to be navigable for more than three hundred leagues up the country; and how much higher it may reach is not yet discovered, as the dreadful fatality of the inland parts of Africa not only deters curiosity, but even avarice, which is a much stronger passion. The celebrated river Nile is said to be nine hundred and seventy leagues, from its source among the mountains of the Moon, in Upper Ethiopia, to its opening into the Mediterranean Sea. Upon its arrival in the kingdom of Upper Egypt, it runs through a rocky channel, which some late travellers have mistaken for its cataracts. In the beginning of its course, it receives many lesser rivers into it; and Pliny was mistaken, in saying that it received none. In the beginning also of its course, it has many windings; but, for above three hundred leagues from the sea, runs in a direct line. Its annual overflowings arise from a very obvious cause, which is almost universal with the great rivers that take their source near the Line. The rainy season, which is periodical in those climates, floods the rivers; and as this always happens in our summer, so the Nile is at that time overflown. From these inundations the inhabitants of Egypt derive happiness and plenty; and, when the river does not arrive at its accustomed height, they prepare for an indifferent harvest. It begins to overflow about the 17th of June; it generally continues to augment for forty days, and decrease in about as many more. The time of increase and decrease, however, is much more inconsiderable now than it was among the ancients. Herodotus informs us, that it was a hundred days rising, and as many falling; which shews that the inundation was much greater at that time than at present. M. Buffon has ascribed the present diminution, as well to the lessening of the mountains of the Moon, by their substance having so long been washed down with the stream, as to the rising of the earth in Egypt, that has for so many ages received this extraneous supply. But we do not find, by the buildings that have remained since the times of the ancients, that the earth is much raised since then. Besides the Nile in Africa, we may reckon Zara, and the Coanza, from the greatness of whose openings into the sea, and the rapidity of whose streams, we form an estimate of the great distance whence they come. Their courses, however, are spent in watering deserts and savage countries, whose poverty or fierceness have kept strangers away.

But of all parts of the world, America, as it exhibits the most lofty mountains, so also it supplies the largest rivers. The principal of these is the great river Amazons, which, from its source in the lake of Lauricocha, to its discharge into the Western ocean, performs a course of more than twelve hundred leagues. The breadth and depth of this river is answerable to its vast length; and, where its width is most contracted, its depth is augmented in proportion. So great is the body of its waters, that other rivers, though before the objects of admiration, are lost in its bosom. It proceeds after their junction, with its usual appearance, without any visible change in its breadth or rapidity; and, if we may so express it, remains great without ostentation. In some places it displays its whole magnificence, dividing into several large branches, and encompassing a multitude of islands; and at length, discharging itself into the ocean, by a channel of an hundred and fifty miles broad. Another river, that may almost rival the former, is the St. Lawrence, in Canada, which rising in the lake Assiniboils, passes from one lake to another, from Christinaux to Alempigo; and thence to lake Superior; thence to the lake Hurons; to lake Erie; to lake Ontario; and, at

last, after a course of nine hundred leagues, pours their collected waters into the Atlantic Ocean. The river Mississippi is more than seven hundred leagues in length, beginning at its source near the lake Assiniboils, and ending at its opening into the Gulph of Mexico. The river Plata runs a length of more than eight hundred leagues from its source in the river Parana, to its mouth. The river Oroonoko is seven hundred and fifty leagues in length, from its source near Pasto, to its discharge into the Atlantic ocean.

Such is the amazing length of the greatest rivers; and even in some of these, the most remote sources very probably yet continue unknown. In fact, if we consider the number of rivers which they receive, and the little acquaintance we have with the regions through which they run, it is not to be wondered at that geographers are divided concerning the sources of most of them. As among a number of roots by which nourishment is conveyed to a stately tree, it is difficult to determine precisely that by which the tree is chiefly supplied; so among the many branches of a great river, it is equally difficult to tell which is the original. Hence it may easily happen, that a similar branch is taken for the capital stream; and its runnings are pursued and delineated, in prejudice of some other branch that better deserved the name and the description. In this manner, in Europe, the Danube is known to receive thirty lesser rivers; the Wolga thirty-two or thirty-three. In Asia, the Hohanno receives thirty-five; the Jenisca above sixty; the Oby as many; the Amour about forty; the Nanquin receives thirty rivers; the Ganges twenty; and the Euphrates about eleven. In Africa, the Senegal receives more than twenty rivers; the Nile receives not one for five hundred leagues upwards, and then only twelve or thirteen. In America, the river Amazons receives above sixty, and those very considerable; the river St. Lawrence about forty, counting those which fall into its lakes; the Mississippi receives forty; and the river Plata above fifty.

The inundations of the Ganges and the Nile have been already mentioned, and it might be added, that almost all great rivers have their periodical inundations from similar causes. The author already quoted observes, that, "besides these annually periodical inundations, there are many rivers that overflow at much shorter intervals. Thus most of those in Peru and Chili have scarce any motion by night; but upon the appearance of the morning sun they assume their former rapidity: this proceeds from the mountain snows, which melting with the heat, increase the stream, and continue to drive on the current while the sun continues to dissolve them."

There are some rivers which are said to lose themselves in chasms under the earth, and to flow for several miles in secret and undiscovered channels. On this circumstance is founded one of the most beautiful fables of antiquity, relative to the fountain of Arethusa, in Sicily. The same thing is affirmed of the Rhine, and even of the river Mole, in Surry, which from this circumstance derives its name. With respect to the two latter rivers, however, some doubts are entertained of the fact.

On this subject there is a memoir of the academy of sciences lately published, by the abbe Guettard. "It is very surprising (he observes) if we reflect on it, that a river in its course, which is very often very extensive, should not meet with spongious soils to swallow up its waters, or gulphs in which they are lost; nevertheless, as there has been hitherto known but a small number of rivers whose waters thus disappear, this phenomenon has been accounted very extraordinary, both by the ancients and moderns." M. Guettard next describes what he has observed in several rivers of Normandy, which are lost and afterwards appear again; these are five in number, viz. the Rille, the Ithon, the Aure, the river of Sap-André, and the Drôme. The three first disappear gradually, and then come in sight again; the fourth loses itself entirely by degrees, but afterwards re-appears; the fifth loses some of its water in its course, and ends by precipitating itself into a cavity, whence it is never seen to rise again.

What seems to occasion the loss of the Rille, the Ithon, and the Aure, is the nature of the soil through which they pass. M. Guettard has observed that it is in general porous, and composed of a thick sand, the grains of which are not well compacted together; it sinks suddenly down by its own weight in some places, and there forms great holes; and when the water overflows the meadows, it frequently makes many cavities in several parts of them. If we therefore suppose inequalities in the channels of these rivers, and that there are certain places in which the water stagnates longer than in others, it must there dilute the ground, if we may use that expression; and having carried away the parts which united the grains of sand together, those grains will become afterwards no other than a kind of sieve, through which the waters will filtrate themselves, provided nevertheless that they find a passage under ground through which they may run. This conjecture appears to be so well founded, that each of these three rivers loses itself nearly in the same manner, that is, through cavities which the people of the country call betoirs, and which swallow up more or less according to their largeness. M. Guettard, who has carefully examined them, remarks, that these betoirs are holes in the form of a tunnel, whose diameter and aperture is at least two feet, and sometimes exceeds eleven; and whose depth varies in like manner from one and two feet, to five, six, and even twenty. The Rille during the summer season loses almost all its water in the space of two short leagues; the Ithon does very near the same. But M. Guettard observes something curious concerning this river, that formerly it was not lost, but kept its course without any interruption, as appears by the history of the country; very likely the mud, which had been collected together in several parts of its channel, might have occasioned the waters remaining in others, and have caused many betoirs. This is the more likely, as the mud having been collected together in the bed of the river Aure, it appears that, in consequence, the cavities were greatly increased, which makes it lose itself much sooner than formerly. Besides, possibly an earthquake happening in the country might have caused several subterraneous canals through which the water of the Ithon has forced its way. In effect, it appears, that a soil's being porous is not sufficient to cause the loss of a river; for if it was, then to do so it would occasion many fens round about, nor would it renew its course after having disappeared a certain time; it must besides find ways under ground through which it may take its course. M. Guettard seems also much inclined to believe, that there are, in these parts, subterraneous cavities through which the waters may

flow; and in consequence of this he reports a number of facts, all tending to prove the truth of it, or at least to prove that there must be hollow quarries serving for strainers to these waters. Upon which occasion he goes into a discussion of this question: Are there any subterraneous rivers, and is the prepossession of some persons in favour of this particular well founded? He makes it appear by several instances which he quotes, and by many reasons which he alleges, that there are at least very great presumptions in favour of this opinion. We are too apt not to look beyond the exterior of things: we feel resistance upon the surface of the earth; when we go deep, we often find it compact. It is therefore hard for us to imagine that it can contain subterraneous cavities sufficient to form channels for hidden rivers, or for any considerable body of water; in a word, that it can contain vast caverns; and yet every thing seems to indicate the contrary. A fact that is observed in the betoirs of the rivers concerning which we have spoken, and particularly of the Rille, proves in some measure that there are considerable lakes of waters in the mountains which limit its course: this fact is, that in winter the greatest part of their betoirs become springs, which supply anew the river's channel with as much water as they had absorbed from it during the summer. Now from whence can that water come, unless from the reservoirs or lakes that are inclosed in the mountains, which being lower than the river in summer, absorb its waters, and being higher in winter by the rain they receive, send it back again in their turn?

M. Guettard strengthens this conjecture by several instances that render it very probable: he remarks at the same time, that this alternate effect of the betoirs swallowing up the water and restoring it again, causes perhaps an invincible obstacle to the restraining of the water within the channel of the river. It has indeed been several times attempted to stop those cavities; but the water returns with such violence in winter, that it generally carries away the materials with which they were stopped.

The river of Sap-André is lost in part, as we have before said, in the same manner as the Ithon and the Rille; but there is something more remarkable in it than in those rivers; to wit, that at the extremity of its course, where there is no perceptible cavity, it is ingulphed, but without any fall; the water passes between the pebbles, and it is impossible to force a stick into that place any further than into the betoirs of which we have spoken. What makes this river take that subterraneous direction, is an impediment which its stream meets with in that place; it is there stopped by a rising ground six or seven feet high, whose bottom it has very likely undermined, to gain a free passage, not having been able to make its way over it. At some distance it appears again; but in winter, as there is a greater quantity of water, it passes over that eminence, and keeps an uninterrupted course.

Lastly, the Drôme, after having lost some of its water in its course, vanishes entirely near the pit of Soucy; in that place it meets with a sort of subterraneous cavity near 25 feet wide, and more than 15 deep, where the river is in a manner stopped, and into which it enters, though without any perceptible motion, and never appears again.

M. Guettard finishes this memoir with some observations upon the Ierre. This river is lost in the same manner as the Rille; and though it is very near Paris, this singularity is unknown to almost every body; was it not for the account of M. l'Abbé le Bœuf, M. Guettard would have been also ignorant of it. And as he thinks the chief object of a naturalist's observation ought to be the public good, he examines the means which might be employed to restrain the water of the Ierre. The same object has made him add a description of the manner how the Rhone is lost, or rather how its course is disturbed; for it is now very certain that it does not lose itself, but that its channel is extremely confined, in the place where it was pretended that it lost itself, by two mountains, between whose feet it runs. M. Guettard makes it appear that it might not be impossible to widen that place, and give a sufficient channel to the river; which would render it navigable, and be of vast utility to all the country.

The many advantages which accrue to a country from an abundance of rivers, especially large navigable ones, are too obvious to require any particular detail: but the disadvantages and calamities occasioned by them are frequently no less obvious and fatal. Whole tracts of country are sometimes overflowed on a sudden, and every thing swept away at once; or if the deluge proceeds not such a length, yet by the quantity of stagnating water which is left, marshes are produced, which bring on diseases in the neighbouring parts. It becomes therefore an object well worthy the public attention, how to secure the banks of rivers, or to form their channels in such a manner that the superfluous water may be carried off into the ocean without producing the mischievous effects abovementioned. In a treatise on rivers and canals published in the Phil. Trans. vol. 69. by Mr. Mann, he treats this subject at great length. Having laid down a number of theorems concerning the descent of the water in rivers, he points out a method of determining whether the motion of a river in any particular place is derived from the inclination of the bottom of its channel, or merely from the pressure of the upper parts of the water upon the lower. "For this purpose," says he, "a pole must be thrust down to the bottom, and held perpendicularly to the current of the water, with its upper end above the surface; if the water swells and rises immediately against the pole, it shows that its flowing is by virtue of a preceding declivity; if, on the contrary, the water stops for some moments before it begins to rise against the pole, it is a proof that it flows by means of the compression of the upper waters upon the lower."

The best and most simple method of measuring the velocity of the current of a river, according to our author, is as follows: "Take a cylindrical piece of dry light wood, and of a length something less than the depth of the water in the river; round one end of it let there be suspended as many small weights as may be necessary to keep up the cylinder in a perpendicular situation in the water, and in such a manner that the other end of it may just appear above the surface of the water. Fix to the centre of that end which appears above water a small and straight rod precisely in the direction of the cylinder's axis; to the end that, when the instrument is suspended in the water, the deviations of the rod from a perpendicularity to the surface of it may indicate which end of the cylinder advances the fastest, whereby may be discovered the different velocities of the water at different depths; for if the rod inclines forwards according to the direction of the

current, it is a proof that the surface of the water has the greatest velocity; but if it inclines back, it shows that the swiftest current is at the bottom; if it remains perpendicular, it is a sign that the velocities at the surface and bottom are equal.

"This instrument being placed in the current of a river or canal receives all the percussions of the water throughout the whole depth, and will have an equal velocity with that of the whole current from the surface to the bottom at the place where it is put in; and by that means may be found, both with ease and exactness, the mean velocity of that part of the river for any determinate distance and time.

"But to obtain the mean velocity of the whole section of the river, the instrument must be put successively both in the middle and towards the sides, because the velocities at those places are often very different from each other. Having by this means found the difference of time required for the currents to run over an equal space, or the different distances run over in equal times; the mean proportional of all these trials, which is found by dividing the common sum of them all by the number of trials, will be the mean velocity of the river or canal.

"If it is required to find the velocity of the current only at the surface, or at the middle, or at the bottom, a sphere of wood, of such a weight as will remain suspended in equilibrium with the water at the surface or depth which we want to measure, will be better for the purpose than a cylinder, because it is only affected by the water of that part of the current where it remains suspended.

"It is a very easy guide both to the cylinder and the globe in that part which we want to measure, by means of two threads, or small cords, which two persons must hold and direct, one on each side of the river; taking care at the same time neither to retard nor accelerate the motion of the instrument."

Our author next proceeds to deduce from his theory the best methods of removing the defects and inconveniencies which must necessarily happen to rivers and canals in a series of years. From his theory he draws the following conclusion: that the deeper the waters are in their bed in proportion to its breadth, the more their motion is accelerated; so that their velocity increases in an inverse ratio of the breadth of a bed, and also of the greatness of the section; whence are deduced the two following universal practical rules; 1st. To augment the velocity of water in a river or canal, without augmenting the declivity of the bed, we must increase the depth and diminish the breadth of its bed. 2dly. But to diminish the velocity of water in a river or canal, we must, on the contrary, increase the breadth and diminish the depth of its bed.

The above proposition is perfectly conformable to observation and experience: for it is constantly seen, that the current is the swiftest where the waters are deepest and the breadth of the bed the least, and that they flow slowest where their depth is the least and the breadth of the bed the greatest. "The velocity of the waters," says M. de Buffon, "augments in the same proportion as the section of the channel through which they pass diminishes, the force of impulsion from the back waters being supposed always the same. Nothing," continues he, "produces so great a diminution in the swiftness of a current as its growing shallow; and on the contrary, the increase of the volume of water augments its velocity more than any other cause whatever." The celebrated Wolfe in his hydraulics assures us, that "it is a constant and universal practice, for accelerating the current of waters, to deepen the bed, and at the same time to render it narrower."

When the velocity which a river has acquired by the elevation of its springs and the impulse of the back water, is at last totally destroyed by the different causes of resistance becoming exactly equal to, or greater than, the first, the bed and current at the same time being horizontal, nothing else remains to propagate the motion, except the sole perpendicular compression of the upper waters upon the lower, which is always in a direct ratio of their depth. But this necessary resource, this remaining cause of motion in rivers, augments in proportion as all the others diminish, and as the want of it increases; for as the waters of rivers in extensive plains lose the acceleration of motion acquired in their descent from their springs, their quantity accumulates in the same bed by the junction of several streams together, and their depth increases in consequence. This junction and successive accumulation of many streams in the same bed, which we see universally in a greater or lesser degree in all rivers throughout the known world, and which is so absolutely necessary to the motion of their waters, can only be attributed, says Signor Guglielmini, to the infinite wisdom of the supreme Author of Nature.

The velocities of flowing waters is very far from being in proportion to the quantity of declivity in their bed. If it was a river whose declivity is uniform and double to that of another, it ought only to run with double the swiftness when compared to it; but in effect it is found to have a much greater, and its rapidity, instead of being only double, will be triple, quadruple, and sometimes even more; for its velocity depends much more on the quantity and depth of the water, and on the compression of the upper waters on the lower, than on the declivity of the bed. Consequently, whenever the bed of a river or canal is to be dug, the declivity must not be distributed equally throughout the whole length; but, to give a swifter current to the water, the declivity must be much greater in the beginning of its course than towards the end where it disembogues itself, and where the declivity must be almost insensible, as we see is the case in all natural rivers; for when they approach near the sea, their declivity is little or nothing; yet they flow with a rapidity which is so much greater, as they contain a greater volume of water; so that in great rivers, although a large extent of their bed next the sea should be absolutely horizontal, and without any declivity at all, yet their waters do not cease to flow, and to flow even with great rapidity, both from the impulsion of the back-waters, and from the compression of the upper waters upon the lower in the same section.

Whoever is well acquainted with the principles of the higher geometry, will easily perceive that it would be no difficult matter so to dig the bed of a canal or river, that the velocity of the current should be every where equal. It would be only giving it in the form of a curve along which a moving body should recede from a given point, and describe spaces every where proportional to the times, allowance being made for the quantity of effect of the compression of the upper waters upon the lower. This curve is what is called the

horizontal isochronic, being the flattest of an infinity of others which would equally answer the problem where fluids were not concerned.

All obstacles whatever in the bed of a river or canal, such as rocks, trunks of trees, banks of sand and mud, &c. must necessarily hinder proportionably the free running off of the water; for it is evident, that the waters so far back from these obstacles, until the horizontal level of the bottom of the bed becomes higher than the top of the obstacles, must be entirely kept up and hindered from running off in proportion. Now as the waters must continue to come down from their sources, if their free running off is hindered by any obstacles whatever, their relative height back from them must necessarily be increased until their elevation, combined with the velocity of their current proceeding from it, is arrived to such a pitch at the point where the obstacles exist, as to counterbalance the quantity of opposition or impediment proceeding thence, which frequently does not happen until all the lower parts of the country round about are laid under water.

Now it is certain from all experience, that the beds of rivers and canals in general are subject to some or others of the obstacles above-mentioned. If rocks or trees do not bar their channels, at least the quantity of sand, earth, and mud, which their streams never fail to bring down, particularly in floods, and which are unequally deposited according to the various windings and degrees of swiftness in the current, must unavoidably, in course of time, fill up, in part, different places in the channel, and hinder the free running off of the back-waters. This is certainly the case, more or less, in all rivers, and in all canals of long standing, as is notorious to all those well acquainted with them. Hence, if these accidents are not carefully and with a constant attention prevented, inundations occur which sometimes lay waste whole districts, and ruin the finest tracts of ground, by covering them with sand; hence rivers become unnavigable, and canals useless for the purposes for which they were constructed. Canals, in particular, as their waters for the most part remain stagnant in them, are still more liable than rivers to have their beds fill up by the subsiding of mud, and that especially for some distance above their sluices; insomuch, that if continual care is not taken to prevent it, or remedy it as often as it happens, they will soon become incapable of receiving and passing the same vessels as formerly. Nay, the very sluices themselves, if the floors of their bottoms are not of a depth conformable to the bed of the canal, will produce the same accidents as those we have been speaking of; for if they are placed too low, they will be continually filling up with sand or mud; if too high, they have the same effect as banks or bars in the bed of a river, that is, they hinder all the back-waters under their level from running off, and soon fill up the bed to that height by the subsiding of mud. This effect is much accelerated by the shutting of the lower sluices, which makes a great volume of water flow back to those next above them, till the whole is filled and become stagnant. Now it is evident, that this state of things must contribute far more to the subsidency of mud, and all other matters brought down by the waters in canals, than can be the case in rivers whose currents constantly flow.

The waters of all rivers and canals are from time to time muddy; their streams, particularly during rains and floods, carry along with them earth and other substances which subside in those places where their currents are the least, by which their beds are continually raised; so that the successive increase of inundations in rivers, and of unfitness for navigation in canals, when they are neglected and left to themselves, is a natural and necessary consequence of the state of things, which no intelligent person can be at a loss to account for; and yet whole countries remain in this habitual state of negligence, to their very great detriment.

Having thus shown the principal accidents which rivers and canals are liable to, with the causes of them, our author proceeds to point out the most efficacious methods of preventing them, or at least of diminishing their effects. They flow immediately from the principles laid down in his essay, and do not need many words to make them completely understood. A work of this kind, he observes, if it is properly conducted, must be begun at the lower end of the river or canal: that is, at that end where their waters are discharged into the sea, or where they fall into some other greater river or canal, whence their waters are carried off without further hindrance. If it is a river whose bed, by being filled up with sand, mud, or other obstacles, and by being otherwise become irregular in its course, is often subject to its inundations, and incapable of internal navigation, the point, from which the work must be begun and directed throughout all the rest of the channel, is from the lowest water-mark of spring-tides on the shore at the mouth of the river, or even something below it, if it can be done; though this part will soon fill up again by the sand, mud, &c. which the tides cease not to roll in.

If it be a canal whose bed is to be dug anew, or one already made, which is to be cleaned and deepened from the sea-shore or some large river back into the country, and where no declivity is to be lost, as is the case in all flat countries; the work must be begun, and the depth of the whole channel directed, from the lower water-mark of spring-tides, if the mouth is to the sea, or from such a depth in the channel of the river, if the canal falls into one, that there may be such a communication of water from the canal to the river, in all situations of the current, as may let boats freely pass from one to the other. This, of course, must also direct the depth of the floor of the last sluice towards the mouth of the canal, be it to the sea or into a river. If the bottom or floor of a sluice already constructed is too low, it will soon fill up with sand or mud, and hinder the gates from opening, unless it is continually cleaned out: if, on the contrary, this floor is too high, and in a canal whose natural declivity is too little for the free current of the water, as is generally the case in Holland and Flanders, all depth of the bed of the canal below the horizontal level of the bottom of the sluice will serve to no manner of purpose, either for navigation, or for carrying off the back-waters, but will soon fill up with mud, in spite of all means used to the contrary, except that of digging it continually anew to no manner of purpose.

Setting off from this determinate point, at the mouth of a river, or at the bottom of the last sluice upon a canal, which are to be cleaned and deepened; the work must be carried on, in consequence, uniformly throughout their whole course backwards into the country as far as is found necessary for the purposes intended. This is to be done after the following manner:

1st. One must dig up and carry away all irregularities in the bottom and sides of the bed, such as banks of sand and mud, rocks, stumps or trunks of trees, and whatever else may cause an obstacle to the regular motion of the water, and to the free passage of vessels upon it.

2dly. If the declivity of the bed should be still too little to give a sufficient current to carry off the water as often and as fast as is necessary, the whole bed itself must be regularly deepened, and what is dug out from the bottom must be laid upon the sides, to render it narrower in proportion to its depth.

3dly. Wherever the banks are too low to contain the stream in all its situations, they must be sufficiently raised; which may be conveniently done with what is dug out from the bed; and the whole being covered with green turf will render these banks firm and solid against the corrosion of the water. It is proper at all times to lay upon the banks what is dug from the bed, by which they are continually strengthened against the force of the current.

4thly. It is often necessary to diminish the windings and sinuosities in the channel as much as possible, by making new cuts, whereby its course may approach towards a right line. This is a great resource in flat countries subject to inundations; because thereby all the declivity of a great extent of the river, through its turns and windings, may be thrown into a small space by cutting a new channel in a straight line; as may generally be done without obstacle in such countries as we are speaking of, and hereby the velocity of the current will be very greatly augmented, and the back-waters carried off to a surprising degree.

5thly. Wherever there is a confluence of rivers or canals, the angle of their junction must be made as acute as possible, or else the worst of consequences will arise from the corrosion of their respective streams; what they carry off from the sides will be thrown into irregular banks in the bottom of the bed. This acute angle of the junction may always be procured by taking the direction at some distance from the point of confluence.

6thly. Wherever the sides or banks of a river are liable to a more particular corrosion, either from the confluence of streams, or from irremediable windings and turns in the channel, they must be secured against it as much as possible by weirs: for this corrosion not only destroys the banks, and alters by degrees the course of the river, but also fills up the bed, and produces all the bad effects we have spoken of above.

7thly. But the principal and greatest attention in digging the beds of rivers and canals must be had to the quantity and form of their declivity. This must be done uniformly throughout their whole extent, or so much of it as is necessary for the purposes in hand, according to the principles laid down. Conformable thereto, the depths of their beds, and of the floors of their sluices, at the mouths where they discharge their waters, being fixed, the depth of the rest of the beds, and the quantity of declivity, must be regulated in consequence thereof, so as to increase regularly the quantity of the declivity in equal spaces the further we recede from their mouths, and proceed towards their sources or to the part where the regular current is to take place.

If the depth and volume of water in a river or canal is considerable, it will suffice, in the part next the mouth, to allow one foot perpendicular of declivity through six, eight, or even, according to Deschales, ten thousand feet in horizontal extent; at most it must not be above one in six or seven thousand. Hence the quantity of declivity in equal spaces must slowly and gradually increase as far as the current is to be made fit for navigation; but in such a manner, as that at this upper end there may not be above one foot of perpendicular declivity in four thousand feet of horizontal extent. If it is made greater than that, in a regular bed containing a considerable volume of water, the current will be so strong as to be found very unfit for the purposes of navigation.

Mr. Mann calls the centre of the current, or more properly, line of greatest current, that line which passes through all the sections of a river, in the point where the velocity of the current is the greatest of all. If the current of a river is regular, and in a right line, its centre or line of greatest velocity will be precisely in the centre of the sections; but on the contrary, if the bed is irregular and full of turns and windings, the centre, or line of greatest current, will likewise be irregular, and often change its distance and direction with regard to the centres of the sections through which the waters flow, approaching successively, and more or less, to all parts of the bed, but always in proportion and conformably to the irregularities in the bed itself.

This deviation of the line of greatest current from the centres of the sections through which it passes, is a cause of many and great changes in the beds of rivers, such as the following:

1st. In a straight and regular bed, the greatest corrosion of the current will be in the middle of the bottom of the bed; because it is that part which is nearest to the line of greatest current, and at the same time which is most acted upon by the perpendicular compression of the water. In this case, whatever matters are carried off from the bottom will be thrown, by the force of the current, equally toward the two sides, where the velocity of the stream is the least in the whole section.

2dly. If the bed is irregular and winding, the line of greatest current will be thrown towards one side of the river, where its greatest force will be exerted in proportion to the local causes which turn it aside: in short turns of a river there will be a gyration, or turning round of the stream, from its beating against the outer side of the angle; this part will be corroded away, and the bottom near it excavated to a great depth. The matters so carried off will be thrown against the opposite bank of the river, where the current is the least, and produce a new ground called an alluvion.

3dly. Inequalities at the bottom of a river retain and diminish the velocity of the water, and sometimes may be so great as to make them reflow; all these effects contribute to the subsiding of sand, earth, and other matters, which cease not to augment the volume of the obstacles themselves, and produce shallows and banks in the channel. These in time, and by a continuance of the causes, may become islands, and so produce great and permanent changes and irregularities in the beds of rivers.

4thly. The percussions of the centre of the current against the sides of the bed are so much the greater as they are made under a greater angle of incidence; whence it follows, that the force of percussion, and the quantity of corrosion and detriment done to the banks and weirs of rivers, and to the walls of buildings which are

exposed to that percussion, are always in a direct compound proportion of the angle of incidence, of the greatness and depth of the section together, and of the quantity of velocity of the current.

5thly. It may happen in time, that the excavation of the bottom, and the corrosion of the sides, will have so changed the form of the bed as to bring the force of percussion into equilibrium with the velocity and direction of the current; in that case, all further corrosion and excavation of the bed ceases.

6thly. This gives the reason why when one river falls into another almost in a perpendicular direction, and makes with it too great an angle of incidence, this direction is changed in time, by corrosions and alluvions, into an angle much more acute, till the whole comes into equilibrium.

7thly. So great and such continued irregularities, from local causes, may happen in the motion of a river as will entirely change its ancient bed, corrode through the banks where they are exposed to the greatest violence of percussion of the stream, and open new beds in grounds lower than the old one is become.

8thly. Hereupon the state of the old bed will entirely depend on the quantity of water, and on the velocity and direction of the current in the new one; for immediately after this division of the waters into two beds is made, the velocity of the current in the old one will be diminished in proportion to its less depth. In consequence, the waters will precipitate more of their mud, &c. in equal spaces than they did before; which will more and more raise up the bottom, sometimes even till it becomes equal with the surface of the stream. In this case, all the water of the river will pass into the new bed, and the old one will remain entirely dry. It is well known that this has happened to the Rhine near Leyden, and to many other rivers.

9thly. Hence the cause of the formation of the new branches and mouth, by which great rivers discharge their waters into the sea.

With respect to the mathematical theory of the motion of water in rivers, although it is highly curious, we cannot enter largely into it here; but shall merely add the following propositions and remarks, from professor Playfair's Outlines of Natural Philosophy.

1. Water running in open canals, or in rivers, is accelerated in consequence of its depth, and of the declivity on which it runs, till the resistance, increasing with the velocity, become equal to the acceleration, when the motion of the stream becomes uniform.

It is evident, that the amount of the resisting forces can hardly be determined by principles already known, and therefore nothing remains, but to ascertain by experiment, the velocity corresponding to different declivities, and different depths of water, and to try, by multiplying and extending these experiments, to find out the law which is common to them all.

The Chevalier du Buat has been successful in this research, and has given a formula for computing the velocity of running water, whether in close pipes, open canals, or rivers, which, though it may be called *empirical*, is extremely useful in practice. Principes d'Hydraulique, par M. Le Chevalier du Buat, 2 vol. 8vo, edit. 2. Paris, 1786. Professor Robison has given an abridged account of this book, in his excellent articles on rivers and water-works, in the Encyclopædia Britannica.

Let V be the velocity of the stream, measured by the inches it moves over in a second; R a constant quantity, viz. the quotient obtained by dividing the area of the transverse section of the stream, expressed in square inches, by the boundary or perimeter of that section, *minus* the superficial breadth of the stream, expressed in linear inches.

The mean velocity is that with which, if all the particles were to move, the discharge would be the same with the actual discharge.

The line R is called by Du Buat the radius, and by Dr. Robison the hydraulic mean depth. As its affinity to the radius of a circle seems greater than to the depth of a river, we shall call it, with the former, the radius of the section.

Lastly, let S be the denominator of a fraction which expresses the slope, the numerator being unity, that is, let it be the quotient obtained by dividing the length of the stream, supposing it extended in a straight line, by the difference of level of its two extremities; or, which is nearly the same, let it be the co-tangent of the inclination or slope.

2. The above denominations being understood, and the section, as well as the velocity, being supposed uniform, $V =$

$$\frac{307\sqrt{R-\frac{1}{10}}}{S^{\frac{1}{2}}-\frac{1}{2}\log.\left(S+\frac{16}{10}\right)}-\frac{3}{10}\sqrt{R-\frac{1}{10}};$$

$$\text{or } V=\sqrt{R-\frac{1}{10}}\left(\frac{307}{S^{\frac{1}{2}}-\frac{1}{2}\log.\left(S+\frac{16}{10}\right)}-\frac{3}{10}\right).$$

See Du Buat, *ubi supra*, § 51., &c. At § 52. p. 65. the formula is reduced to English measure, as now given.

When R and S are very great, $V =$

$$R^{\frac{1}{2}}\left(\frac{307}{S^{\frac{1}{2}}-\frac{1}{2}\log S}-\frac{3}{10}\right) \text{ nearly.}$$

The logarithms understood here are the hyperbolic.

The slope remaining the same, the velocities are as $\sqrt{R-\frac{1}{10}}$.

The velocities of two great rivers that have the same declivity, are as the square roots of the radii of their sections.

If R is so small, that $\sqrt{R-\frac{1}{10}}=0$, or $R=\frac{1}{10}$, the velocity will be nothing; which is agreeable to experience; for in a cylindric tube $R=\frac{1}{2}$ the radius: the radius, therefore, equal two-tenths; so that the tube is nearly capillary, and the fluid will not flow through it.

The velocity may also become nothing, by the declivity becoming so small, that

$$\frac{307}{S^{\frac{1}{2}}-\frac{1}{2}\,\text{Log}\left(S+\frac{16}{10}\right)}-\frac{3}{10}=0; \text{ but}$$

$\frac{1}{S}$ if is less than $\frac{1}{500000}$, or than $\frac{1}{10}$th of an inch to an English mile, the water will have sensible motion.

3. In a river, the greatest velocity is at the surface, and in the middle of the stream, from

which it diminishes toward the bottom and the sides, where it is least. It has been found by experiment, that if from the square root of the velocity in the middle of the stream, expressed in inches *per* second, unity be subtracted, the square of the remainder is the velocity at the bottom.

Principes d'Hydraulique, par Du Buat, § 67.

Hence, if the former velocity be $= v$, the velocity at the bottom $= v - 2\sqrt{v} + 1$.

4. The mean velocity, or that with which, were the whole stream to move, the discharge would be the same with the real discharge, is equal to half the sum of the greatest and least velocities, as computed in the last proposition.

The mean velocity is, therefore, $= v - \sqrt{v} + \frac{1}{2}$.

This is also proved by the experiments of Du Buat.

5. Suppose that a river having a rectangular bed, is increased by the junction of another river equal to itself, the declivity remaining the same; required the increase of depth and velocity.

Let the breadth of the river $= b$, the depth, before the junction, d, and after it, x; and, in like manner, v and v' the mean velocities before and after; then $\frac{b\,d}{b + 2\,d}$ is the radius before, and $\frac{b\,x}{b + 2\,x}$ the radius after, so $v = \frac{307\,R^{\frac{1}{2}}}{S^{\frac{1}{2}}}$, supposing the breadth of the river to be such, that we may reject the small quantity subtracted from R, in § 287.; and, in like manner, $v' = \frac{307\,R'^{\frac{1}{2}}}{S^{\frac{1}{2}}}$.

Then, substituting for R and R', we have

$$v = \frac{307}{S^{\frac{1}{2}}} \times \sqrt{\frac{b\,d}{b + 2\,d}}, \text{ and}$$

$$v' = \frac{307}{S^{\frac{1}{2}}} \times \sqrt{\frac{b\,x}{b + 2\,x}}.$$ Multiplying these into the areas of the sections $b\,d$ and $b\,x$, we have the discharges, viz. $b\,d\,v = \frac{307}{S^{\frac{1}{2}}} \times \frac{b\,d\sqrt{b\,d}}{\sqrt{b + 2\,d}}$ and $b\,x\,v' = \frac{307}{S^{\frac{1}{2}}} \times \frac{b\,x\sqrt{b\,x}}{\sqrt{b + 2\,x}}$. Now the last of these is double of the former; therefore

$$\frac{b\,x\sqrt{b\,x}}{\sqrt{b + 2\,x}} = \frac{2\,b\,d\sqrt{b\,d}}{\sqrt{b + 2\,d}}, \text{ or } \frac{x^3}{b + 2\,x} = \frac{4\,d^3}{b + 2\,d}, \text{ and } x^3 - \frac{3\,d^3}{b + 2\,d}\,x = \frac{4\,b\,d^3}{b + 2\,d},$$

a cubic equation which can always be resolved by Cardan's rule.

As an example, let $b = 10$ feet, and $d = 1$, then $x^3 - \frac{2}{3}x = \frac{10}{3}$, and $x = 1.4882$, which is the depth of the increased river. Hence we have $1.488 \times v' = 2\,v$, and $1.488 : 2 :: v : v'$, or $v : v' :: 37$ to 50 nearly.

When the water in a river receives a permanent increase, the depth and the velocity, as in the example above, are the first things that are augmented. The increase of the velocity increases the action on the sides and bottom, in consequence of which the width is augmented, and sometimes also, but more rarely, the depth. The velocity is thus diminished, till the tenacity of the soil, or the hardness of the rock, afford a sufficient resistance to the force of the water. The bed of the river then changes only by insensible degrees, and, in the ordinary language of Hydraulics, is said to be permanent, though in strictness this epithet is not applicable to the course of any river.

RIVER GOD. Tutelary deity of a river.

RIVER HORSE. In mastiology. See HIPPOPOTAMUS.

RI'VET. *s.* (*river*, Fr. to drive.) A fastening pin clenched at both ends (*Dryden*).

To RI'VET. *v. a.* (from the noun.) 1. To fasten with rivets (*Ben Jonson*). 2. To fasten strongly; to make immoveable (*Congreve*). 3. To drive or clench a rivet (*Moxon*).

RIVINA, in botany, a genus of the class tetrandria, order monogynia. Corol four-petalled, permanent; calyxless; berry one-seeded; seed lentiform. Four species; natives of America or the West Indies. Three, as follow, are cultivated.

1. R. humilis. Downy rivina.
2. R. lævis. Smooth rivina.
3. R. octandra. Climbing rivina.

The flowers and berries of rivina lævis are scarlet; and the juice extracted from the latter is sometimes used to stain paper and linen of a bright red; and various experiments have proved that it will also colour the white petals of fresh flowers with a similar hue, their stalks being plunged into phials filled with the juice: it has succeeded best with the tuberose and double white narcissus.

RIVINUS (Andrew), of Halle, in Saxony, was a physician, and professor of poetry and philosophy at Leipsic, and died 1656, aged 56. His works are, remarks on ancient christian poets—dissertation on literary subjects, 4to.—veterum scriptorum de medicinâ collectanea, 8vo.—mysteria medico-physica, 12mo. &c.

RIVINUS (Augustus Quirinus), professor of medicine at Leipsic, died there 1722, aged 70. He wrote introductio in rem herbariam, folio, with plates—ordo plantarum quæ sunt flore irregulari monopetalo, tetrapetalo, pentapetalo, folio, with figures—censura medicamentorum officinal. 4to.—dissertationes medicæ, 4to. &c.

RIVOLO, a town of Italy, in the Veronese, on the lake Garda, 16 miles N.W. of Verona.

RI'VULET. *s.* (*rivulus*, Latin.) A small river; a brook; a streamlet (*Bentley*).

RIXDO'LLAR. *s.* A German coin, worth about four shillings and sixpence sterling.

RIZZIO (David), or RIZZI, an Italian musician, born at Turin. He came in the retinue of the Piedmontese ambassador to Scotland, and as he was a good singer, Mary placed him near her person, and made him her secretary for foreign languages. His influence, as well as his religion, proved offensive to the nobles, especially Darnley, her husband, who headed a conspiracy against him, and dispatched him with 56 wounds in the queen's presence, 1566. It is said that Rizzio refined the Scotch airs, and infused into them that sweetness so much admired.

ROACH, in ichthyology, a species of CYPRINUS, which see.

The fishes of this species are more to be esteemed which are found in rivers than those found in ponds, though the latter are much larger. It is a fish of no great reputation for his dainty taste, and his spawn is accounted much better than any other part of him: as the carp is accounted the water-fox for his cunning, so the roach is accounted the water-sheep, for his simplicity or foolishness. The roach and dace recover strength, and grow in season a fortnight after spawning; the barbel and chub in a month, the trout in four months, and the salmon in the like time, if he get into the sea, and afterwards into fresh water.

The season for fishing for roach, in the Thames, begins about the latter end of August, and continues much longer than it is either pleasant or safe to fish. It requires some skill to hit the time of taking them exactly; for all the summer long they live on the weed, which they do not forsake for the deeps till it becomes putrid; and that is sooner or later, according as the season is wet or dry: whence the fishermen who live in all the towns along the river, from Chiswick to Stains, are about the time of the rotting of the weeds nightly upon the watch, as soon as the roach come out to sweep them away with a drag-net; while the poor patient angler is perhaps left baiting the ground, and adjusting his tackle, to catch those very fish which, perhaps, the night before had been carried to Billingsgate.

There is a kind of bastard small roach, that breeds in ponds, with a very forked tail, and of a very small size; which some say is a mule, bred by the bream and right roach. Some ponds are stored with these beyond belief; and the curious, who know their difference, call them ruds. They differ from the true roach, as much as a herring from a pilchard; and this bastard breed of roach is now scattered in many rivers, but not in the Thames, which affords the largest and fattest in this nation.

The roach is a leather-mouthed fish, and has a kind of saw-like teeth in his throat.

In April, the caddy, or worms, are proper baits for him; in summer, angle for him with small white snails, or flies; but they must be under water, for he will not bite at the top: or you may take a May fly, and with a plumb sink it where you imagine roaches lie, whether in deep water, or near the posts and piles of a bridge or wear. Having so done, do not hastily, but gently pull up your fly; and if there be a roach there, you will see him pursue and take it near the surface of the water.

In autumn you may angle for him with paste only, made of crumbs of fine white bread, moulded with a little water in your hands, till it becomes tough paste; and colour it, but not very deep, with red lead; with which you may mix a little fine cotton, or lint, and a little butter. These last are to connect the paste, so that it do not wash off your hook; with which you must fish with much circumspection, lest you lose your bait. In winter you may also fish for roach with paste; yet gentles are then a better bait.

There is excellent bait experienced to be very good, either for winter or summer, viz. Take a handful of well-dried malt, and put it into a dish of water; and having grubbed it and washed it between your hands till it be clean and free from husks, pour that water from it, and put in a little fresh water; set it over a gentle fire, and let it boil till pretty soft; then pour the water from it, and with a sharp knife turning the sprout end of the corn upward, take off the back part of the husk with the point of your knife, leaving a kind of inward husk on the corn, otherwise you spoil all: then cut off a little of the sprout end, that the white may appear, and also a very little of the other end, for the hook to enter.

When you make use of this bait, occasionally cast a little of it into the water; and if your hook be small and good, you will find it an excellent bait either for roach or dace.

The way of fishing for roach at London Bridge, is as follows. In the months of June and July, a great multitude of roach resort there, where those that make a trade of it take a strong cord, at the end of which is fastened a three pound weight, and a foot above the lead is fixed a packthread of twelve feet long to the cord; and to the packthread, at convenient distances, a dozen strong links of hair, with roach-hooks at the end, baited with a white snail, or perriwinkle. While the fishermen hold the cord in their hands, the biting of the fish draws the packthread, and the packthread the cord, which is a signal to pull up; on doing which they sometimes pull up half a dozen, but seldom less than two or three at a draught.

ROAD, an open way, or public passage, forming a communication between one place and another. Of all the people in the world the Romans took the most pains in forming roads; and the labour and expenses they were at in rendering them spacious, firm, straight, and smooth, are incredible. They usually strengthened the ground by ramming it, laying it with flints, pebbles, or sands, and sometimes with a lining of masonry, rubbish, bricks, &c. bound together with mortar. In some places in the Lionois, F. Menestrier observes that he has found huge clusters of flints cemented with lime, reaching 10 or 12 feet deep, and making a mass as hard and compact as marble; and which, after resisting the injuries of time for 1600 years, is still scarce penetrable by all the force of hammers, mattocks, &c. and yet the flints it consists of are not bigger than eggs. The most noble of the Roman roads was the Via Appia, which was carried to such a vast length, that Procopius reckons it five days journey to the end of it, and Leipsius computes it at 350 miles: it is 12 feet broad, and made of square free stone, generally a foot and a half on each side; and though this has lasted for above 1800 years, yet in many places it is for several miles together as entire as when it was first made.

The ancient roads are distinguished into military roads, double roads, subterraneous roads, &c. The military roads were grand roads, formed by the Romans for marching their armies into the provinces of the empire; the principal of these Roman roads in England are Watling-street, Ikenild-street, Foss-way, and Erminage-street. Double roads among the

Romans were roads for carriages, with two pavements, the one for those going one way, and the other for those returning the other: these were separated from each other by a causeway raised in the middle, paved with bricks, for the conveniency of foot passengers; with borders and mounting stones from space to space, and military columns to mark the distance. Subterraneous roads are those dug through a rock, and left vaulted; as that of Puzzuoli near Naples, which is near half a league long, and is 15 feet broad, and as many high.

The first law enacted respecting highways and roads in England was in the year 1285; when the lords of the soil were enjoined to enlarge those ways where bushes, woods, or ditches be, in order to prevent robberies. The next law was made by Edward III. in the year 1346, when a commission was granted by the king to lay a toll on all sorts of carriages passing from the hospital of St. Giles in the fields to the bar of the old Temple, and also through another highway called Portpool (now Gray's Inn Lane) joined to the before-mentioned highway; which roads were become almost impassable.

ROAD (Rail). See RAILROAD.

ROAD, in navigation, a bay, or place of anchorage, at some distance from the shore, whither ships or vessels occasionally repair to receive intelligence, orders, or necessary supplies; or to wait for a fair wind, &c. The excellence of a road consists chiefly in its being protected from the reigning winds and the swell of the sea; in having a good anchoring ground, and being at a competent distance from the shore. Those which are not sufficiently inclosed are termed *open roads*.

ROAD, signifies also, 1. Inroad; incursion (*Knolles*). 2. Journey (*Milton*). 3. The act, or state of travelling (*Law*).

To ROAM. *v. n.* (*romigare*, Italian.) To wander without any certain purpose; to ramble; to rove; to play the vagrant (*Prior*).

To ROAM. *v. a.* To range; to wander over (*Milton*).

ROA'MER. *s.* (from *roam.*) A rover; a rambler; a wanderer; a vagrant.

ROAN. A designation of colour applied to a horse when his coat seems to be formed of a combination of sorrel and white hairs in nearly an equal proportion. Horses of this description are, in general, of no great attraction, although they may prove equal in execution with others of every colour: the general opinion, however, is, that they are weaker in constitution, less likely to work, and more subject to disease.

ROAN TREE. See CORBUS.

ROANNE, a town of France, in the department of Loire, seated on the Loire, where it begins to be navigable for barks. Hence the merchandise of Lyon is conveyed to Paris, Orleans, Nantes, &c. Roanne is 45 miles W.N.W. of Lyon, and 210 S.S.E. of Paris. Lon. 3. 58 E. Lat. 46. 4 N.

ROANOKE, an island of N. Carolina, on the S. side of Albemarle sound. It is famous for being the place where sir Walter Raleigh made the first British settlement in N. America.

ROANOKE, a river of the United States, formed by the junction of the Staunton and Dan, in the S. part of Virginia. It is subject to inundations, and, on account of the falls, is navigable for shallops only, about 60 or 70 miles. It enters, by several mouths, into the S.W. part of Albemarle sound.

To ROAR. *v. n.* (ռαραn, Saxon.) 1. To cry as a lion or other wild beast (*Shakspeare*). 2. To cry in distress (*Dryden*). 3. To sound as the wind or sea (*Pope*). 4. To make a loud noise (*Milton*).

ROAR. *s.* (from the verb.) 1. The cry of the lion or other beast (*Thomson*). 2. An outcry of distress. 3. A clamour of merriment (*Sh.*). 4. The sound of the wind or sea (*Philips*). 5. Any loud noise (*Dryden*).

ROA'RER. *s.* (from *roar.*) A noisy brutal man (*Howel*).

ROA'RY. *a.* (better *rory*, *rores*, Lat.) Dewy.

To ROAST. *v. a.* (*rosten*, Germ. ȝeռoɼꝛoȝ, Saxon, roasted.) 1. To dress meat, by turning it round before the fire (*Swift*). 2. To impart dry heat to flesh (*Swift*). 3. To dress at the fire without water (*Bacon*). 4. To heat any thing violently (*Shakspeare*).

ROAST, for *roasted* (*Swift*).

To rule the ROAST. To govern; to manage; to preside (*Shakspeare*).

ROASTING. A chemical process, generally performed in crucibles, by which mineral substances are divided, some of their principles being volatilized and others changed, so as to prepare them for other operations.

ROB. (from *robe*, dense, Arab.) An old term in pharmacy for an inspissated juice.

To ROB. *v. a.* (*rober*, old Fr. *robbare*, Ital.) 1. To deprive of any thing by unlawful force, or by secret theft; to plunder (*Addison*). 2. To set free; to deprive of something bad. Ironical (*Shakspeare*). 3. To take away unlawfully (*Bacon*).

ROBBEN ISLAND, sometimes called Penguin Island, a barren sandy island, near the Cape of Good Hope, at the entrance into False bay. Lon. 18. 22 E. Lat. 33. 50 S.

RO'BBER. *s.* (from *rob.*) One that plunders by force, or steals by secret means; a plunderer; a thief (*Shakspeare*).

ROBBERY, is a felonious taking away of another man's goods from his person, or presence, against his will, putting him in fear, on purpose to steal the same. The value is immaterial.

If a man force another to part with his property, for the sake of preserving his character from the imputation of having been guilty of an unnatural crime, it will amount to a robbery, even though the party was under no apprehension of personal danger. If any thing is snatched suddenly from the head, hand, or person of any one, without any struggle on the part of the owner, or without any evidence of force, or violence being exerted by the thief,

it does not amount to robbery. But if any thing be broken or torn in consequence of the sudden seizure, it would be evidence of such force as would constitute a robbery: as where a part of a lady's hair was torn away by snatching a diamond pin from her head, and an ear was torn by pulling off an ear-ring; each of these cases was determined to be a robbery.

The hundred in which a robbery on the highway is committed, is liable to pay the damage when it is committed between the rising and setting of the sun, in any day, except Sunday, in case the robbers are not taken in forty days; hue and cry being made after the robber. And he who apprehends and prosecutes a robber on the highway, so as to convict him, is entitled to receive of the sheriff of the county where the robbery was committed the sum of forty pounds, with the horse, furniture, arms, &c. upon such person's producing a proper certificate from the judge before whom the robber was convicted.

ROBE *s.* (*robbe*, Fr. *robba*, Ital.) A gown of state; a dress of dignity (*Shakspeare*).

To ROBE. *v. a.* (from the noun.) To dress pompously; to invest (*Pope*).

ROBERGIA, in botany, a genus of the class decandria, order pentagynia. Calyx five-parted; petals five; drupe with a one-seeded nut, and a two-valved shell. One species; a Guiana shrub, with alternate, pinnate leaves, and corymbed panicle.

ROBERT DE COURTENAY, French emperor of the East after his father Peter, 1218, was a weak prince, under whom the empires of Trebizond and Thessalonica were established. He died of grief 1228, because his wife had been mutilated by a gentleman of Burgundy to whom she had been formerly betrothed.

ROBERT, elector palatine, was emperor, 1400. He alienated the German princes from his government by his attachment to the antipope Gregory XII. and died 1410, aged 58.

ROBERT, king of France, surnamed the Wise or the Devout, succeeded his father Hugh Capet, 996. He married Bertha of Burgundy: but as she was his cousin, this union was annulled by Gregory V. and the monarch afterwards took for his second wife Constance of Arles and Provence. He refused the crown of the empire and of Italy, better satisfied to reign over his native dominions. He died 1031, aged 60.

ROBERT the Magnificent, duke of Normandy, succeeded his brother Richard 1028. In 1035 he undertook a pilgrimage to the Holy Land, and on his return was poisoned in Bithynia. He was succeeded by his natural son William, better known as the Conqueror.

ROBERT, Short Shanks, was son of William the Conqueror, and obtained the dukedom of Normandy. He was in the holy wars, but on his return he found himself stripped of the throne of England, and afterwards he lost Normandy, and being made prisoner by his brother Henry, remained in cruel captivity till his death in 1134.

ROBERT BRUCE, a Scotch nobleman, who disputed the crown with John Baliol. The influence of Edward I. of England, prevailed in favour of his rival; but after his deposition, he escaped from retirement, and was unanimously elected king. He defeated the English at the famous battle of Bannockburn, 1314. Peace was afterwards re-established, and Robert advanced the happiness and the prosperity of his subjects. He died 1329, and desired that his heart might be buried in the holy sepulchre of Jerusalem. He was succeeded by David II.

ROBERT (Nicholas), of Langres, was eminent as a painter. His birds and plants, painted chiefly on vellum, were deservedly admired. He died 1684, aged 74.

ROBERT DE VAUGONDY (N.), a French geographer of Paris. His atlas, in 108 maps, is well known. He wrote abridgement of the different systems of the world—introduction to geography, &c. and died at Paris 1766, aged 78.

ROBERT (Herb). See GERANIUM.

ROBERTSON (Dr. William), was born at Dublin in 1705, but took the degree of M. A. in the university of Glasgow, from whence he returned to Ireland, and entering into orders, he obtained some considerable livings, which he quitted on embracing the Arian doctrines in 1764, and in 1766 he published his apology to his friends for what he had done, and soon after left Ireland. He presented one of his books to his *alma mater* the university of Glasgow, and received in return a degree of D. D. The company of merchant taylors being patrons of the grammar school at Wolverhampton, presented him with the mastership of it, and in that office he died in 1783.

ROBERTSON (William), a celebrated Scotch historian and divine, was born in 1721, and educated at the university of Edinburgh, where he proceeded to his degree of D. D. His greatest works are the history of Charles the Fifth, and the history of America, which are above all praise. He also wrote a history of Scotland, and an historical disquisition concerning India. Though his pulpit discourses were very masterly compositions, only one has been published. He was principal of the university of Edinburgh, historiographer for Scotland, one of his majesty's chaplains for that kingdom, and a minister of the Old Grey Friar's parish, Edinburgh. He died in 1793.

ROBERVAL (Giles-Personne), an eminent French mathematician, was born in 1602, at Roberval, a parish in the diocese of Beauvais. He was first professor of mathematics at the college of Maitre-Gervais, and afterwards at the college-royal. A similarity of taste connected him with Gassendi and Morin; the latter of whom he succeeded in the mathematical chair at the royal college, without quitting however that of Ramus.

Roberval made experiments on the Torricellian vacuum: he invented two new kinds of balance, one of which was proper for weighing air; and made many other curious experi-

ments. He was one of the first members of the ancient Academy of Sciences of 1666; but died in 1675, at 73 years of age. His principal works are,

I. A treatise of Mechanics. II. A work entitled Aristarchus Samos. He had several memoirs inserted in the volumes of the Academy of Sciences of 1666, viz. 1. Experiments concerning the Pressure of the Air. 2. Observations on the Composition of Motion, and on the Tangents of Curve Lines. 3. The Recognition of Equations. 4. The Geometrical Resolution of Plane and Cubic Equations. 5. Treatise on Indivisibles. 6. On the Trochoid, or Cycloid. 7. A Letter to Father Mersenne. 8. Two Letters from Torricelli. 9. A new kind of Balance.

ROBIN HOOD, a celebrated free-booter, who made Sherwood Forest, in Nottinghamshire, the grand haunt of himself and his associates in the reign of Richard I. He died in 1247.

Robin Hood Bay, a bay on the coast of Yorkshire, between Scarborough and Whitby, about one mile broad. Here is a village of fishermen, who supply the city of York, and the adjacent country, with all sorts of fish in their season. Lon. 0. 18 W. Lat. 54. 25 N.

Robin red-breast. See Motacilla.

ROBINIA, in botany, a genus of the class diadelphia, order decandria. Calyx four-cleft, the upper partition a little divided; legume gibbous, elongated. Twenty species; natives of Siberia or America. The following are cultivated.

1. R. pseud-acacia. False acacia. A spinous tree with pendulous white racemes, laburnum-like, with white flowers. It has several varieties.

2. R. hispida. Rose acacia, or robinia. Branchlets, peduncles, and calyxes bristly; flowers rosy.

3. R. caragana. Siberian abrupt-leaved robinia. Leaves abruptly pinnate in about four pairs; buds alternate, frequent, bearing both leaves and flowers.

4. R. frutescens. Shrubby robinia. Branches rodlike, pliant, loaded with leaves and flowers of a shining yellowish colour.

5. R. pygmæa. Dwarf robinia. A low shrub, seldom exceeding three feet; leaves in fours, sessile; flowers yellow.

6. R. spinosa. Thorny robinia. Stipules and petioles spinescent; the shrub about the height of a man: on account of its large stout thorns and the length and toughness of the branches, which, upon a trunk of not more than an inch and half in diameter, often extend to a fathom's length, this plant is admirably calculated to form impenetrable hedges, and is sufficiently hardy to bear our own climate.

7. R. violacea. Ash-leaved robinia. Tree upright, unarmed, twelve feet high; racemes axillary, half a foot long, with flowers of the smell and colour of violets.

8. R. mitis. Smooth Indian robinia. Shrubby, three feet high; racemes short, corols yellow.

The two last are the tenderest: all may be raised from seeds, cuttings, layers, and suckers; but the two last must have the seeds or cuttings in pots of light earth plunged into a hot-bed.

ROBINS (Benjamin), an English mathematician and philosopher of great genius and eminence, was born at Bath in Somersetshire, 1707. His parents were of low condition, and Quakers; and consequently neither able from their circumstances, nor willing from their religious profession, to have him much instructed in that kind of learning which they are taught to despise as human. Nevertheless, he made an early and surprising progress in various branches of science and literature, particularly in the mathematics; and his friends being desirous that he might continue his pursuits, and that his merit might not be buried in obscurity, wished that he could be properly recommended to teach that science in London. Accordingly, a specimen of his abilities, in this way, was sent up thither, and shown to Dr. Pemberton, the author of the View of sir Isaac Newton's Philosophy; who thence, conceiving a good opinion of the writer, for a further trial of his skill, sent him some problems, which Robins resolved very much to his satisfaction. He then came to London, where he confirmed the opinion which had been preconceived of his abilities and knowledge.

But though Robins was possessed of much more skill than is usually required in a common teacher; yet being very young, it was thought proper that he should employ some time in perusing the best writers, upon the sublimer parts of the mathematics, before he should undertake publicly the instruction of others. In this interval, besides improving himself in the modern languages, he had opportunities of reading, in particular, the works of Archimedes, Apollonius, Fermat, Huygens, De Witt, Slusius, Gregory, Barrow, Newton, Taylor, and Cotes. These authors he readily understood without any assistance, of which he gave frequent proofs to his friends: one was, a demonstration of the last proposition of Newton's Treatise on Quadratures, which was thought not undeserving a place in the Philos. Trans. for 1727.

Not long after an opportunity offered him of exhibiting to the public a specimen also of his knowledge in natural philosophy. The Royal Academy of Sciences at Paris had proposed, among their prize questions in 1724 and 1726, to demonstrate the laws of motion in bodies impinging on one another. John Bernoulli here condescended to be a candidate; and as his dissertation lost the reward, he appealed to the learned world by printing it in 1727. In this piece he endeavoured to establish Leibnitz's opinion of the force of bodies in motion from the effects of their striking against springy materials; as Poleni had before attempted to evince the same thing from experiments of bodies falling on soft and yielding

substances. But as the insufficiency of Poleni's arguments had been demonstrated in the Philos. Trans. for 1722; so Robins published in the Present State of the Republic of Letters, for May 1728, a Confutation of Bernoulli's performance, which was allowed to be unanswerable.

Robins now began to take scholars. About this time he quitted the dress and profession of a quaker; and, probably, without reflecting very much upon the subject of religion, he soon shook off the prejudices of his early habits. But though he professed to teach the mathematics only, he would frequently assist particular friends in other matters; for he was a man of universal knowledge; and the confinement of this way of life not suiting his disposition, which was active, he gradually declined it, and went into other courses that required more exercise. Hence he tried many laborious experiments in gunnery; believing that the resistance of the air had a much greater effect on swift projectiles, than was generally supposed. And hence he was led to consider those mechanic arts that depend upon mathematical principles, in which he might employ his invention; as the constructing of mills, the building of bridges, draining of fens, rendering of rivers navigable, and making of harbours. Among other arts of this kind, fortification very much engaged his attention; in which he met with opportunities of perfecting himself, by a view of the principal strong places of Flanders, in some journeys he made abroad with persons of distinction.

On his return home from one of these excursions, he found the learned here amused with Dr. Berkeley's treatise, printed in 1734, entitled The Analyst, in which an examination was made into the grounds of the doctrine of fluxions, and occasion thence taken to explode that method. Robins was, therefore, advised to clear up this affair, by giving a full and distinct account of Newton's doctrines, in such a manner as to obviate all the objections, without naming them which had been advanced by Berkeley, and accordingly he published, in 1735, a Discourse concerning the Nature and Certainty of Sir Isaac Newton's Method of Fluxions, and of Prime and Ultimate Ratios. This is a very clear, neat, and elegant performance; nevertheless some persons, even among those who had written against the Analyst, taking exception at Robins's manner of defending Newton's doctrine, he afterwards wrote two or three additional discourses.

In 1738, he defended Newton against an objection, contained in a note at the end of a Latin piece, called Matho sive Cosmotheoria puerilis, written by Baxter, author of the Inquiry into the Nature of the Human Soul: and the year after he printed Remarks on Euler's Treatise of Motion, on Smith's System of Optics, and on Jurin's Discourse of Distinct and Indistinct Vision, annexed to Dr. Smith's work.

In the mean time Robins's performances were not confined to mathematical subjects; for, in 1739, there came out three pamphlets upon political affairs, which did him great honour. The first was entitled, Observations on the present Convention with Spain; the second, A Narrative of what passed in the Common-Hall of the Citizens of London, assembled for the Election of a Lord Mayor; the third, An Address to the Electors and other Free Subjects of Great Britain, occasioned by the late Succession; in which is contained a particular Account of all our Negociations with Spain, and their Treatment of us for above ten Years past. These were all published without our author's name; and the first and last were so universally esteemed, that they were generally reputed to have been the production of the great man himself, who was at the head of the opposition to sir Robert Walpole. They proved of such consequence to Mr. Robins, as to occasion his being employed in a very honourable post; for, the patriots at length gained ground against sir Robert, and a committee of the house of commons being appointed to examine into his past conduct, Robins was chosen their secretary. But after the committee had presented two reports of their proceedings, a sudden stop was put to their further progress, by a compromise between the contending parties.

In 1742, being again at leisure, he published a small treatise, entitled New Principles of Gunnery; containing the result of many experiments he had made, by which are discovered the force of gunpowder, and the difference in the resisting power of the air to swift and slow motions. To this treatise was prefixed a full and learned account of the progress which modern fortification had made from its first rise; as also of the invention of gunpowder, and of what had already been performed in the theory of gunnery. It seems that the occasion of this publication was the disappointment of a situation at the Royal Military Academy at Woolwich. On the new modelling and establishing of that academy, in 1741, our author and the late Mr. Muller were competitors for the place of professor of fortification and gunnery. Mr. Muller held then some post in the Tower of London, under the Board of Ordnance, so that, notwithstanding the great knowledge and abilities of our author, the interest which Mr. Muller had with the Board of Ordnance carried the election in his favour. Upon this disappointment Mr. Robins, indignant at the affront, determined to show them, and the world, by his military publications, what sort of a man he was whom they had rejected.

Upon a discourse containing certain experiments being published in the Philos. Trans. with a view to invalidate some of Robins's opinions, he thought proper, in an account he gave of his book in the same Transactions, to take notice of those experiments: and in consequence of this, several dissertations of his on the resistance of the air were read, and the experiments exhibited before the Royal Society, in 1746 and 1747; for which he was presented with the annual gold medal by that society.

In 1748, came out Anson's Voyage round the World; which, though it bears Walter's name in the title-page, was, in reality, written by Robins. Of this voyage the public had for some time been in expectation of seeing an account, composed under that commander's own inspection: for which purpose the reverend Richard Walter was employed, as having been chaplain on board the Centurion, the greatest part of the expedition. Walter had accordingly almost finished his task, having brought it down to his own departure from Macao for England; when he proposed to print his work by subscription. It was thought proper, however, that an able judge should first review and correct it, and Robins was appointed; when, upon examination, it was resolved that the whole should be written entirely by Robins, and that what Walter had done being mostly taken, verbatim, from the journals, should serve as materials only. Hence it was that the whole of the introduction, and many dissertations in the body of the work, were composed by Robins, without receiving the least hint from Walter's manuscripts; and what he had transcribed from it regarded chiefly the wind and weather, the currents, courses, bearings, distances, offings, soundings, moorings, the qualities of the ground they anchored on, and such particulars as usually fill up a seamen's account. No production of this kind ever met with a more favourable reception, four large impressions having been sold off within a year: it was also translated into most of the European languages; and it still supports its reputation, having been repeatedly reprinted in various sizes. The fifth edition, at London, in 1749, was revised and corrected by Robins himself; and the ninth edition was printed there in 1761.

Thus becoming famous for his talents in elegant writing, he was requested to compose an apology for the unfortunate affair at Preston-Pans in Scotland. This was added as a preface to the report of the proceedings and opinion of the board of general officers on their examination into the conduct of lieutenant-general sir John Cope, &c. printed at London in 1749; and this preface was esteemed a master-piece in its kind.

Robins had afterwards, by the favour of lord Anson, opportunities of making farther experiments in gunnery; which have been published since his death, in the edition of his works by his friend Dr. Wilson. He also not a little contributed to the improvements made in the Royal Observatory at Greenwich, by procuring for it, through the interest of the same noble person, a second mural quadrant, and other instruments; by which it became perhaps the completest of any observatory in the world.

His reputation being now arrived at its full height, he was offered the choice of two very considerable employments. The first was to go to Paris, as one of the commissaries for adjusting the limits in Acadia; the other, to be engineer-general to the East India Company, whose forts, being in a most ruinous condition, wanted an able person to put them into a proper state of defence. He accepted the latter, as it was suitable to his genius, and as the company's terms were both advantageous and honourable. He designed, if he had remained in England, to have written a second part of the Voyage round the World; as appears by a letter from lord Anson to him, dated Bath, Oct. 22, 1749, as follows.

"Dear Sir, when I last saw you in town, I forgot to ask you, whether you intended to publish the second volume of my voyage before you leave us; which I confess I am very sorry for. If you should have laid aside all thoughts of favouring the world with more of your works, it will be much disappointed, and no one in it more than your very obliged humble servant, "ANSON."

Robins was also preparing an enlarged edition of his New Principles of Gunnery: but, having provided himself with a complete set of astronomical and other instruments, for making observations and experiments in the Indies, he departed hence at Christmas in 1749; and after a voyage, in which the ship was near being cast away, he arrived at India in July following. There he immediately set about his proper business with the greatest diligence, and formed complete plans for Fort St. David and Madras: but he did not live to put them into execution. For the great difference of the climate from that of England being beyond his constitution to support, he was attacked by a fever in September the same year; and though he recovered out of this, yet about eight months after he fell into a languishing condition, in which he continued till his death, which happened the 29th of July 1751, at only 44 years of age.

It is but justice to say, that Mr. Robins was one of the most accurate and elegant mathematical writers that our language can boast of; and that he made more real improvements in artillery, the flight and the resistance of projectiles, than all the preceding writers on that subject. His New Principles of Gunnery were translated into several other languages, and commented upon by several eminent writers. The celebrated Euler translated the work into the German language, accompanied with a large and critical commentary; and this work of Euler's was again translated into English in 1714, by Mr. Hugh Brown, with notes, in one volume 4to. A new edition of Robins's original work has been recently published, with a few brief but valuable notes, by Dr. Hutton.

ROBINSON (Robert), a writer of considerable celebrity among the English baptists, was born at Swaffham, in Norfolk, about 1735, and educated at the grammar-school of his native town. His parents being poor, he was put apprentice to a hairdresser; but after reaching years of maturity, having been much impressed by the preaching of the Calvinistic or Whitfieldean methodists, he relinquished his business to become a preacher amongst them. After a few years he adopted the sentiments of

the baptists, with respect to the proper subjects of baptism as well as the proper mode of administering that ordnance, and from that time united himself with persons of that persuasion. He was soon invited to become pastor of the church and congregation of baptists, at Cambridge; and being a man of very fascinating manners as well as of considerable talents, he formed intimacies with many of the most eminent men in the university both among the clergy and laity. In consequence of this, he was indulged with the free and almost unlimited use of books from the public library there, as well as from several of the college libraries; a circumstance which was of great importance to him, both in the way of storing his own mind, and of laying in a stock of information to be employed in his several historical and polemical works.

One of the most celebrated of his productions is his Plea for the Divinity of Jesus Christ, first published in the year 1776; and which is doubtless one of the most able defences of that important article of the Christian faith which was ever printed. His biographer, Mr. Dyer, however, affirms, that before he published this Plea, he began to entertain considerable doubts upon the subject; and it is certain that in a few years he sunk into Arianism, afterwards there is reason to believe into Socinianism; and, a short time before he died, he declared to Dr. Priestley, that his arguments alone preserved him from infidelity!

Possessing remarkable extemporaneous talents as a preacher, he was extremely popular; and there is reason to fear he would have led many of his numerous admirers to adopt his erroneous notions, had his life continued long after this change of sentiments. But, conformably to the wish he had often expressed, he died suddenly. He died in the summer of 1790, at Birmingham; being found dead in his bed, after having preached for Dr. Priestley.

Mr. Robinson was a man of extensive powers, and of some genius, as well as of indefatigable industry. But his productions are in general indicative of some peculiar bias. Besides the work abovementioned, he published several others, viz. A translation of Claude's Essay on the Composition of a Sermon, in 2 vols. 8vo. with an immense assemblage of notes, most of them very ludicrous ones, to illustrate the excellencies and defects in pulpit compositions. A History of Baptism, and Ecclesiastical Researches, both in 4to. These are elaborate works, but evidently marked with the author's strong and prevailing bias against orthodoxy and establishments. A Syllabus of a Course of Lectures on Nonconformity, and the History and Mystery of Good Friday; the latter of these is a very humorous essay, but marked, as usual, with the author's peculiarities. The Political Catechism, Dissenting Minister's Companion, and various single sermons. He also translated several of Saurin's sermons, and published them in 4 octavo vols. with very ingenious and able prefaces in defence of liberty of conscience, &c. in some of which, however, he has pushed his principles farther than many pious men among the dissenters would wish to see them carried. There is likewise an interesting volume under the title of Village Sermons and Morning Exercises, some of which are exquisitely beautiful in point of composition; but approaching to nothing like precision and clearness of doctrinal sentiment.

Very amusing Memoirs of Mr. Robinson were published by Mr. Dyer, in 1 vol. 8vo. and an abridgment of these, by Mr. B. Flower of Harlow, as an introduction to an edition of Robinson's Miscellaneous Works, in 4 vols. 8vo.

We cannot describe the nature and extent of Mr. Robinson's powers more correctly than by saying, he had the same kind of versatility, of acuteness, and of playfulness as Voltaire, and often the same habit of writing between jest and earnest, so that his real meaning should not be readily seen. Had Voltaire been a baptist minister, he would have been talked of as much as Mr. Robinson, but no more. Had Mr. Robinson been an infidel, and not lost any of his activity, he would have been as highly celebrated throughout the world as Voltaire. Had both of them been clergymen, and actuated solely by a desire to do good, and not at all by a wish to startle, to puzzle, or to dazzle, we are not sure that either would have been often mentioned, except by their surviving personal friends, 20 years after their death.

ROBINSON CRUSOE'S BOAT, in botany, a species of CACTUS, which see.

ROBINSONIA, in botany, a genus of the class icosandria, order monogynia. Calyx five-toothed; petals five; berry striate, two-celled; the cells one-seeded; seeds villous. One species; a Guiana tree with alternate, unevenly pinnate leaves; leaflets lanceolate, pointed, serrate; flowers minute, yellow, in a terminal panicle; berry the size of a cherry, eatable, and of a very grateful acid taste.

ROBISON (John), LL.D. an eminent philosopher, was born in Scotland, about 1733. After having received a liberal education in his native country, he went to Russia, where he was appointed director of the marine cadet academy at Cronstadt, an appointment which he held for several years. On his return to Scotland he was appointed professor of chemistry in the university of Glasgow, and shortly after he was invited to fill the chair of natural philosophy professor at Edinburgh. This latter situation he filled with great honour to himself and great benefit to the students of that university, till his death, which happened early in the year 1805.

Although Dr. Robison laboured under a most distressing and painful disorder during the last eighteen years of his life, still his mind was always active, and generally directed to the most beneficial purposes. He is well known as the author of most of the mathematical and philosophical articles in the third edition of the Encyclopædia Britannica, and

the supplement to that valuable work. Those articles are of established character, and, although several of them are written in a very desultory manner, yet they are rich in important remarks and useful information. They appear to have been the substance of his lectures delivered in the college; and some of them were afterwards thrown into an improved form, and published under the title of Elements of Mechanical Philosophy, of which we believe only one large 8vo. vol. has yet been published. Dr. Robison also published in 1797, Proofs of a Conspiracy against all the Religions and Governments of Europe, carried on in the Secret Meetings of Free Masons, Illuminati, and Reading Societies; a work which made a great impression at the time of its first appearance, and rapidly passed through four or five editions. In 1803 he published a very valuable edition of Dr. Black's Lectures on the Elements of Chemistry, accompanied by much interesting disquisition and history, by the editor.

Altogether Dr. Robison may very justly be considered as one of the most eminent philosophers ever produced in Scotland. He was doubtless inferior to Gregory and Maclaurin; yet he had a very extensive acquaintance with chemistry and with pure and mixed mathematics; and he had a most happy talent at converting the knowledge he possessed to important practical purposes. We regret that, for want of more particulars, we have been compelled to offer so scanty a memoir of so eminent a man. But all who are able to appreciate his profound acquirements will revere the man, however little they know of his life: and, notwithstanding the deservedly high character of his successor, we do not wonder that some of the students at Edinburgh are still applying to Dr. Robison the language of Hamlet: "He was a man, take him for all in all we shall not look upon his like again."

ROBORANTS. (*medicamenta roborantia*, from *roboro*, to strengthen.) Strengthening medicines. See STIMULANTS.

ROBO'REUS. *a.* (*robur*, Lat.) Made of oak.

ROBU'ST. ROBU'STIOUS. *a.* (*robustus*, Lat.) 1. Strong; sinewy; vigorous; forceful (*Milton*). 2. Boisterous; violent; unwieldy (*Dryden*). 3. Requiring strength (*Locke*).

ROBU'STNESS. *s.* (from *robust.*) Strength; vigour (*Arbuthnot*).

ROCA (Cape), the most western extremity of Portugal, and of Europe. On its summit is a remarkable monastery, said to be 3000 feet above the sea; and on the E. of the mountain is a summer palace, of Moorish architecture. Here is also a small vineyard, that of Carcavella, yielding a peculiar grape; and the environs supply most of the fruits and greens used at Lisbon. This cape is called generally by the English sailors, the Rock of Lisbon. Lon. 9. 36 W. Lat. 38. 42 N.

ROCAMBOLE, in botany. See ALLIUM.

ROCCELLA. The principal use of this plant, lichen roccella of Linnæus, is as a blue dye. It has been employed medicinally with success in allaying the cough attendant on phthisis, and in hysterical coughs.

ROCHDALE, a town in Lancashire, with a market on Tuesday, and manufactures of bays, flannels, serges, and other woollen goods. It has two churches; and a canal from Manchester passes hence to the Calder navigation, near Halifax. It is seated on the river Roch, at the foot of the Yorkshire hills, 13 miles N. by E. of Manchester, and 198 N.N.W. of London.

ROCHE, or ROCHE EN ARDENNES, a town of the Netherlands, in the late duchy of Luxemburg, with a strong castle, seated on a rock, near the river Ourte, 22 miles S. of Liege, and 32 N.W. of Luxemburg.

ROCHE ALUM. See ALUMEN.

ROCHE POSAY, a town of France, in the department of Vienne. It has a mineral spring, and is seated on the Creuse, 32 miles E.N.E. of Poitiers.

ROCHE SUR YON, a town of France, in the department of Vendee, seated near the Yon, 20 miles N.W. of Lucon.

ROCHECHOUART, a town of France, in the department of Upper Vienne, with a castle on a mountain; seated near a rivulet that flows into the Vienne, 18 miles W. of Limoges.

ROCHEFORT, a town of the Netherlands, in the late duchy of Luxemburg, with a castle, said to have been built by the Romans. It it situate on the Somme, surrounded by rocks, 50 miles N.W. of Luxemburg. Lon. 5. 10 E. Lat. 50. 12 N.

ROCHEFORT, a seaport of France, in the department of Lower Charente, with a commodious harbour, one of the most famous in France. It stands on the Charente, 15 miles from its mouth, which is defended by several forts. The streets are broad and straight; the houses low, but regular; and it is supposed to contain 10,000 inhabitants. It has a magnificent hospital, spacious barracks, the finest hall of arms in France, a noble arsenal, a ropeyard, a foundry for cannon, and all the other magazines necessary for the construction and equipment of ships of war. It is 18 miles S.S.E. of Rochelle, and 127 S.W. of Paris. Lon. 0. 54 W. Lat. 46. 3 N.

ROCHEFORT, a town of France, in the department of Morbihan, 17 miles E. of Vannes, and 40 S.W. of Rennes. Lon. 2. 26 W. Lat. 47. 42 N.

ROCHEFORTIA, in botany, a genus of the class pentandria, order digynia. Calyx five-parted; corol funnel-form, with the throat open; fruit two-celled, many-seeded. Two species; shrubs of Jamaica.

ROCHEFOUCAULT, a town of France, in the department of Charente, with a castle. It is seated on the Tardouere, 12 miles N.W. of Angoulême, and 208 S. by W. of Paris. Lon. 0. 29 E. Lat. 45. 46 N.

ROCHEFOUCAULT (Francis duke of), an eminent French genius, born in 1613. He wrote a collection of Maxims, which Voltaire

says, "contributed more than any performance to form the taste of the French nation, and give it a true relish of propriety and correctness." He wrote also Memoirs of the Regency of Anne of Austria. He died in 1680.

ROCHELLE, a fortified town of France, in the department of Lower Charente, with a commodious and safe harbour. It was lately a bishop's see, contains 16,000 inhabitants, and has five gates. The houses are supported by piazzas, under which persons may walk in all weathers. Lewis XIII. took this place from the Huguenots, in 1628, after a siege of 13 months, during which the inhabitants suffered all the horrors of famine, only 4000, out of 15,000, surviving the siege. To prevent the English throwing in succours by sea, cardinal Richelieu constructed a prodigious mole, 4482 feet in extent. The inhabitants carry on a considerable trade, especially in wines, brandy, sugar, salt, paper, linen, and serges. Rochelle is seated on the bay of Biscay, 67 miles N. by E. of Nantes, and 220 S.W. of Paris. Lon. 1. 4 W. Lat. 46. 9 N.

ROCHELLE SALT. See TARTRIS SODÆ.

ROCHESTER, a city in Kent, with a market on Wednesday and Friday. It is governed by a mayor, sends two members to parliament, and was formerly much larger than at present. Its castle, now in ruins, once rendered it of great importance; and here also are some remains of a priory. Rochester is a bishop's see, and has, besides the cathedral, three parish churches. The inhabitants are chiefly tradesmen and innkeepers; no sort of manufacture being carried on here. It has two freeschools, one called the king's and the other the city school. Here is also an almshouse for six poor travellers, who are supplied with a supper, a bed, and a breakfast, with fourpence to carry them forward on their journey; but they are to stay no longer than one night; and an inscription over the door intimates, that rogues and proctors are excepted. The corporation has jurisdiction over the great oyster-fishery in the several creeks of the Medway. Rochester is parted from Stroud on the W. by its bridge, and it is contiguous to Chatham on the E. It is seated on the Medway, 27 miles N.W. of Canterbury, and 30 S.E. of London. Lon. 0. 36 E. Lat. 51. 23 N. See BRIDGE.

ROCHESTER, a village in Northumberland, on the Watling-street, N.W. of Otterbrun, and near the source of the Read. It has some Roman altars, inscriptions, and other antiquities.

ROCHESTER (Earl of). See WILMOT.

RO'CHET. *s.* (*rochet*, Fr.) 1. A surplice; the white upper garment of the priest officiating (*Cleaveland*). 2. (*rubellio*, Lat.) A fish (*Ainsworth*).

ROCHFORD, a town in Essex, with a market on Thursday, 16 miles S.E. of Chelmsford, and 40 E. by N. of London. Lon. 0. 41 E. Lat. 51. 36 N.

ROCK. *s.* (*roc*, *roche*, Fr. *rocca*, Ital.) 1. A vast mass of stone (*Pope*). 2. Protection; defence. A scriptural sense. 3. (*rock*, Dan.) A distaff held in the hand, from which the wool was spun by twirling a ball below (*Ben Jonson*).

To ROCK. *v. a.* (*rocquer*, Fr.) 1. To shake; to move backward and forward (*Boyle*). 2. To move the cradle in order to procure sleep (*Dryden*). 3. To lull; to quiet (*Shakspeare*).

To ROCK. *v. n.* To be violently agitated; to reel to and fro (*Young*).

ROCK, a stony mass, consisting either of one or more materials, forming a portion of the solid surface of the globe.

The study of the general nature and composition of rocks constitutes that branch of mineralogy which, under M. Werner's system, is denominated *oryctology*, and which contemplates them under the five following distinct classes:

1. Primitive, or those which lie lowest and form the bases of all the rest; which are altogether chemical or crystallized compositions, and evince not the smallest portion of carbonaceous matter, or animal or vegetable relics. M. Werner supposes these to have been produced or consolidated first when the earth issued from a state of chaos, and hence their classific name.

2. Transition rocks; consisting of those that, excepting when the general order is broken in upon, lie immediately over the primitive rocks; and evince proofs of animal and vegetable relics though of the lowest kinds, and, of these kinds, limited to species at present not known to be extant. M. Werner hence supposes this class to have been produced next, in the order of creation, to the preceding, and at a time when the rude face of the earth was passing from an inorganic to an organic state, and from an uninhabited to an inhabitable condition; and it is on this account he has denominated them *transition rocks*.

3. Floetz, or horizontal rocks; supposed to be of still later origin than the preceding; evincing larger examples of animal and vegetable remains, and great abundance of carbonaceous matter. The classific name is taken from the flatter and more stratified appearance which these rocks evince; and they comprise those which, from their containing such frequent proofs of animal and vegetable or secondary matters, have been called by many writers *secondary rocks*.

4. Alluvial rocks. These constitute by far the greatest portion of the actual surface of the earth; and have been washed down by rains and other causes from the older and loftier mountains, and consequently consist of a great multiplicity of materials combined together, as sand, gravel, loam, &c.

5. Volcanic rocks, the name for which sufficiently explains its own meaning.

Let us take a brief view of them under this general division.

I. PRIMITIVE ROCKS.

The meaning of the classific term we have explained already. Werner has adopted it from Lehman, along with the outline of his system. The following is the arrangement of the class.

1. Granite,
2. Gneiss,
3. Micaceous shist,
4. Argillaceous shist,
5. Porphyry,
6. Sienite,
7. Serpentine,
8. Primitive limestone,
9. Primitive trap,
10. Quartz,
11. Topaz-rock,
12. Kieselchiefer, or flint slate.

Granite is composed essentially of felspar, quartz, and mica, crystallized and united to each other. It lies the lowest of all the rocks, and whenever from any particular cause it is left naked and is not covered by the rest, it rises highest and forms the substance of our loftiest chains of mountains. It contains few ores; those of gold and tin are sometimes found in it.

Gneiss is composed of the same elements as granite, but its particles are coarser, and form plates, which are laid on each other and separated by mica.

Micaceous shist consists of alternations of quartz and mica in distinct plates. The mica is usually most abundant. We meet with beds of other rocks in it, and also with most of the metals.

Argillaceous shist. This is chiefly slate; but often containing beds of quartz, felspar, shorl, hornblend, and pyrites. It usually covers micaceous shist. Ores are frequently found in it.

Porphyry. This term is applied to all rocks consisting of a compact ground in which distinct and separate crystals of some other substance are imbedded. M. Werner subdivides the porphyry rocks into the following species, each of which is denominated from its ground.

1. Hornstone porphyry. The hornstone is sometimes conchoidal, sometimes splintery, and of a red or green colour. The crystals are quartz and felspar.

2. Felspar porphyry. The ground is usually red. The crystals are felspar and quartz.

3. Sienite porphyry. The ground is a mixture of felspar and hornblende. The crystals are felspar and quartz.

4. Pitchstone porphyry. The ground is red or green, sometimes brown, and even black.

5. Clay porphyry. The ground is an indurated clay, commonly reddish, which sometimes passes into splintery hornstone. The crystals are felspar and quartz; sometimes it contains hornblende, and more rarely mica.

Porphyry mountains are not stratified, and contain no beds of foreign substances. They are not rich in ores, yet frequently contain veins worth working.

Sienite. This rock is composed essentially of crystals of felspar and hornblende, immediately and intimately united. The felspar usually predominates. When the felspar is compact, the rock assumes a porphyritic structure. It sometimes contains accidentally grains of quartz and mica, but in a very small proportion. Its texture is granular, rarely shistose. Seldom stratified. Does not contain foreign beds. It sometimes contains metallic veins. It usually covers porphyry.

Serpentine. This rock is essentially simple. Sometimes it contains accidentally talc, asbestus, and steatites; and sometimes mica, garnets, and granular limestone, magnetic ironstone, arsenical pyrites, &c. Serpentine rocks are not stratified. Seldom contain beds of foreign minerals. They contain few ores, and seldom any worth working.

Primitive limestone. This rock is essentially simple; its mass is granular limestone of a greyish white colour. Sometimes it is accidentally mixed with mica, quartz, hornblende, tremolite, actinote, asbestus, talc, &c. Its texture granular; the grains have a foliated texture, and a crystallized appearance. This rock sometimes contains metallic veins; chiefly of galena, magnetic ironstone, blende, and pyrites.

Primitive traps. The word trap is Swedish, and signifies a stair. It was applied by the Swedish mineralogists to certain rocks whose strata when exposed, the one jutting out under the other, gave an appearance somewhat like a stair. The term was adopted by other nations, and was applied indiscriminately to a great variety of rocks; which yet bore a certain resemblance to each other. This generalization, however, introduced much confusion into the subject, which was first cleared up by Werner and his disciples. Under the term traps Werner comprehends certain series of rocks, distinguished chiefly by the hornblende, which they all contain. In the most ancient, the hornblende is almost pure; this purity gradually diminishes, and in the most recent traps the hornblende degenerates to a kind of indurated clay. There are, then, three formations of traps; 1. Primitive traps; 2. Transition traps; 3. Secondary traps. The first only occupy our attention at present.

The primitive traps are composed almost entirely of hornblende. It is sometimes mixed with felspar, more rarely with mica and pyrites. There are four species; 1. Common hornblende; 2. Shistose hornblende; 3. Primitive grunstein; 4. Shistose grunstein.

1. Common hornblende is a simple rock. Its grains are sometimes so small that it appears compact. Sometimes it contains mica.

2. Shistose hornblende occasionally contains quartz, actinote, and pyrites.

3. Primitive grunstein is a mixture of hornblende and felspar. It is divided into different varieties, according as its texture is granular or compact. 1st. Common grunstein, in which the hornblende and felspar are intimately united. It resembles a sienite, in which the hornblende predominates. 2d. Fine grained grunstein, in which are embedded crystals of felspar. Texture at once granular and porphyritic. 3d. When the grains become very fine, the grunstein becomes porphyritic. 4th. When the mass becomes entirely homogeneous, we have the green porphyry of the ancients.

4. Shistose grunstein is a rock composed of compact felspar, hornblende, and a little mica; sometimes it contains also quartz. Its texture is shistose. The hornblende and felspar occur nearly in equal proportion.

Grunstein often contains metallic veins.

Quartz. Considerable rocks occur composed entirely of quartz. Sometimes, indeed, they contain accidentally mica, felspar, tin, pyrites. The texture of these rocks is usually compact, but sometimes shistose.

Topasfels. This rock is composed of quartz, shorl, topaz, and lithomarga. The first three ingredients alternate in thin beds. Its texture is granular; its structure shistose. Very rare. It has been found only in Saxony, near Awerbach, forming a mountain called Schneckenstein. It rests upon granite, and contains no ores.

Kieselchiefer. Kieselchiefer, or siliceous shistus, often forms considerable rocks. Their texture is compact. They are often traversed by small veins of quartz. They contain no metallic substance.

II. Rocks of transition.

The rocks belonging to this class agree with those of the first in containing no remains of organized beings, or at least but seldom; but they have a considerable resemblance to those of the

third class. Werner considers them as forming the passage between the first and third class of rocks; hence their name. The following table contains a list of the transition rocks.

1. Transition limestone,
2. Grauwacke,
3. Transition traps.

Let us take a view of each of these in order.

Transition limestone. This rock is simple. Its mass is a limestone; sometimes granular, sometimes compact, according as its age approaches to primitive or secondary limestone. Fracture is somewhat splintery. Somewhat transparent. Its colours are variously mingled; often red or black with white veins. Seldom contains foreign substances. Sometimes shells are observed in its superior strata.

Sometimes it alternates with beds of argillaceous shistus, and sometimes with beds of mandelstein, as in Derbyshire. It usually covers argillaceous shistus. Seldom rises to any considerable height. Usually stratified. Strata very thick. Often contains metallic veins.

Grauwacke. There are two species of rocks of grauwacke, common and shistose.

Common grauwacke is a sandstone composed of grains of quartz, kieselchiefer, and argillaceous shistus agglutinated by a cement of clay. The grains are sometimes very small, sometimes as large as a hazel nut.

Shistose grauwacke is a simple shistose rock, which has a strong resemblance to argillaceous shistus, but differing in its position. It forms beds which alternate with common grauwacke.

Grauwacke rocks are traversed by veins of quartz. They contain sometimes shells and reeds petrified. They contain no foreign beds. These rocks are distinctly stratified. The strata do not run parallel to those of the other rocks on which they lie. They usually cover transition limestone, and do not rise to any great height. They are rich in ores.

Transition traps. The principal base of all the rocks belonging to this formation is grunstein. This constitutes many of the primitive traps; but in the transition traps, the mixture is much more intimate, the grain is much finer, and the mass much more homogeneous, and its constituents are more or less blended together. Transition traps consist principally of two species, mandelstein and globular trap.

1. Mandelstein or amygdaloid. By this term is implied all rocks composed of a compact ground, containing imbedded in it minerals of a round or almond form, or containing cavities of that form. They are distinguished into primitive, transition, and secondary mandelsteins. Transition mandelstein consists of a ground of shistose hornblende, decomposed and resembling wacken or ferruginous clay. The cavities are sometimes empty, sometimes full, and then they contain quartz and chalcedony. The toadstone of Derbyshire is referred to this species. It contains round masses of calcareous spar.

2. Globular trap. This is a shistose grunstein, partly decomposed and reduced to the state of a fine-grained wacken. It is composed of large spherical bodies, consisting of concentric layers; the central part being hardest.

Transition traps are not stratified. They form separate conical mountains, usually near those of transition limestone. They contain some metallic veins of copper, iron, tin, &c,

III. Floetz or secondary rocks.

These rocks are distinguished by the remains of organized bodies, which they contain abundantly. They are usually stratified. The following table contains a list of these different rocks, arranged according to the supposed time of their formation.

1. Sandstone,
2. Secondary limestone,
3. Chalk,
4. Gypsum,
5. Rock salt,
6. Pit coal,
7. Eisenthon,
8. Secondary traps.

Sandstone. This rock is composed of quartz, varying in size; sometimes also grains of kieselchiefer, and very rarely of felspar. These grains are cemented together, sometimes by means of clay, sometimes of marl or lime, and sometimes of quartz. The cement varies in quantity, but never predominates. The size of the grains varies much; when large, the rock is usually called pudding stone.

This rock is very distinctly stratified. The beds of it often alternate with beds of compact limestone, pit coal, oolite, and a species of sandstone shistus fine grained, and mixed with leaves of mica, which gives it the appearance of micaceous shistus. It contains few metallic ores of value. Sometimes cobalt is found in it.

Secondary limestone. This rock is simple, and composed of compact limestone. Occasionally it contains crystals of quartz, pyrites, &c. Shells occur very frequently in it. It is very distinctly stratified. Its beds are sometimes separated by beds of shistose bituminous marl and sandstone, and by tubereles of hornstone and flint often arranged in beds. It is often traversed by metallic veins, chiefly of galena, grey copper ore, malachite, &c.

Chalk. The strata of chalk may be considered perhaps as subordinate to those of secondary limestone. They consist entirely of chalk, sometimes interrupted by thin beds of flint in tubercles. Shells often occur converted into siliceous matter, and sometimes pyrites in spherical masses. No metallic ores ever occur in them.

Gypsum. The strata of gypsum usually occur in mountains alternating with those of sandstone, limestone, marl, clay, rock salt. They often contain foreign crystals; chiefly quartz, aragonite, boracite, garnet; sometimes they contain sulphur. Few petrefactions are found in them except the bones of quadrupeds. They contain scarcely any metallic ores. See Sulphat of lime.

Rock salt. The mountains which contain strata of rock salt are to be referred to a particular formation of gypsum, with which they usually alternate. They contain no ores.

Pit coal is found in two different formations. The first of these is distinguished particularly by the name of coal formation, or mountains of coal. They are usually composed of beds of, 1. Very brittle sandstone, containing often small particles of mica; 2. Another sandstone or pudding stone of very large grains; 3. Shistose clay; 4. Marl; 5. Limestone; 6. An argillaceous porphyry distinguished by the name of secondary porphyry; 7. Ferruginous clay; 8. Coal. The beds of coal vary in thickness and in number.

This formation of coal occupies countries of no great elevation. They occur chiefly at the bottom of chains, and in the intermediate valleys. The

strata of coal in the north of England belong to it.

Coal is found in other situations, especially in the secondary trap formation. Those of Scotland belong to this class.

Argillaceous ironstone. The beds of this mineral usually alternate with those of indurated clay, shistose clay, marl, brandschiefer, and sandstone. They frequently contain calamine mixed with galena. The impressions of plants and marine petrefactions are often observable in them. They usually form small insulated hills, and are not very common.

Secondary traps. The mountains of secondary traps are composed of various rocks; some of which belong exclusively to this formation; others are found also in other mountains. The rocks peculiar to secondary traps are, 1. Basalt; 2. Wacken; 3. Basaltic tufa; 4. Secondary mandlestein; 5. Porphyry shistus; 6. Graustein; and, 7. Secondary grunstein.

1. Basalt, considered as the mass of a mountain, is a rock more or less compound; usually it is of a porphyritic structure, has for its ground the mineral called basalt. It contains usually grains of olivine, augite, basaltic hornblende, magnetic ironstone, and sometimes leucite, felspar, quartz, &c.; sometimes also mica, actinote, chalcedony. Sometimes it assumes the structure of mandelstein. In that case its cavities are filled with zeolite, steatites, limestone, &c.

It usually appears in large separate masses, often prismatic. It is very common, often forming detached mountains.

2. Wacken sometimes forms beds in the secondary traps. It is usually between clay and basalt. It neither contains olivine nor augite, but crystals of basaltic hornblende, and above all of black hexahedral mica. This last substance distinguishes wacken from basalt, which very seldom contains it.

3. Basaltic tufa results from the decomposition of certain basalts. It consists of fragments of basalt, pieces of olivine, the remains of vegetables, &c. agglutinated by a cement of clay.

4. The amygdaloids or mandelsteins of the secondary traps have for their base a clay which seems to be a decomposed grunstein, often penetrated with siliceous matter. It has a good deal of resemblance to wacken, and sometimes passes into it; at other times it assumes a more compact texture, and passes into basalt. Its cavities are sometimes empty, sometimes filled with green earth, zeolite, limestone, &c.

5. Porphyry shistus is a rock whose structure is shistose, and its texture porphyritic. Its base is klingstein, containing grains of felspar and sometimes of hornblende. It has a good deal of resemblance to basalt, and often passes into it. But it is more nearly a chemical compound, being more transparent, sonorous, and hard.

6. Graustein is a rock composed of small grains of felspar and hornblende, which graduate into each other and form a mass almost homogeneous, of an ash grey colour. It contains olivine and augite.

7. Secondary grunstein, like the primitive and transition, is composed of hornblende and felspar; but its grains are less perfectly crystallised, and less intimately mixed. It usually covers rocks of basalt.

Such are the rocks peculiar to the secondary traps. They have all less or more of a crystallized structure; whereas the other minerals found in secondary traps, but not peculiar to them, are mechanical depositions. Wacken and basalt form the passage from the one to the other. The mechanical depositions, sand, clay, &c. are usually lowermost; they are covered by wacken. Some of the other substances always occupy the summits.

Trap mountains contain abundance of petrefactions, but no ores except some veins and grains of iron. They are usually insulated; very seldom forming chains. The mountains of basalt and porphyry shistus are usually conical. They are hardly ever covered by other rocks. They usually cover sandstone, coal, secondary limestone, shistose clay; and veins of them are not uncommon in primitive mountains.

IV. Alluvial rocks.

These consist of what are properly called soils; and are materials that formerly constituted a part of the preceding rocks, and have been detached from them by the operation of air, rain, rivers, or torrents, heat, light, and the aerial gasses, and have been carried forward from the higher to the lower grounds, intermixed in their course with a very large portion of animal and vegetable substances more or less decomposed, and in this state not unfrequently deposited in the beds of rivers, and even of the sea.

Those found in the higher grounds consist chiefly of gravel, sand, and irregular pebbles, occasionally intermixed with small nodules of metals, especially of gold and tin, that in like manner formerly constituted a part of the older and loftier mountains.

Those of the lower grounds are chiefly sand, loam, calctuff, or stalactitic tufa; proper earths, brown-coal, wood-coal, bituminous wood, and bog iron ore.

V. Rocks volcanic.

This name is given to all the minerals thrown out during volcanic eruptions. The most complete account of them has been given by Dolomieu, who devoted the greatest part of his life to the study of volcanoes. Part of his division was published by him in the Journal de Physique for 1794; and an abstract of the whole has been given by Brochant from notes taken during a course of geology given by Dolomieu in 1797. Volcanic products have been divided by this celebrated geologist into five classes: 1. Minerals modified by the fire of volcanoes; 2. Substances not modified by the fire, or thrown out unaltered; 3. Substances sublimed by the fire of volcanoes; 4. Minerals altered by the sulphurous acid vapours of volcanoes; 5. Volcanic minerals altered by the action of the atmosphere.

Minerals modified by the fire. This set of minerals is subdivided into two heads. The first comprehends those minerals which, though they have been modified by fire, yet exhibit no appearance of its action. The second consists of those which retain obvious marks of the action of fire. Those of the first head have been distinguished by the name of compact lavas; those of the second by the name of porous.

Compact lavas bear so close a resemblance to certain rocks of an origin not volcanic, that it is extremely difficult to distinguish them. Some have the appearance of basalt; others of granite, porphyry, and various secondary traps. Dolomieu divides them into four species according to their base.

1. Compact lavas with an argillo-ferruginous base. Their colour is usually black. Fracture

imperfectly conchoidal. Texture very compact. Sonorous. Smell argillaceous. Attract the magnetic needle. Very common in volcanic countries. Frequently contain crystals of augite, felspar, hornblende, garnet, leucite, olivine, mica. A specimen of the lava of Catania in Sicily, analysed by Dr. Kennedy, contained,

51.0 silica,
19.0 alumina,
14.5 oxyd of iron,
9.5 lime,
4.0 soda,
1.0 muriatic acid,

99.0

A specimen of the lava of Sta. Venere in Sicily he found to contain

55.78 silica,
17.50 alumina,
14.25 oxyd of iron,
10.00 lime,
4.00 soda,
1.00 muriatic acid,

97.5

Compact lava with a petrosiliceous base. Colour very variable, grey, black, and white; but all become white before the blow-pipe. Fracture conchoidal. Grain fine and compact. Smell slightly argillaceous. Does not affect the magnetic needle. Contains usually grains of felspar; sometimes of hornblende mica; and occasionally lucites.

Porous lavas. These consist of those lavas which are often employed as millstones and in buildings; as also of scorias, or those materials which either are or have a great resemblance to puzzolanas, or earthy matters ejected by volcanoes, and which make an excellent mortar with lime. They also include compact glasses; and porous glasses or pumice-stones, volcanic sands and ashes, and calcined materials.

The *minerals not modified by fire* are for the most part volcanic tufas, or substances which, without a change of structure, have been thrown out of the volcano, and are of some consequence in determining its interior composition.

The *sublimated matters* are usually gasses, and metallic bodies which have elevated along with them.

The *substances altered* by the sulphureous acid vapour of volcanoes are chiefly the lavas themselves, which are hence changed in colour, and rendered more pulverulent; the results of this action are for the most part alum and sulphats of lime, magnesia, and iron.

The *volcanic substances altered* by the action of the atmosphere are nearly of the same kind as the preceding, but submitting to a more gradual though a more extensive change.

Mountain rocks are simple, as when formed of limestone, clay-slate, serpentine, or any other simple fossil; and compound, when formed by the aggregations of simple fossils. The compound rocks are either cemented, formed of various parts brought together and connected by a cement, as in sand-stones, pudding-stones, and brecciæ; or are aggregated, being composed of parts existing originally on the spot where the masses are now found, and connected together by their original structure. They are also considered as simple aggregated, when one, as a base, includes the other; when the contained portion is in the form of grains or crystals, the structure is termed porphyritic; and when of a vesicular form, amygdaloidal: the double aggregated is when a smaller structure is contained in a larger, as granular slaty; or when the two structures exist near or beside each other; when the one not including the other is pointed out by a conjunction, as porphyritic and amygdaloidal.

The mountain masses themselves are either of a stratified or of a seamed structure. When the masses composing the rock are of one species, and disposed parallel to each other, those masses are termed strata; but when the mountain mass is composed of different species of rocks, thus disposed, it is said to be formed of beds. In the seamed structure, the seams of stratification, though parallel in one direction, intersect each other in another. The masses thus divided by these intersecting seams may be considered as distinct concretions, and may be instanced in the columnar formed. Straight and much thicker masses are also thus formed, by what is termed the tabular seamed structure, and large globular masses result from the large globular or massive structure.

By a rock formation Mr. Jameson understands "a determinate assemblage of similar or dissimilar rock masses, which are characterised by external and internal relations, as an independent whole, that is, as an unity in the series of rock formations." When the mass is uniform throughout, it constitutes a simple formation; but when dissimilar, a compound formation; and when these formations are repeated, the whole is denominated a series or suite of formations. When individual beds occur in different principal formations, as primitive trap in gneiss, mica-slate, &c. forming single independent wholes, which always continue the same, notwithstanding the difference of rocks in which they are imbedded, and still form members of a series of formations; they are considered as independent formations. The inclination of a stratum is the angle which the stratum forms with the horizon, and is determined by the quadrant. The dip is the point of the compass towards which the stratum inclines. The direction is the angle which the stratum makes with the meridian, and is determined by the compass. It is always at right angles to the dip. The form, and other visible characters, of many of the mountain rocks are frequently sufficient to point out their nature to the attentive observer. Granite is characterised by its very high and precipitous cliffs and peaks; gneiss is less lofty, and its summits are less steep and abrupt; and the mountains of mica slate are still less lofty, and bear more of a rounded form. Clay-slate mountains are generally less lofty than those already noticed, and their cliffs are still less steep and rough. Primitive limestone sometimes presents lofty peaks, like those of granite; but the mountains containing it in general assume the characters of gneiss, mica-slate, or clay-slate, with which it is in general found. Rocks of primitive trap are generally lofty, steep, and conical. "No rock," Mr. Jameson observes, "presents a greater variety of external appearance than the sand-stone. Its vallies are deep, rocky, and romantic; its hills are conical, steep, and cliffy; and it often presents grand colossal pillars, which, from their number, and variety of their shape, form most striking rocky scenes." Floëtz limestone assumes very different forms from those already particularised, being extended in large, flat hills, intersected by steep vallies. Chalk in some

situations forms hills of considerable height, which are generally rounded, with an extensive base.

The position, extent, and direction of the several strata of different formations, either taken with or without reference to the fundamental rock, yield very convincing testimony in favour of the opinions delivered by the celebrated Werner respecting the formation of the earth. (See GEOLOGY.) Previously to viewing the illustration of his theory in the formation of a suite of rocks, it may be necessary to particularise some of the peculiarities in the formation of different rocks, and to show the different terms by which they are expressed. The formations themselves are distinguished as universal or partial, and as unbroken or broken. The strata are considered as conformable or unconformable, with the direction of the fundamental rock; and overlying, when lying over the ends of the strata of the fundamental rock. They are said to be straight, when disposed in one direction on the fundamental rock: when they turn round it, leaving the top uncovered, mantle-formed; and when they also cover its extremities, saddle-formed. When concave, they are termed basin-shaped; and if the concavity is long, trough-shaped. Their upper extremities, appearing at the surface of the earth, are termed the outgoings of the strata: the outermost of the circles formed by these is the oldest in the concave (the basin and trough-shaped), and newest in the convex (the mantle and saddle-shaped). When detached portions occur on the summits of hills, they are called caps; when filling up hollow spaces, up-fillings; and when only on one side of a mountain, shield-formed.

It has been here said, according to the theory of Werner, that one class of mountains was deposited, by chemical formation from an aqueous solution, previous to the creation of vegetables and animals; that to these succeeded another class, in which materials mechanically separated were discoverable, formed during the passage of this globe into a habitable state; and that during the existence of animals and vegetables in considerable number, another (the latest) class was produced, in which mechanical deposits and remains of organized bodies exist in considerable quantity. Of these different classes of rocks, it may be expected, that the rocks of the earliest period would be found invested in various modes by those of later formation, and disposed in the order of their separation from the waters from which they derived their origin.

The rocks which exist in the Hartz appear to be beautifully illustrative of this successive deposition. In the centre a vast mass of granite rises through the other strata, and round this clay-slate is disposed in mantle-shaped strata. Gneiss and mica-slate not existing in this country, transition limestone succeeds to the clay-slate, and then grey wacké and grey wacké slate: the whole being wrapped round the granite in mantle-shaped strata, and invariably with lower and lower outgoings, corresponding to the newer and newer strata. To these the floëtz rocks succeed, the oldest of the floëtz resting on the newest of the transition; and the different floëtz rocks resting on each other according to their relative age. Last of all, the alluvial rocks are found in the lowest situations. We have thus, as Mr. Jameson observes, all the series of rocks, from the granite to the alluvial, marked with a diminishing level, in proportion to the newness of the strata.

ROCK ALUM, in mineralogy. See ALUMEN.

ROCK CRYSTAL, in mineralogy, a species of quartz. See QUARTZUM.

ROCK OIL, in mineralogy, a species of bitumen. See BITUMEN.

ROCK OUZEL. See TURDUS.

ROCK FISH. See GOBIUS.

ROCK ROSE, in botany. See CISTUS.

ROCK SALT, in mineralogy, fossil-salt, sal gem. *Steinsalz.* Wern. *Sal gemme.* Brock. Muriat of soda exists abundantly in a native state either as a solid fossil or dissolved in water, and in whatever way obtained constitutes our common or culinary salt.

In the former state it ranks as a peculiar mineral, that is highly entitled to attention, and is denominated rock-salt.

It is found in a cubic, fibrous, compact, and stalactitical shape; for which see the article MURIA. Its proper geological situation is between the oldest secondary gypsum and secondary sandstone. It forms continuous beds of great thickness, and often occurs in large solitary blocks; it is always accompanied by semi-indurated clay, for the most part strongly impregnated with salt; and alternates with beds of swinestone, gypsum, limestone and sandstone. The beds of salt are mostly below the surface of the ground, but it sometimes rises into hills of considerable elevation. At Cordova, according to Bowles, there is a hill between four and five hundred feet high, composed entirely of this mineral. The most celebrated mines are those of Wielicza in Galicia, Halle in Tyrol, Poland, Castile in Spain, and Cheshire in England. In the province of Lahor in Hindustan is a hill of rock-salt of equal magnitude with that near Cordova. The mines of Iletski in Russia yield vast quantities of this substance. It is so plentiful in the desert of Caramania, and the air is so dry, that it is there used as a material for building; it forms the surface of a large part of the northern desert of Lybia, according to Horneman; and is found abundantly in the mountains of Peru. It has a pure saline taste, without any mixture of bitterness; and crystallises in cubes when obtained by slow evaporation from its solution.

Of all these the most useful and manageable, if not the most abundant, is the rock-salt, found and so extensively manufactured in Cheshire; and we shall hence give the following account of it from a very valuable paper, lately communicated to the geological society by H. Holland, esq.

The Cheshire rock-salt, with a few exceptions, has yet been ascertained to exist only in the valleys of the Weaver and its tributary streams; in some places manifesting its presence by springs impregnated with salt; in other places being known by mines actually carried down into the substance of the strata. Between the source of the Weaver and Nantwich, it will be seen that many brine springs make their appearance; and in the latter part of this course, it would seem that brine might be obtained by sinking to some depth in any place near the banks of the Weaver. Proceeding down the stream, salt-springs occur again at Winsford, and in several situations between Winsford and Northwich. At Moulton, between these two places, a mine has been sunk into the body of rock-salt, and another also between Winsford and Middlewich. At Northwich the brine springs are very abundant, and here also many mines have been sunk for the purpose of working out the fossil salt. The springs occur again in several places further down the river, but none have been met with below Saltersford, about

two miles from Northwich. At Whitley, however, two miles north of the Weaver, and six miles from Northwich, a body of rock-salt is stated to have been met with in boring for coal.

On the course of the river Wheelock, brine springs have been found at Lawton, Roughwood, Wheelock, and again at Middlewich, where this stream unites itself with the Dane. At Lawton, a mine has been sunk into the rock-salt. In the valley of the Dane, no salt springs actually appear, but several circumstances indicate that brine has at some former period been discovered there, and this as high up the stream as the neighbourhood of Congleton. No springs have been found in the valley of Witton Brook, except at the part of it immediately adjoining the Weaver at Northwich.

The evidences of the presence of rock-salt occur in very few places out of these valleys, and even some of the excepted instances appear to have a local relation to the southern or central plain. This is the case with the salt springs of Dirtwich, in the south-western angle of Cheshire; with a spring of very weak brine lately found at Adderley, in the northern extremity of Shropshire; and probably also with other saline springs which occur in the contiguous parts of Flint and Denbighshire. At Dunham, however, in the north of Cheshire, we find a weak spring, which cannot strictly be considered as connected with the formations of the southern plain. At Barton and Adlington, in the southern parts of Lancashire, brine springs likewise appear; and it is not improbable that other instances of the same kind may occur in the northern portion of the great plain. It appears possible, however, that these weak springs may derive their saline contents, not from distinct subjacent beds of the fossil salt, but merely from beds of clay or argillaceous stone, strongly impregnated with particles of the muriate of soda.

The brines met with in this district are very generally formed by the penetration of spring or rain waters to the upper surface of the rock-salt, in passing over which they acquire a degree of strength, modified by several circumstances, which it would be needless to detail. Their average strength, however, appears to be much greater than that of the springs met with in Hungary, Germany, or France. At Winsford, Northwich, Anderton, Lawton, Roughwood, Wheelock, and Middlewich, where all the principal salt works are situated, the brine springs contain between twenty-five and twenty-six per cent. of the pure muriat of soda; and in some of the springs at Anderton, the proportion stands as high as 26·566 per cent. a very near approach to the perfect saturation of the brine. The earthy salts held in solution together with the muriat of soda are principally muriat of magnesia and sulphat of lime; the quantity of these varying from $\frac{6}{10}$ per cent. to 2 or to $2\frac{1}{2}$ per cent. in different springs. The brine being pumped out of the pits, is first conveyed into large reservoirs, and afterwards drawn off as it is wanted, into evaporating pans, made of wrought iron. Here heat is applied in a degree determined by the nature of the salt intended to be manufactured, and various additions are made to the brine, with a view either to assist the crystallization of the muriat of soda, or to promote the separation of the earthy salts. The latter exist in a very small proportion in the manufactured salt, and cannot be supposed in any degree to affect the uses to which it is applied. The importance of the Cheshire salt manufacture will be sufficiently obvious from the statement, that besides the salt made for home consumption, which annually amounts to more than 16,000 tons, the average of the quantity sent to Liverpool for exportation has not been less than 140,000 tons.

Though springs impregnated with salt occur in several parts of the Cheshire plain, it may be remarked that the rock-salt itself has only been worked into, near the banks of the Weaver and its tributary streams. It was first discovered at Marbury near Northwich, about one hundred and forty years ago, in searching for coal. This bed of rock was the only one worked for more than a century, when, in the same neighbourhood, a second and inferior stratum was met with, separated by a bed of indurated clay from the one previously known. This lower stratum was ascertained to possess at a certain depth a great degree of purity and freedom from earthy admixture; on which account, and from the local advantages of Northwich for exportation, the fossil salt is now worked only in the vicinity of this place.

The rock-salt of Northwich occurs, in two great strata or beds, lying nearly horizontally, but on different levels, and separated, the superincumbent from the subjacent stratum, by several layers of indurated clay or argillaceous stone. These intervening beds possess in conjunction a very uniform thickness of ten or eleven yards, and are irregularly penetrated by veins of the fossil salt. Though the evidence on the subject is not entirely of a positive nature, there seem strong grounds for believing that the beds of rock-salt at Northwich are perfectly distinct from any others in the salt district, forming what the Germans would call *liegende stöcke*, lying bodies or masses of the mineral. It will readily be conceived that there is much difficulty in acquiring precise information with respect to the extent and limitation of these great masses, and that there are many sources of error to which such an inquiry is liable. There are, however, a few leading facts upon which dependence may be placed, and which will be admitted to furnish fair grounds for deduction.

It would appear that the great beds of rock-salt at Northwich assume a general longitudinal direction from north-east to south-west, the line which has been traced upon them in this direction being a mile and a half in length, and no direct evidence existing that they may not extend further in these points; while their transverse extent, as measured by a line at right angles to the former, is much more limited, probably not exceeding in any place one thousand three hundred or one thousand four hundred yards. Several circumstances concur in giving probability to this statement. Let two parallel lines, drawn from NE to SW, with an intervening distance equal to about half their length, be employed to designate the supposed extent of the subjacent rock-salt. In a mine which approaches very nearly to the eastern limit of the area thus formed, the upper bed of rock-salt was actually worked through in an horizontal direction on this side, and discovered to be going off with a very rapid declivity. A similar fact has been stated with respect to another pit further to the south on the same line of boundary; but as the mine was destroyed many years ago by the ingress of fresh water, this statement is considerably more doubtful than the former. It may be remarked too, that in sinking for brine a little beyond, or out of the area, on this side, the brine

met with is of a very weak and inferior kind, and at a short distance altogether disappears. Appearances leading to the same conclusion of the sudden termination of the body of rock-salt occur on the opposite side of the area marking its extent. In a mine at the northern extremity of the western line of boundary, a shaft situated nearer to this line is fifteen yards deeper than another shaft immediately contiguous, apparently in consequence of the rapid sinking of the rock-salt at this point. In most of the pits on this side, the upper bed of rock is met with at a depth of from thirty to forty yards; yet at Barnton, a mile further to the west, and on the same or a lower level, none was met with in a sinking of one hundred and fifteen yards.

Corresponding appearances have been observed in the body of rock-salt which occurs at Moulton, between Winsford and Northwich, where in two sinkings on the same level, and at the distance of one hundred yards from each other, the difference in the depth at which the rock was found was nearly twenty yards, a circumstance from which the limitation or going off of the bed at this particular point may reasonably be inferred.

Another important observation with respect to the Northwich rock-salt is, that there seems to be a progressive thinning of the upper bed of salt from NW to SE, or in a direction nearly at right angles to the longitudinal extent of the stratum. Though much uncertainty exists with respect to the rate and progression of this decrease, the general fact seems to be sufficiently confirmed by observations taken from different mines. In those which have been sunk near to the western or north-western side of the area before described, the thickness of the upper bed has been very generally twenty-eight, twenty-nine, or thirty yards. Proceeding towards the east or south-east, we find this thickness decreasing to twenty-five yards, and in the mines near the eastern boundary the bed of rock-salt comes down to twenty, eighteen, and even seventeen yards in thickness. It will be observed that this thinning takes place in a general direction from the nearest sea coast; the thickest part of the body of rock being situated furthest down the Weaver, and just above the contraction which takes place in the valley of the river at Anderton.

Besides this general variation of surface in the superior stratum of rock-salt, it has been found that there is a considerable irregularity of level on its upper surface. In one of the mines, in which a tunnel was carried one hundred yards along this surface, many small risings and depressions were met with; and similar appearances have been observed in the other mines near Northwich.

The depth at which the upper bed of rock-salt is found, though varied by several of these circumstances, depends principally, of course, upon the surface of the ground above, which at Northwich, from the confluence of streams there, is somewhat irregular. In the greater number of the mines, it is met with at a depth varying from thirty-five to forty yards. The smallest depth at which it has been found is in a mine situated close to Witton Brook, about half a mile above the entrance of this stream into the Weaver. Here it appears at twenty-nine yards from the surface; and a general estimate of level from this mine shows that the upper surface of the salt is at least twelve or thirteen yards below the low-water mark of the sea at Liverpool; a fact perhaps not wholly unimportant as regards our ideas of the formation of this mineral.

The thickness of the upper bed of salt at Northwich has been already stated to vary from twenty to thirty yards: that of the lower bed has never yet been ascertained in any one of the mines in this district. The workings in this lower stratum are usually begun at the depth of from twenty to twenty-five yards, and are carried down for five or six yards, through what forms, as will afterwards be mentioned, the purest portion of the bed. In one of the mines a shaft has been sunk to a level of fourteen yards still lower, without passing through the body of rock-salt. We have thus an ascertained thickness of this bed, of about forty yards, and no direct evidence that it may not extend to a considerably greater depth.

Though only two distinct beds of the fossil salt have been met with at Northwich, it has been ascertained that the same limitations do not exist throughout the whole of the salt district. At Lawton, near the source of the river Wheelock, three distinct beds were found, separated by strata of indurated clay; one, at the depth of forty-two yards, four feet in thickness; a second, ten yards lower, and twelve feet thick; and a third, fifteen yards still further down, which was sunk into twenty-four yards, without passing through its substance. Coal is found and worked within two or three miles of this place, and the only limestone known in the county of Chester is got from the hills which here form the southern boundary of the plain. In no other parts of the salt district, than at Northwich and Lawton, has the upper bed of rock been worked through.

The strata passed through in going down to the upper bed of rock are nearly horizontal in position, and very uniform in their structure, consisting in every instance of beds of clay and marl; and these, with the exception of a few of the most superficial, appearing in similar progression in each mine. The clays, or argillaceous stone, of which these beds are composed, are indurated in different degrees, tinged with various shades of red, blue, brown, &c. and usually contain a portion of sulphat of lime. They are known to the miners by the general name of metals; a distinctive appellation being given to each from the shade of colour which it assumes. It will be observed that, though these clays in general possess a considerable degree of induration, there are some of them sufficiently porous to admit the passage of water through their substance. Where this structure of the clay occurs it goes by the name of the shaggy metal, and the fresh water which makes its way through the pores has the expressive appellation of Roaring Meg. This term will not appear too strong, when it is mentioned that in the mine from which the section of strata was taken, and where the shaggy metal was found at the depth of twenty-six yards, the quantity of water, ascertained to issue from its pores in one minute, was not less than three hundred and sixty gallons; a circumstance greatly enhancing the difficulties of passing a shaft down to the body of rock-salt.

A portion of salt, sufficient strongly to affect the taste, is found to exist in many of these beds of argillaceous stone: and this saltness increases, as might be expected, as we approach the body of the rock-salt. In the strata or layers immediately above the rock, which in all the mines are perfectly uniform in their appearance and structure, it is particularly remarkable. It may be observed, however, that there are not in these strata any veins of rock-salt connected with the great mass

below: on the contrary, the line of division between the clay and rock-salt is drawn with great distinctness in every instance, and presents none of those inequalities which would arise from a mutual penetration of the strata.

It may, perhaps, be considered as a decided fact, that no marine exuviæ or organic remains are found in the strata situated over the rock-salt; and the almost universal occurrence of gypsum, in connexion with beds of fossil salt, is another fact worthy of observation. This connection appears in the salt mines of Hungary, Transylvania, and Poland, as well as in those of Cheshire, and it has led Werner to assign to the rock-salt and flœtz gypsum a conjunct situation in his Geognostic System. The gypsum, contained in the clays over the Cheshire rock-salt, occurs in varying proportions, and under different appearances in the several beds passed through. It is found both in large masses and in small granular concretions. The compact, foliated, and fibrous varieties are all met with; the last of these occurring in very considerable proportion.

The fineness or purity of the rock is a circumstance very important to the interests of the mining proprietor, and in this point considerable varieties appear in different parts of the strata. The great body of the rock-salt, both in the upper and lower stratum, is composed of crystals of muriate of soda, intimately mixed with certain proportions of clay and oxyd of iron, giving to the mass a red or reddish-brown tinge; and, in addition to these constituent parts, contains likewise certain earthy salts, the sulphat of lime, and the muriats of lime and magnesia, but these in small proportion. In every part, however, of this compound rock, we find separate crystalline concretions of muriat of soda, variously disposed, sometimes occurring distinctly in the cubical form; in other places in masses of larger size, and irregularly shaped. The colour of these concretions, which are of the foliated species of fossil salt, is usually a greyish, or milk-white; they are always translucent, and often attain a considerable degree of transparency. It would appear that they contain the muriat of soda in its purest form; the sulphat of lime in specimens of this kind being scarcely distinguishable by the delicate tests applied to its discovery.

This finer rock-salt occurs not only in separate concretions, but also in veins intersecting the coarser mass, and in the rims or borders of the polyhedral figures which will afterwards be mentioned. Its proportion varies both in the two great beds of rock, and likewise in different parts of the same bed; and it is a regard to this circumstance which determines the situation and extent of the workings in the several mines. In the upper bed this variety is less considerable than in the lower; but here the substance of the rock-salt is evidently purer three or four yards above the lower surface than in other parts of the same stratum, and continues so for about four feet. In the lower bed, the first twenty or twenty-five yards passed through contain a proportion of earth as large as in the upper stratum: at this depth, however, a greatly increased degree of purity appears, which is continued for five or six yards further down, when the proportion of earthy admixture again becomes as large as before.

It is invariably this purer portion of the lower bed which is at present worked in the Northwich mines, and the rock-salt obtained from it, being principally exported to the Baltic, obtains the name of Prussian rock. The extent of the cavity formed by the workings varies in different mines; the average depth may probably be taken at about sixteen feet. In some of the pits, where pillars six or eight yards square form the supports of the mine, the appearance of the cavity is singularly striking, and the brilliancy of the effect is greatly increased if the mine be illuminated by candles fixed to the side of the rock. The scene so formed would almost appear to realize the magic palaces of the eastern poets. Some of the pits are worked in aisles or streets, but the choice here is wholly arbitrary. The methods employed in working out the rock-salt offer nothing worthy of notice. The operation of blasting is applied to the separation of large masses from the body of the rock, and these are afterwards broken down by the mechanical implements in common use. The present number of mines is eleven or twelve, from which there are raised, on an annual average, fifty or sixty thousand tons of rock-salt. The greater part of this quantity is exported to Ireland and the Baltic: the remainder is employed in the Cheshire district in the manufacture of white salt by solution and subsequent evaporation.

It is very doubtful whether in any instance the body of rock-salt can be considered as stratified, or disposed in distinct layers. A perpendicular section does sometimes indeed present irregular appearances of this kind, and more especially in the purer part of the lower bed; but the great body of the rock offers to the eye merely a confused red mass, varied here and there by the occurrence of the crystalline portions of salt.

One of the most striking facts connected with the internal structure of the Northwich rock-salt, is the appearance observable on the surface of an horizontal section of the rock, as viewed in any of the mines. On this surface may be traced various figures, more or less distinctly marked, and differing considerably in the forms which they assume; some appearing nearly circular, others perfectly pentagonal, and others again having an irregular polyhedral form. The lines which form the boundary of these figures are composed of extremely pure white salt, forming a division between the coarse red rock exterior to the figure, and the equally coarse rock included within its area. These bordering lines or rims vary from two to six inches in width. The figures themselves differ greatly in size; some of them being less than a yard in diameter, others as much as three or four yards; and they very frequently are observed, one within another, gradually diminishing in size to a centre. Professor Playfair, in his Illustrations of the Huttonian Theory, has stated, that the compression of these figures is always mutual; the flat side of one being turned to the flat side of another, and never an angle to an angle, nor an angle to a side. This remark seems perfectly founded in fact. From the mode of working the mines, it is difficult to ascertain the progressive appearance of these figures in a perpendicular plane. It has been stated that their form is a pyramidal one, the area enlarging by a determinate ratio of increase as they are traced downwards; but several circumstances induce us to consider this statement as a very doubtful one, and certainly founded upon insufficient evidence.

One very important negative fact remains to be mentioned with respect to the internal structure of the Cheshire rock-salt, viz. that no organic impressions or remains have ever been met with in any of the beds of the mineral which have been

worked in this district. This fact rests on evidence of a satisfactory kind, and there is not, perhaps, more than a single instance adduced in opposition to it, and that of a very dubious nature. The same remark may be applied to the strata of argillaceous stone between the two beds of rock-salt. The veins of rock-salt intersecting these intermediate strata contain principally the fibrous variety of the fossil. It may be remarked too of these strata, that at their junction with the upper and lower beds of rock-salt, the lines of division are nearly as distinct as that between the upper bed of rock and the superincumbent layers of argillaceous stone.

The general situation of the rock-salt in Transylvania and Poland is very similar to that which it occupies in Cheshire; the beds of this mineral being disposed in small plains, bounded by hills of inconsiderable height, forming a kind of basin or hollow, from which there is usually only a narrow egress for the waters. The situation of the Austrian salt-mines near Salzburgh is however very different. The mineral here appears to be disposed in beds of great thickness, which occur near the summit of limestone hills, at a great elevation above the adjoining country. This fact is a singular one; and, if we admit the idea that rock-salt is formed from the waters of the sea, makes it necessary to suppose the occurrence on this spot of the most vast and wonderful changes. M. Hassenfratz states it as a general fact, that in countries where salt-mines occur, fragments of primitive rocks appear in great abundance over these beds. It does not seem, however, that any deduction of importance can be connected with this fact.

The disposition of the beds of salt in the continental mines seems to be very generally a horizontal one, and as in the English mines, they are separated by strata of clay of a varying thickness. It would appear, however, with respect to extent of dimensions, that they are in general greatly inferior to the bodies of rock-salt met with in our own island. In Hungary and Poland these beds do not present a thickness of more than one or two feet, and are separated by layers of clay a few inches in thickness. Much, however, it is evident, must depend upon the number of the beds thus disposed; but this I do not find any where noticed. The earthy saline contents of the foreign rock-salt very exactly resemble those of the Cheshire; the gypsum existing in much larger proportion than the other earthy salts, and appearing in considerable masses, both distinctly, and in mixture with the beds of clay. It is an important fact, however, that sea-shells and other marine exuviæ are found in these beds of clay and gypsum; a circumstance which never occurs in the Cheshire mines. It would seem that the portion of oxyd of iron combined with the clay in the substance of the English rock-salt does not exist in the mineral as found abroad, or at least in a proportion not so considerable.

The comparative commercial value of the English and Polish mines is best ascertained by the fact that many thousand tons of rock-salt are annually sent from Cheshire to the parts of the Prussian coast most nearly adjacent to the salt-mines; independently of the large supplies of the English manufactured white salt which are exported to the same country.

With respect to the theory of the formation of rock-salt, it must be acknowledged that though there are some difficulties connected with the supposition, little doubt can exist of the general fact, that the beds of this mineral have been formed by deposition from the waters of the sea. Such an opinion acquires much probability from the situation in which these beds usually occur; occupying the valleys and lower parts of plains which are so surrounded by hills of secondary formation, as to leave only a narrow egress for the waters collected on their surface. This structure of the plain constituting the salt district of Cheshire, regarded in its general character, leads strongly to the conclusion that the waters of the sea must, at some former period, have occupied the lower parts at least of the basin thus formed, which at that time had a level eighty or one hundred yards lower than the one now appearing. To account for the great depositions of salt in the lower parts of this basin, it is necessary to suppose that some barrier must have been afterwards interposed to prevent the free communication of the waters of the sea with those thus collected; and the general course of the streams, the position of the beds of rock-salt, and the contractions in the valley of the Weaver, which appear below Northwich at Anderton and Frodsham, point out with some distinctness the place where these obstructions may probably have occurred.

To explain the appearance of the strata of indurated clay, intermediate between the beds of salt, we must suppose that the obstruction still continued, when the deposition of salt from the waters first confined had nearly ceased; and that at this period the deposition of clay, which had hitherto been going on in conjunction with that of the salt, proceeded in a great measure alone; the salt which remained in the water being merely sufficient to form small veins in its substance. When these strata had been deposited to a thickness of ten or eleven yards, it would appear that the barrier preventing the access of the sea to the basin or plain was again so far removed as to allow the entrance of a fresh body of sea water; from the gradual evaporation of which, the formation of the upper bed of rock-salt took place; and there being then no further admission of sea water to the plain, the superincumbent strata of clay and marl were successively deposited in the order in which they at present appear.

This is a general sketch of the probable mode of formation of the Cheshire rock-salt; but as it would seem very doubtful whether any single accumulation of sea water could contain the materials of depositions possessing so great a thickness, the theory might perhaps be successfully modified, by supposing the barrier before noticed to have had such an elevation in the progressive stages of the deposition of the salt, as to allow the very frequent ingress of sea water into the basin. Admitting this idea, we must suppose that the formation of the strata of indurated clay between the beds of rock-salt took place, either during some intermission of these overflowings, or when there was a great predominance of this earth in the water from which the depositions were made. It seems probable too that the veins of salt intersecting these strata were formed rather by the penetration of water holding salt in solution, from the upper bed of rock-salt, than by a direct deposition from the waters of the sea. With respect to the sources of the clay, combined with the substance of the rock-salt, or found in intermediate and superincumbent beds, little doubt can exist that it has been derived from the decomposition of more ancient rocks, of the situation and

precise characters of which no vestiges now remain.

This general idea of the formation of the Cheshire rock-salt derives confirmation from the fact that, with the exception of the sulphat of magnesia, the same earthy salts occur together with the muriat of soda in these strata, as are met with in the waters of the sea. The circumstance of the beds decreasing in thickness as they recede from the sea, may perhaps be admitted as another argument in behalf of the opinion.

The principal objection to the theory undoubtedly is, the non-existence of marine exuviæ either in the rock-salt or in the adjacent strata of clay; a fact very difficult to connect with the idea of a deposition from the waters of the sea. Other objections, though perhaps of less moment, arise from the appearance of the earthy salts in smaller proportion in the rock-salt than in sea water; from the apparently partial deposition of the beds, and from the difficulty of explaining the formation of the figured appearances which occur in the substance of the rock. These circumstances, however, will by no means authorize us to reject the general idea which has been given of the origin of this mineral, strengthened as it is by the situation and appearances observed in the foreign salt mines, where the proofs of marine deposition are still stronger than those presented in the Cheshire district.

Section of the Strata sunk through to the second Bed of Rock-Salt at Witton, near Northwich.

No.	Nature of the Strata.	yards.	feet.	inch.
1	Calcareous marl	5	—	—
2	Indurated red clay	1	1	6
3	Indurated blue clay with sand	2	1	—
4	Argillaceous marl	1	2	—
5	Indurated blue clay	—	1	—
6	Red clay, with sulphat of lime irregularly intersecting it	1	1	—
7	Indurated blue and brown clay, with grains of sulphat of lime interspersed	1	1	—
8	Indurated brown clay, with sulphat of lime crystallized in irregular masses, and in large proportion	4	—	—
9	Indurated blue clay, laminated with sulphat of lime	1	1	6
10	Argillaceous marl	1	1	—
11	Indurated brown clay, laminated with sulphat of lime	1	—	—
12	Indurated blue clay, with laminæ of sulphat of lime	1	—	—
13	Indurated red and blue clay	4	—	—
14	Indurated brown clay, with sand and sulphat of lime irregularly interspersed through it. The fresh water (360 gallons per minute) finds its way through holes in this stratum, and has its level at sixteen yards from the surface	4	1	—

RO'CKER, *s.* (from *rock.*) One who rocks the cradle (*Dryden*).

ROCKET, in pyrotechny, an artificial firework, usually consisting of a cylindrical case of paper, filled with a composition of certain combustible ingredients; which being tied to a rod, mounts into the air to a considerable height, and there bursts. These are called sky rockets. Beside which, there are others called water rockets, from their acting in water.

The composition with which rockets are filled consists of the three following ingredients, viz. saltpetre, charcoal, and sulphur, all well ground; and in the smaller sizes, gunpowder dust is also added. But the proportions of all the ingredients vary with the weight of the rocket, as in the following table.

Compositions for rockets of various sizes.

The general composition for rockets is,

Saltpetre 4 lb.
Sulphur 1 lb.
Charcoal 1 lb.

But for large rockets,

Saltpetre 4 lb.
Sulphur 1 lb.
Mealpowder 1 lb.

For rockets of a middle size,

Saltpetre 3 lb.
Sulphur 2 lb.
Mealpowder 1 lb.
Charcoal 1 lb.

When rockets are intended to mount upwards, they have a long slender rod fixed to the lower end, to direct their motion.

Rockets have often been employed to throw among an enemy's army, by firing them at oblique angles. In this way they have been used by the Indians for many ages; and they have recently been introduced into the English service by Mr. Hume and colonel Congreve.

Theory of the flight of rockets.—Mariotte takes the rise of rockets to be owing to the impulse or resistance of the air against the flame. Desaguliers accounts for it thus.

Conceive the rocket to have no vent at the choke, and to be set on fire in the conical bore; the consequence would be, either that the rocket would burst in the weakest place, or that, if all parts were equally strong, and able to sustain the impulse of the flame, the rocket would burn out immoveable. Now, as the force of the flame is equable, suppose its action downwards, or that upwards, sufficient to lift 40 pounds; as these forces are equal, but their directions contrary, they will destroy each other's action.

Imagine then the rocket opened at the choke; by this means the action of the flame downwards is taken away, and there remains a force equal to 40 pounds acting upwards, to carry up the rocket, and the stick or rod it is tied to. Accordingly we find that if the composition of the rocket be very weak, so as not to give an impulse greater than the weight of the rocket and stick, it does not rise at all; or if the composition be slow, so that a small part of it only kindles at first, the rocket will not rise.

The stick serves to keep it perpendicular; for if the rocket should begin to tumble, moving round a point in the choke, as being the common centre of gravity of rocket and stick, there would be so much friction against the air, by the stick between the centre and the point, and the point would beat against the air with so much velocity, that the reaction of the medium would restore it to its perpendicularity. When the composition is burnt out, and the impulse upwards has ceased, the common centre of gravity is brought lower towards the middle of the stick; by which means the velocity of the point of the stick is decreased, and that of the point of the rocket is increased; so that the whole will tumble down, with the rocket end foremost.

All the while the rocket burns, the common centre of gravity is shifting and getting downwards, and still the faster and the lower as the stick is lighter; so that it sometimes begins to tumble before it is quite burnt out: but when the stick is too heavy, the common centre of gravity will not get so low, but that the rocket will rise straight, though not so fast.

From the experiments of Mr. Robins, and other gentlemen, it appears that the rockets of 2, 3, or 4 inches diameter, rise the highest; and they found them rise to all heights in the air, from 400 to 1254 yards, which is about three quarters of a mile. See Robins's Tracts, vol. 2, p. 317; and the Philos. Trans. vol. 46, p. 578.

The theory of rockets, however, is still in a very imperfect state. Mr. Moore of the Royal Military Academy, Woolwich, has published some essays on the subject in Nicholson's Journal; but we still need a complete treatise on this interesting and rather abstruse subject.

ROCKET, in botany. See BRASSICA.

ROCKET (Dame's violet, or Gilliflower), in botany. See HESPERIS.

ROCKET (Bastard), in botany. See RESEDA.

ROCKET (Night smelling), in botany. See HESPERIS.

ROCKINGHAM, a town in Northamptonshire, in England, 87 miles from London, stands on the river Welland. It has a charity-school, a market on Thursday, and a fair on Sept. 8, for five days. Its forest was reckoned one of the largest and richest of the kingdom, in which William the Conqueror built a castle; it extended, in the time of the ancient Britons, almost from the Welland to the Nen, and was noted formerly for iron-works, great quantities of flags, i. e. the refuse of the iron-ore, being met with in the adjacent fields. It extended, according to a survey in 1641, near 14 miles in length, from the west of Middleton-woods to the town of Wansford, and five miles in breadth, from Brigstock to the Welland; but is now dismembered into parcels, by the interposition of fields and towns, and is divided into three bailiwics. In several of its woods a great quantity of charcoal is made of the tops of trees, of which many waggon-loads are sent every year to Peterborough. There is a spacious plain in it called Rockinghamshire, which is a common to the four towns of Cottingham, Rockingham, Corby, and Gretton. King William Rufus called the council here of the great men of the kingdom. Lon. 0. 46 W. Lat. 52. 32 N.

ROCKLESS. *a.* Without rocks.

ROCKLING, in ichthyology. See GADUS.

ROCKOMBOLE. See ALLIUM.

RO'CKWORK. *s.* (*rock* and *work*.) Stones fixed in mortar, in imitation of the asperities of rocks (*Addison*).

RO'CKY. *a.* (from *rock*.) 1. Full of rocks (*Sandys*). 2. Resembling a rock (*Milton*). 3. Hard; stony; obdurate (*Shakspeare*).

ROD. *s.* (*roede*, Dutch.) 1. A long twig (*Boyle*). 2. A kind of sceptre (*Shakspeare*). 3. Any thing long and slender (*Glanville*). 4. An instrument for measuring (*Arbuthnot*). 5. An instrument of correction, made of twigs tied together (*Spenser*).

ROD, or POLE, in land measuring, a lineal measure of $16\frac{1}{2}$ feet.

ROD (Aaron's). See SOLIDAGO.

ROD (Golden). See SOLIDAGO.

ROD TREE (Golden). See BOSEA.

ROD (Black). See GENTLEMAN.

ROD (Fishing). See ANGLING and FISHING.

RODE. The preterit of *ride*.

RODNEY (George Brydges, lord), an English admiral, born about 1718. He was in 1759 employed as admiral, to bombard Havre

de Grace. In 1761, he was sent against Martinico, and for his services was made knight of the bath. A disputed election at Northampton rendered his pecuniary resources very scanty, and he fled to France to escape his creditors. Very liberal offers were made to him by the French court, to enter into their service, which he rejected with becoming indignation. This conduct was honourably mentioned by Sartine the French minister to the English government; and Rodney, at the invitation of lord Sandwich, returned to serve his country. He was placed at the head of a fleet, and in 1780 captured a Spanish convoy near Cadiz, and a few weeks after defeated the squadron of Langara, by the capture of five ships of the line. In 1781, he took St. Eustathius from the Dutch, and on the 12th of April 1782, he obtained a complete triumph over de Grasse's fleet in the West Indies, by the sinking of one ship, and the capture of five others. For these services he was raised to the peerage, and had a pension of 2000l. a year settled upon him. He died 1792.

RODOMONTA'DE. *s.* (from a boastful hero of Ariosto, called *Rodomonte*.) An empty noisy bluster or boast; a rant (*Dryden*).

To RODOMONTA'DE. *v. n.* (from the noun.) To brag thrasonically; to brag like Rodomonte.

RODOSTO, a seaport of European Turkey, in Romania, and a Greek bishop's see. It is seated on the side of a hill, on the sea of Marmora, 62 miles W. of Constantinople. Lon. 27. 37 E. Lat. 41. 1 N.

RODRIGUEZ, an island in the Indian ocean, lying 100 leagues E. of Mauritius, and possessed by the French. It is 30 miles long and 12 broad; the country mountainous, and in many parts rocky, though there are others in which the soil is excellent; but the best production of the island is the land turtle, which are in great abundance. On the N. side is a bay that affords secure shelter for ships, and ample supplies of wood and water. Lon. 63. 0 E. Lat. 19. 30 S.

ROE, in zoology. See CERVUS.

ROE, the seed or spawn of fish. See SPAWN.

ROE (Sir Thomas), an eminent statesman, born at Low Layton, Essex, 1580. He resided for about two years at Magdalen college, Oxford, and then studied at the inns of court. He was knighted by James 1604, and 1614 went as ambassador to the court of the Great Mogul. In 1621, he was ambassador to the Grand Signior, till 1628. During his residence abroad, not only the commercial interests of his country were his great concern, but also literature, and he made a valuable collection of MSS. which he presented to the Bodleian library. He brought also as a present from Cyril, patriarch of Constantinople, to Charles I. the famous Alexandrian MS. of the New Testament, and some other MSS. which are deposited in the Bodleian library. He died in 1644.

ROELLA, in botany, a genus of the class pentandria, order monogynia. Corol funnel-form, closed at the bottom by valves bearing the stamens; stigma two-cleft; capsule two-celled, cylindrical, inferior. Five species—four shrubby plants of the Cape; one of Ethiopia.

ROEMER (Olaus), a Danish astronomer and mathematician, born in 1644, and educated at the university of Copenhagen. His fame having reached France, he was invited thither, and received from Louis XIV. a pension for teaching the dauphin mathematics. In 1681 Christian V. king of Denmark called him back to his own country, and made him professor of astronomy at Copenhagen. He died in 1710. He is principally celebrated for having discovered, by means of the eclipses of Jupiter's satellites, that light moves with finite velocity, and for having determined nearly what that velocity is.

ROER, a river of Germany, which rises in the duchy of Westphalia, flows by Arensberg, Schwerte, Werden, and Duysburg, and enters the Rhine at Roerort.

ROER, a new department of France, including the duchy of Juliers, and part of the territories of Cleve, Gelders, and Cologne. It takes its name from a river, which rises above Juliers, and joins the Meuse at Ruremonde. The capital is Aix-la-Chapelle.

ROGA, in antiquity, a present made by the emperors to the senators, magistrates, and even to the people; and by the popes and patriarchs to their clergy. These rogæ were distributed by the emperors on the first day of the year, on their birth-day, or on the *natalis dies* of the cities; and by the popes and patriarchs in passion-week. Roga is also used for the common pay of the soldiers.

ROGATION (*rogatio*), in the Roman jurisprudence, a demand made by the consuls or tribunes of the Roman people, when a law was proposed to be passed. Rogatio is also used for the decree itself made in consequence of the people's giving their assent to this demand; to distinguish it from a *senatus consultum*, or decree of the senate.

ROGATION-WEEK, the week immediately succeeding Whitsunday; so called from the three feasts therein, viz. on Monday, Tuesday, and Wednesday.

ROGER I. king of Sicily, born in 1097, was the grandson of Hauteville of Normandy. He continued to extend his territories in spite of the pope, who endeavoured to stop his career by troops and excommunications. He espoused the cause of Anacletus the anti-pope, and took Innocent II. prisoner with all his suite, releasing him only upon condition of being acknowledged in all his newly acquired dominions. He died in 1154.

ROGER (of Hexham), was brought up in the convent of Hexham, in Northumberland, and was elected prior of it about 1138. He wrote a history of the campaign of the Scottish army under their king David, when the battle of the standard was fought.

ROGERS (Woods), an English navigator,

known for his expedition against the Spanish settlements in the South seas, in a ship of war from Bristol. He returned 1711, after surrounding the globe, and published an account of his voyage. He died 1732. His works have appeared in French, 3 vols. 12mo.

Rogers (John), a divine, educated at Cambridge. He was chaplain to the English factory at Antwerp, and on the succession of Edward VI. he returned, and obtained a prebend of St. Paul's. In Mary's reign, he was the first who suffered martyrdom at the stake in Smithfield, 1555. He had assisted Coverdale and Tindal in translating the bible into English.

Rogers (John), a divine, born 1679, at Ensham, Oxfordshire. He was educated at New college school, and Corpus Christi, and in 1712 went to London as lecturer of St. Clement Danes. He obtained in 1716, the rectory of Wrington, Somersetshire, and engaged in 1719, in the Bangorian controversy, and acquired on that occasion so much credit by his discourse on the visible and invisible church of Christ, that the university of Oxford conferred upon him the degree of D. D. in 1721. He obtained a canonry, and the office of subdean, in the cathedral of Wells, and in 1728 was promoted to the living of St. Giles's, Cripplegate, London. He died 1729. After his death were published 4 vols. of his sermons —a persuasive to conformity, addressed to dissenters, &c. He wrote besides, a defence of Christianity against Collins' scheme of literal prophecy, &c.

ROGERWICK, or Port Baltic, a seaport of Russia, in the province of Revel, seated on a fine bay at the entrance of the gulf of Finland, 40 miles W.N.W. of Revel. Lon. 23. 20 E. Lat. 59. 10 N.

ROGUE. *s.* (of uncertain etymology.) 1. A wandering beggar; a vagrant; a vagabond (*Bacon*). 2. A knave; a dishonest fellow; a villain; a thief (*South*). 3. A name of slight tenderness and endearment (*Shakspeare*). 4. A wag (*Shakspeare*).

To Rogue. *v. n.* (from the noun.) 1. To wander; to play the vagabond (*Carew*). 2. To play knavish tricks.

RO'GUERY. *s.* (from *rogue.*) 1. The life of a vagabond (*Donne*). 2. Knavish tricks (*Shakspeare*). 3. Waggery; arch tricks.

RO'GUESHIP. *s.* (from *rogue.*) The qualities or personage of a rogue (*Dryden*).

RO'GUISH. *a.* (from *rogue.*) 1. Vagrant; vagabond (*Spenser*). 2. Knavish; fraudulent (*Swift*). 3. Waggish; wanton; slightly mischievous (*Addison*).

RO'GUISHLY. *ad.* (from *roguish.*) Like a rogue; knavishly; wantonly.

RO'GUISHNESS. *s.* (from *roguish.*) The qualities of a rogue.

RO'GUY. *a.* (from *rogue.*) Knavish; wanton. A bad word (*L'Estrange*).

ROHACZOW, a town of Lithuania, in the palatinate of Minsk, seated on the Dnieper, near the influx of the Ordrwa, 100 miles S.E. of Minsk. Lon. 30. 20 E. Lat. 53. 2 N.

ROHAN, a town of France, in the department of Morbihan, seated on the Aoust, 20 miles N. of Vannes.

Rohan (Henry, duke of), a peer of France, born 1579. He gained the friendship of Henry IV. by his bravery at the siege of Amiens, and distinguished himself at the head of the Huguenots, for whom he obtained a very advantageous peace with Lewis XIII. After being in the service of Venice, he was recalled by Lewis XIII. and employed in negociation as well as in war, but the jealousy of Richelieu drove him to Geneva. He joined his friend the duke of Saxe Weimar against the imperialists, and was fatally wounded in battle, and died six weeks after, 1638. His memoirs of the political affairs of France, &c. from 1610 to 1629, in 2 vols. 12mo. are much admired. He wrote besides the interest of princes, printed Cologne, 1666, 12mo.—on the government of the 13 cantons—an abridgment of Cæsar's commentaries, &c.

ROHAULT (James), an able French philosopher, was the son of a merchant at Amiens, where he was born in 1620. He became well skilled in the mathematical sciences of that time, and taught them at Paris; pursuing them chiefly as introductory to the study of philosophy. He seems to have been a great lover of truth, at least what he thought so, and to have sought it with much impartiality. He read the ancient and modern philosophers; but Des Cartes was the author who most engaged his notice. Accordingly he became a zealous follower of that great man, and drew up an abridgment and explanation of his philosophy with great clearness and method. In the preface to his Physics, for so his work is called, he makes no scruple to say, that the abilities and accomplishments of this philosopher must oblige the whole world to confess, that France is at least as capable of producing and raising men versed in all arts and branches of knowledge, as ancient Greece. Clerselier, well known for his translation of many pieces of Des Cartes, conceived such an affection for Rohault, on account of his attachment to this philosopher, that he gave him his daughter in marriage, against all the remonstrances of his family.

Rohault's Physics were written in French, but have been translated into Latin by Dr. Samuel Clarke, with notes, in which the Cartesian errors are corrected upon the Newtonian system. The fourth and best edition of Rohault's Physica, by Clarke, is that of 1718, in 8vo. He wrote also, Elemens de Mathematiques, Traité de Mechanique, and Entretiens sur la Philosophie.

But these dialogues are founded and carried on upon the principles of the Cartesian philosophy, which has now little other merit than that of having corrected the errors of the ancients. Rohault died in 1675, and left behind him the character of an amiable, as well as a learned and philosophic man.

His posthumous works were collected and printed in two neat little volumes, first at

Paris, and then at the Hague in 1690. The contents of them are, 1. The first 6 books of Euclid. 2. Trigonometry. 3. Practical Geometry. 4. Fortification. 5. Mechanics. 6. Perspective. 7. Spherical Trigonometry. 8. Arithmetic.

ROHILCUND, or ROHILLA, a territory of Hindustan Proper, whose inhabitants are called Rohillas. It lies to the E. of Delhi, and is subject to the nabob of Oude, by whom, with the assistance of the British, it was conquered in 1774. Bereilly is the capital.

ROHRIA, in botany, a genus of the class triandria, order monogynia. Calyx campanulate, five-parted; corol five-petalled, unequal; stigmas three, revolute; capsule undecided. One species; a branched shrub of Guiana, with flowers in small clustered racemes.

To ROIST. *To* ROI'STER. *v. n.* (*rister*, Islandic, a violent man.) To behave turbulently; to act at discretion; to be at free quarter; to bluster (*Shakspeare*).

ROI'STER, or *Roisterer. s.* (from the verb.) A turbulent, brutal, lawless, blustering fellow.

ROLANDRA, in botany, a genus of the class syngenesia, order polygamia segregata. Florets fascicled in a head, mixed with intervening scales, all hermaphrodite; calycle two-valved, one-flowered; seeds crowned with a toothed margin. One species; a West Indian shrub.

To ROLL. *v.a.* (*rouler*, Fr. *rollen*, Dutch.) 1. To move any thing by volutation, or successive application of the different parts of surface, to the ground (*Mark*). 2. To move any thing round upon its axis. 3. To move in a circle (*Milton*). 4. To produce a periodical revolution (*Milton*). 5. To wrap round upon itself. 6. To enwrap; to involve in bandage (*Wiseman*). 7. To form by rolling into round masses (*Peacham*). 8. To pour in a stream of waves (*Pope*).

To ROLL. *v. n.* 1. To be moved by the successive application of all parts of the surface to a plane: as a cylinder (*Dryden*). 2. To run on wheels (*Dryden*). 3. To perform a periodical revolution (*Dryden*). 4. To move with the surface variously directed (*Milton*). 5. To float in rough water (*Pope*). 6. To move as waves or volumes of water (*Temple*). 7. To fluctuate; to move tumultuously (*Pope*). 8. To revolve on an axis (*Sandys*). 9. To be moved with violence (*Milton*).

ROLL. *s.* (from the verb.) 1. The act of rolling; the state of being rolled. 2. The thing rolling (*Thomson*). 3. (*rouleau*, Fr.) Mass made round (*Addison*). 4. Writing rolled upon itself (*Prior*). 5. A round body rolled along; a cylinder (*Mortimer*). 6. (*rotulus*, Lat.) Public writing (*Hale*). 7. A register; a catalogue (*Davies*). 8. Chronicle (*Dryden*). 9. (*rolé*, Fr.) Part; office: not in use (*L'Estrange*).

ROLL, in manufactories, something wound and folded up in a cylindrical form.

Few stuffs are made up in rolls, except sattins, gawses, and crapes, which are apt to break, and take plaits not easy to be got out, if folded otherwise. Ribbons, laces, galloons, and paduas of all kinds, are also thus rolled.

A roll of tobacco is tobacco in the leaf, twisted on the mill, and wound twist over twist, about a stick or roller. A great deal of tobacco is sold in America in rolls of various weights; and it is not till its arrival in England, Spain, France, and Holland, that it is cut. A roll of parchment properly denotes the quantity of sixty skins.

The ancients made all their books up in the form of rolls, and in Cicero's time the libraries consisted wholly of such rolls.

ROLL, in law, signifies a schedule or parchment which may be rolled up by the hand into the form of a pipe.

In these schedules of parchment all the pleadings, memorials, and acts of court, are entered and filed by the proper officer; which being done, they become records of the court. Of these there are in the exchequer several kinds, as the great wardrobe-roll, the cofferer's-roll, the subsidy-roll, &c.

Roll is also used for a list of the names of persons of the same condition, or of those who have entered into the same engagement. Thus a court-roll of a manor is that in which the names, rents, and services of each tenant are copied and inrolled.

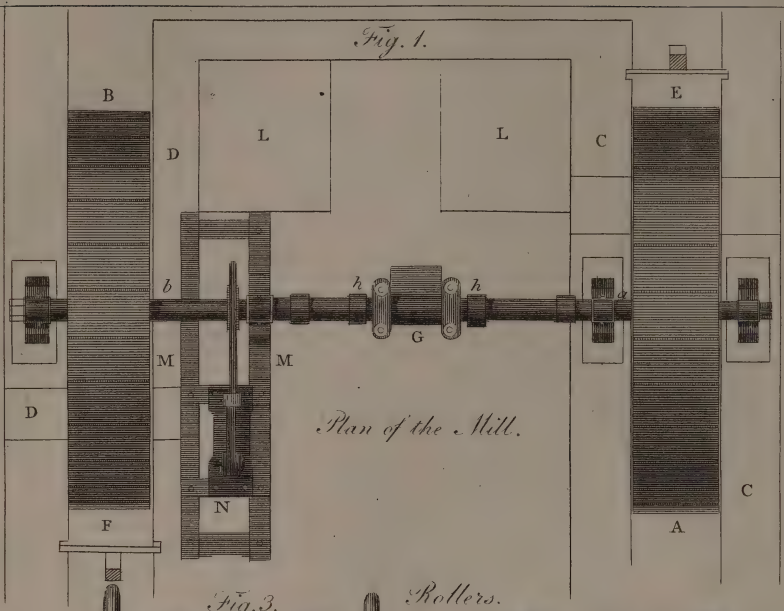
ROLL (Muster), that in which are entered the soldiers of every troop, company, regiment, &c.

As soon as a soldier's name is written down on the roll, it is death for him to desert.

ROLLS-OFFICE, is an office in Chancery-lane, London, appointed for the custody of the rolls and records in chancery.

ROLLS OF PARLIAMENT, are the manuscript registers, or rolls of the proceedings of our ancient parliaments, which before the invention of printing were all engrossed on parchment, and proclaimed openly in every county. In these rolls are also contained a great many decisions of difficult points of law, which were frequently in former times referred to the decision of that high court.

ROLL, or ROLLER, is also a piece of wood, iron, brass, &c. of a cylindrical form, used in the construction of several machines, and in several works and manufactures.



ROLLED BACK, in botany. See REVOLUTE.

ROLLER, in surgery, a long and narrow bandage, usually of linen-cloth, rolled round any part of the body, to keep it in, or dispose it to a state of health.

ROLLER, in ornithology. See CORACIAS.

ROLLIN (Charles), a celebrated French writer, was born at Paris in 1661. After studying in the college of Plessis, he became rector of the university, and professor of eloquence, and member of the academy of Inscriptions, but having sided with the Jansenists against the Jesuits, he was removed from his offices. He wrote the Roman History down to about 70 years short of the battle of Actium, the Ancient History of the Egyptians, Cartha-

ginians, Babylonians, &c. in 8 vols. 8vo. as also a Treatise upon the manner of studying and teaching the Belles Lettres. This excellent man died in 1741.

ROLLING. A word applied to that rapid pulsation of the drum by which the sounds so closely succeed each other, as to beat upon the ear with a rumbling continuity of effect.

Rolling, the motion by which a ship rocks from side to side like a cradle, occasioned by the agitation of the waves. Rolling, therefore, is a sort of revolution about an imaginary axis passing through the centre of gravity of a ship: so that the nearer the centre of gravity is to the keel, the more violent will be the rolling motion; because the centre about which the vibrations are made is placed so low in the bottom, that the resistance made by the keel to the volume of water which it displaces in rolling, bears very little proportion to the force of the vibration above the centre of gravity, the radius of which extends as high as the mast-heads. But if the centre of gravity is placed higher above the keel, the radius of vibration will not only be diminished, but an additional force to oppose the motion of rolling will be communicated to that part of the ship's bottom which is below the centre of gravity. So far as relates to the effect of rolling, when produced by the quality or stowage of the ballast, and to the manner by which it may be prevented, viz. a change of the quantity or disposition of the ballast, we shall endeavour to explain under the article Trim. It may, however, be necessary to remark that the construction of the ship's bottom may also contribute to diminish this movement considerably. Many fatal disasters have happened to ships arising from a violent rolling; as the loss of the masts, loosening of the cannon, and straining violently on the decks and sides, so as to weaken the ship to a great degree.

Rolling mill, in mechanics, a machine employed to laminate or flatten metals to a uniform thickness, by passing between iron rollers fixed in a strong frame, and turned round by the power of a water mill. This machine is very generally employed for making iron bars and plates, for rolling brass and copper plates: and the reduction of gold and silver to the proper thicknesses for the artificer, is almost exclusively performed by rolling; as this method makes no waste, is the most expeditious, and produces better work than any other method of reducing, particularly where an even surface is an object; such, for example, as in gold or silver which is always to be polished.

Plate 150 is a representation of a rolling mill, such as is used in the iron works, for reducing irregular masses of iron into thin flat plates, or parallel bars for hoops, &c. and other purposes which have been detailed under the article Iron manufacture. Fig. 1 is a plan of the mill, figs. 2 and 3 are separate views of the rollers, and fig. 4 is a detached view of the shears for cutting off the ends of iron bars. AB, fig. 1, are the two water wheels, having iron axes *ab* which are supported on bearings which lie upon the walls CC and DD, enclosing the wheels, and confining the water to act upon its float boards. E and F are the shuttles which admit the water to the wheels; the water wheels (which are undershot) turn in contrary directions to each other. The wheel B is connected with the lowest of the two rollers at G, and A turns the upper roller. These rollers are seen in figs. 2 and 3, where G is the upper and H the lower roller. Their gudgeons turn on brasses which are fitted into strong pieces of iron II, KK, having holes through their ends to receive four strong iron bolts *dd*, which form the frame to retain the rollers at the proper distance. The upper ends of these bolts are cut with screws, upon which nuts are fitted, and these being turned round by their handles *ee*, screw down the pieces KK, and advance the rollers nearer together; or by a contrary motion increase the distance between them: *f*, fig. 2, is a strong iron bar extended from one bolt *d* to the other; it supports an iron plate, fig. 3, forming a kind of table before the rollers to guide the iron through them. The rollers have square heads upon the ends of their gudgeons, upon which squares large cast iron sockets *h* are fitted; and these at the other ends are fitted on similar squares upon the ends of the water wheel axis *ab*. A little play or looseness is admitted in all these squares, because the upper roller being set at different heights, according to the work which is to be rolled between them, this play is required to allow the rollers to move when they are not exactly in the line of the water wheel's axis. At LL in fig. 1 are the furnaces for heating the iron to be rolled; they are a kind of oven into which the iron is introduced, and remains till heated to a white heat; it is then taken out by a pair of pincers and presented to the rollers, (the water wheels being previously set in motion by drawing their shuttles). The rollers draw in the metal, and as they cannot recede from each other because of the nuts of the bolts *dd*, the metal is reduced to the exact thickness of space between them, increasing in length but not at all in breadth. The iron is caught by another workman in front of the rollers, and returned over the top roller to the first man who puts it through again, first giving the handles *ee* of the nuts a small turn to bring the rolls nearer together. In this manner it is repeatedly rolled, till it is reduced to any required length and thickness; but the breadth is not at all increased by rolling; and if it is required to increase the breadth it is done by putting the iron obliquely through the rollers, or if a great increase is wanted the iron is put through breadthwise.

Iron plate is rolled out from short pieces of iron bar, which are cut from the bars by a pair of shears, fig. 4 and fig. 1. MM are two strong beams bedded on the walls, and having two cross beams on which an iron plate N is bolted. This plate, see fig. 4, has a piece *m* fixed to it, which is the joint of the shears. The upper blade Q is supported at the end in an upright P, having a groove through it to receive the lower blade O, which is a long lever, and its

end rests upon the circumference of an elliptical wheel R fixed on the axis of the water-wheel B, which as it revolves lifts up the lever closing the shears, and cutting any iron bar which is put in between them. The blades consist of plates of steel *s* screwed to the cast-iron arms. The workman puts the end of the bar into the opening S, and when the shears open, he introduces it between the blades; as the mill closes them, they cut at once through the bar, though some are as much as 3 inches wide and 1 inch thick.

RO'LLINGPIN. *s.* (*rolling* and *pin.*) A round piece of wood tapering at each end, with which paste is moulded (*Wiseman*).

RO'LLING-PRESS. *s.* A cylinder rolling upon another cylinder, by which engravers print their plates upon paper. See PRINTING.

ROLLO (John), M. D. was born at Dundee, in North Britain, in the year 1755. Devoting himself to the medical profession, he studied first in the neighbourhood of his native place, and afterwards at Edinburgh. Early in life he was appointed an ordnance surgeon, and in consequence went abroad with the army, and continued several years in the West Indies. On his return to England about 1790, he commenced private practice as a surgeon at Woolwich. But in the year 1793 he was appointed a surgeon to the Royal Horse Artillery: and in March 1794, on the death of Dr. Urwin (his son, the present surgeon-general, being abroad,) he was promoted to the rank of surgeon-general of the Royal Artillery. The duties of this important employment he discharged with great honour to himself, with singular benefit to the junior and assistant surgeons, and with a feeling and skilful regard to the sick and wounded soldiery, till within two or three years of his death, when personal infirmities and domestic afflictions incapacitated him for active exertion. He died at Woolwich, in December 1809, after a lingering indisposition, and was buried at the neighbouring village of Plumstead.

Dr. Rollo, during the most active part of his life, was much distinguished for his professional talents. He published two respectable works. The first entitled An Account of the Artillery Hospital at Woolwich. The second, Cases of the Diabetes Mellitus, in an 8vo vol. This is a very interesting work, in which the author proposes a new theory of that lamentable disorder, and deduces from it a new mode of treatment, which has been often adopted with success; and which, indeed, though the theory has by no means so many advocates as it had a few years ago, has led to an entire change in the manner of treating the malady. See DIABETES.

RO'LLYPOOLY. *s.* A sort of game, in which, when a ball rolls into a certain place, it wins (*Arbuthnot*).

RO'MAGE. *s.* (*ramage*, Fr.) A tumult; a bustle; an active and tumultuous search for any thing (*Shakspeare*).

ROM, an island of Denmark, on the E. coast of S. Jutland. It is seven miles long and nearly three broad, and contains a few villages.

ROMAGNA, a province of Italy, bounded on the N. by the Ferrarese, E. by the gulf of Venice, S. by Tuscany and Urbino, and W. by the Bolognese and Tuscany. It is fertile in corn, wine, oil, and fruits; and has also mines, mineral waters, and salt-works, which make its principal revenue. This province lately belonged to the Ecclesiastical State, but is now a part of the new-formed kingdom of Italy. Ravenna is the capital.

ROMAINMOTIER, a town of Swisserland, in the Pays de Vaud, capital of a bailiwic, with a castle; seated in a narrow valley, through which flows the river Diaz, 11 miles S.W. of Yverdun.

ROMAN, in general, something belonging to the city of Rome. See ROME.

ROMANS (King of the), in modern history, is a prince elected to be successor to the reigning emperor of Germany.

ROMAN CATHOLICS. See PAPISTS.

ROMAN ALUM. See ALUMEN.

ROMANCE, in literature, a fabulous relation of certain adventures designed for the entertainment and instruction of the readers, and differing from the novel as it always exhibits actions great, dangerous, and generally extravagant. Many authors of the first name have written on the ancient romance. It has exercised the pen of Hurd, of Warburton, and of some ladies, who have not thought it any derogation to the sensibility of their sex to unite antiquarian research with the cultivation of the belles lettres. We have not, however, seen any where so concise, just, and elegant an account of the origin and progress of romances as in D'Israeli's Curiosities of Literature. "Romance (says this writer) has been elegantly defined the offspring of fiction and love. Men of learning have amused themselves with tracing the epocha of romances. In this research they have displayed more ingenuity than judgment; and some have fancied that it may have existed as far back as the time of Aristotle; Dearchus, one of his disciples, having written several works of this amusing species.

"But romance was in fact the current name for all those popular dialects of Europe which were formed from the Roman, which itself retained the name of Latin; and a romance was originally nothing more than a history or poem in the popular language. Mary, the Norman poetess, when she translates any thing into the language of her country, says always, such a work *en Romans*. Thus, in a version of Cato's Distichs, she says:

"Seignor ains Re je vous commans
Espondre Caton *en Romans*."

Also, in her translation of Æsop's Fables:

"Au finement de cest escrit
Quen Romans ai fine et dit."

"Soon, however, romances became a monstrous assemblage of histories, in which truth and fiction were equally blended, but all without probability; a composition of amorous adventures, and all the extravagant ideas of chivalry. The incidents are infinitely multiplied; destitute of connection, of order, and

art. These are the ancient and miserable romances which Cervantes, in his celebrated satirical romance of Don Quixote, has covered with an eternal ridicule.

"It is, however, from these productions rather in their improved state, that poets of all nations have drawn their richest inventions. The agreeable wildness of that fancy which characterised the eastern nations was caught by the crusaders. When they returned home, they mingled in their own the customs of each country. The Saracens, who were men like themselves, because they were of another religion, and were therefore their enemies, were pictured under the tremendous form of Paynim Giants. The credulous reader of that day followed with trembling anxiety the Red cross Knight. It was thus that fiction embellished religion, and religion invigorated fiction. Such incidents have enlivened the cantos of Ariosto, and adorned the epic of Tasso. Spenser is the child of their creation; and it is certain that we are indebted to them for some of the bold and strong touches of Milton."

To ROMA'NCE. *v. n.* (from the noun.) To lie; to forge (*Pamela*).

ROMA'NCER. *s.* (from *romance*.) A liar; a forger of tales (*Tate*).

To RO'MANIZE *v. a.* (from *roman*, Fr.) To latinize; to fill with modes of the Roman speech (*Dryden*).

ROMANI, a town of European Turkey, in Moldavia, and a bishop's see: seated on the Siret, 50 miles W.S.W. of Jassy.

ROMANIA, a province of Turkey in Europe, 200 miles long and 130 broad; bounded on the N. by Bulgaria, E. by the Black sea, S. by the sea of Marmora and the Archipelago, and W. by Macedonia. It was formerly called Thrace, and is the largest of all the Turkish provinces in Europe. It is fruitful in corn, and has mines of silver, lead, and alum. It is divided into three sangiacates, or governments, the capitals of which are Philipopoli, Gallipoli, and Constantinople.

ROMANO (Giulio), a famous painter, was the disciple of Raphael, who had such an affection for him, that he appointed him, with John Francis Penni, his heir. His conceptions were more extraordinary and more elevated than even those of his master, but not so natural. He was wonderful in the choice of attitudes; but did not perfectly understand the lights and shades, and is frequently harsh and ungraceful. The folds of his draperies, says Du Fresnoy, are neither beautiful nor great, easy nor natural, but all extravagant, like the fantastical habits of comedians. He was, however, superior to most painters, by his profound knowledge of antiquity; and by conversing with the works of the most excellent poets, particularly Homer, he made himself master of the qualifications necessarily required in a great designer. Giulio Romano was also well skilled in architecture. He was employed by cardinal de Medicis, who was afterwards pope under the name of Clement VII. and afterwards went to Mantua, whither he was invited by Frederic Gonzaga, marquis of that city, in order to avoid his being justly punished for his having drawn at Rome the designs of 20 obscene plates, engraved by Mark Antony, to which Aretine added the same number of sonnets. Giulio Romano embellished the city of Mantua with many of his performances both in painting and architecture; and died in that city in 1545, at 54 years of age, much regretted by the marquis, who had an extraordinary friendship for him.

ROMANS (The Epistle of St. Paul to the), was written at Corinth, in the beginning of the year 58, according to some writers; though others place it towards the end of the same year.

The Christian church at Rome consisted of a mixture of Jewish and Gentile converts; and this letter was intended to compose any differences that might arise among them concerning the preferences claimed by either. The Jews assumed glory to themselves that God had given them the law and the prophets; that they had worshipped the true God; and that the Messiah was to spring from their nation. The Gentiles on the contrary maintained, that though God had not been revealed to them, as he had been to the Jews, their philosophers had nevertheless known him; that though the Messiah had been promised, and afterwards sent to the Jews, yet they had rejected him, and the greatest part of them had continued unbelieving. St. Paul shows that neither the one nor the other had reason to boast: not the Gentiles, because though the wisest among them had discovered the true God, by the light of nature, they had not honoured him, but had delivered themselves up to the worship of false gods: nor the Jews, because not having observed their law, they had not availed themselves of the advantages arising from it: and he confounds them both by showing that they are only justified by faith in Jesus Christ, to which God in his mercy hath called both Jew and Gentile, without any merit of theirs. St. Paul's great drift through this whole epistle is evidently to fix on the minds of the Christians to whom he writes, a deep sense of the excellency of the gospel, and to engage them to act suitably to their profession of it.

Such is the general sketch of this Epistle. The particular questions debated in it are these, viz. 1. "Whether the Gentiles are at all to be admitted into the church and kingdom of the Messiah? or, at least, 2. Whether both they and the Jews ought not to observe the ceremonial law along with the Christians? 3. Whether the true religion were so appropriated and confined to the Jewish nation and the Jewish land, as that for their obstinacy they could never be cut off and excluded from the church of God?" Of these questions, which form a key to this very difficult epistle, the first two are handled in the first eight chapters, and some particular branches of them in the 13th, 14th, and 15th. The third is treated in the 9th, 10th, and 11th chapters.

The remainder of the Epistle is taken up in

a variety of practical instructions and exhortations, to charity, peace ableness, purity, &c. the grand design of all which is to engage Christians to act in a manner worthy of that gospel, whose excellence the Apostle had been displaying.

It is for want of attending to the true nature of the questions treated of in this and some of the epistles, that so many vain disputes have perplexed the minds of Christians concerning faith and works, justification and sanctification, election and reprobation, &c. all which have arisen from the grand mistake of applying certain words and phrases in these apostolical letters to themselves or other particular persons, which evidently referred to the state and condition of whole churches, either Jewish or Gentile, at that particular period, and not of private Christians in all ages.

ROMA'NTIC. *a.* (from *romance.*) 1. Resembling the tales of romances; wild (*Keil*). 2. Improbable; false. 3. Fanciful; full of wild scenery (*Thomson*).

ROME, a city of Italy, in Campagna di Roma, capital of the Ecclesiastical State, and the residence of the pope. It is the ancient Latium, and one of the finest and most famous cities in the world, situate on the Tiber, over which it has four bridges. The walls are of brick, in which are 15 gates; and its whole circumference, including that part beyond the Tiber and all belonging to the Vatican, is upward of 16 miles. It is computed to contain 162,000 inhabitants, which though greatly inferior to what it could boast in the days of its ancient power, is considerably more than it could number at some former periods since the fall of the empire. Some of the principal streets are of considerable length, and perfectly straight. That called the Corso is the most frequented. Here the nobility display their equipages during the carnival, and take the air in the evenings, in fair weather. The shops on each side are three or four feet higher than the street; and there is a path for foot passengers, on a level with the shops. The palaces, of which there are several in this street, range in a line with the houses, having no courts before them. The Strada Felice, and the Strada di Porta Pia, are also very long and noble streets. There are no lamps lighted in the streets at night; and all Rome would be in utter darkness, were it not for the candles which the devotion of individuals sometimes places before the statues of the Virgin: these appear glimmering, at vast intervals, like stars in a cloudy night. Rome exhibits a strange mixture of magnificent and interesting, and of common and beggarly objects; the former consists of palaces, churches, fountains, and the remains of antiquity; the latter comprehend all the rest of the city. The church of St. Peter, in the opinion of many, surpasses, in size and magnificence, the finest monuments of ancient architecture. It was begun to be built in 1506, finished in 1621, and is entirely covered both within and without with marble. Its length is 730 feet, the breadth 520, and the height, from the pavement to the top of the cross which crowns the cupola, 450. The high altar under the cupola is 90 feet in height, and of extraordinary magnificence. A complete description of this church, and of its statues, basso-relievos, columns, and various other ornaments, would fill volumes. The cathedral of St. John Lateran, the Romans say, is the most ancient of all the churches of Rome, and the mother of all the churches in Christendom. It contains the Scala Santa, of 28 white marble steps, brought from Jerusalem, by which Christ is said to have ascended to the palace of Caiaphas. To this church every new pope constantly goes first, in a magnificent procession, to take possession of the holy see. The Pantheon is the most perfect of the Roman temples which now remain, and notwithstanding the depredations it has sustained from Goths, Vandals, and popes, is still a beautiful monument of Roman taste. The pavilion of the great altar of St. Peter, and the four wreathed pillars of Corinthian-brass which support it, were formed out of the spoils of the Pantheon, which, after 1900 years, has still a probability of outliving its proud capacious rival. The Pantheon, originally erected to the honour of all the gods, is now become a christian temple, dedicated to the Virgin, and has obtained, from its circular form, the name of the Rotundo. Its height is 150 feet, and its width nearly the same. There are no pillars to support the roof, which is constructed in the manner of a cupola; neither has it any windows, a sufficiency of light being admitted through a central opening in the dome. As the Pantheon is the most entire, the amphitheatre of Vespasian is the most stupendous monument of antiquity in Rome. About one half of the external circuit still remains; from which a pretty exact idea may be formed of the original structure, and by computation it could contain 85,000 spectators. But the antiquities of Rome are too numerous to be minutely described; so that the ancient Forum, now a cow-market; the beautiful column of Trajan, &c. must be passed over. The Campidoglio, built by Michael Angelo, is a beautiful structure, standing on the site of the ancient Capitol, so long the centre of the empire of the world. The body of this palace is the residence of the senators of Rome, and the wings are inhabited by the conservatores of the city. The pope has three superb palaces, of which the principal is the Vatican, near St. Peter's church. The library of this palace is the largest and most complete in the world; rich, especially in manuscripts, in all languages, and of all ages. In Rome the connoisseur will meet with innumerable paintings by the greatest masters, and with the finest works of sculpture, &c. Beside the university, which consists of several noble colleges, there are numerous academies and literary societies. The castle of St. Angelo serves more to keep the city in awe, than to repel any foreign attack. Rome was entered, in 1798, by the French, and in consequence of a tumult, in which their

general was killed, they deposed the pope, abolished the papal government, and erected in its stead a republic, styled the Roman Republic. The aged pope they sent to France, where he died on his various removals; they also sent away a great number of the most valuable statues and paintings, and levied heavy contributions on the inhabitants. However, in 1799, the city was retaken by the allies, the new republic overthrown, and the papal government restored. Rome is 110 miles N.W. of Naples, 410 S.S.W. of Vienna, and 600 S.E. of Paris. Lon. 12. 29 E. Lat. 41. 54 N.

RO'MISH. *a.* (from *Rome.*) Popish (*Ayliffe*).

ROMNEY, a town of the county of Kent. It is one of the cinque-port towns, and is seated on a marsh of the same name, famous for feeding cattle; but the air is very unhealthy. It was once a large and populous place, but the retiring of the sea has reduced it very much: however, it sends two members to parliament.

ROMONT, or RODMONT, a strong town of Switzerland, in the canton of Friburg, seated on a mountain, 10 miles from Friburg, and 12 from Bern. Lon. 7. 1 E. Lat. 46. 50 N.

ROMORENTIN, a town of France, in the department of Loir and Cher, and late province of Blaisois, with a castle, on the brook Morentin, which loses itself in the Saudre. On one of its gates is inscribed *Romo Minor*; but there is nothing to justify this appellation. On the contrary, were it not for its manufactures of serges and cloths, which are very good, this place would be scarcely known. It is 45 miles east of Tours, and 100 south by west of Paris. Lon. 1. 47 E. Lat. 47. 22 N.

ROMP. *s.* 1. A rude, awkward, boisterous, untaught girl (*Arbuthnot*). 2. Rough rude play (*Thomson*).

To ROMP. *v. n.* To play rudely, noisily, and boisterously (*Swift*).

ROMPEE, or ROMPU, in heraldry, is applied to ordinaries that are represented as broken; and to chevrons, bends, or the like, whose upper points are cut off.

ROMSEY. See RUMSEY.

ROMULUS, the son of Mars and the vestal Rhea, otherwise called Silvia and Ilia. Lucius Terentius Fermianus, a person well skilled in the curious sciences of the Chaldæans, having exactly observed the life and death of Romulus, says, he was born the 21st day of Thoth, which is our August, at sun-rising, and that he was begot the 23d of Cheac, which is our November, at three in the afternoon, in the first year of the second olympiad. Plutarch says, that the sun on the day of his conception suffered a great eclipse from eight to nine in the morning: Ant. Contius will have him to be born in the first year of the first olympiad, and Fuccius asserts he was born in the third year of the second olympiad. He with his brother were by Amulius's command exposed to be drowned in the Tiber; but Faustulus, who was Numitor's shepherd, saved him and his brother Remus, and they were both nursed by his wife. The story is, that they were suckled by a she-wolf, because of the lewdness of Laurentia, Faustulus's wife, which gave occasion to the fable. But the thing has been even so represented on the consulary medals, where we have a she-wolf and two twins sucking her. Romulus traced out the plan of his new city and prescribed laws to his people, who coalesced together from all parts into a body; for he made an asylum of a vale lying at the foot of Mons Capitolinus, for all those that came thither; which increased the number of his subjects in a very little time. He regulated matters of religion, divided his people into three tribes, and each tribe into curiæ or parishes: each curia chose its own priests, priestesses, augurs, and camillæ, who were to supply what was requisite for the charge of the sacrifices and sacred feasts that were solemnized throughout a curia at certain times. Pliny speaks of a society instituted by Romulus, somewhat like unto the knights of the former French king's order, and they were called Fratres Arvales; Romulus was the sovereign or grand-master of the order, the ensign of which was a crown of ears of corn tied with a white riband, and this dignity they held for life. He was killed in a scuffle; others affirm that he was cut in pieces by the senate, who gave out that the gods had carried him into heaven. He was deified and worshipped under the name of Quirinus, according to the relation of Proculus: Dionysius of Halicarnassus says, he lived 55 years, and Plutarch 54, and that he reigned 37. We have medals of the emperor Antoninus Pius where Romulus is represented habited like Mars with a javelin in one hand, and with the other holding a trophy on his shoulders with this inscription, *Romulo Augusto.*

Gronovius excepts against all that has been said by such a multitude of authors (concerning the origin of Romulus) for near 2500 years. He pretends that a Greek named Diocles was the first who invented the fable of the she-wolf's suckling Romulus and Remus, who were exposed by Amulius's order to be destroyed, and begotten by Mars upon Rhea Silvia a vestal; and he is so assured that there is no need to refute this fable, that he lays it down as an established principle that Romulus was not born in Italy, but that he came thither from another country; and the proof he gives for it is, that no people of Italy would supply the first inhabitants of Rome with wives. But it is by no means to be thought, in case Romulus was owned to be the grandson of Numitor, after his expelling the usurper Amulius, and re-establishing his grandfather upon the throne, but that he would have found the Albans inclined to make an alliance with him, and to supply him and his people with wives. Whereas it is supposed he had recourse to the Sabines or some other people: who having refused him, he resolved upon the entire extirpation of them. Other authors will have Romulus to be a Greek by birth; for this his name implies, as Salmasius says, who thought

the word Romulus to be a diminitive of ῥωμὴ, which in the Eolic dialect signifies strength: Gronovius is of opinion, that Romulus was neither a Gaul nor African, but a Syrian; since Josephus and Nicephorus translated the name by υἱος Ρωμελιω, the son of Romelia, of whom mention is made in scripture.

RONCIGLIONE, a town of Italy, in the ecclesiastical state, and patrimony of St. Peter. Lon. 13. E. Lat. 42. 12 N. It is a small place, but had a pretty good trade, and was one of the richest in the province while it belonged to the dukes of Parma, which was till 1646, when pope Innocent X. became master of it, and it has ever since continued in the possession of his sucessors.

RO'NDEAU. *s.* A kind of ancient poetry, commonly consisting of thirteen verses; of which eight have one rhyme and five another: it is divided into three couplets, and at the end of the second and third, the beginning of the *rondeau* is repeated in an equivocal sense, if possible (*Trevoux*).

RONDELETIA, in botany, a genus of the class pentandria, order monogynia. Corol funnel-form; capsule two-celled, inferior, many-seeded, roundish, crowned. Thirteen species; some with numerous seeds; others with seeds mostly solitary: natives of the West Indies or South America.

The species chiefly cultivated is rondeletia Americana, American rondeletia; with a woody stalk ten or twelve feet high; leaves sessile, opposite, lanceolate: panicle forked; flowers sessile, white.

RONDLE, a round mass.

RONDO, (Ital.) or RONDEAU (Fr.). In music, a composition, vocal or instrumental, generally consisting of three strains, the first of which closes in the original key, while each of the others is so constructed in point of modulation as to reconduct the ear in an easy and natural manner to the first strain. This construction is an inherent and indispensable quality in the rondo, since it takes its name from the circumstance of the melody going round, after both the second and third strain, to the first strain, with which it finally closes. In the vocal rondo considerable discernment is requisite in the choice of proper words. The lines of the first strain should be complete in themselves, while those of each of the other strains should not only rise out of them, but, like the music, lead to them again.

RO'NION. *s.* (*rognon*, French, the loins.) A fat bulky woman (*Shakspeare*).

RONSARD (Peter de), a French poet, born in the Vendomois, in 1524, was educated in the college of Navarre, at Paris. He was page to the duke of Orleans, who transferred him to James Stuart king of Scotland, who had married Madelaine of France. His poems were once held in extraordinary estimation. He died in 1585.

RONT. *s.* An animal stinted in the growth; commonly pronounced *runt* (*Spenser*).

ROOD. *s.* (from *rod.*) 1. The fourth part of an acre in square measure, or 1210 square yards (*Swift*). 2. A pole; a measure of sixteen feet and a half in long measure (*Milton*). 3. (ꝓoꝺe, Saxon.) The cross; sometimes an image of a saint (*Shakspeare*).

ROO'DLOFT. *s.* (*rood* and *loft.*) A gallery in the church on which reliques or images were set to view.

ROOF. *s.* (hꝛoꝼ, Saxon.) 1. The cover of a house (*Shakspeare*). 2. The house in general (*Chapman*). 3. The vault; the inside of the arch that covers a building (*Hooker*). 4. The palate; the upper part of the mouth (*Bacon*).

To ROOF. *v. a.* (from the noun.) 1. To cover with a roof (*Creech*). 2. To enclose in a house (*Shakspeare*).

ROOF, in architecture, the uppermost part of a building; being that which forms the covering of the whole.

The roof contains the timber-work and its furniture of slate or tile, wherewith the house is covered, or that which serves it as a cover. Though carpenters usually restrain roof to the timber-work only.

The roofs in Persia and Arabia are flat, but those of Greece are without exception sloping. It seems therefore a gross violation of the true principles of taste in architecture (at least in the regions of Europe), to take away or to hide the roof of a house; and it must be ascribed to that rage for novelty which is so powerful in the minds of the rich. Our ancestors seemed to be of a very different opinion, and turned their attention to the ornamenting of their roofs as much as any other part of a building. They showed them in the most conspicuous manner, running them up to a great height, broke them into a thousand fanciful shapes, and stuck them full of highly dressed windows. We laugh at this, and call it gothic and clumsy; and our great architects, not to offend any more in this way, conceal the roof altogether by parapets, balustrades, and other contrivances. Our forefathers certainly did offend against the maxims of true taste, when they enriched a part of a house with marks of elegant habitation, which every spectator must know to be a cumbersome garret: but their successors no less offend, who take off the cover of the house altogether, and make it impossible to know whether it is not a mere skreen or colonnade we are looking at.

The architect is anxious to present a fine object, and a very simple outline discusses all his concerns with the roof. He leaves it to the carpenter, whom he frequently puzzles (by his arrangements) with coverings almost impossible to execute. Indeed it is seldom that the idea of a roof is admitted by him into his great compositions; or if he does introduce it, it is from mere affectation, and we may say pedantry. A pediment is frequently stuck up in the middle of a grand front, in a situation where a roof cannot perform its office; for the rain which is supposed to flow down its sides must be received on the top of the level buildings which flank it. This is a manifest incongruity. The tops of dressed windows, trifling porches, and sometimes a projecting por-

tico, are the only situations in which we see the figure of a roof correspond with its office. Having thus lost sight of the principle, it is not surprising that the draughtsman (for he should not be called architect) runs into every whim: and we see pediment within pediment, a round pediment, a hollow pediment, and the greatest of all absurdities, a broken pediment. Nothing could ever reconcile us to the sight of a man with a hat without its crown, because we cannot overlook the use of a hat.

But when one builds a house, ornament alone will not do. We must have a cover; and the enormous expense and other great inconveniences which attend the concealment of this cover by parapets, balustrades, and screens, have obliged architects to consider the pent roof as admissible, and to regulate its form. Any man of sense, not under the influence of prejudice, would be determined in this by its fitness for answering its purpose. A high pitched roof will undoubtedly shoot off the rains and snows better than one of a lower pitch. The wind will not so easily blow the dropping rain in between the slates, nor will it have so much power to strip them off. A high pitched roof will exert a smaller thrust on the walls, both because its strain is less horizontal, and because it will admit of lighter covering. But it is more expensive, because there is more of it. It requires a greater size of timbers to make it equally strong, and it exposes a greater surface to the wind.

There have been great changes in the pitch of roofs: our forefathers made them very high, and we make them very low. It does not, however, appear that this change has been altogether the effect of principle. In the simple unadorned habitations of private persons, every thing comes to be adjusted by an experience of inconveniences which have resulted from too low pitched roofs; and their pitch will always be nearly such as suits the climate and covering. Our architects, however, go to work on different principles. Their professed aim is to make a beautiful object. The sources of the pleasures arising from what we call taste are so various, so complicated, and even so whimsical, that it is almost in vain to look for principle in the rules adopted by our professed architects. We cannot help thinking, that much of their practice results from a pedantic veneration for the beautiful productions of Grecian architecture. Such architects as have written on the principles of the art in respect of proportions, or what they call the ordonnance, are very much puzzled to make a chain of reasoning; and the most that they have made of the Greek architecture is, that it exhibits a nice adjustment of strength and strain. But when we consider the extent of this adjustment, we find it is wonderfully limited. The whole of it consists of a basement, a column, and an entablature; and the entablature, it is true, exhibits something of a connection with the framework and roof of a wooden building; and we believe that it really originated from this in the hands of the orientals, from whom the Greeks certainly borrowed their forms and their combinations. We could easily show in the ruins of Persepolis, and among the tombs in the mountains (which were long prior to the Greek architecture), the fluted column, the base, the Ionic and Corinthian capital, and the Doric arrangement of lintels, beams, and rafters, all derived from unquestionable principle. The only addition made by the Greeks was the pent roof; and the changes made by them in the subordinate forms of things are such as we should expect from their exquisite judgment of beauty.

But the whole of this is very limited; and the Greeks, after making the roof a chief feature of a house, went no further, and contented themselves with giving it a slope suited to their climate. This we have followed, because in the milder parts of Europe we have no cogent reason for deviating from it; and if any architect should deviate greatly in a building where the outline is exhibited as beautiful, we should be disgusted; but the disgust, though felt by almost every spectator, has its origin in nothing but habit. In the professed architect or man of education, the disgust arises from pedantry: for there is not such a close connection between the form and uses of a roof as shall give precise determinations; and the mere form is a matter of indifference.

We should not therefore reprobate the high-pitched roofs of our ancestors, particularly on the continent. It is there where we see them in all the extremity of the fashion, and the taste is by no means exploded as it is with us. A baronial castle in Germany and France is seldom rebuilt in the pure Greek style, or even like the modern houses in Britain; the high pitched roofs are retained. We should not call them Gothic, and ugly because Gothic, till we show their principle to be false or tasteless. Now we apprehend that it will be found quite the reverse; and that though we cannot bring ourselves to think them beautiful, we ought to think them so. The construction of the Greek architecture is a transference of the practices that are necessary in a wooden building to a building of stone. To this the Greeks have adhered, in spite of innumerable difficulties. Their marble quarries, however, put it in their power to retain the proportions which habit had rendered agreeable. But it is next to impossible to adhere to these proportions with freestone or brick, when the order is of magnificent dimensions. Sir Christopher Wren saw this; for his mechanical genius was equal to his taste. He composed the front of St. Paul's church in London of two orders, and he coupled his columns; and still the lintels which form the architrave are of such length that they could carry no additional weight, and he was obliged to truss them behind. Had he made but one order, the architrave could not have carried its own weight.

The principle of what is called a Norman roof is extremely simple. The rafters all butted on joggled king posts AF, BG, CH, &c. (pl. 149, fig. 3.) and braces or ties were then di-

posed in the intervals. In the middle of the roof HB and HD are evidently ties in state of extension, while the post CH is compressed by them. Towards the walls on each side, as between B and F, and between F and L, they are braces, and are compressed. The ends of the post were generally ornamented with knots of flowers, embossed globes, and the like, and the whole texture of the truss was exhibited and dressed out.

This construction admits of employing very short timbers; and this very circumstance gives greater strength to the truss, because the angle which the brace or tie makes with the rafter is more open. We may also perceive that all thrust may be taken off the walls. If the pieces AF, BF, LF, be removed, all the remaining diagonal pieces act as ties, and the pieces directed to the centre act as struts; and it may also be observed, that the principle will apply equally to a straight or flat roof or to a floor. A floor such as *a b c*, having the join in two pieces *a b*, *b c*, with a strut *b d*, and two ties, will require a much greater weight to break it than if it had a continued joist *a c* of the same scantling. And, lastly, a piece of timber acting as a tie is much stronger than the same piece acting as a strut; for in the latter situation it is exposed to bending, and when bent it is much less able to withstand a very great strain. It must be acknowledged, however, that this advantage is balanced by the great inferiority of the joints in point of strength. The joint of a tie depends wholly on the pins; for this reason ties are never used in heavy works without strapping the joints with iron. In the roofs we are now describing, the diagonal pieces of the middle part only act purely as ties, while those towards the sides act as struts or braces. See farther the article CARPENTRY.

ROOFY. *a.* (from *roof*.) Having roofs (*Dryden*).

ROOK, in ornithology. See CERVUS.

ROOK denotes, 1. A common man at chess (*Dryden*). 2. A cheat; a trickish rapacious fellow (*Wycherly*).

To ROOK. *v. n.* To rob; to cheat (*Hudibras*).

ROOKE (Sir George), a gallant English admiral, was born of a good family in Kent, in 1650. He entered early into the navy, and rose by his merit to the first honours of his profession. He gave eminent proofs of his skill and courage in many expeditions, particularly in burning the French ships at La Hogue, at the battle off Malaga, and in the glorious action at Vigo. The taking of Gibraltar shewed his spirit and sagacity in the clearest light. He sat in parliament for Portsmouth, and distinguished himself as an honest independent senator Sir George died in 1709, and was buried in Canterbury cathedral.

ROOKE (Laurence), an English astronomer, was born at Deptford, in Kent, in 1623, and educated at King's college, Cambridge, from whence he removed to Oxford. In 1652 he was appointed Gresham professor of astronomy, and distinguished himself as one of the founders of the Royal Society. He died in 1662. Some astronomical tracts by him have been printed.

ROOKERY, a place where rooks build their nests, breed their young, and usually inhabit and rest in the night, after they have been abroad feeding in the day. Rooks may be taken the same way as pigeons. They are very destructive of corn, especially of wheat, though they clear the ground of caterpillars, that do incredible damage by eating the roots of the corn, and on this account may be considered the farmers friends. They search out the lands where it is sown, and watching them more carefully than the owners, perceive when the seed first begins to shoot up its little blade: as this is the time of feeding on it, they will not be at the pains of searching for it at random in the sown land, for that is more trouble than so small a grain will requite them for; but, as soon as these blades appear they are directed, without loss of time or pains, by them to the places where the grain lies, and in three or four days time they will root up such vast quantities of them, that a good crop is often thus destroyed in embryo. After a few days, the wheat beginning to grow, its blades appear green above ground, and then the time of danger from these birds is over; for then the seeds are so far robbed of their mealy matter, that they are of no value to that bird, and it will no longer give itself the trouble to destroy them.

The best remedy the farmer has, is to mark well the time of the corn's being in the condition to feed upon it; and as this lasts only a few days, he should keep a boy constantly in pay to watch the field from daybreak till the dusk of the evening. Every time they settle upon the ground, or fly over it, the boy is to halloo, and throw up a dead rook into the air: this will always make them rise, and by degrees they will be so tired of this constant disturbance, that they will seek out other places of preying, and will leave the ground even before the time of the corn's being unfit for them. The reason of their rising so suddenly at the tossing up of a dead rook is, that they are naturally extremely apprehensive of danger, and always alarmed when one of their comrades ascends. They take this for the rising of an out-bird, and all fly off at the signal. The shooting young rooks before they fly, when they are called perchers, is a common exercise for young shooters, but there cannot be a worse, as the ample time they have to adjust the aim is directly contrary to the sudden precision required, by the person who shoots flying.

ROOKY, *a.* Inhabited by rooks (*Shakspeare*).

ROOM. *s.* (rum, Saxon; *rums*, Gothic.) 1. Space; extent of place (*Milton*). 2. Space or place unoccupied (*Bentley*). 3. Way unobstructed (*Creech*). 4. Place of another; stead (*Calamy*). 5. Unobstructed opportunity (*Addison*). 6. Possible admission (*Philips*). 7. An apartment in a house (*Pope*).

ROO'MAGE. *s.* (from *room.*) Space; place (*Wotton*).

ROO'MINESS. *s.* (from *roomy.*) Space; quantity of extent.

ROO'MY. *a.* (from *room.*) Spacious; wide; large (*Dryden*).

ROOST. *s.* (hpoꝛt, Sax.) 1. That on which a bird sits to sleep (*Dryden*). 2. The act of sleeping (*Derham*).

To ROOST. *v. n.* (*roesten*, Dutch.) 1. To sleep as a bird (*L'Estrange*). 2. To lodge. In burlesque.

ROOT. *s.* (*rot*, Swedish; *roed*, Danish.) 1. That part of the plant which rests in the ground, and supplies the stems with nourishment (*Evelyn*). 2. The bottom; the lower part (*Milton*). 3. A plant, of which the root is esculent (*Watts*). 4. The original; the first cause (*Davies*). 5. The first ancestor (*Shakspeare*). 6. Fixed residence. 7. Impression; durable effect (*Hooker*).

To ROOT. *v. n.* (from the noun.) 1. To fix the root; to strike far into the earth (*Shakspeare*). 2. To turn up earth. 3. To sink deep (*Fell*).

To ROOT. *v. a.* 1. To fix deep in the earth (*Dryden*). 2. To impress deeply (*South*). 3. To turn up out of the ground; to eradicate; to extirpate (*Raleigh*). 4. To destroy; to banish.

ROOT, in arithmetic and algebra, denotes a quantity which being multiplied by itself produces some higher power; or a quantity considered as the basis or foundation of a higher power, out of which this arises and grows, like as a plant from its root.

In the involution of powers, from a given root, the root is also called the first power; when this is once multiplied by itself, it produces the square or second power; this multiplied by the root again, makes the cube or 3d power; and so on. And hence the roots also come to be denominated the square-root, or cube-root, or 2d root, or 3d root, &c. according as the given power or quantity is considered as the square, or cube, or 2d power, or 3d power, &c. Thus, 2 is the square-root or 2d root of 4, and the cube-root or 3d root of 8, and the 4th root of 16, &c.

Hence, the square-root is the mean proportional between 1 and the square or given power; and the cube-root is the first of two mean proportionals between 1 and the given cube; and so on.

To extract the root of a given number or power. This is the same thing as to find a number or quantity, which being multiplied the proper number of times, will produce the given number or power. So, to find the cube-root of 8, is finding the number 2, which multiplied twice by itself produces the given number 8.

For the usual methods of extracting the roots of numbers, see the common treatises on arithmetic.

A root of any power, that consists of two parts, is called a binomial root; as 12 or 10 + 2. If it consist of three parts, it is a trinomial root; as 126 or 100 + 20 + 6. And so on.

The extraction of the roots of algebraic quantities, is also performed after the same manner as that of numbers; as may be seen in any treatise on algebra. See also the article EXTRACTION.

A general method for all roots, is also by Newton's binomial theorem. See BINOMIAL THEOREM.

Finite approximating rules for the extraction of roots have also been given by several authors, as Raphson, De Lagney, Halley, &c. See the articles APPROXIMATION and EXTRACTION. See also Newton's Universal Arith. the Appendix; Philos. Trans. numb. 210, or Abridg. vol. 1, pa. 81; Maclaurin's Alg. pa. 242; Simpson's Alg. pa. 155; or his Essays, pa. 82, or his Dissertations, pa. 102, or his Select Exerc. pa. 215: where various general theorems for approximating to the roots of pure powers are given.

Dr. Halley's formula for the roots of the first six powers, may be thus expressed. Let a^2, a^3, a^4, &c. be the nearest rational power, whether above or below, and b the difference: then

$$\sqrt{(a^2 \pm b)} = a \pm \frac{ab}{2a^2 \pm \frac{1}{2}b},$$

$$\sqrt[3]{(a^3 \pm b)} = \tfrac{1}{2}a + \sqrt{\tfrac{1}{4}a^2 \pm \frac{b}{3a}}, \text{ or } a \pm \frac{ab}{3a^3 \pm b}$$

$$\sqrt[4]{(a^4 \pm b)} = \tfrac{3}{4}a + \sqrt{\tfrac{1}{8}a^2 \pm \frac{b}{6a^2}}, \text{ or } a \pm \frac{ab}{4a^4 \pm \frac{3}{4}b}$$

$$\sqrt[5]{(a^5 \pm b)} = \tfrac{3}{4}a + \sqrt{\tfrac{1}{16}a^2 \pm \frac{b}{10a^3}}, \text{ or } a \pm \frac{ab}{5a^5 \pm 2b}$$

$$\sqrt[6]{(a^6 \pm b)} = \tfrac{4}{7}a + \sqrt{\tfrac{1}{21}a^2 \pm \frac{b}{15a^4}}, \text{ or } a \pm \frac{ab}{6a^6 \pm \frac{5}{2}b}$$

From whence the nature and shape, both of the rational and of the irrational formula for any higher powers, may be at once seen.

But the most commodious and general rule of any, for such approximations, is that which was invented by Dr. Hutton, and explained in his Tracts, vol. 1, pa. 49: which theorem is this;

$$\frac{n+1 \,.\, \mathrm{N} + n - 1 \,.\, a^n}{n-1 \,.\, \mathrm{N} + n + 1 \,.\, a^n} a = \sqrt[n]{\mathrm{N}}.$$ That is, having to extract the nth root of the given number N; that, a^n the nearest rational power

to that given quantity N, whether greater or less, its root of the same kind being a; then the required root, or $\sqrt[n]{N}$, will be as is expressed in this formula above; or the same expressed in a proportion will be thus:

$\overline{n-1} \cdot N + \overline{n+1} \cdot a^n : n+1 \cdot N + \overline{n-1} \cdot a^n :: a : \sqrt[n]{N}$ the root sought very nearly. Which rule includes all the particular rational formulas of De Lagney, and Halley, which were separately investigated by them; and yet the general formula is perfectly simple and easy to apply, and more easily kept in mind than any one of the said particular formulas.

Ex. Suppose it be required to double the cube, or to extract the cube root of the number 2.

Here $N = 2$, $n = 3$, the nearest root $a = 1$, also $a^3 = 1$; hence, for the cube root the formula becomes $\frac{4N + 2a^3}{2N + 4a^3} a$ or $\frac{2N + a^3}{N + 2a^3} a = \sqrt[3]{N}$.

But $N + 2a^3 = 4$, and $2N + a^3 = 5$; therefore as $4 : 5 :: 1 : \frac{5}{4} = 1 \cdot 2^5$ = the root nearly by a first approximation.

Again, for a second approximation, take $a = \frac{5}{4}$, and consequently $a^3 = \frac{125}{64}$;

hence $2N + a^3 = 4 + \frac{125}{64} = \frac{381}{64}$,

and $N + 2a^3 = 2 + \frac{250}{64} = \frac{378}{64}$;

therefore as 378 : 381, or as 126 : 127 : : $\frac{5}{4} : \frac{635}{504} = 1{\cdot}259921$ &c. for the required cube root of 2, which is true even in the last place of decimals.

Root of an Equation, denotes the value of the unknown quantity in an equation; which is such a quantity, as being substituted instead of that unknown letter, into the equation, shall make all the terms to vanish, or both sides equal to each other.

Every equation has as many roots, or values of the unknown quantity, as are the dimensions or highest power in it. As a simple equation one root, a quadratic two, a cubic three, and so on.

Roots are positive or negative, real or imaginary, rational or radical, &c. See EQUATION, ALGEBRA, and QUADRATICS.

The roots of the equation $x^n - 1 = 0$ or of $x^n = 1$, are 1, $a + \sqrt{a^2-1}$, $a - \sqrt{a^2-1}$, $b + \sqrt{b^2-1}$ $b - \sqrt{b^2-1}$, $c + \sqrt{c^2-1}$, $c - \sqrt{c^2-1}$, &c. where $a = \cos. \frac{360°}{n}$, $b = \cos. \frac{2 \cdot 360°}{n}$, $c = \cos. \frac{3 \cdot 360°}{n}$, $d = \cos. \frac{4 \cdot 360°}{n}$, &c.

ROOT, in botany, that organ of a vegetable which draws in the nourishment, and produces the herb with the fructification.—It is composed of medulla or pith, wood, inner and outer bark: and consists of the caudex, stock or main body; and the ridiculæ or fibres, by which the moisture is immediately imbibed. We commonly regard all that part of a vegetable only which is under ground as the root; but Linnéus comprehends the ascending caudex, or what we commonly term the body, trunk or bole, within his idea. According to him, therefore, trees and shrubs are all root, except the leaves and fructification; and consequently if a tree be turned upside down, the descending caudex will produce leaves, and the ascending caudex will put forth fibres.

A root in duration is—1. Annual. 2. Biennial. 3. Perennial.

In form,—*a*. 4. Fibrose. 5. Branching. 6. Fusiform. 7. Præmorse or bitten off.

b. 8. Creeping. 9. Jointed. 10. Toothed.

c. 11. Globular. 12. Tuberous. 13. Fascicled or bundled. 14. Palmate.

d. 15. Bulbous. 16. Granulate. 17. Tunicated. 18. Solid. 19. Scaly.

In substance,—20. A bulb. 21. A tuber. 22. A fibre. 23. A fibril.

ROOT (China), in botany. See SMILAX.

ROOT (False China), in botany. See SENECIO.

ROOT (Hollow), in botany. See ADOXA.

ROOT (Rose), in botany. See RHODIOLA.

ROOT (Rattle-snake), in botany. See POLYGALA.

ROOT (Snake), in botany. See ARISTOLOCHIA.

ROOT (Sweet), in botany. See ROSA.

ROOTED. *a*. (from *root*.) Fixed; deep; radical (*Hammond*).

ROOTEDLY. *ad*. (from *rooted*.) Deeply; strongly (*Shakspeare*).

ROOTING STEM. In botany. Caulis radicans. Bending to the earth and striking root, but not creeping along.—A rooting leaf. Folium radicans. Shooting forth roots; as in some aquatic plants: this is sometimes called folium radicatum.

ROOT-LEAF. Folium radicale. In botany. Proceeding immediately from the root, or growing next the ground: frequently different from the leaves on the stem and branches; as in campanula rotundifolia.—Peduncles sometimes spring from the root, and may be named root-peduncles.

ROOTLET, radicle, or fibre. See RADICLE.

Root-leaf and rootlet are more proper in English than radical leaf and radicle, on account of the analogy.

ROOTY. *a*. (from *root*.) Full of roots.

ROPE. (nap, Saxon; *roep*, *roop*, Dutch.) 1. A cord; a string; a halter (*Hudibras*). 2. Any row of things depending: as, *a rope of onions*.

To ROPE. *v. n.* (from the noun.) To draw out into viscosities; to concrete into glutinous filaments (*Dryden*).

ROPE-MAKING. The art of uniting ani-

mal or vegetable fibres into an aggregate line, so that the whole may concur in one joint action; and be employed under the form of string, cord, halter, haulser or cable.

Animal fibres are so much more expensive than those of plants, that they are comparatively employed but seldom. Those of this kind most commonly used are generally obtained from the intestines of ruminating quadrupeds, and especially sheep and lambs; the tendrils of the ovary of the squalus canicula (*dog-fish*), or other fishes of a similar structure, or the hair of various animals. The cord produced by the first is called *cat-gut*, and is used, of different powers and diameters, by musicians, watch-makers, cutlers, turners, and a variety of other artificers: the fibre of the second is chiefly employed in angling, and more frequently single than in a combined state. It is known by the name of Indian-grass. It is the third material, however, that is chiefly had recourse to; and where there is no great degree of friction, it forms a rope or cord of far greater durability than any that can be obtained from vegetables. Animal hair, indeed, from its being impervious to moisture, is capable of resisting all weathers, almost for ever; and where elasticity is required offers this property to any extent we can wish. It is not many animals however that afford this material of a sufficient length for the purpose of cordage; and hence, it is obvious, that hair-ropes must be of much greater expense than hempen, or other vegetable ropes. Hair, moreover, does not bear friction so well as many vegetable fibres; and hence, where this effect cannot be avoided, there is another inconvenience in employing it.

It is hence obvious that the rope-maker must derive his chief material from the vegetable kingdom; from the inner bark of some of the plants we have noticed in a former article. This art consists in uniting the strength of different fibres which are thus offered to him. This would be done in the easiest manner by laying the fibres parallel to each other, and fastening the bundle at the two ends; but this would be of very limited use, because the fibres are short, not exceeding three feet and a half at an average. They must therefore be entangled together, in such a manner, that the strength of a fibre shall not be able to draw it out from among the rest of the bundle. This is done by twisting or twining them together, which causes them mutually to compress each other. When the fibres are so disposed in a long skain, that their ends succeed each other along its length, without many of them meeting in one place; and this skain is twisted round; we may cause them to compress each other to any degree we please; and the friction on a fibre which we attempt to pull out may be more than its cohesion can overcome. It will therefore break. Consequently, if we pull at this twisted skain, we shall not separate it by drawing one parcel out from among the rest, but the whole fibres will break: and if the distribution of the fibres has been very equable, the skain will be nearly of the same strength in every part. If there is any part where many ends of fibres meet, the skain will break in that part.

We know very well that we can twist a skain of fibres so very hard, that it will break with any attempt to twist it harder. In this state all the fibres are already strained to the utmost of their strength. Such a skain of fibres can have no strength. It cannot carry a weight, because each fibre is already strained in the same manner as if loaded with as much weight as it is able to bear. What we have said of this extreme case is true in a certain extent of every degree of twist that we give the fibres. Whatever force is actually exerted by a twisted fibre, in order that it may sufficiently compress the rest to hinder them from being drawn out, must be considered as a weight hanging on that fibre, and must be deducted from its absolute strength of cohesion, before we can estimate the strength of the skain. The strength of the skain is the remainder of the absolute strength of the fibres, after we have deduced the force employed in twisting them together. From this observation may be established a fundamental principle in rope-making, that all twisting, beyond what is necessary for preventing the fibres from being drawn out without breaking, diminishes the strength of the cordage, and should be avoided when in our power.

It is necessary then to twist the fibres of hemp together, in order to make a rope; but we should make a very bad rope if we contented ourselves with twisting together a bunch of hemp sufficiently large to withstand the strains to which the rope is to be exposed. As soon as we let it go out of our hands, it would untwist itself, and be again a loose bundle of hemp; for the fibres are strained, and they are in a considerable degree elastic; they contract again, and thus untwist the rope or skain. It is necessary to contrive the twist in such a manner, that the tendency to untwist in one part may act against the same tendency in another and balance it. The process, therefore, of rope-making is more complicated.

The first part of this process is spinning of rope-yarns, that is, twisting the hemp in the first instance. This is done in various ways, and with different machinery, according to the nature of the intended cordage. We shall confine our description to the manufacture of the larger kinds, such as are used for the standing and running rigging of ships.

An alley or walk is inclosed for the purpose, about 200 fathoms long, and of a breadth suited to the extent of the manufacture. It is sometimes covered above. At the upper end of this rope-walk is set up a spinning-wheel, the band of which goes over several rollers called whirls, turning on pivots in brass holes. The pivots at one end come through the frame, and terminate in little hooks. The wheel being turned by a winch, gives motion in one direction to all those whirls. The spinner has a bundle of dressed hemp round his waist, with the two ends meeting before him. The hemp is laid in this bundle in the same way that women spread the flax on the distaff. There is great variety in this; but the general aim is to lay the fibres in such a manner, that as long as the bundle lasts there may be an equal number of the ends at the extremity, and that a fibre may never offer itself double or in a bight. The spinner draws out a proper number of fibres, twists them with his fingers, and having got a sufficient length detached, he fixes it to the hook of a whirl. The wheel is now turned, and the skain is twisted, becoming what is called a rope-yarn, and the spinner walks backwards down the rope-walk. The part already twisted draws along with it more fibres out of the bundle. The spinner aids this with his fingers, supplying hemp in due proportion as he walks away from the wheel, and taking care that the fibres come in equally from both

sides of his bundle, and that they enter always with their ends, and not by the middle, which would double them. He should also endeavour to enter every fibre at the heart of the yarn. This will cause all the fibres to mix equally in making it up, and will make the work smooth, because one end of each fibre is by this means buried among the rest, and the other end only lies outward; and this, in passing through the grasp of the spinner, who presses it tight with his thumb and palm, is also made to lie smooth. The greatest fault that can be committed in spinning is to allow a small thread to be twisted off from one side of the hemp, and then to cover this with hemp supplied from the other side; for it is evident, that the fibres of the central thread make very long spirals, and the skin of fibres which covers them must be much more oblique. This covering has but little connection with what is below it, and will easily be detached. But even while it remains, the yarn cannot be strong, for on pulling it, the middle part, which lies the straightest, must bear all the strain, while the outer fibres that are lying obliquely, are only drawn a little more parallel to the axis. This defect will always happen if the hemp is supplied in a considerable body to a yarn that is then spinning small. In whatever part of the yarn it is made to enter, it becomes a sort of loosely connected wrapper. Such a yarn, when untwisted a little, will have a very different appearance to the eye than more perfect yarn. A good spinner therefore endeavours always to supply the hemp in the form of a thin flat skain with his left hand, while his right is employed in grasping firmly the yarn that is twining off, and in holding it tight from the whirl, that it may not run into loops or kinks.

It is evident, that both the arrangement of the fibres and the degree of twisting depend on the skill and dexterity of the spinner, and that he must be instructed, not by a book, but by a master. The degree of twist depends on the rate of the wheel's motion, combined with the retrograde walk of the spinner.

We may suppose him arrived at the lower end of the walk, or as far as is necessary for the intended length of his yarn. He calls out, and another spinner immediately detaches the yarn from the hook of the whirl, gives it to another, who carries it aside to the reel; and this second spinner attaches his own hemp to the whirl-hook. In the mean time, the first spinner keeps fast hold of the end of his yarn; for the hemp, being dry, is very elastic, and if he were to let it go out of his hand, it would instantly untwist, and become little better than loose hemp. He waits, therefore, till he sees the reeler begin to turn the reel, and he goes slowly up the walk, keeping the yarn of an equal tightness all the way, till he arrives at the wheel, where he waits with his yarn in his hand till another spinner has finished his yarn. The first spinner takes it off the whirl-hook, joins it to his own, that it may follow it on the reel, and begins a new yarn.

Rope-yarns, for the greatest part of the large rigging, are from a quarter of an inch to somewhat more than a third of an inch in circumference, or of such a size that 160 fathoms weigh from 3¼ to 4 pounds when white. The different sizes of yarns are named from the number of them contained in a strand of a rope of three inches in circumference. Few are so coarse that 16 will make a strand of British cordage; 18 is not unfrequent for cable yarns, or yarns spun from harsh and coarse hemp; 25 is, we believe, the finest size which is worked up for the rigging of a ship. Much finer are indeed spun for sounding-lines, fishing-lines, and many other marine uses, and for the other demands of society. Ten good spinners will work up above 600 weight of hemp in a day; but this depends on the weather. In very dry weather the hemp is very elastic, and requires great attention to make smooth work. In the warmer climates the spinner is permitted to moisten the rag with which he grasps the yarn in his right hand for each yarn. No work can be done in an open spinning-walk in rainy weather, because the yarns would not take on the tar, if immediately tarred, and would rot if kept on the reel for a long time.

The second part of the process is the conversion of the yarns into what may with propriety be called a rope, cord, or line. That we may have a clear conception of the principle which regulates this part of the process, we shall begin with the simplest possible case, the union of two yarns into one line. This is not a very usual fabric for rigging, but we select it for its simplicity.

When hemp has been split into very fine fibres by the hatchel, it becomes exceedingly soft and pliant, and after it has lain for some time in the form of fine yarn, it may be unreeled and thrown loose, without losing much of its twist. Two such yarns may be put on the whirl of a spinning-wheel, and thrown, like flaxen yarn, so as to make sewing thread. It is in this way, indeed, that the sailmakers' sewing thread is manufactured; and when it has been kept on the reel, or on balls or bobbins, for some time, it retains its twist as well as its uses require. But this is by no means the case with yarns spun for great cordage. The hemp is so elastic, the number of fibres twisted together is so great, and the diameter of the yarn (which is a sort of lever on which the elasticity of the fibres exerts itself) is so considerable, that no keeping will make the fibres retain this constrained position. The end of a rope-yarn being thrown loose, it will immediately untwist, and this with considerable force and speed. It would, therefore, be a fruitless attempt to twist two such yarns together; yet the ingenuity of man has contrived to make use of this very tendency to untwist not only to counteract itself, but even to produce another and a permanent twist, which requires force to undo it, and which will recover itself when this force is removed. Every person must recollect, that when he had twisted a packthread very hard with his fingers between his two hands, if he slackens the thread by bringing his hands nearer together, the packthread will immediately curl up, running into loops or kinks, and will even twist itself into a neat and firm cord.

The component parts of a rope are called strands, and the operation of uniting them with a permanent twist is called laying or closing, the latter term being chiefly appropriated to cables and other very large cordage.

Lines and cordage less than 1½ inches circumference are laid at the spinning-wheel. The workman fastens the ends of each of two or three yarns to separate whirl-hooks. The remote ends are united in a knot. This is put on one of the hooks of a swivel called the loper, represented in fig. 213, and care is taken that the yarns are of equal length and twist. A piece of soft cord is put on the other hook of the loper; and, being put over

a pulley several feet from the ground, a weight is hung on it, which stretches the yarn. When the workman sees that they are equally stretched, he orders the wheel to be turned in the same direction as when twining the yarns. This would twine them harder; but the swivel of the loper gives way to the strain, and the yarns immediately twist around each other, and form a line or cord. In doing this, the yarns lose their twist. This is restored by the wheel. But this simple operation would make a very bad line, which would be slack, and not hold its twist; for, by the turning of the loper, the strands twist immediately together, to a great distance from the loper. By this turning of the loper the yarns are untwisted. The wheel restores their twist only to that part of the yarns that remains separate from the others, but cannot do it in that part where they are already twined round each other, because their mutual pressure prevents the twist from advancing. It is, therefore, necessary to retard this tendency to twine, by keeping the yarns apart. This is done by a little tool called the top.

It is a truncated cone, have three or more notches along its sides, and a handle called the staff. This is put between the strands, the small end next the loper, and it is pressed gently into the angle formed by the yarns which lie in the notches. The wheel being now turned, the yarns are more twisted, or hardened up, and their pressure on the top gives it a strong tendency to come out of the angle, and also to turn round. The workman does not allow this till he thinks the yarns sufficiently hardened. Then he yields to the pressure, and the top comes away from the swivel, which immediately turns round, and the line begins to lay. Gradually yielding to this pressure, the workman slowly comes up towards the wheel, and the laying goes on, till the top is at last close to the wheel, and the work is done. In the mean time, the yarns are shortened, both by the twining of each and the laying of the cord. The weight, therefore, gradually rises. The use of this weight is evidently to oblige the yarn to take a proper degree of twist, and not run into kinks.

A cord, or line, made in this way, has always some tendency to twist a little more. However little friction there may be in the loper, there is some, so that the turns which the cord has made in the laying are not enough to balance completely the elasticity of the yarns; and the weight being appended, causes the strands to be more nearly in the direction of the axis, in the same manner as it would stretch and untwist a little any rope to which it is hung. On the whole, however, the twist of a laid line is permanent, and not like that upon thread doubled or thrown in a mill, which remains only in consequence of the great softness and flexibility of the yarn.

The process for laying or closing large cordage is considerably different from this. The strands of which the rope is composed consist of many yarns, and require a considerable degree of hardening. This cannot be done by a whirl driven by a wheel-band; it requires the power of a crank turned by the hand. The strands, when properly hardened, become very stiff, and when bent round the top, are not able to transmit force enough for laying the heavy and unpliant rope which forms beyond it. The elastic twist of the hardened strands must, therefore, be assisted by an external force. All this requires a different machinery and a different process.

At the upper end of the walk is fixed up the tackle-board, fig. 215. This consists of a strong oaken plank called a breast-board, having three or more holes in it, such as A, B, C, fitted with brass or iron plates. Into these are put iron cranks, called heavers, which have hooks or forelocks, and keys, on the ends of their spindles. They are placed at such a distance from each other, that the workmen do not interfere with each other while turning them round. This breast-board is fixed to the top of strong posts well secured by struts or braces facing the lower end of the walk. At the lower end is another breast-board fixed to the upright posts of a sledge, which may be loaded with stones or other weights. Similar cranks are placed in the holes of this breast-board. The whole goes by the name of the sledge. The top necessary for closing large cordage is too heavy to be held in the hand: it therefore has a long staff, which has a truck on the end. This rests on the ground; but, even this is not enough in laying great cables. The top must be supported on a carriage, where it must lie very steady, and it needs attendance, because the master workman has sufficient employment in attending to the manner in which the strands close behind the top, and in helping them by various methods. The top is, therefore, fixed to the carriage by lashing its staff to the two upright posts. A piece of soft rope, or strap, is attached to the handle of the top by the middle, and its two ends are brought back and wrapped several times tight round the rope, in the direction of its twist, and bound down. This is shown at W, and it greatly assists the laying of the rope by its friction. This both keeps the top from flying too far from the point of union of the strands, and brings the strands more regularly into their places.

The first operation is warping the yarns. At each end of the walk are frames called warping frames, which carry a great number of reels or winches filled with rope-yarn. The foreman of the walk takes off a yarn end from each, till he has made up the number necessary for his rope or strand, and bringing the ends together, he passes the whole through an iron ring fixed to the top of a stake driven into the ground, and draws them through: then a knot is tied on the end of the bundle, and a workman pulls it through this ring till the intended length is drawn off the reels. The end is made fast at the bottom of the walk, or at the sledge, and the foreman comes back along the skain of yarns, to see that none are hanging slacker than the rest. He takes up in his hand such as are slack, and draws them tight, keeping them so till he reaches the upper end, where he cuts the yarns to a length, again adjusts their tightness, and joins them all together in a knot, to which he fixes the hook of a tackle, the other block of which is fixed to a firm post, called the warping-post. The skain is well stretched by this tackle, and then separated into its different strands. Each of these is knotted apart at both ends. The knots at their upper ends are made fast to the hooks of the cranks in the tackle-board; and those at the lower ends are fastened to the cranks in the sledge. The sledge itself is kept in its place by a tackle, by which the strands are again stretched in their places, and every thing adjusted, so that the sledge stands square on the walk, and then a proper weight is laid on it. The tackle is now cast off, and the cranks are turned at both ends, in the contrary direction to the twist of the yarns. (In

some kinds of cordage the cranks are turned the same way with the spinning twist). By this the strands are twisted and hardened up; and as they contract by this operation, the sledge is dragged up the walk. When the foreman thinks the strands sufficiently hardened, which he estimates by the motion of the sledge, he orders the heavers at the cranks to stop. The middle strand at the sledge is taken off from the crank. This crank is taken out, and a stronger one put in its place at. The other strands are taken off from their cranks, and are all joined on the hook which is now in the middle hole. The top is then placed between the strands, and being pressed home to the point of their union, the carriage is placed under it, and it is firmly fixed down. Some weight is taken off the sledge. The heavers now begin to turn at both ends. Those at the tackle-board continue to turn as they did before; but the heavers at the sledge turn in the opposite direction to their former motion, so that the cranks at both ends are now turning one way. By the motion of the sledge-crank the top is forced away from the knot, and the rope begins to close. The heaving at the upper end restores to the strand the twist which they are constantly losing by the laying of the rope. The workmen judge of this by making a chalk mark on intermediate points of the strands, where they lie on the stakes which are set up along the walk for their support. If the twist of the strands is diminished by the motion of closing, they will lengthen, and the chalk mark will move away from the tackle-board; but if the twist increases by turning the cranks at the tackle-board, the strands will shorten, and the mark will come nearer to it.

As the closing of the rope advances, the whole shortens, and the sledge is dragged up the walk. The top moves faster, and at last reaches the upper end of the walk, the rope being now laid. In the meantime, the sledge has moved several fathoms from the place where it was when the laying began.

These motions of the sledge and top must be exactly adjusted to each other. The rope must be of a certain length. Therefore the sledge must stop at a certain place. At that moment the rope should be laid; that is, the top should be at the tackle-board. In this consists the address of the foreman. He has his attention directed both ways. He looks at the strands, and when he sees any of them hanging slacker between the stakes than the others, he calls to the heavers at the tackle-board to heave more upon that strand. He finds it more difficult to regulate the motion of the top. It requires a considerable force to keep it in the angle of the strands, and it is always disposed to start forward. To prevent or check this, some straps of soft rope are brought round the staff of the top, and then wrapped several times round the rope behind the top, and kept firmly down by a lanyard or bandage, as is shown in the figure. This both holds back the top, and greatly assists the laying of the rope, causing the strands to fall into their places, and keep close to each other, which is sometimes very difficult, especially in ropes composed of more than three strands. It will greatly improve the laying the rope, if the top has a sharp, smooth, tapering pin of hard wood, pointed at the end, projecting so far from the middle of its smaller end, that it gets in between the strands which are closing. This supports them, and makes their closing more gradual and regular. The top, its notches, the pin, and the warp or strap, which is lapped round the rope, are all smeared with grease or soap to assist the closing. The foreman judges of the progress of closing chiefly by his acquaintance with the walk, knowing that when the sledge is abreast of a certain stake, the top should be abreast of a certain other stake. When he finds the top too far down the walk, he slackens the motion at the tackle-board, and makes the men turn briskly at the sledge. By this the top is forced up the walk, and the laying of the rope accelerates, while the sledge remains in the same place, because the strands are loosing their twist, and are lengthening, while the closed rope is shortening. When, on the other hand, he thinks the top too far advanced, and fears that it will be at the head of the walk before the sledge has got to its proper place, he makes the men heave briskly on the strands, and the heavers at the sledge-crank work softly. This quickens the motion of the sledge by shortening the strands; and by thus compensating what has been overdone, the sledge and top come to their places at once, and the work appears to answer the intention.

When the top approaches the tackle-board, the heaving at the sledge could not cause the strands immediately behind the top to close well, without having previously produced an extravagant degree of twist in the intermediate rope. The effort of the crank must therefore be assisted by men stationed along the rope, each furnished with a tool called a woolder. This is a stout oak stick, about three feet long, having a strap of soft rope-yarn or cordage fastened on its middle or end. The strap is wrapped round the laid rope, and the workman works with the stick as a lever, twisting the rope round in the direction of the crank's motion. The woolders should keep their eye on the men at the crank, and make their motion correspond with his. Thus they send forward the twist produced by the crank, without either increasing or diminishing it, in that part of the rope which lies between them and the sledge.

Such is the general and essential process of rope-making. The fibres of hemp are twisted into yarns, that they may make a line of any length, and stick among each other with a force equal to their own cohesion. The yarns are made into cord of permanent twist by laying them; and that we may have a rope of any degree of strength, many yarns are united in one strand, for the same reason that many fibres were united in one yarn; and in the course of this process it is in our power to give the rope a solidity and hardness which make it less penetrable by water, which would rot it in a short while. Some of these purposes are inconsistent with others; and the skill of a rope-maker lies in making the best compensation, so that the rope may on the whole be the best in point of strength, pliancy, and duration, that the quantity of hemp in it can produce.

The following rule for judging of the weight which a rope will bear is not far from the truth. It supposes them rather too strong; but it is so easily remembered that it may be of use.

Multiply the circumference in inches by itself, and take the fifth part of the product, it will express the tons which the rope will carry. Thus, if the rope has 6 inches circumference, 6 times 6 is 36, the fifth of which is $7\frac{1}{5}$ tons; apply this to the rope of $3\frac{1}{2}$, on which sir Charles Knowles made his experiments $3\frac{1}{2} \times 3\frac{1}{2} = 10{,}25\frac{1}{2}$ of which is 2,05 tons, or 4592 pounds. It broke with 4550.

This may suffice for an account of the mechanical part of the manufacture. But we have taken

no notice of the operation of tarring; and our reason was, that the methods practised in different rope-works are so exceedingly different, that we could hardly enumerate them, or even give a general account of them. It is evidently proper to tar in the state of twine or yarn, this being the only way that the hemp could be uniformly penetrated. The yarn is made to wind off one reel, and having passed through a vessel containing hot tar, it is wound up on another reel; and the superfluous tar is taken off by passing through a hole surrounded with spongy oakum; or it is tarred in skains or hauls, which are drawn by a capstern through the tar-kettle, and through a hole formed of two plates of metal, held together by a lever loaded with a weight.

It is established beyond a doubt, that a tarred cordage when new is weaker than white, and that the difference increases by keeping. The following experiments were made by Mr. Du Hamel at Rochefort on cordage of three inches (French) in circumference, made of the best Riga hemp.

White.	Tarred.
August 8, 1741.	
Broke with 4500 pounds.	3400 pounds.
4900	3300
4800	3250
April 25, 1743.	
4600	3500
5000	3400
5000	3400
Sept. 3, 1746.	
3800	3000
4000	2700
4200	2800

A parcel of white and tarred cordage was taken out of a quantity which had been made February 12, 1746. It was laid up in the magazines, and comparisons were made from time to time as follows:

White bore.	Tarred bore.	Differ.
1746, April 14, 2645 lbs.	2312 lbs.	333
1747, May 18, 2762	2155	607
1747, Oct. 21, 2710	2050	660
1748, June 19, 2575	1752	823
1748, Oct. 2, 2425	1837	588
1749, Sept. 25, 2917	1865	1052

Mr. Du Hamel says, that it is decided by experience, 1. That white cordage in continual service is one-third more durable than tarred. 2. That it retains its force much longer while kept in store. 3. That it resists the ordinary injuries of the weather one-fourth longer.

We know this one remarkable fact: in 1758 the shrowds and stays of the Sheer hulk at Portsmouth dock-yard were over-hauled, and when the worming and service were taken off, they were found to be of white cordage. On examining the store-keeper's books, they were found to have been formerly the shrowds and rigging of the Royal William, of 110 guns, built in 1715, and rigged in 1716. She was thought top-heavy, and unfit for sea, and unrigged, and her stores laid up. Some few years afterwards, her shrowds and stays were fitted on the Sheer hulk, where they remained in constant and very hard service for about 30 years, while every tarred rope about her had been repeatedly renewed.

Why then do we tar cordage? It is chiefly serviceable for cables and ground tackle, which must be continually wetted, and even soaked. The result of careful observation is, 1. That white cordage, exposed to be alternately very wet and dry, is weaker than tarred cordage. 2. That cordage which is superficially tarred is constantly stronger than what is tarred throughout, and it resists better the alternatives of wet and dry. The shrowds of the Sheer hulk were well tarred and blacked, so that it was not known that they were of white cordage.

Attempts have been made to increase the strength of cordage by tanning. But although it remains a constant practice in the manufacture of nets, it does not appear that much addition, either of strength or durability, can be given to cordage by this means. The trial has been made with great care, and by persons fully able to conduct the process with propriety. But it is found that the yarns take so long time in drying, and are so much hurt by drying slowly, that the room required for a considerable rope-work would be immense, and the improvement of the cordage is but trifling, and even equivocal.

ROʹPEDANCER. *s.* (*rope* and *dancer.*) An artist who dances on a rope (*Wilkins*).

ROʹPEMAKER, or *Roper. s.* (*rope* and *maker.*) One who makes ropes to sell (*Shakspeare*).

ROʹPERY. *s.* (from *rope.*) Rogue's tricks (*Shakspeare*).

ROʹPETRICK. *s.* (*rope* and *trick.*) Probably rogue's tricks; tricks that deserve the halter (*Shakspeare*).

ROʹPINESS. *s.* (from *ropy.*) Viscosity; glutinousness.

ROʹPY. *a.* (from *rope.*) Viscous; tenacious; glutinous (*Dryden*).

ROQUEFORT CHEESE; a cheese of a peculiar character and beautiful marble blue colour, obtained from the milk of goats and sheep. These animals are grazed for this purpose in the election of Milhaud in France, on a rich, fertile, and extensive plain, ten leagues in diameter, called the Larzac, and the cheese derives its distinctive name from that of the town to which it is chiefly carried from the adjoining farms for sale. It is often variable in its quality, which M. Chaptal attributes to a difference it undergoes in the first processes of its manufactory. When the quality, however, is of an inferior kind, he ascribes it, with Huzard, to the rennet. He thinks that the variable nature of this material, the delay of the milk in the stomach, the variable quality of the curd, the more or less perfect mixture of the gastric juice with the food, the gastric juice itself, and even the age, constitution, and temperament of the animal, all produce a greater or less degree of influence.

The character of this cheese when perfect, is mildness, whiteness, firmness, an agreeable taste, and colour marbled with blue. It soon, however, changes its quality, from change of temperature and transportation; and so nice is its point of excellence, that the connoisseurs have concurred in opinion that it can only be had in perfection at Roquefort. The first degrees of fermentation when in curd make it insensibly lose the mild and insipid taste it possesses before the fermentation takes place, and at last it contracts a sharp disagreeable savour; between these extremes therefore the fermentation must be stopped. It is also necessary to attend to its changes after having

been salted and placed in the cellars. It is first covered with a white down, which afterwards becomes blue, and then red. These colours arise from the attraction of oxygen, which, by producing a different density, or otherwise changing the position of the particles, enables them to refract particular rays, according to their respective power of refraction: as the blue ray is the weakest, this is the first reflected when the oxygen gass is fixed in a body during the fermenting process. The red which succeeds the blue proceeds from a further application of the same principle, and so of the rest. It is from this red colour that the judges determine the perfection of the cheese.

RO'QUELAURE. *s.* (French.) A cloak for men (*Gay*).

ROQUET. See ROCKET.

RORATION. *s.* (*roris*, Latin.) A falling of dew.

RO'RID. *s.* (*roridus*, Lat.) Dewy (*Brown*).

RORIDULA, in botany, a genus of the class pentandria, order monogynia. Corol five-petalled; calyx five-leaved; capsule three-valved; anthers bag-shaped at the base. One species; a Cape plant, with shrubby stem; leaves subulate, ciliate; the whole plant viscid with glandular hairs.

RORI'FEROUS. *a.* (*ros* and *fero*, Latin.) Producing dew.

RORI'FLUENT. *a.* (*ros* and *fluo*, Latin.) Flowing with dew.

ROS CALABRINUS. The officinal manna is sometimes so termed.

ROS SOLIS. (*ros*, *roris*, dew.) Rosella. Sun dew. This elegant little plant, drosera rotundifolia scapis radicatis; foliis orbiculatis of Linnéus, is said to be so acrid as to ulcerate the skin, and remove warts and corns, and to excite a fatal coughing and delirium in sheep who eat it. It is seldom given medicinally in this country but by the lower orders, who esteem a decoction of it as serviceable in asthmas and coughs.

ROSA. Rose. In botany, a genus of the class icosandria, order polygynia. Calyx arm-shaped, fleshy, contracted at the orifice, terminating in five segments; petals five; seeds numerous, bristly, fixed to the inside of the calyx. Thirty-eight species, scattered over the globe; six indigenous to our own country. Of these, some have their fruit nearly globular, others ovate. The different species run so closely into each other, that it is difficult to determine between species and varieties; whence some botanists resolve the whole into the single species of rosa canina, or dog-rose, believing all others to be varieties of this alone. The cultivated species are as follow:

1. R. lutea. Single yellow rose.

2. R. sulphurea. Double yellow rose. Probably only a variety of the preceding.

3. R. blanda. Hudson's Bay rose. Unarmed, when full grown, but possessing prickles when young; branches round, shining, reddish.

4. R. cinnamomea. Cinnamon rose. Roses single, largish, of a pale colour; armed with great thorns: somewhat resembling the eglantine.

5. R. arvensis. White dog-rose. Smaller than the common dog-rose, and the flower never otherwise than white.

6. R. pimpinellifolia. Small burnet-tree rose. Flowers white; segments of the calyx entire.

7. R. spinosissima. Scotch rose. Slender, numerous, unequal needle-like prickles on the branches; petals white or cream-coloured, yellow at the base, delicately fragrant, sometimes striped with red. It has several varieties.

8. R. parviflora. Small-flowered American rose. Corol single, of a pale reddish colour. It has a variety with a double flower.

9. R. lucida. Shining-leaved American rose. Flowers bright red, single, with little scent.

10. R. Carolina. Carolina rose. Five or six feet high; petals obcordate, red. Flowers late in the summer.

11. R. villosa. Apple-rose. Taller than the last; leaves fragrant when rubbed; corol full rose-colour, not very fragrant: the fruit globular, larger than any of the other sorts, bristly and blood red, and surrounded with a pleasant acid pulp, which is sometimes made into conserves and sweetmeats, like that of rosa canina. A native of our own woods.

12. R. Provincialis. Provence rose. Well known, and one of the most beautiful species: the flowers are sometimes very large, and the petals closely folded over each other like cabbages, whence it is also called cabbage rose; the corol has the most fragrant odour of all the sorts. The varieties are very numerous.

13. R. centifolia. Hundred-leaved rose. Fruit, peduncles, petioles and stem bristly; leaflets ovate, hairy underneath: flowers very double, and of a deep red, but of small scent. Supposed to be a native of China. Varieties very numerous.

14. R. Gallica. Red rose. Flowers large, but not very double; spread open wide, and decay soon; when well dried, will hold their colour and scent longer than most other species. It has many varieties.

The flowers are valued for their adstringent qualities, which are most considerable before the petals expand; and therefore in this state they are chosen for medicinal use, and ordered by the pharmacopœias in different preparations, as those of a conserve, a honey, an infusion, and a syrup. The infusion of roses is a grateful cooling subadstringent, and useful in hæmoptysis, and other hæmorrhagic complaints; its efficacy, however, depends chiefly on the acid.

15. R. Damascena. Damask rose. Prickly stalks eight or ten feet high; peduncles with prickly hairs; calyxes hairy; corol soft, pale red, not very double, but of an agreeable odour. A native of the south of France.

The pharmacopœias direct a syrup to be prepared from the petals of this rose which is found to be a pleasant and useful laxative for children, or to obviate costiveness in adults.

Most of the roses, though much cultivated in our gardens, are far from being distinctly characterised. Those denominated varieties are extremely numerous, and often permanently uniform; and the specific differences, as hitherto pointed out, are in many respects so adequate to the purpose of satisfactory discrimination, that it becomes a difficult matter to distinguish which are species, and which are varieties only. The London College, following Gerard and Parkinson, has still retained the name rosa damascena; but the damask rose is another species, widely different from the centifolia, as appears from the description given of it by Du Roi and Miller.

The petals are directed for medicinal use: they are of a pale red colour, and of a very fragrant odour, which to most people is extremely agreeable; and therefore this and most of the other roses are much used as nosegays. We may remark, however, that in some instances they have, under certain circumstances, produced alarming symptoms. The petals "impart their odorous matter to watery liquors, both by infusion and distillation. Six pounds of fresh roses impregnate, by distillation, a gallon or more of water strongly with their fine flavour. On distilling large quantities, there separates from the watery fluid a small portion of a fragrant butyraceous oil, which liquifies by heat, and appears yellow, but concretes in the cold into a white mass. An hundred pounds of the flowers, according to the experiments of Tachenius and Hoffman, afforded scarcely half an ounce of oil." The smell of the oil exactly resembles that of roses, and is therefore much used as a perfume. It possesses very little pungency, and has been highly recommended for its cordial and analeptic qualities. These flowers also contain a bitterish substance, which is extracted by water along with the odorous principle, and remains entire in the decoction after the latter has been separated by distillation or evaporation.

This fixed sapid matter of the petals manifests a purgative quality; and it is on this account that the flowers are received in the Materia Medica.

16. R. sempervirens. Ever-green rose. Slender stalks that trail on the ground unless supported: leaves perennial; flowers small, single, white, of a musky odour. Germany.

17. R. pumila. Dwarf Austrian rose. Branches with great abundance of prickles, which fall off on the stems; fruit large, pear-shaped.

18. R. turbinata. Frankfort rose. Nearly unarmed; fruit large; flowers thick, and double as the red rose, swelling so strongly in the bud that the latter often breaks before the corol is full blown; colour pale red, with a hard umbone of yellow threads in the middle.

19. R. rubinosa. Sweet-briar. Eglantine. Well known, and possessing many varieties from duration of the leaf or colour of the flower.

20. R. muscosa. Moss rose. Petioles, peduncles, calyx, and branchlets thickly covered with viscid glandular moss: flower of an elegant crimson, and most agreeable odour: native soil doubtful.

21. R. moschata. Musk rose. Ten or twelve feet high; armed; flowers in large branches, umbelled, terminal, white, of a fine musky odour. Stalks too weak to support themselves. A variety with double flowers. A native of Barbary.

22. R. Alpina. Alpine rose. Low shrub, lower half armed; petioles hispid; flowers solitary, red, middle-sized.

23. R. semperflorens. Deep-red China rose. Shrub three feet high; flowers large in proportion to the plant, semidouble, dark-red and very richly so, extremely fragrant, coming out in succession during the greater part of the year, but more sparingly in the winter months. A native of China.

24. R. alba. White rose. Fruit ovate, glabrous; peduncles bristly; stem and petioles prickly. A native of Europe.

25. R. canina. Dog-rose. Hip or Hep-tree. Found wild in our hedges, both red-flowered and white-flowered; fruit surrounded with a pleasant acid pulp, admitted into the Materia Medica on this account, and prepared with sugar in the form of a conserve. See the article CYNOSBATUS, under which name it is generally described in the pharmacopœias.

All these, whether indigenous or of foreign origin, are propagated either by suckers, by layers, or by budding them on the other sorts of roses; the last method is but seldom practised, but is necessary for the finer sorts, which do not naturally shoot vigorously, and which produce few or no suckers. The best sort of rose for stocks is the Frankfort kind; the season for doing it is in June, and there must be great care taken afterwards, that the stalk produce no suckers at the bottom, for these would soon starve the bud.

When roses are to be propagated from suckers, they are to be taken off annually, and planted into nursery beds, or into the places where they are to remain. They always take root well the first year, but if suffered to remain on the stock longer, they grow woody, and often fail. But the best method of obtaining vigorous plants is, by laying down the shoots; this is to be done in autumn, and by the autumn following they will have taken root so well, that they may be taken off from the old plant, and removed to the places where they are to remain. These may be transplanted any time from October to April, but the earlier the better. Roses, in general, delight in a rich moist soil, and an open situation, in which they will produce great quantity of flowers, and those much more beautiful than when they are on a dry soil, and shady situation. All the pruning they require is, to have their dead wood cut, and their suckers taken away every autumn; and if there are any very luxuriant branches, they may be shortened, and the doing this will supply the other parts of the tree with fresh wood.

ROSA (Salvator), an admirable painter, born

at Naples in 1614. He was first instructed by Francesco Francazano, a kinsman: but the death of his father reduced him to sell drawings sketched upon paper for any thing he could get; one of which happening to fall into the hands of Lafranc, he took him under his protection, and enabled him to enter the school of Spagnoletto, and to be taught moreover by Daniel Falcone, a distinguished painter of battles at Naples. Salvator had a fertile imagination. He studied nature with attention and judgment; and always represented her to the greatest advantage: for every tree, rock, cloud, or situation, that enters into his composition, shows an elevation of thought that extorts admiration. He was equally eminent for painting battles, animals, sea or land storms; and he executed these different subjects in such taste as renders his works readily distinguishable from all others. His pieces are exceedingly scarce and valuable; one of the most capital is that representing Saul and the witch of Endor, which was preserved at Versailles. He died in 1673; and as his paintings are in few hands, he is more generally known by his prints; of which he etched a great number. He painted landscapes more than history; but his prints are chiefly historical. The capital landscape of this master at Chiswick is a noble picture. However, he is said to have been ignorant of the management of light, and to have sometimes shaded faces in a disagreeable manner. He was however a man of undoubted genius; of which he has given frequent specimens in his works. A roving disposition, to which he is said to have given full scope, seems to have added a wildness to all his thoughts. We are told that he spent the early part of his life in a troop of banditti; and that the rocky desolate scenes in which he was accustomed to take refuge furnished him with those romantic ideas in landscape, of which he is so exceedingly fond, and in the description of which he so greatly excels. His *robbers*, as his detached figures are commonly called, are supposed also to have been taken from the life.

Salvator Rosa is sufficiently known as a painter; but until lately we never heard of him as a musician. Among the musical manuscripts purchased at Rome by Dr. Burney was a music-book of Salvator, in which are many airs and cantatas of different masters, and eight entire cantatas written, set, and transcribed by this celebrated painter himself. From the specimen of his talents for music here given, we make no scruple of declaring, that he had a truer genius for this science, in point of melody, than any of his predecessors or contemporaries: there is also a strength of expression in his verses, which sets him far above the middle rank as a poet. Like many other artists of real original merit, he complains of the ill usage of the world, and the difficulty he finds in procuring a bare subsistence.

ROSACEA. See GUTTA ROSACEA.

ROSACEOUS, among botanists, an appellation given to such flowers as are composed of several petals or leaves disposed in a sort of circular form, like those of a rose.

ROSALIA. A term applied by the Italians to the repetition of a musical passage one note higher. A resource very tiresome in its effect when injudiciously introduced, but capable of greatly heightening the melody when dictated by taste, and sanctioned by judgment.

ROSARY, in the Romish church, a chaplet consisting of five or fifteen decads of beads, to direct the recitation of so many Ave Maria's, in honour of the Virgin.

ROSARY also denotes a particular mass or form of devotion addressed to the Virgin, to which the chaplet of that name is accommodated. It consists of fifteen repetitions of the Lord's prayer, and an hundred and fifty salutations of the blessed Virgin; whilst the crown, as it is called, according to the different opinions of the learned concerning the age of the Virgin, consists of six or seven repetitions of the Lord's prayer, and six or seven times ten salutations or Ave Maria's.

Some attribute the institution of the rosary to St. Dominic; but F. d'Achery shews it was in use in the year 1100; so that St. Dominic could only make it more celebrated. Others attribute it to Paulus Libycus, and others to St. Benedict; others to the Chartreux; others to Venerable Bede; and, finally, others to Peter the Hermit. Those who ascribe it to St. Dominic, differ as to the particular time of its institution; some referring it to the year 1208, when he preached against the Albigenses; others will have him to have set it on foot in the course of his missions in Spain, before he passed into France.

ROSARY (Order of the), or of our Lady of the Rosary, is an order of knights, supposed by Schoonebeck, and the Jesuit Bonanni, to have been instituted by St. Dominic; but by mistake; for that saint never instituted any order under this name, and these authors apparently make a military order of an army of croisees, who, under the command of the count de Montfort, fought against the Albigenses.

ROSBACH, a town of Germany, in Saxony, famous for a victory obtained here by the king of Prussia over the French, on November 5, 1757, in which 10,000 of the French were killed or taken prisoners, with the loss of no more than 500 Prussians.

ROSCHILD, a town of Denmark, in the isle of Zealand, with a bishop's see and a small university. It is famous for a treaty concluded here in 1658; and in the great church there are several tombs of the kings of Denmark. It is seated at the bottom of a small bay. Lon. 12. 20 E. Lat. 55. 40 N.

RO'SCID. *a.* (*roscidus*, Latin.) Dewy; abounding with dew; consisting of dew (*Bacon*).

ROSCIUS, a celebrated Roman actor. His eyes were naturally distorted, and he always appeared on the stage with a mask, but the Romans overlooked the deformities of his face, that they might the better hear his elegant pronunciation, and the sweetness of his voice.

He was accused of murder; but Cicero undertook his defence, and cleared him of the aspersion in an oration still extant. Roscius wrote a treatise, in which he compared, with much judgment and learning, the profession of the orator with that of the comedian. He died about sixty years before Christ.

ROSCOMMON, a county of Ireland, in the province of Connaught, 50 miles long and 28 broad; bounded on the E. by Longford and W. Meath, on the N. by Sligo and Leitrim, on the S. by Galway, and on the W. by Galway and Mayo. It is a level fruitful country, and by the help of good husbandry yields excellent corn. It contains 59 parishes, and sends eight members to parliament.

ROSCOMMON, a borough of Ireland, in a county of the same name, with a sessions-house and a gaol, 80 miles W. of Dublin. Lon. 8. 2 W. Lat. 53. 34 N.

ROSCOMMON (Wentworth Dillon, earl of), a British poet, born in Ireland in 1633. He was brought up in England, but the commotions of the times, and the impeachment of his uncle, lord Stafford, drove him to Caen, where he finished his education under Bochart. At the restoration he came to England, where he was made by Charles II. captain of the band of pensioners. He nearly ruined himself by gaming, and by the vicious indulgences prevalent at a corrupted court; but when master of horse to the duchess of York, he married Frances, daughter of lord Burlington, and devoted himself to literature and poetry, and planned with Dryden a design to fix and refine the English language. He died of the gout, improperly treated by a French empiric, 1684. His poems are few, and of those the best are, his essay on translated verse—and his translation of Horace's art of poetry. Though perhaps not a sublime poet, he certainly is a correct one, and he has the singular merit of being the only moral writer among that class in Charles's days.

ROSE, in botany. See ROSA.

ROSE OF JERICHO, in botany. See ANASTATICA.

ROSE (Rock), in botany. See CISTUS.

ROSE (Root), in botany. See RHODIOLA.

ROSE (Bay), in botany. See NERIUM.

ROSE (Dwarf Bay), in botany. See RHODODENDRON.

ROSE (Mountain), in botany. See RHODODENDRON.

ROSE (Willow herb), in botany. See EPILOBIUM.

ROSE (Campion), in botany. See AGROSTEMMA.

ROSE (China), in botany. See HIBISCUS.

ROSE (Christmas), in botany. See HELLEBORUS.

ROSE (Corn), in botany. See PAPAVER.

ROSE (Guelder), in botany. See VIBURNUM.

ROSE (Japan), in botany. See CAMELLIA.

ROSE (Mallow), in botany. See ALCEA.

ROSES (Ottar of), the fine essential oil of the flower whose name it bears. This is an Arabic and Persian term, and is probably derived from the same source as the Latin *odor*, with which it is synonymous if not univocal.

Roses are capable of communicating a very elegant and exquisite perfume in various ways. The more common is by distillation, which is sometimes effected with the dry, but more generally with the moist corol. If with the former, the flowers should be macerated in water for a few hours antecedently to the process; after which they are to be introduced into a tinned copper still or alembic, and rammed down till it is as full as it can hold; a sufficient quantity of water is then to be poured upon them to cover them; the head luted on, the refrigeratory filled with cold water, and the fire lighted, and so regulated as to keep the contents of the still constantly simmering, but scarcely boiling. The steam being condensed in the worm, will form a small current of water, and is to be collected in proper vessels till it comes off nearly insipid, when the distillation is to be stopped: and the produce will be common rose-water.

If the odour be required of a fuller and more exquisite degree, the distillation must be repeated; the water obtained by the first process being poured, instead of fresh spring water, upon another collection of rose-petals, as in the former instance, and whatever deficiency there may be must be supplied by spring-water; and for a still more exalted perfume a third, fourth, or even further distillation may be persevered in; in consequence of which the amount of essential oil yielded by equal quantities of the same substance will form a constantly increasing series, till the whole of the water drawn off by such repeated distillations becomes at length completely saturated with oil. And hence the cause of that difference which is observed in the fragrance of rose or other perfumed waters obtained by different chemists; for Bindheim has satisfactorily shown that it is not till the seventh, nor even, in some instances, till the tenth distillation that the produce of the spiritus rector or aromatic principle attains its maximum.

In the ottar of roses, however, we possess this aromatic principle or essential oil without any mixture with water; and the process for obtaining this delicious and costly purfume in India is thus conducted, and bears a near analogy to that by which vegetable butters in general are separated from the other parts of the plant. A clean cask or large glazed earthen jar is filled with rose leaves carefully separated from the calyxes, and spring-water is poured upon them just sufficiently to cover them; after which the vessel, with its contents, is set in the sun for two or three days and taken under cover during the night. At the end of the third or fourth day small particles of yellow oil will be seen floating on the surface of the water, which in the course of a week will have increased to a thin scum. This scum is the

ottar of roses: it is taken up by a little cotton tied to the end of a stick, and squeezed into a phial.

This is the common mode; but it may be obtained, as may also the oils that exist in the fragrant blossoms of the violet, mignonette, jasmine, tuberose, hyacinth, and all the scented liliaceous plants, whose odorous principle is exceedingly minute in quantity, and so evaporable as to be instantly destroyed by heat, by means of the oil of ben, for whose production and properties we refer the reader to the article OILS, ESSENTIAL. For which purpose layers of cotton soaked in oil of ben are to alternate with layers of any of the preceding flowers in a large covered dish; which, after it has been set in hot water or exposed to the action of the sun for a few days, is to have its contents unpacked, when the oil is to be squeezed out of the cotton, and will be found highly impregnated with the aromatic principle of the flower made use of.

If it be desired to separate this principle, or rather the oil in which it is lodged, from the oil of ben with which it is now combined, the following process should be adopted. Let a phial be half filled with a mixture of alkohol and the perfumed oil in equal proportions, and shaken for a few minutes, that every particle of each may come in contact with the other: then pour off the alkohol from the oil, which will be found to be nearly inodorous, the fragrant principle being yielded to the former. Let this perfumed spirit be shaken with successive portions of oil till the richness of its fragrance is not sensibly increased, and then pour it into a bason containing two or three times its bulk of pure water: the water and alkohol will combine together; and the greater part of the essential oil will be liberated and will float at the top of the liquor, from which it may be scummed off by a little cotton. The liquor being afterwards submitted to a very gentle distillation, the first portion of spirit that comes over will be found to be still very fragrant, and may be employed, mixed with fresh alkohol, in treating other portions of scented oil.

ROSE-WOOD. See RHODIUM LIGNUM.

ROSE-WORT. See RHODIA.

To speak under the ROSE. To speak any thing with safety, so as not afterward to be discovered (*Brown*).

ROSE. The preterit of *rise*.

ROSE CASTLE, in Cumberland, a seat of the bishop of Carlisle, situate on the river Caude, near Inglewood Forest. It was burnt down in the civil wars; but has since by several of its bishops been restored, though perhaps not to that magnificence which it had when Edward I. lodged here, in his expedition to Scotland.

ROSEBAY WILLOW HERB. The epilobium angustifolium of Linnéus, common in our woods in moist situations. The young shoots are said to be little inferior to asparagus when boiled.

RO'SEATE. *a.* (from *rose*.) 1. Rosy; full of roses (*Pope*). 2. Blooming, fragrant, purple, as a rose.

RO'SED. *a.* (from the noun.) Crimsoned; flushed (*Shakspeare*).

ROSEMARY. See ROSMARINUS.

ROSEMARY (Wild). See LEDUM.

ROSENIA, in botany, a genus of the class syngenesia, order polygamia superflua. Receptacle chaffy; down capillary and chaffy; calyx imbricate, scarious. One species; a Cape plant, with branchy flexuous stem and solitary flowers.

ROSES, a seaport of Spain, in Catalonia, with a citadel, seated on the bay of Roses, in the Mediterranean, 15 miles N.E. of Gironna. It was taken by the French in 1693 and in 1795.

ROSETTO, a town of Egypt, seated on the west branch of the Nile. The Egyptians call it Raschid, and account it one of the pleasantest places in the country. It has a great manufacture of striped and other coarse linens; but its chief business is the carriage of goods hence to Cairo; for all European merchandise is brought hither from Alexandria by sea, and carried hence by boats to Cairo. The Europeans have their viceconsuls and factors here. It is 25 miles N.E. of Alexandria, and 100 N.W. of Cairo. Lon. 30. 45 E. Lat. 31. 30 N.

ROSICRUCIANS, or Brothers of the Rosy-cross, a name assumed by a sect or cabal of hermetical philosophers; who arose, as it has been said, or at least became first taken notice of, in Germany, in the beginning of the fourteenth century.

They bound themselves together by a solemn secret, which they all swore inviolably to preserve; and obliged themselves, at their admission into the order, to a strict observance of certain established rules.

They pretended to know all sciences, and chiefly medicine: whereof they published themselves the restorers. They pretended to be masters of abundance of important secrets; and among others, that of the philosophers stone; all which they affirmed to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnosophists.

Their chief was a German gentleman, called Christian Rosencruz, educated in a monastery, where he learned the languages About the close of the fourteenth century, he went to the Holy Land, where falling sick, at Damascus, he consulted the Arabs, and other eastern philosophers, by whom he was supposed to be initiated into this wonderful art. At his return into Germany, he formed a society, to whom he communicated the secrets he had brought with him out of the east, and finally died in 1484. The whole of this account is generally rejected as fabulous.

They have been distinguished by several names, accommodated to the several branches of their doctrine.

Because they pretend to protract the period of human life, by means of certain nostrums, and even to restore youth, they were called immortales.

As they pretended to know all things, they

have been called illuminati: and because they have made no appearance for several years, but have kept altogether incognito, they have been called the invisible brothers.

Their society is frequently signed by the letters F. R. C. which some among them interpret *fratres roris cocti*; it being pretended, that the matter of the philosophers stone is dew concocted, exalted, &c.

At the head of these fanatics were Robert Fludd, an English physician, Jacob Behmen, and Michael Mayer. The common principles, which serve as a kind of centre of union to the Rosicrucian society, are the following. They all maintain, that the dissolution of bodies, by the power of fire, is the only way by which men can arrive at true wisdom, and come to discern the first principles of things. They all acknowledge a certain analogy and harmony between the powers of nature and the doctrines of religion, and believe that the deity governs the kingdom of grace by the same laws with which he rules the kingdom of nature; and hence they are led to use chemical denominations to express the truths of religion. They all hold, that there is a sort of divine energy, or soul, diffused through the frame of the universe, which some call the argheus, others the universal spirit, and which others mention under different appellations. They all talk in the most superstitious manner of what they call the signatures of things, of the power of the stars over all corporeal beings, and their particular influence upon the human race, of the efficacy of magic, and the various ranks and orders of demons. In fine, they all agree in throwing out the most crude incomprehensible notions and ideas, in the most obscure, quaint, and unusual expressions. Mosh. Eccl. Hist. vol. iv.

ROSIENNE, a town of Samogitia, seated on the Dubisse, 70 miles S. of Mittau, and 188 N.E. of Warsaw. Lon. 23. 45 E. Lat. 55. 30 N.

ROSIERS-AUX-SALINES, a town of France, in the department of Meurthe, famous for its salt-works. It is seated on the Meurthe, nine miles S.E. of Nanci, and 170 E. of Paris. Lon. 6. 27 E. Lat. 48. 35 N.

ROSIN. See RESINA.

To RO'SIN. *v. a.* (from the noun.) To rub with rosin (*Gay*).

RO'SINY. *a.* (from *rosin.*) Resembling rosin.

ROSMARINUS. Rosemary. In botany, a genus of the class diandria, order monogynia. Corol unequal, the upper lip two-parted; filaments long, curved, simple, with a tooth. Two species, as follows.

1. R. Chilensis. A native of Chili, with petioled leaves.

2. R. officinalis. Common rosemary. A native of Europe, with sessile leaves. This has two varieties.

α. Silver rosemary, with white-striped leaves.

β. Golden rosemary, with yellow striped leaves.

Both varieties grow wild in the south of France, and in Spain and Italy, on rocks near the sea, where they multiply prodigiously. With us they grow the most vigorously on a moist, rich soil, but they are much sweeter scented when on a poor soil, and on such they bear the severity of our seasons much better than where they grow more freely. They are all propagated by planting slips, or cuttings of them, in the spring of the year, on a bed of light fresh earth; and when they are rooted, they are to be removed into the places where they are to remain. The best season for doing this is in August; if they are planted later than this, they seldom live through the winter; therefore such as are not transplanted at this time should be left till the following spring, when March is a very good time for removing them; and if this be done in showery weather, they take root almost immediately. The plants are sometimes killed in cold winters in our gardens, but when by accident they have rooted themselves in an old wall, as is often the case, they stand all weathers unhurt, which is owing to their being stinted and their roots dry.

The leaves and tops of this plant have a fragrant aromatic smell, and a bitterish pungent taste. Rosemary is reckoned one of the most powerful of those plants which stimulate and corroborate the nervous system; it has therefore been recommended in various affections supposed to proceed from debility or defective excitement of the brain and nerves, as in certain head-achs, deafness, giddiness, and in some hysterical and dyspeptic symptoms.

ROSOI (Barnaby Firmin du), a writer, born at Paris 1745. He wrote dramatic pieces, acted with applause, but possessing little merit. He was also author of a romance—the annals of Toulouse, &c. but though a voluminous writer, he continued poor. At the revolution he wrote in favour of the unfortunate monarch his gazette, called l'ami du roi, and in consequence of his principles, he was marked for death. In his last moments he wished to benefit mankind by soliciting that his blood might be extracted from his veins, and transfused into the body of an old man, which was rejected. He was executed 1792.

ROSOY, a town of France, in the department of Seine and Marne, with a magnificent castle, 15 miles S. of Meaux. Lon. 2. 59 E. Lat. 48. 40 N.

ROSS, a town in Herefordshire, with a market on Thursday. It owes most of its improvements and charitable institutions to John Kyrle, commonly called the Man of Ross, whose benevolent character is so interestingly delineated by the pen of Pope. It is seated on the Wye, 12 miles S.E. of Hereford, and 115 W. by N. of London. Lon. 2. 25 W. Lat. 51. 56 N.

Ross, a seaport of Ireland, in the county of Cork. It is united to Cork as an episcopal see, and is seated on a bay of the Atlantic, 20 miles S.W. of Kinsale. Lon. 8. 58 W. Lat. 51. 32 N.

Ross (New), a seaport of Ireland, in Wexford, situate on the Barrow, which is navigable

for large vessels up to the quay. The town has a considerable trade, and exports a great quantity of butter and beef. It is 11 miles N.E. of Waterford, and 17 W. of Wexford. Lon. 6. 58 W. Lat. 51. 22 N.

Ross (Alexander), a prelate, born at Aberdeen, 1640, and educated at St. Andrew's. He was in 1686 bishop of Edinburgh; but the revolution put an end to the episcopal authority in Scotland. He died at Edinburgh 1720, aged 80. He was author of some tracts little known.

Ross (Alexander), author of Virgilius evangelizans, a singular canto on the life of Christ, extracted all from Virgil—a view of all religions, in 8vo.—and other tracts, was of Aberdeen, and became master of Southampton school, and chaplain to the first Charles. He died 1654, aged 64.

Ross (John), of Herefordshire, was educated at St. John's college, Cambridge. He obtained Frome vicarage, Somersetshire, and in 1778 was preferred to the see of Exeter. He wrote a defence of Dr. Middleton against Mr. Markland, 1746, and in 1749 edited Cicero's epistles ad familiares, in 2 vols. 8vo. He published besides, single sermons, and died 1792.

ROSSEL, a name for light sand.

ROSSANO, a strong town of Naples, in Calabria Citeriore, and an archbishop's see. The adjacent valleys yield oil, capers, saffron, and excellent pepper. It is seated on an eminence, surrounded by rocks, three miles from the gulf of Tarento, and 136 S.E. of Naples. Lon. 16. 38 E. Lat. 39. 48 N.

ROSSLAU, a town of Upper Saxony, in the principality of Anhalt, with a castle; seated at the conflux of the Rosslau with the Elbe, 10 miles S.S.E. of Zerbst.

ROSS-SHIRE, a county of Scotland, 80 iles long and 70 broad; bounded on the N. by Sutherlandshire and the frith of Dornock, W. by the Minch, S. by Invernessshire, and E. by the frith of Murray and the county of Cromarty, which last it almost incloses. It is divided into 30 parishes, and the number of inhabitants in 1801 was 52,291. The middle and N.W. parts are mountainous and dreary; the E. part is variegated with woods, lakes, and rivers. The hills feed horses, beeves, sheep, and goats, and abound with game; the rivers and lakes teem with fish and waterfowl; and the loches on the W. coast are visited regularly by a shoal of herrings. The inhabitants of the W. and S. parts speak the Erse language, which is also understood on the E. coast, where, however, English is generally spoken. The island of Lewis is attached to this county. Tain is the capital.

ROSSLYN, (Alexander Wedderburn, earl of,) an able lawyer, born in Scotland 1733. He was educated at Edinburgh university, and called to the Scotch bar 1752, and entered the next year at the Inner Temple. In parliament, as member for Richmond, he distinguished himself as a well informed orator in support of Mr. George Grenville's administration, and he espoused the cause of the mother country in the American war. He was appointed solicitor-general in 1771, attorney-general in 1778, and created 1780 baron Loughborough, and made chief justice of the common pleas. He supported the coalition ministry, and was in 1783 commissioner for keeping the great seal; but was dismissed with lord North and Mr. Fox, whose opposition to the new ministry he ably seconded in parliament. In 1793 he accepted the seals, and was in 1801 created earl Rosslyn, and soon after retired to privacy. He died suddenly 1805, at Baylis, near Salt-hill. He was author of a pamphlet, called Observations on the State of the English Prisons, and the Means of improving them; a work of merit.

ROSTEL, in botany. (*Rostellum*, from *rostrum*, a beak.) The rostel, or descending plane part of the corcle or heartlet in the first vegetation of the seed.—Pars corculi simplex descendens.

ROSTOCK, a fortified town of Lower Saxony, in the duchy of Mecklenburg, with a university, a good harbour, a strong citadel, an arsenal, and three churches. It is divided into three parts, the old, the new, and the middle town, and carries on a large trade. It was often taken in the 18th century; the last time in 1761 by the Prussians. It is seated on the river Warne, 10 miles from its entrance into the Baltic, and 32 E.N.E. of Wismar. Lon. 12. 20 E. Lat. 54. 10 N.

ROSTOF, a town of Russia, in the government of Xaroslaf, and an episcopal see. It is seated on the lake Nero, or Rostof, which communicates with the Volga by the river Kotorost, 95 miles N.E. of Moscow. Lon. 40. 25 E. Lat. 57. 5 N.

ROSTRATE FRUIT, in botany. A beaked fruit. Having a process resembling the beak of a bird: as in geranium, scandix, pecten.

RO'STRUM. *s.* (Latin.) 1. The beak of a bird. 2. The beak of a ship. 3. The scaffold whence orators harangued (*Addison*). 4. The pipe which conveys the distilling liquor into its receiver in the common alembics; also crooked scissars, which the surgeons use in some cases for the dilatation of wounds (*Quincy*).

RO'SY. *a.* (*roseus*, Latin.) Resembling a rose in bloom, beauty, colour, or fragrance (*Prior*).

To ROT. *v. n.* (ꝓotan, Saxon; *rotten*, Dutch.) To putrefy; to lose the cohesion of its parts (*Woodward*).

To ROT. *v. a.* To make putrid; to bring to corruption (*Dryden*).

ROT. A well known disease in the liver of sheep, and other domestic animals, but principally in that of the former; producing general marasmus, but not contagious; and generally evinced by the existence of large quantities of the liver-fluke, or fasciola hepatica, in this organ. It has been ascribed to a variety of causes: yet the real cause is still doubtful. The following history of the disease is fur-

lished us by Dr. Harrison, and is the best we possess.

" When in warm, sultry, and rainy weather, sheep that are grazing on low and moist lands feed rapidly, and some of them die suddenly, there is reason to fear that they have contracted the rot. This suspicion will be further increased, if a few weeks afterwards the sheep begin to shrink, and become flaccid in their loins. By pressure about the hips at this time, a crackling is sometimes perceptible. Now, or soon afterwards, the countenance looks pale, and upon parting the fleece, the skin is found to have exchanged its vermilion tint for a pale red; and the wool is easily separated from the pelt. As the disorder advances, the skin becomes dappled with yellow, or black spots. About this time, the eyes lose their lustre, and become white and pearly, from the red vessels of the tunica adnata, and eye-lids, being contracted or entirely obliterated. To this succeeds debility and emaciation, which increase continually till the sheep die; or else ascites, and perhaps general dropsy, supervene, before the fatal termination. These symptoms are rendered more severe, by an obstinate purging, which comes on at an uncertain period of the disorder. In the progress of the complaint, sheep become what the graziers call chockered, i. e. affected with a swelling under the chin, which proceeds from a fluid contained in the cellular membrane, under the throat.

" In five or six days after contracting the rot, the thin edge of the small lobe of the liver becomes of a transparent white or bluish colour, and this spreads along the upper and lower sides, according to the severity of the complaint. Sometimes it does not extend more than an inch from the margin. In severe cases, the whole peritoneum investing the liver is diseased; and then it commonly assumes an opaque colour, interspersed with dark red lines or patches. The upper part of the liver is sometimes speckled like the body of a toad, to which it is said to bear a striking resemblance: round the ductus communis choledocus, and hepatic vessels, a jelly-like matter is deposited, which varies according to the severity of the attack, from a tablespoonful, or less, to five or six times that quantity. Upon boiling, the liver loses its firmness, and separates into small pieces in the water, or remains soft and flaccid."

The doctor here observes, that graziers and butchers having remarked that sheep are much disposed to feed during the first three or four weeks after being tainted, avail themselves of this circumstance, very commonly, to increase their profits. " When the first stage is over," continues he, " flukes begin to appear in the pori biliarii, the ductus communis choledocus, and in the gall-bladder. At first, the number of these creatures is small; but as the disease advances, they increase, and before death are often very numerous. In the last part of the complaint, they are sometimes to be found in the stomach, as well as in the intestines and liver. This, like the visceral disorders of the human body, may terminate in resolution, effusion, suppuration, or schirrus.

1st, " The complaint is said to terminate in resolution, when the inflammatory action goes off, without destroying the state and texture of the parts. However, I am strongly inclined to believe, that every considerable inflammation in the human body, and in other animals, although it ends in resolution, leaves behind it some remains, which may be discovered by an experienced anatomist. When the vessels are thrown into inflammatory action for a few days only, effusion commonly takes place, and the coats become thicker, and assume a buffy colour. These changes in the sanguinary system often continue through life, and lay the foundation of many chronic and incurable disorders. Sheep that recover from the rot exhibit very different appearances after death, according to the severity of the attack; but the taint is seldom or never entirely removed." The liver of an old ewe, that lately died fat, and contained fourteen pounds of suet in her body, had the following appearances in the liver. " The back part of the small lobe was dappled with whitish spots; the coats of the ductus communis and pori biliarii were considerably thickened, and more solid than usual. In colour, they resembled the human aorta in old people, and were full of flukes: in other respects, the liver appeared to be sound and natural. The butcher asserted, that the variegated appearance and alteration in the ducts were occasioned by a slight taint of long standing, which had not been considerable enough to disorder the economy, or impair the health of the animal, sufficiently to prevent its feeding.

2dly, " When sheep die suddenly in the first stage of the disorder, an effusion of serum, or of wheyish coloured fluid, may be commonly discovered, in the cavity of the abdomen, and then the peritonæum surrounding the liver is generally covered with a membrane or coat of coagulable lymph. This form of the rot has been frequently confounded with the resp or red-water, though it differs from the latter disorder, in the colour of the effused liquid, in being much less disposed to putrefaction, and in several other particulars.

3dly, " Abscesses in the liver exhibit another termination of this malady. They are seldom considerable enough to kill immediately; but, in consequence of the absorption of purulent matter from them, the sheep frequently waste away, and die hectical or dropsical. When the collections are small, sheep will recover sufficiently to bear lambs, for three or four seasons, and afterwards become tolerable mutton.

4thly, " The most common termination is in schirri, or what the shepherds call knots in the liver. The whole substance of this important viscus has been found so full of small roundish lumps, or schirrous bodies, that it was difficult to find any sound part in it. The first attack is unfortunately so very insidious,

that the disorder is scarcely observable, before the animal begins to waste and lose flesh. In this advanced state, it is said to labour under the rot or pourriture, from overlooking the commencement of the disorder.

" Hydatids are observed to affect schirrous and purulent livers more frequently than others. When livers are much diseased, the butchers carefully conceal them from the public eye. To me, it is always matter of surprise, to find the mutton saleable in these severe cases. It shews in an extraordinary manner, the accommodating power of living matter, which is able to maintain life, and increase corpulence, under such unfavourable circumstances. Shepherds and breeders, who make it a general rule to kill every sheep that becomes indisposed, from an opinion that very few of them ever recover from any illness, would do will to examine the livers and others viscera of slaughtered sheep. By such a practice, they would soon be convinced, that sheep are able to endure a great deal." Dr. Harrison concludes his history of the rot with expressing his firm persuasion, that the uniform mortality among these animals proceeds rather from ignorance, or erroneous treatment, than from the inevitable tendency of their disorders. Reversing the order which the author observes, we shall now state his opinion of the cause of this inveterate malady.

" The disorder," says he, " has been imputed,

1st, " To a vitiated dew.

2dly, " To a grust, which adheres to the grass after wet weather, or the overflowing of running water.

3dly, " To the luxuriant and quick growth of plants, in hot, moist seasons.

4thly, " To grazing upon certain herbs.

5thly, " To fasciolæ hepaticæ, (liver-flukes) or their ova, being introduced into the stomachs of animals, by feeding on swampy and low grounds in moist weather.

6thly, " It has been called the sheep-pox, by professor Vibourg, of the veterinary college at Copenhagen; but this is not properly a cause of the rot.

7thly, " It is ascribed, by Daubenton, to poor diet, and drinking too much water."

To each of these Dr. Harrison opposes such reasoning as he thinks sufficient to demonstrate their fallacy, and concludes,

8thly, " It seems to be occasioned by poisonous effluvia, which, under certain circumstances, are emitted from marshy soils."

We must, of necessity, confine ourselves to the latter, in support of which the ingenious author offers the following strong, we had almost said decisive, facts.

" Mr. Harrison resides upon a considerable inheritance, which was formerly tenanted by his father and grandfather. It consists of high and low lands of a loamy and tenacious nature. While a brook which runs through the farm remains overflowed, and the water continues upon the adjoining flat grounds, his sheep never suffer any inconvenience, though they are frequently obliged to wade for their provisions. As soon as the flood is subsided, the sheep can at any time be tainted in a quarter of an hour, while the land retains its moisture, and the weather is hot and sultry. The butchers are so well acquainted with the importance of this fact, that when my friend has disposed of any fat sheep, they are usually turned upon his rotten ground to make them thrive faster.

" Mr. Harrison has, by judicious management, laid the greatest part of his farm completely dry, and is now little troubled with the rot, unless when he wishes to give it to some particular animals. His neighbours, who have been less provident, are still severe sufferers by it, nor are their misfortunes confined to sheep alone. Pigs, cows, asses, horses, poultry, hares, and rabbits, become rotten in this lordship, and have flukes in their livers.

" Many years since the grandfather of this gentleman removed ninety sheep, from a considerable distance, to his own residence. On coming near to a bridge, which is thrown over the Barling's river, one of the drove fell into a ditch, and fractured his fore-leg. The shepherd immediately took it in his arms to a neighbouring house, and replaced the limb. During this time, which did not occupy more than one hour, the remainder were left to graze in the ditches, and lane. The flock were then driven home, and in a month afterwards, the other sheep joined its companions. The shepherd soon discovered that all had contracted the rot, except the lame sheep; and as they were never separated upon any other occasion, it is reasonable to conclude, that the disorder was acquired by feeding in the road and ditch bottoms.

" A Lincolnshire farmer purchased some turnips in Nottinghamshire, upon which he intended to winter a flock of sheep. The first division, consisting of about forty, were detained one night at a village near to the place formerly alluded to, by the overflowing of the Barling's Eau, and were put upon a piece of flat land, which leads to the river. The water had not returned to its former channel more than a day or two. Every one of the forty sheep became rotten; whereas the other division, which stopped no where by the way, escaped the disorder, and remained well. Sheep were formerly admitted into some adjoining pastures, in travelling to and from the neighbouring fairs and markets; but so many of them contracted the rot, that, for some time past, the graziers in this country will not suffer their flocks to stop for a moment near the village. I have repeatedly examined the suspected ditches and pastures, but never observed either flukes, or any of the plants, to which the rot has been attributed; though I must candidly acknowledge, that I ought to have sought for them with more care and attention. These ditches communicate with a rivulet, which frequently overflows its banks, and the enclosures are then deluged with water. The soil consists chiefly of loam or clay, and the surface is so flat and level on

both sides of the river, that, for want of proper descent, the water is a long time detained upon the ground. I am credibly informed, that in this place the rot affects swine, hares, and rabbits, as well as sheep.

"I have likewise been informed, by Mr. David Wright, that a few years since, as a drove of sheep were passing through a long lane in the parish of Irby, one of them, being weary, fell down in the middle of the road. The others were permitted to range at large, till their companion was able to travel. They were then driven altogether into a pasture, and it was soon discovered that only the tired sheep had escaped the rot. As the flock had never been separated upon any occasion, we are entitled to conclude that the disorder was contracted while the tired animal remained upon the road."

From these and other cases the doctor thinks himself justified in attributing the rot in sheep, and other animals, to paludal effluvia; but with respect to the nature and chemical characters of such effluvia, he acknowledges it is very difficult to form any rational opinion, as they have hitherto eluded the most subtile and delicate enquiries. His suggestions on the prevention of the rot we shall notice very briefly.

"Where necessity requires the pasturage of moist grounds in summer or autumn, the shepherd ought carefully to remove his flock into a dry situation before the evening, and provide them with corn, and good hay, or green food.

"A considerable farmer of Bohemia kept his sheep sound in the wet and fatal year 1769, by feeding them every night, when turned under a shed, or into stables, with hashed straw; and by eating it greedily, they were all saved. By this judicious practice, the sheep were removed to sleep in better air, as well as preserved in a more vigorous state of body. Sir John Pringle informs us, that persons have maintained themselves in good health, during sickly seasons, by inhabiting the upper stories of their houses; and I have reason to believe, that merely by confining sheep on high grounds, through the night, they have escaped the rot.

"After the dew is exhaled by the sun's heat, sheep may be suffered to range in moist and swampy places, with less danger, because the miasmata, which are formed in the night, and remain entangled among the grass, or float in the lower part of the atmosphere, are chiefly dissipated with the dew. Therefore, unless they be very copiously produced in the day-time, or are unusually virulent, they will not be sufficiently concentrated to do much injury to healthy sheep. While at rest and asleep, the operations of the system are more feebly performed, and then sheep are peculiarly exposed to diseased actions. By conforming to these regulations, I have known one flock escape entirely, while others have suffered materially in the same open field.

"It is confidently asserted, that decoctions of bitter herbs, with salt, have frequently preserved sheep from the rot. Salt is supposed to constitute a part of Fleet's celebrated nostrum: and we know, that bitters are deservedly recommended to prevent intermittents, the dysentery, and other disorders, which originate from exhalations.

"In Oxfordshire, Dr. Lower has frequently known six or seven spoonfuls of strong brine and stale urine, with soot steeped in it, to be given with great success. This is done at spring and fall of the year, when the dew is counted most dangerous. This course of physic is continued eight or ten days, or till the sheep eat their meat heartily; and if they were taken in time, there seldom died any in a whole flock. For the same purpose, Ellis recommends the following medicine in his Practical Husbandry.

"'Take a peck or more of malt, and mash it as though you would brew it into ale or beer, and make eleven or twelve gallons of liquor; then boil in it a quantity of shepherd's purse, comfrey, sage, plantain, penny-royal, wormwood, and bloodwort: add yeast, and afterwards salt to the mixture: then turn the liquor into a vessel. After April comes in, give seven or eight spoonfuls to every sheep, once in the week, if the weather be wet, and if dry, not so often.'"

The whole of Dr. Harrison's remarks are well worth consideration. We shall conclude with the following hints.—When the shepherd determines to examine the eyes of a sheep, which ought to be done frequently, he should place it between his thighs, and hold the head with both hands. He then proceeds to raise the upper and depress the under eye-lid; by which means the blood-vessels of the tunica albuginea are brought into view. When they are red, and in great numbers, the sheep is supposed to be in good health. The caruncula lacrymalis, and inner surface of the eyelids, should be as red as the vessels on the eye-ball. If they be pale, and the veins are in small quantities, and faint-coloured, or livid, the sheep is in a debilitated state, or afflicted with the rot. In all cases where the blood-vessels have entirely disappeared, the mutton is bad. By frequently examining the eyes in dangerous seasons, shepherds might always discover the rot before their sheep begin to shrink, and, consequently, in time to prevent any material injury to their profits. Where the demand is considerable, and the market is not far distant, the grazier may always turn the rot to his advantage, by keeping the tainted sheep while they continue to feed, and taking care to kill them immediately after they cease to thrive.

Just after this article was prepared, an ingenious treatise on the Rot or Resp, by Mr. B. Holdich, reached us. We think it a valuable essay on this disease, and beg therefore to recommend it to our readers.

ROT (Dry), in timber, a decay in the wood employed in building ships, houses, or other habitations, from causes very differently assigned by different writers on the subject: and which ought perhaps to be regarded as a generic term including various species of vegetable corruption.

It occurs most frequently in what is called the sap-wood or alburnum of timber, and particularly when felled in the spring instead of in the autumn: whence Dr. Darwin conceives it to be a decay resulting from the greater quantity of sugar which the sap-wood contains in that season of the year, and the ready fermentation into which it is disposed to run; the buds and leaves exhausting it of its sugar after this period, and rendering it, in consequence, less liable to change. Whence he conceives, and with great ingenuity, that "the rot of wood might probably be entirely prevented by soaking dry timber first in lime water, till it has absorbed as much of it as may be; and then, after it is dry, by soaking it in a weak solution of vitriolic acid in water; which will unite with the lime already deposited in the pores of the timber, and convert it into gypsum;" a fact that he supposes "will not only preserve it from decay for many centuries, if it be kept dry, but also render it less inflammable, a circumstance worthy attending to in the construction of wood-built houses." He also conceives "that beams so impregnated would be less liable to swag, and boards so prepared less liable to warp."

The chief circumstances under which the rot takes place are those of moisture and want of ventilation: when these exist it will be found in the heart of timber as well as in the sap-wood; and when it once occurs, it will be often found to spread with great rapidity from one part to another, till the whole of the timber is destroyed, of whatever kind it consist, and to be communicated with great facility from one joist or plank, or one portion of a floor or wainscot to another.

It has hence been supposed by Johnson, and various others, to be the effect of a parasitic fungus, the seeds of which have by some means or other obtained an introduction into the pores of the timber, and which is denominated boletus lachrymans, a stemless plant, coriaceous, semioval, orange, with reticulate pores, and broad white border: in which case it may be regarded as a disease of a nature somewhat similar to the blight or smut of wheat; the first is perhaps the effect of the mucor erysiphe of Linnéus, and the second of a small fungus which occupies the whole ear of various gramina, and is seldom found except in this family.

The chief instrumental causes, whatever be the immediate cause, being moisture and want of ventilation, the best preventives are perfect dryness or imporosity, and a free exposure to the atmosphere. With a view of obtaining the first, which alone will succeed when pushed to a considerable extent, Mr. Batson and many other physiologists recommend charring; while another set, and with equal reason and upon the same principle, advise painting, or pitching, and taring. It is probable that the encaustic painting of the ancients, if we could revive the art, would be one of the best methods, as combining in itself both the preceding principles.

The mischief which has not unfrequently been produced from this cause to our shipping, renders it a subject of great national importance to attend to: and there is an article directed to it in this point of view in Nicholson's Journal, vol. xxx. that ought not to be overlooked, though it is published anonymously. Adopting the last of the two hypotheses to which we have above alluded, the author tells us that the dry rot proceeds from the growth of a parasitical plant named by botanists boletus lachrymans, which belongs to the class of cryptogamia. Its injurious tendency, he asserts, is mentioned as far back as history will carry us, and its appearance and ravages are particularly pointed out in the Bible, Levit. ch. xiv. "The cure there directed is, to remove the materials injured; and, if this did not stop the disease, the house was raised, and the entire articles of which it was composed taken without the city. In latter times an equally effectual but more easy remedy has been applied in buildings, where this plant has taken root—that of causing a circulation of air in the parts affected; but this cannot be introduced in the fabrics of which we are now treating.

The fatal tendency of the dry rot in ships cannot be pointed out in a more forcible way, than it is in the memoirs of Pepys, who was secretary to the Admiralty during the reigns of Charles II. and James II. At that time a commission was formed to inquire into the state of the navy, by which it appeared, that there were thirty ships called new ships, which, as he observes, "for want of proper care and attention, had toadstools growing in their holds as big as his fists, and were in so complete a state of decay, that some of the planks had dropped from their sides." From that time to the present, the evil has in some measure existed; and, although it has not since appeared in so great an extent as it then did, yet the state of some ships recently launched both justifies and demands all possible inquiry as to the causes of the growth of this fungus, and its prevention. Several means have been tried to prevent its vegetating, many of which might have answered this purpose, had they not been found to introduce evils as great as that which they pretended to cure. Among the most prominent, was the mode practised on the timbers of many ships, between the years 1768 and 1773, by saturating them with common salt; but this was found to cause a rapid corrosion in the iron fastenings, and the ships were (between decks) in a continual state of damp vapour. Mundic, found in the mines in Devonshire, has been lately employed, in fusion, to eradicate the vegetation, and prevent its future growth; but time is required to prove its efficacy.

In the common mode of constructing ships there are several causes, which promote the growth of fungi. The accumulation and consequent fermentation of materials not sufficiently seasoned, divested too of a free circulation of air, and permitting sap to remain on the edges of the frames, generate carbonic acid

gass to the prejudice of the timber, and which promotes the growth of this boletus. Mr. Humboldt has found by experiments, that eight or ten hundredths of carbonic acid gass, added to the air of the atmosphere, rendered it extremely fit for vegetation; and that the air in mines, and other subterraneous passages, was found in this state, which is very favourable to the germination of all plants of the class cryptogamia. The gass found in the openings between the timbers of ships affected with the dry rot has been proved to be precisely what Mr. Humboldt has mentioned.

The means of late proposed to prevent or cure this evil are twofold; charring the whole surfaces of the timbers, and the inner surfaces of the planks, of which the ships are composed; and causing some slight deviations to be made in the modes practised in building them. "I do not pretend, says an ingenious writer, to originality, when I recommend charring of timber, either to add to its durability, or prevent the growth of parasitical plants; for the experience of ages has proved the incorruptibility of charcoal, whether buried in the earth, or exposed to the action of air or water. The beams of the theatre of Herculaneum, which were reduced to this state by lava, were found, after a period of nearly eighteen centuries, to be perfect. The piles, supposed to have been driven into the earth by order of Julius Cæsar, when he forded the Thames at Cowey Stakes, near Shepperton, were charred, and, when recently taken up, found in a complete state, free from decay! Among many other instances, that may be adduced, the practice, almost universally adopted, of burning the ends of posts to be put into the ground, to prevent premature dissolution, may be added as an additional proof of the efficacy of this recommendation; and makes us lament, that it has not been generally introduced in fabrics, where so much timber, labour, and money, have been expended; and the hopes and expectations of government or individuals frequently disappointed, by their rapid decay.

"There are several other advantages, that will be obtained by burning the surfaces of timber. Rats, which are so destructive to ships, will not touch charcoal; nor will the white ants and cockroaches, so common in the Indies, commit their depredations on substances so prepared. If farther evidence of its utility, when employed only on a small scale, be necessary, the durability of the Royal William, the flag ship at Spithead, which was built in the year 1719, and the planks only were burned on their inner surfaces, would be sufficient to prove its efficacy when practised on ships. Of late years the ends of ships' beams have been charred, and the sound state in which they are now found has justified and established the practice. Indeed all substances, that have undergone the action of fire, have been proved to be unfavourable to the growth of the boletus lachrymans; for, while stone has been rapidly destroyed by it, well burnt bricks, in the same buildings, and in nearly the same situation, have been free from its attacks.

"The scarcity of English oak, occasioned partly by the improved state of agriculture, but more by the increased numbers of our fleet, has obliged this country to have recourse to wood grown in other states. The principal that have been introduced in aid of oak are the varieties of American pine: it becomes therefore of some importance to inquire which sort of this timber is the most durable, and which the soonest destroyed by vegetation. Pitch pine has been used by all nations in the construction of ships, and appears to be very superior to every other species for general durability; but this wood is the soonest destroyed by fungi, as these plants are nourished by the great quantity of resin contained in its numerous cells. I have lately seen some pitch pine plank of seven inches in thickness completely decomposed; and, when cut open, the boletus was found to be vegetating in every part of it, but principally in the cells which were originally filled with resin. This proves how improper it will be to employ it as treenail fastenings, on which the strength and safety of ships so much depend. Pitch pine should not be covered with paint, as the pores of the wood are thereby stopped, and the expansion of the resin prevented, by which means the ligneous cells are broken, and decomposition takes place. The Americans pay the topsides of their ships with a mixture of oil, resin, &c. which are not unlike the substances that are contained in the wood they cover, and produce a hard varnish, impervious to water. Perhaps the preparation recommended by Dr. Parry, to prevent the dry rot, given in the Transactions of the Bath and West of England Societies, might be introduced also for this purpose with success. Whitewash or lime water to be used between decks is much to be preferred to paint, both on account of its cheapness and cleansing qualities, and also as it is detrimental to vegetation.

"Instead of the frames of a ship being converted to their proper shape for some months before they are put up, and afterward standing on a slip a year to season, as is now the usual practice; I would recommend, that they should be converted, and remain, together with the planks, in that state (under cover where there shall be a free circulation of air) for two years, then charred, put up, and the planking immediately begun; commencing operations from within board, by which means chips and dirt will not accumulate between the timbers; care being taken, that the holes be not bored too near the seams in the outboard plank. Holes should be bored, but no treenails driven till within a short time of the ship's being launched; this will both convey air within board, and carry off the vegetable juices, if any remain in the interior of the timbers. The planks could be kept in their places by the usual butt bolts, and some copper nails, or small bolts ragged, being driven at intermediate spaces. This too would strengthen the ship, as metallic fastenings are always to be preferred, in the wales and bottom, to treenails.

"An objection may be made to the bringing

round thick planks in the bow of a ship by burning, rather than the usual practice of boiling them in a kiln, on account of breaking their fibres. Although I do not see that any difficulty can exist in the former method, as it is the usual practice of the French; yet, if any should occur on trial, and boiling them be considered absolutely necessary, vegetation may be prevented by dissolving some green vitriol in the water, and afterward fixing it in the wood by a weak alkali. The method approved of by many judicious shipwrights, and constantly practised by the Dutch, that of sawing the thick planks, that are to be much bent, into two parts, might also be employed for this purpose. If a doubt should exist of the efficacy of wood prepared in these several ways to prevent the dry rot, specimens might be placed in a ship almost destroyed thereby, such a one as I recollect to have seen at Woolwich about 13 years since, which was in so bad a state, that the decks sunk with a man's weight, and the orange and brown coloured fungi were hanging in the shape of inverted cones from deck to deck. A few months trial of wood put into a ship so infected would prove the efficacy of either mode of preparation."

Exsiccation of timber in an oven, as recommended by Fourcroy, is also likely to add considerably to its durability.

One farther precaution is necessary. After a ship is built, she should lie at least six months in ordinary, with her hatchways covered to prevent the admission of rain water; some planks should be removed in the ceiling, and above the waterways of the several decks; and fires constantly kept in stoves, placed in the hold, and on the decks; by which means the moisture, that the charcoal may have attracted, will be dissipated, and the durability of the fabric insured.

ROTA, in mechanics. See WHEEL.

ROTA ARISTOTELICA, or ARISTOTLE'S WHEEL, denotes a celebrated problem in mechanics, concerning the motion or rotation of a wheel about its axis; so called because first noticed by Aristotle.

The difficulty is this. While a circle makes a revolution on its centre, advancing at the same time in a right line along a plane, it describes in that plane a right line which is equal to its circumference. Now if this circle, which may be called the deferent, carry with it another smaller circle, concentric with it, like the nave of a coach wheel; then this little circle or nave will describe a line in the time of the revolution, which shall be equal to that of the large wheel or circumference itself; because its centre advances in a right line as fast as that of the wheel does, being in reality the same with it.

The solution given by Aristotle is no more than a good explication of the difficulty.

Galileo, who next attempted it, has recourse to an infinite number of infinitely little vacuities in the right line described by the two circles; and imagines that the little circle never applies its circumference to those vacuities; but in reality only applies it to a line equal to its own circumference; though it appears to have applied it to a much larger. But all this is nothing to the purpose.

Tacquet will have it, that the little circle, making its rotation more slowly than the great one, does on that account describe a line longer than its own circumference; yet without applying any point of its circumference to more than one point of its base. But this is no more satisfactory than the former.

After the futile attempts of so many great men, M. Dortous de Meyran, a French gentleman, had the good fortune to hit upon a solution, which he sent to the Academy of Sciences; where being examined by Mess. de Louville and Soulmon, appointed for that purpose, they made their report that it was satisfactory. The solution is to this effect:

The wheel of a coach is only acted on, or drawn in a right line; its rotation or circular motion arises purely from the resistance of the ground upon which it is applied. Now this resistance is equal to the force which draws the wheel in the right line, inasmuch as it defeats that direction; of consequence the causes of the two motions, the one right and the other circular, are equal. And hence the wheel describes a right line on the ground equal to its circumference.

As for the nave of the wheel, the case is otherwise. It is drawn in a right line by the same force as the wheel; but it only turns round because the wheel does so, and can only turn in the same time with it. Hence it follows, that its circular velocity is less than that of the wheel, in the ratio of the two circumferences; and therefore its circular motion is less than the rectilinear one. Since then it necessarily describes a right line equal to that of the wheel, it can only do it partly by sliding, and partly by revolving, the sliding part being more or less, as the nave itself is smaller or larger. See CYCLOID.

ROTACEÆ. (*rota*, a wheel.) The name of the fifty-second order in Linneus's Fragments; and of the twentieth in his Natural Orders.

ROTALA, in botany, a genus of the class triandria, order monogynia. Calyx three-toothed; corolless; capsule three-celled; many-seeded. One species; an annual of the East-Indies.

ROTANG. See SANGUIS DRACONIS.

RO'TARY, *a.* (*rota*, Latin.) Whirling as a wheel.

ROTAS, a town of Hindustan, in the country of Lahore, 85 miles N.W. of Lahore. Lon. 71. 52 E. Lat. 32. 4 N.

ROTAS, a town of Hindustan, in the country of Bohar, 108 miles S.W. of Patna. Lon. 84. 0 E. Lat. 24. 38 N.

RO'TATED, *a.* (*rotatus*, Latin.) Whirled round.

ROTATION, *s.* (*rotatio*, Lat.) The act of whirling round like a wheel; whirl (*Newton*).

ROTA'TION, is a term which expresses the motion of the different parts of a solid body round an axis, and distinct from the progressive motion which it may have in its revolution round a distant point. The earth has a rota-

tion round its axis, which produces the vicissitudes of day and night; while its revolution round the sun, combined with the obliquity of the equator, produces the varieties of summer and winter.

The mechanism of this kind of motion, or the relation which subsists between the intensity of the moving forces, modified as it may be by the manner of application, and the velocity of rotation, is highly interesting, both to the speculative philosopher and to the practical engineer. The precession of the equinoxes, and many other astronomical problems of great importance and difficulty, receive their solutions from this quarter: and the actual performance of our most valuable machines cannot be ascertained by the mere principles of equilibrium, but require a previous acquaintance with certain general propositions of rotatory motion.

It is chiefly with a view of assisting the engineer that we propose to deliver in this place a few fundamental propositions; and we shall do it in as familiar and popular a manner as possible, although this may cause the application of them to the abstruse problems of astronomy to be greatly deficient in the elegance of which they are susceptible.

When a solid body turns round an axis, retaining its shape and dimensions, every particle is actually describing a circle round this axis, and the axis passes through the centre of the circle, and is perpendicular to its plane. Moreover, in any instant of the motion, the particle is moving at right angles with the radius vector, or line joining it with its centre of rotation. Therefore, in order to ascertain the direction of the motion of any particle, we may draw a straight line from the particle perpendicular to the axis of rotation. This line will lie in the plane of the circle of rotation of the particle, and will be its radius vector; and a line drawn from the particle perpendicular to this radius vector will be a tangent to the circle of rotation, and will have the direction of the motion of this particle.

The whole body being supposed to turn together, it is evident that when it has made a complete rotation, each particle has described a circumference of a circle, and the whole paths of the different particles will be in the ratio of these circumferences, and therefore of their radii; and this is true of any portion of a whole turn, such as $\frac{1}{2}$, $\frac{1}{4}$, or 20 degrees, or any arch whatever; therefore the velocities of the different particles are proportional to their radii vectores, or to their distances from the axis of rotation.

And, lastly, all these motions are in parallel planes, to which the axis of rotation is perpendicular.

When we compare the rotations of different bodies in respect of velocity, it is plain that it cannot be done by directly comparing the velocity of any particle in one of the bodies with that of any particle of the other; for, as all the particles of each have different velocities, this comparison can establish no ratio. But we familiarly compare such motions by the number of complete turns which they make in equal times, and we say that the second hand of a clock turns 60 times faster than the minute hand; now this comparison is equally just in any part of a turn as in the whole. While the minute hand moves over one degree, the second-hand moves 60; therefore, as the length or number of feet in the line uniformly described by a body in its progressive motion is a proper measure of its progressive velocity, so the number of degrees described by any particle of a whirling body in the circumference of its circle of rotation, or the angle described by any radius vector of that body, is a proper measure of its velocity of rotation. And in this manner may the rotation of two bodies be compared; and the velocity is with propriety termed angular velocity.

An angle is directly as the length of the circumference on which it stands, and inversely as the radius of the circle, and may be expressed by the fraction of which the numerator is the arch, and the denominator the radius. This fraction expresses the portion of the radius which is equal to the arch which measures the angle; and it is converted into the usual denomination of degrees, by knowing that one degree, or the 360th part of the circumference, is $\frac{1}{57,296}$ of the radius, or that an arch of 57,296 degrees is equal to the radius.

When a solid body receives an impulse on any one point, or when that point is any how urged by a moving force, it cannot move without the other points also moving. And whatever is the motion of any particle, that particle must be conceived as urged by a force precisely competent to the production of that motion, by acting immediately on the particle itself. If this is not the particle immediately acted on by the external force, the force which really impels it is a force arising from the cohesion of the body. The particle immediately impelled by the external force is pressed towards its neighbouring particles, or is drawn away from them; and by this change of place, the connecting forces are brought into action, or are excited; they act on the particles adjoining, and change, or tend to change, their distances from the particles immediately beyond them; and thus the forces which connect this next series of particles are also excited, and another series of particles are made to exert their forces; and this goes on through the body till we come to the remote particle whose motion we are considering. The forces which connect it with the adjoining series of particles are excited, and the particle is moved. We frequently say that the external moving force is propagated through the body to the distant particle; but this is not accurate. The particle is really and immediately moved by the forces which connect it with those adjoining.

We have not room to enter upon the doctrine of rotatory motion in all its varieties, yet think it of far too great importance to be passed over silently: we therefore present the following propositions, in which the primary properties of compound rotatory motion are investigated from clear and unexceptionable principles.

1. Let C, (plate 149, fig. 4) be the centre of

two circular arcs AB, EF, which are the measures of the angle ACB, ECF; and let CB cut EF in D. Then, as the sectors ACB, ECD are similar, CA : CE :: AB : ED $= \frac{CE \times AB}{CA}$. But (Eu. 33. VI.) ED : EF :: the angle ACB : the angle ECF; and therefore $\frac{CE \times AB}{CA}$: EF :: ∠ACB : ∠ECF. Consequently CE × AB × ∠ECF = CA × EF × ∠ACB; and therefore AB : EF :: CA × ∠ACB : CE × ∠ECF.

2. Let ACB, GEF (fig. 5.) be two angles, of which the arcs AB, GF are the measures; and the radii CA, EG not being necessarily equal, let the lines BK, FQ be equal to one another. Let BH, FM be tangents to the curves; and let HD, MN be parallel to CA, EG respectively, and meet BK, FQ in D, N, as represented. Then as CBH, BDH are right angles, the triangles CBK, BHD are equiangular, and CB : BK :: BH : HD or its equal KL, if HL be drawn parallel to BK, and meet CA in L. Consequently BK $= \frac{CB \times KL}{BH}$. For the same reasons, if MP be parallel to FQ and meet EG in P, FQ $= \frac{EF \times QP}{FM}$; and therefore as BK, FQ are, by hypothesis, equal $\frac{CB \times KL}{BH} = \frac{EF \times QP}{FM}$. Hence CB × KL × FM = EF × QP × BH, and BH : FM :: CB × KL : EF × QP.

3. If, therefore, we suppose straight lines CH, EM to be drawn, and that the angles BCH, FEM are indefinitely small, and generated in the same time by the revolution of CB, EF respectively, then BH, FM may be considered as circular arcs, and by article 1, BH : FM :: CB × ∠BCH : EF × ∠FEM. Hence by article 2, (and 11. V.) CB × ∠BCH : EF × ∠FEM :: CB × KL : EF × QP, and therefore ∠BCH : ∠FEM :: KL : QP. Consequently, during the generation of the angles BCH, FEM, the angular velocity of CB is to the angular velocity of EF as KL to QP.

4. If ACB (fig. 6.) be any plane angle, and from any point E, EF be drawn perpendicular to AC and EH perpendicular to CB, then the angle FEH is equal to the angle ACB. For let HK be drawn perpendicular to AC, and let EH be produced to G. First let ACB be an obtuse angle, and then ∠ACB = ∠KHC + ∠HKC + ∠KHC + ∠CHG = ∠KHG = ∠FEH. Secondly, ACB being an acute angle, the right angle GHC = ∠GHK + ∠KHC = ∠KHC + ∠HCK = ∠KHC + ∠ACB. Consequently the angle ACB = ∠GHK = ∠FEH.

5. Let G (fig. 7.) be the centre of gravity of a body, and AB, DC two axes passing through G; and, while the body revolves round AB, let AB and consequently the whole body revolve round DC, the periodical times of these revolutions not being necessarily equal; it is required to determine the direction and angular velocity with which any particle of the body revolves in consequence of this compound motion.

Suppose the simple motion of the body about AB to be such, that during the revolution the parts towards D from AB would rise above the plane, on which the figure is drawn, and the parts towards C sink below it. And suppose the simple motion about DC to be such, that during the revolution the parts towards A from DC would rise above the plane of the figure, and those towards B sink below it. Let P (fig. 8.) be a particle of the body, above the plane, and let PR be a perpendicular to the said plane. With the centre G suppose a spherical superficies to be described, passing through P and let ADBC be the great circle of this sphere in the plane on which the whole is represented. Let the straight lines EF, HK pass through R, and be perpendicular to AB, DC respectively; and let EPF, HPK be lesser circles of the sphere, EF being a diameter of the one, and HK a diameter of the other. Then it is evident, that by the simple motion of the body about AB only the particle P would move in the circumference FPE; and by the simple motion of the body about DC only, P would move in the circumference HPK. Let the indefinitely small arcs Ps, Pq be those which P would describe in equal times with the revolutions about AB, DC separately, and let the parallelogram $Pqps$ be completed on the spherical superficies. Then it is evident, from the composition of motion, that the direction and velocity of P, in consequence of the compound motion, is as the diagonal Pp of the parallelogram $Pqps$.

Let $RrMN$ be the orthographical projection of $Pqps$ on the plane ADBC, and then as PR is perpendicular to this plane, it is evident that $RrMN$ is a parallelogram, and that its diagonal RM is the direction and velocity of P in the projection, in consequence of the compound motion. It therefore follows, from article 3, as RN is the angular velocity about the axis AB, and Rr that about the axis DC, that RM is the angular velocity about the axis, round which the body is caused to revolve by the compound motion.

6. The same things being supposed, and the parallelogram $RrMN$ being the same in fig. 7 as in fig. 8, let RM produced meet the circumference in L and Q, and the diameter TGS, at right angles to LQ, is the axis sought.

The same axis may be obtained in the following manner. In GB take GV equal to RN; and in GC take GW equal to Rr, and VW being drawn it will be parallel to the axis TS. For as NR is perpendicular to AB, and Rr or NM to DC, by article 4, the angle RNM, or its equal RrM, is equal to the angle VGW. Also, on account of the equals, VG : GW :: Mr : rR, and therefore the angles rRM, GWV are equal. Let TS meet HK in O, and LQ in I; and let DC meet HK in X. Then as the angle OIR is equal to the angle OXG, each being a right one, and as the angles IOR, XOG are equal, the angle IRO, or MRr is equal to the angle OGX. Consequently the alternate angles XGO, GWV are equal, and therefore TS, VW are parallel. Hence it is evident that if the axes AB, DC, and also GV, GW the angular velocities round

Fig. 1.

London, Published by Sherwood & Co. Paternoster Row, Aug. 1. 1812.

them be given, the axis TS is easily found, being parallel to VW. It is proper to observe that GV, GW are to be set off on that side of TS towards which the body is moving, in consequence of the revolutions round DC, AB.

7. From the last article it is evident that VW is equal to RM, and consequently equal to the angular velocity, with which the body revolves about the axis TS. If therefore CGB be a right angle, then the angular velocity $VW = \sqrt{VG^2 + GW^2}$. In other cases the value of VW may be easily calculated by plane trigonometry.

8. It is to be remarked, for the sake of precision, that the linear velocity of any point is as the angular velocity multiplied into the radius of the circle in whose circumference it revolves. Thus the linear velocity Ps (fig. 8.) of the point P in the circumference FPE, is as its angular velocity in the same, multiplied into the radius of the circle FPE, as is evident from article 3. In the following articles, linear velocity is meant when no adjective is annexed to the word velocity.

9. Let AB, DC (fig. 9.) be the two axes about which separately the body would revolve, as stated in article 5, and let TS be the axis about which it revolves, in consequence of a combination of these two revolutions. Let TE be at right angles to AB, and meet it in H, and let TF be at right angles to DC, and meet it in K; and let GV, GW be the angular velocities about AB, DC, as in the preceding articles. Then it follows, from the last article, that the velocity of the point T, by the revolution about the axis AB only, is equal to GV × HT. And as this velocity is in the direction of a tangent at T to the circle of which TE is a diameter, and as this circle is perpendicular to the plane ADBC, the direction of this velocity is evidently perpendicular to the plane ADBC. The direction of this velocity of the point T is also upwards from the plane of the figure, agreeable to the statement in article 5. Again, by the revolution about the axis DC only, the velocity of T is equal to GW × KT, and, for the foregoing reasons, the direction of this velocity of the point T is perpendicularly downwards below the plane, according to article 5. Now as TS is the axis about which the body revolves, in consequence of the combined revolutions about AB, DC, every point in TS is rendered quiescent by the compound motions. It is therefore evident that GV × HT = GW × KT.

10. The revolutions about DC, AB may be supposed to be caused by instantaneous impulses at A and D, made at the same time, or at different times; or they may be supposed to be occasioned by the agency of constant forces, like that of gravity. For if the causes be adequate to the production of the same velocities, taken separately, and in the same directions, the velocity and direction of a particle will be the same from their combined influence upon it, whether these causes be impulses or constant forces.

As the body is understood to be in free space, if the causes of the revolutions, taken separately, be instantaneous impulses, and made at the same time, immediately after their agency the body will revolve about the axis TS, and it will continue so to revolve with an uniform velocity. If whilst the body is revolving with an uniform velocity about the axis DC, a constant force begin to act at D, so as to cause a tendency to revolution about AB, as stated in article 5, and continue afterwards to act at T, the pole of the new axis, from a combination of the constant agency at the new pole and the uniform velocity about DC, the axis TS will incessantly shift its position.

Such exactly are the circumstances to which the earth is subject as to the production of the precession of the equinoxes. See PRECESSION. The preceding are the leading propositions. The following two are added, by reason of their usefulness, but without demonstration.

11. A body may begin to revolve on any line as an axis, that passes through its centre of gravity, but it will not continue to revolve permanently about that axis, unless the opposite centrifugal forces exactly balance one another.

Thus, a homogeneous sphere may revolve permanently on any diameter, because the opposite parts of the solid, being in every direction equal and similar, the opposite centrifugal forces must be equal; so that no force tends to change the position of the axes.

Also, a homogeneous cylinder may revolve permanently about the line which is its geometric axis. It may also revolve permanently about any line that bisects that axis at right angles; but it can revolve permanently about no other line, since the centrifugal forces cannot be equal. The same is true with respect to all solids of revolution.

12. In every body, however irregular, there are three permanent axes of rotation, at right angles to one another, on any one of which when the body revolves the opposite centrifugal forces exactly balance one another. These are called the principal axes of rotation

This singular theorem was first proposed by Segner in 1755, and first demonstrated by Albert Euler, in a memoir crowned at Paris, in 1760. Leonard Euler has also given a demonstration of it in his treatise de Motu Corporum rigidorum, prop. 27. See also Frisius, de Rotatione Corporum quorum cunque, theorema vii.; and Gregory's Mechanics, vol. i. book 2. chap. 4.

These three axes have also this remarkable property, that the momentum of inertia with respect to any of them, is either a max. or a min., that is, is either greater or less than if the body revolved about any other axis.

ROTA'TOR. *s.* (Lat.) That which gives a circular motion (*Wiseman*).

ROTE. *s.* (*rote*, old Fr.) 1. A harp; a lyre: obsolete (*Spenser*). 2. (*routine*, French.) Words uttered by mere memory without meaning; memory of words without comprehension of the sense (*Swift*).

To ROTE. *v. a.* To fix in the memory, without informing the understanding (*Shaksp.*).

ROTENBERG, a town and fortress of Franconia, capital of a lordship of the same name; situate on a mountain, 18 miles N.E. of Nurenburg, and 27 S.S.W. of Bayreuth.

ROTENBURG, a town of Swisserland, in the canton of Lucern, four miles N. of Lucern.

ROTENBURG, a town of Westphalia, in the duchy of Verden, on the river Wumme, 15 miles N. by E. of Verden.

ROTENBURG, a town of Germany, in the late bishopric of Spire, 12 miles E. of Philipsburg.

ROTENBURG, a town of Germany, in Lower Hesse, with a palace, belonging to the prince of Hesse-Rheinfes; seated on the Fulda, 24 miles S.S.E. of Cassel.

ROTGUT. *s.* Bad beer (*Harvey*).

ROTH, a town and castle of Franconia, in the principality of Anspach. It is the birthplace of the celebrated Gessner, and stands at the conflux of the Roth with the Rednitz, 18 miles S. of Nuremberg.

ROTHBURY, a town in Northumberland, with a market on Friday; seated on the Coquet, nine miles S.W. of Alnwick, and 302 N. by W. of London.

ROTHENBERG, a town of Upper Lusatia, on the river Neissa, 17 miles N. of Gorlitz.

ROTHENBURG, a town of Franconia, capital of a territory of the same name. It is surrounded by moats and ramparts, and stands on a mountain by the river Tauber, from which it is supplied with water by means of a machine. It has five churches, and was lately an imperial town. It is 15 miles W.N.W. of Anspach. Lon. 10. 18 E. Lat. 49. 22 N.

ROTHER, a river which rises in Sussex, forms the boundary between that county and Kent for a short space, and enters the English channel at Rye.

RO'THER-NAILS. *s.* Among shipwrights, nails with very full heads, used for fastening the rudder irons of ships (*Bailey*).

ROTHERHAM, a town in W. Yorkshire, with a market on Monday. It has a large church, and is famous for considerable ironworks in its vicinity at Masbrough. It is seat at the conflux of the Rother with the Don, 32 miles S. of Leeds, and 159 N. by W. of London.

ROTHIA, in botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle villous, with the margin chaffy; calyx of many equal leaves; down of the centre, simple and sessile; of the ray none. Three species; natives of the south of Europe.

ROTHSAY, a borough of Scotland, the capital of the isle of Bute. Here is an ancient castle, once a royal palace, which gives the title of duke to the heir apparent of the crown. It has a considerable trade in the herring fishery, and several cotton works. In 1801, the number of inhabitants was 5231. It is situate on the E. side of the island, and has an excellent harbour and pier, 80 miles W. by S. of Edinburg. Lon. 4. 53 W. Lat. 55. 48 N.

ROTHWEIL, a town in Suabia, lately imperial, but given in 1802 to the duke of Wirtemberg. Two miles to the S. is Rothmunster abbey, where they receive none but noble women. Rothweil is seated on the Neckar, near its source, 27 miles S.S.W. of Tubingen. Lon. 8. 37 E. Lat. 48. 8 N.

ROTIFER, in zoology, a microscopic animalcule of a very singular character, inhabiting the sand of tiles and sewers, and called by Spalanzani and various other naturalists the wheel-animal, from its peculiar formation. The abdomen is comparatively large, and situated towards the middle of the body, in the central regions of which some microscopists have conceived that they have discerned traces of a heart. The posterior part of the animal is provided with a minute trident, and the anterior divides into two trunks, bearing two most singular wheels at the summits, whence its ordinary name.

If the sand in which it exists be put in water and remain infused for some time, it will exhibit all its organs. If the water fail, the action of the wheels and supposed heart ceases; the animalcule gradually loses motion, and becomes apparently lifeless; it contracts, grows very minute, and assumes the resemblance of a piece of dry emaciated skin. If the sand be moistened, it revives; the body soon extends, the wheels and trident re-appear, and general motion is regenerated. That it has remained long dry in the sand is of no importance. Leeuwenhoek, who first discovered it, asserts that he has seen it re-animated after having been kept in dry sand for nearly two years: and Spalanzani has recovered it after nearly double this period. "Some sand," says he, "is in my possession on which I made experiments near four years ago, and it has been kept dry in a small glass bottle. When moistened, the wheel-animals in it instantly revive. However," he continues, "these facts must be understood with some limitation. Though the animals do revive repeatedly, and even after remaining long dry, it is certain that the number revived always decreases in proportion to the length of time the sand has continued in an arid state, and the number of times it has been wetted for their resurrection. The first time I recovered them, they were very numerous, but the numbers continually decreased, and at last became very small; none revived the sixteenth time. I have preserved the sand dry in a box for three years, only moistening once in every fifth or sixth month, but the resurrections are always fewer, and now, at the end of the third year, it is no exaggeration to say that one third do not revive." See TILEEELS.

ROTTBÆLIA, in botany, a genus of the class triandria, order digynia. Calyx fixed, mostly one-flowered, simple or two-parted; flowers ranged alternately on a jointed common receptacle. Sixteen species, indigenous to the south of Europe and both the Indies; one, rottbælia incurvata, common to the salt-marshes of our own country, denominated hard-grass.

ROTONDO, (*rotunda*) in architecture, a popular term for any building that is round both within and withoutside, whether it be a church, hall, a saloon, a vestible, or the like.

The most celebrated rotondo of antiquity is the Pantheon at Rome, dedicated to Cybele, and all the gods, by Agrippa, son-in-law of Augustus; but since consecrated by pope Boniface

IV. to the Virgin, and all the saints, under the title of Sta. Maria della Rotondo.

The chapel of the Escurial, which s the burying-place of the kings of Spain, is also a rotondo; and in imitation of that of Rome, is also called Pantheon.

RO'TTEN. *a.* (from *rot.*) 1. Putrid; carious; putrescent (*Sandys*). 2. Not firm; not trusty (*Shakspeare*). 3. Not sound; not hard (*Knolles*) 4. Fetid; stinking (*Shakspeare*).

RO'TTENNESS. *s.* (from *rotten.*) State of being rotten; cariousness; putrefaction (*Shakspeare*).

ROTTEN-STONE, in mineralogy, a species of argillaceous earth. See CARIOSUS.

ROTTERDAM, a city of S. Holland, with one of the finest harbours in the Netherlands. It is the most considerable place in Holland, for the beauty of its buildings, and trade, next to Amsterdam; and the inhabitants are computed at 48,000. There are so many deep canals, that ships may unload at the very doors of the warehouses. On the E. side of the city is a large basin and dock, for the purpose of building and launching vessels employed in the service of the admiralty and the East-India Company. This port is more frequented than Amsterdam, because the ice breaks up sooner, and the tide, in two or three hours, will carry a ship into the open sea. The townhouse, the bank, and the arsenal are magnificent. Some of the houses are built in the old Spanish style, with the gable ends embattled in front; but there is a great number of modern brick houses, which are lofty and spacious, particularly on that magnificent quay called the Bomb Tees. On this quay is a handsome Jewish synagogue. Erasmus was born in this city, whose statue in bronze stands in an open place, at the head of one of the canals; and the house in which he was born has an inscription, in front, to his honour. Rotterdam received the French troops, Jan. 23, 1795. It is seated at the influx of the Rotte with the Merwe (the most northern branch of the Meuse) 30 miles S.S.W. of Amsterdam. Lon. 4. 29 E. Lat. 51. 56 N.

ROTTERDAM, one of the Friendly islands, in the Pacific ocean, discovered by Tasman in 1643. Lon. 174. 30 W. Lat. 20. 16 S.

RO'TULA, in anatomy. (*Rotula*, of *rota*, a wheel; so called from its shape.) See PATELLA.

ROTU'ND. *a.* (*rotundus*, Latin.) Round; circular; spherical (*Addison*).

ROTU'NDIFOLIUS. *a.* (*rotundus* and *folium*, Latin.) Having round leaves.

ROTU'NDITY. *s.* (*rotunditas*, Latin.) Roundness; sphericity; circularity (*Bentley*).

ROTUNDO. See ROTONDO.

To ROVE. *v. n.* (*roffver*, Danish.) To ramble; to range; to wander (*Watts*).

To ROVE. *v. a.* To wander over (*Gay*).

ROUEN, a city of France, capital of the department of Lower Seine, with an archbishop's see. It is seated on the N. side of the Seine. The streets are narrow, crooked, dirty, and consist of wooden houses; notwithstanding which, it is one of the most opulent and important places in France. It is two leagues and a half in circuit, and (its six suburbs included) is computed to contain 73,000 inhabitants. Among the public buildings, the most distinguished are, the Great Hall of the Palace, in which the late parliament of Rouen met; the old castle; and the principal church, ornamented with three towers, in one of which is the great bell, which bears the name of cardinal George d'Amboise, a minister, whose memory is much respected in France. Near this church, which is not the only remarkable one, is the public library. The steeple of the late Benedictines of St. Owen is an elegant Gothic structure. The linens of Rouen, particularly what are called the Siamoise, are much esteemed. There are also manufactures of cloth, and one of oil of vitriol. The suburb of St. Sever, situate on the other side of the Seine, communicates with the city by a bridge of boats, which rises and falls with the tide, and is made to open so as to admit the passage of the ships. Rouen is the birth-place of the two Corneilles, and of Fontenelle. It is 50 miles S.W of Amiens, and 70 N.W. of Paris. Lon. 1. 10 E. Lat. 49. 27 N.

RO'VER. *s.* (from *rove.*) 1. A wanderer; a ranger. 2. A fickle inconstant man. 3. A robber; a pirate (*Bacon*). 4. *At* ROVERS. Without any particular aim (*South*).

ROVEREDO, or ROVERE, a town of Austria, in the Tyrol, seated on the Adige, at the foot of a mountain, and on the side of a stream, over which is a bridge, defended by two large towers and a strong castle. The Austrians were defeated near this place, in 1796, by the French, who took possession of the town; but they were obliged to abandon it soon afterward. It is eight miles S. of Trent. Lon. 11. 27 E. Lat. 46. 0 N.

ROVERBELLA, a town of Italy, in the duchy of Mantua, 12 miles N.N.W. of Mantua. Lon. 10. 42 E. Lat. 45. 18 N.

ROUERGUE, a late province of France, in the government of Guienne, 75 miles long and 50 broad; bounded on the E. by the Cevennes and Gevaudan, on the W. by Querci, on the N. by the same and Auvergne, and on the S. by Languedoc. It is not very fertile, but feeds a number of cattle, and has mines of copper, iron, alum, vitriol, and sulphur. It now forms the department of Aveiron.

ROUGE. *s.* (*rouge*, French.) Red paint.

ROUGE, a celebrated cosmetic prepared chiefly from the red dye of the safflower, or carthamus lanatus or tinctorius of Linnéus. See SAFFLOWER.

ROUGE ET NOIR, or RED AND BLACK, in card-playing, a modern game, so styled, not from the cards, but from the colours marked on the tapis or green cloth with which the table is covered.

The first parcel of cards played is usually for noir, the second for rouge, though sometimes the cards are cut to determine which shall begin. All the terms of this game are French, and that language is used in playing. Any number of persons may play, and the punters may risk their money on which colour they please, placing the stakes on the outer semicir-

cle; but after the first card is turned up, no stakes can be laid for that coup.

The tailleur and croupier are seated opposite each other, with a basket for receiving the cards of every coup after dealing, placed on the middle of the table. The tailleur then passing round six packs of cards to be shuffled and mixed confusedly all together by the company, afterwards finally shuffles them, and inserts all the end cards into various parts of the 312, till he meets with an honour, which, being placed upright at the end, is offered to a punter, who putting the same into any part of the pack, the tailleur there separates it, and lays that part which was below the said honour uppermost, and taking therefrom a handful of cards, and placing a weight upon the remainder, proceeds to deal, taking afterwards other parcels from the heap as they may be wanted, till all are dealt out. He looks at the first card, and puts its face downwards; two others, one red, and the other black, are then laid back to back, and that placed conspicuously uppermost which is of a similar colour with the first card; these two cards are turned according to the colour of that card which afterwards may be dealt in each succeeding coup. When the stakes are deposited, the tailleur cries noir, turns the top card, and places each succeeding one in a row, till the points of those so turned shall exceed 30; he then declares the numbers, at trente et une, one-and-thirty; or, if above that, up to 40, he only says, deux, trois, quatre, cinque, six, sept, huit, neuf, two, three, four, five, six, seven, eight, nine, and when forty, quarante.

Another parcel is then dealt in a similar mode for rouge, and the punters win who had staked on that colour, the points for which were 31 or nearest to it, which the tailleur declares, by saying rouge gagne, red wins; or rouge perd, red loses. These two parcels, one for each colour make a coup. When the same number is dealt for each, the tailleur says apres, after, which forms un refait, or doublet, by which neither party loses, except it be un refait trente et un, one-and-thirty, when the tailleur wins half the stakes punted on each colour, which half the punters may either pay, or have their stake moved into the middle semicircles of the colour they then choose, called la premiere prison, the first prison, to be determined by the next event, whether they lose all, or are set at liberty; but if un refait second trente et un, a second doublet of one-and-thirty, should occur in the next succeeding deal, the punters lose only one half of their remaining moiety, making three-fourths of their original stakes, and are removed into the smallest semicircle, stiled la seconde prison, the second prison, and the next coup determines whether the punter loses all, or is to be removed again into la premiere prison.

Punters after winning may paroli, &c. and pursue their luck up to a soixante, as at faro; but as no livrets are used at rouge et noir, they cannot make either paix or pont.

At this game, a banker cannot refuse any stake not exceeding his fund; which the punter declares, by saying Je va la banque, Va la banque, or Va banque, I aim at the bank. Bankers generally furnish punters with slips of card paper, ruled in columns, each marked N or R at the top, on which accounts are kept by pricking with a pin, and when un refait happens, the same is denoted by running the pin through the middle line. Some bankers give up the profit of the refait during the first deal.

The odds against le refait being dealt are reckoned 63 to 1, but bankers expect it twice in three deals, and there are generally from twenty-nine to thirty-two coups in each deal.

ROUGH. *a.* (hnuh, Sax. *rouw*, Dutch.) 1. Not smooth; rugged; having inequalities on the surface (*Burnet*). 2. Austere to the taste: as, rough *wine*. 3. Harsh to the ear (*Pope*). 4. Rugged of temper; inelegant of manners; not soft; coarse; not mild; rude (*Cowley*). 5. Not gentle; not proceeding by easy operation (*Clarendon*). 6. Harsh to the mind; severe (*Locke*). 7. Hard featured; not delicate (*Dryden*). 8. Not polished; not finished by art. 9. Terrible; dreadful (*Milton*). 10. Rugged; disordered in appearance; coarse (*Pope*). 11. Tempestuous; stormy; boisterous (*Shakspeare*).

To ROU'GHCAST. *v. a.* (*rough* and *cast.*) 1. To mould without nicety or elegance; to form with asperities and inequalities (*Cleav.*). 2. To form any thing in its first rudiments.

ROU'GHCAST. *s.* (*rough* and *cast.*) 1. A rude model; a form in its rudiments (*Digby*). 2. A kind of plaster mixed with pebbles, or by some other cause very uneven on the surface.

ROU'GHDRAUGHT. *s.* (*rough* and *draught.*) A draught in its rudiments; a sketch (*Dryden*).

To ROU'GHDRAW. *v. a.* (*rough* and *draw.*) To trace coarsely (*Dryden*).

To ROU'GHEN. *v. a.* (from *rough.*) To make rough (*Swift*).

To ROU'GHEN. *v. n.* To grow rough (*Thomson*).

To ROUGHHE'W. *v. a.* (*rough* and *hew.*) To give to any thing the first appearance of form (*Hudibras*).

ROUGHHE'WN. *particip. a.* 1. Rugged; unpolished; uncivil; unrefined (*Bacon*). 2. Not yet nicely finished (*Howel*).

ROU'GHLY. *ad.* (from *rough.*) 1. With uneven surface; with asperities on the surface. 2. Harshly; uncivilly; rudely (*Spenser*). 3. Severely; without tenderness (*Dryden*). 4. Austerely to the taste. 5. Boisterously; tempestuously. 6. Harshly to the ear.

ROU'GHNESS. *s.* (from *rough*). 1. Superficial asperity; unevenness of surface (*Boyle*). 2. Austereness to the taste (*Brown*). 3. Taste of astringency (*Spectator*). 4. Harshness to the ear (*Dryden*). 5. Ruggedness of temper; coarseness of manners; tendency to rudeness (*Denham*). 6. Absence of delicacy (*Addison*). 7. Severity; violence of discipline. 8. Violence of operation in medicines. 9. Unpolished or unfinished state. 10. Inelegance of dress or appearance. 11. Tempestuousness; storminess. 12. Coarseness of features.

ROUGHT. old pret. of *reach*. Reached.

To ROU'GHWORK. *v. a.* (*rough* and

work). To work coarsely over without the least nicety (*Moxon*).

ROVIGNO, a populous town of Venetian Istria, with two good harbours, and quarries of fine stone. It is seated in a territory which produces excellent wine, on a peninsula, on the western coast, eight miles S. of Parenzo, and 32 of Capo d'Istria. Lon. 14. 2 E. Lat. 45. 16 N.

ROVIGO, a town of Italy, capital of Polesino di Rovigo, seated on the Adige, 21 miles S. of Padua, and 37 S.W. of Venice. Lon. 12. 14 E. Lat. 45. 38 N. See POLESINO DI ROVIGO.

ROULADE, in music, a trill or shake.

ROU'NCEVAL. *s.* A species of pea (*Tusser*).

ROUND. *a.* (*rond*, French; *rondo*, Italian.) 1. Cylindrical (*Milton*). 2. Circular (*Brown*). 3. Spherical; orbicular (*Milton*). 4. Smooth; without defect in sound (*Peach.*). 5. Whole; not broken (*Arbuthnot*). 6. Large; not inconsiderable (*Addison*). 7. Plain; clear; fair; candid; open (*Bacon*). 8. Quick; brisk (*Addison*). 9. Plain; free without delicacy or reserve; almost rough (*Bacon*).

ROUND. *s.* 1. A circle; a sphere; an orb (*Shakspeare*). 2. Rundle; step of a ladder (*Norris*). 3. The time in which any thing has passed through all hands, and comes back to the first: hence applied to a carousal (*Prior*). 4. A revolution; a course ending at the point where it began (*Smith*). 5. Rotation; succession in vicissitude (*Holyday*). 6. (*ronde*, Fr.) A walk performed by a guard or officer, to survey a certain district.

ROUND. *ad.* 1. Every way; on all sides (*Genesis*). 2. In a revolution (*Gov. of the Tongue*). 3. Circularly (*Milton*). 4. Not in a direct line (*Pope*).

ROUND. *prep.* 1. On every side of (*Milton*). 2. About; circularly about (*Dryden*). 3. All over; here and there in (*Dryden*).

To ROUND. *v. a.* (from the noun.) 1. To surround; to encircle (*Prior*). 2. To make spherical; cylindrical, or circular (*Cheyne*). 3. To raise to a relief (*Addison*). 4. To move about any thing (*Milton*). 5. To mould into smoothness (*Swift*).

To ROUND. *v. n.* 1. To grow round in form (*Shakspeare*). 2. (*runen*, Ger.) To whisper (*Bacon*). 3. To go round, as a guard (*Milton*).

ROUND. A species of fugue in the unison, composed in imitation of a catch, and so called because the performers follow each other through the several parts in a circulatory motion.

ROUND LIGAMENTS. (*ligamenta rotunda.*) A bundle of vessels and fibres contained in a duplicature of the peritonæum, that proceed from the sides of the uterus, through the abdominal ring, and disappear in the pudenda.

ROUND, or VOLTE, in the manage. A circular head. See VOLTE. *To round a horse*, or make him round, a general expression of all kinds of manage upon rounds. To round a horse upon a trot or gallop, is to make him carry his shoulders and haunches compactly, or roundly, upon a greater or smaller circle, without traversing, or bearing to one side.

ROUND, in a military sense, signifies a walk which some officer, attended with a party of soldiers, takes in a fortified place around the ramparts, in the night-time, in order to see that the centries are watchful, and every thing in good order.

The centries are to challenge the rounds at a distance, and rest their arms as they pass, to let none come near them; and when the round comes near the guard, the centry calls aloud, "who comes there?" and being answered, "the rounds;" he says, "stand;" and then calls the corporal of the guard, who draws his sword, and calls also, "who comes there?" and when he is answered, "the rounds," he who has the word advances, and the corporal receives it with his sword pointed to the giver's breast. In strict garrison, the rounds go every quarter of an hour.

ROU'NDABOUT. *a.* 1. Ample; extensive (*Locke*). 2. Indirect; loose (*Felton*).

ROUNDELAY, or RONDEL. (from the French word *rondelet*.) A kind of ancient poem, so called, according to Menage, from its form, by which it constantly returned to the first verse, and thus went round. The common roundelay consisted of thirteen verses, eight in one rhyme, and five in another. One of its rules was, that the first verse should have a complete sense, and yet join agreeably with the closing verse, though in itself independent. Some writers speak of the roundelay, or rondel, as a kind of air appropriated to dancing; and in this sense, the word seems to imply little more than dancing in a circle. Our old English poets use this word as signifying a simple, rural strain, both short and lively.

ROU'NDER. *s.* (from *round.*) Circumference; enclosure (*Shakspeare*).

ROU'NDHEAD. *s.* (*round* and *head.*) A puritan, so named from the practice once prevalent among them, of cropping their hair round (*Spectator*).

ROUN'DHOUSE. *s.* (*round* and *house.*) The constable's prison, in which disorderly persons, found in the street, are confined (*Pope*).

ROU'NDISH. *a.* (from *round.*) Somewhat round; approaching to roundness (*Boyle*).

ROU'NDLY. *ad.* (from *round.*) 1. In a round form; in a round manner. 2. Openly; plainly; without reserve (*Addison*). 3. Briskly; with speed (*Locke*). 4. Completely; to the purpose; vigorously; in earnest (*Davies*).

ROU'NDNESS. *s.* (from *round.*) 1. Circularity; sphericity; cylindrical form (*Watts*). 2. Smoothness (*Spenser*). 3. Honesty; openness; vigorous measures.

To ROUSE. *v. a.* (of the same class of words with *raise* and *rise.*) 1. To wake from rest (*Pope*). 2. To excite to thought or action (*Atterbury*). 3. To put into action (*Spenser*). 4. To drive a beast from his laire (*Shakspeare*).

To ROUSE. *v. n.* 1. To awake from slumber (*Pope*). 2. To be excited to thought or action (*Shakspeare*).

ROUSE. *s.* (*rusch*, German, half drunk.) A dose of liquor rather too large: not in use (*Shakspeare*).

ROU'SER. *s.* (from *rouse*.) One that rouses.

ROUSSEAU (James), a painter of great merit, born at Paris, in 1630. He excelled in representations of architecture by his skill in perspective. Louis XIV. employed him to decorate the room at St. Germain's, in which Lully's operas were performed. Lord Montagu also engaged him, along with La Fosse and Monnoyer, to embellish his mansion house. He died at London, in 1693.

ROUSSEAU (John Baptist), a French poet, was the son of a shoemaker at Paris, and born in 1669. However, he received a good education, and distinguished himself, when young, by some little ingenious pieces of poetry, which recommended him to marshal Tallard, who took him to England as his secretary. He was greatly favoured by the great, but he is reported to have cultivated the muses at court, and neglected fortune in the midst of riches. His interest could not secure him from a sentence of banishment, for suborning a witness in order to throw the imputation of a libel upon an innocent person, against whom he had a violent animosity. The count de Luc, nevertheless, patronized him, and prince Eugene took him to Vienna. From thence he went to Brussels, where a misunderstanding commenced between him and Voltaire. He was in London in 1721, and printed there a collection of his works in 2 vols. 4to. He died at Brussels in 1741. He wrote odes, epistles, epigrams, and comedies in verse, also a collection of letters in prose.

ROUSSEAU (John James), an eccentric genius, was the son of a watchmaker at Geneva, where he was born in 1712. His birth cost his mother her life, and, as he says, was the first of his misfortunes. His earliest reading was romances, to which succeeded better books, as Bossuet's Discourses on Universal History, Plutarch's Lives, &c. His education was but scanty, but he made up for this by self-application. His friends put him apprentice to an engraver, from whom he says he learnt to be idle, and even to steal: at length the brutal behaviour of his master forced him to elope from him; and, by the kindness of M. de Pontverre, the rector of Consignon, in Savoy, he was recommended to madam de Warens, a charitable lady at Annecy. By her assistance he went to Turin with letters of recommendation, and was admitted into a seminary there, having been first made a proselyte to the Roman catholic religion by his benefactress. He was soon disgusted with his new life, which he quitted almost pennyless, and was obliged to engage himself as a footman to a lady of quality. She dying in three months, her nephew procured him another place out of livery. He was reduced to great distress, when he was employed to copy music for a small allowance. He afterwards became a composer and teacher of music; and about the year 1743 began to launch out of the obscurity in which he had been buried. It was not, however, till the year 1750 that he appeared in the field of literature, when the academy of Dijon proposed the question, "Whether the re-establishment of the arts and sciences had contributed to purify morals," in answering which he supported the negative, and the academy crowned his work. His next work was A discourse upon the causes of the inequality among men; and upon the origin of societies. In 1752 he composed a dramatic pastoral, called The Devin-de Village: he published also, in 1757, A letter to M. d'Alembert upon the project of establishing a theatre at Geneva, which occasioned the quarrel between him and Voltaire. He composed a dictionary of music, which contains some very excellent articles, though it is a work of great inequality.

That interesting and tender style, which is so conspicuous throughout the Village Conjuror, animates several letters in the New Heloisa, in six parts, published in 1761, in 12mo. This epistolary romance, of which the plot is ill-managed, and the arrangement bad, like all other works of genius, has its beauties as well as its faults, though the latter sadly preponderate. The characters, as well as their style, have too much sameness, and their language is too affected and exaggerated. Some of the letters are indeed admirable, from the force and warmth of expression, from an effervescence of sentiments, from the irregularity of ideas which always characterise a passion carried to its height. But why are so affecting letters so often accompanied with an unimportant digression, an insipid criticism, or a self-contradicting paradox? Why, after having shone in all the energy of sentiment, does he on a sudden turn affecting? It is because none of the personages are truly interesting. That of St. Preux is weak, and often forced. Julia is an assemblage of tenderness and pity, of elevation of soul and of coquetry, of natural parts and pedantry. Wolmar is a violent man, and almost beyond the limits of nature. In fine, when he wishes to change his style, and adopt that of the speaker, it may easily be observed that he does not long support it, and every attempt embarrasses the author and cools the reader. In the Heloisa, Rousseau's vile talent of rendering every thing problematical, appears very conspicuous; as in his arguments in favour of and against duelling, which afford an apology for suicide, and a just condemnation of it: in his facility in palliating the crime of adultery, and his very strong reasons to make it abhorred: on the one hand, in declamations against social happiness; on the other, in transports in favour of humanity; here in violent rhapsodies against philosophers; there, by a rage for adopting their opinions: the existence of God attacked by sophistry, and atheists confuted by the most irrefragable arguments; the Christian religion combated by the most specious objections, and celebrated with the most sublime eulogies. But this has always been a favourite method of procedure with unbelievers. By affecting to give the strongest

reasonings on both sides of a question, and thus to enable a reader to weigh carefully before he decides, such a writer *naturally* takes care to give greater force to the sceptical side of an argument; and thus compels an unsuspecting reader, who is not aware of the design, to determine in favour of principles which he should abhor.

His Emilia afterwards made more noise than the New Heloisa. This moral romance, which was published in 1762, in four vols. 12mo., treats chiefly of education. Rousseau wished to follow nature in every thing; and of course, though the performance contains much that is valuable, it also contains much that is absurd, impracticable, or dangerous. Here again, conformably with his leading, though disguised, object, in affecting to educate a young man as a Christian, he has filled his third volume with objections against Christianity. He has, it must be confessed, given a very sublime eulogium on the gospel, and an affecting portrait of its divine Author: but the miracles, and the prophecies which serve to establish his mission, he attacks without the least reserve. Admitting only natural religion, he weighs every thing in the balance of reason; and this reason, being false, leads him into dilemmas very unfavourable to his own repose and happiness.

From the literary history of Rousseau and Voltaire, our readers may learn, that if a man of genius wishes to degrade, embase, and brutalize this glorious faculty, he has nothing to do but to adopt infidel notions: whereas, if he wish, enjoying such a requisite, still farther to exalt and ennoble his character, he has only to imitate such men as Pascal, Newton, and Euler.

The French parliament condemned Emilia in 1762, and entered a criminal prosecution against the author, which forced him to make a precipitate retreat. He directed his steps towards his native country, which shut its gates upon him. Proscribed in the place where he first drew breath, he sought an asylum in Switzerland, and found one in the principality of Neufchatel. His first care was to defend his Emilia against the mandate of the archbishop of Paris, by whom it had been anathemised. In 1763 he published a letter, in which he re-exhibits all his errors, set off with the most animated display of eloquence, and in the most insidious manner. In this letter he describes himself as "more vehement than celebrated in his researches, but sincere, on the whole, even against himself; simple and good, but sensible and weak; often doing evil, and always loving good; united by friendship, never by circumstances, and keeping more to his opinions than to his interests; requiring nothing of men, and not wishing to be under any obligation to them; yielding no more to their prejudices than to their will, and preserving his own as free as his reason; disputing about religion without licentiousness; loving neither impiety nor fanaticism, but disliking precise people more than bold spirits," &c. &c. From this specimen, the limitation he would appoint to this portrait may easily be discovered.

By the invitation of Mr. Hume he came, in 1766, to England, where he did not long remain, owing to his own strange capricious humour, which led him to think his best friends were his greatest enemies. He obtained leave to return to Paris, upon condition of never writing either upon religion or government. On the first of July 1770, Rousseau appeared, for the first time, at the Regency coffee-house, dressed in ordinary clothing, having for some time previous to this worn an Arminian habit. He was loaded with praises by the surrounding multitude. "It is somewhat singular (says M. Sennebier) to see a man so haughty as he, returning to the very place from whence he had been banished so often. Nor is it one of the smallest inconsistencies of this extraordinary character, that he preferred a retreat in that place of which he had spoken so much ill." It is as singular, that a person under sentence of imprisonment should wish to live in so public a manner in the very place where his sentence was in force against him. His friends procured for him, however, liberty of staying, on the conditions just specified. He died of an apoplexy, at Ermenon-ville, belonging to the marquis de Girardin, about ten leagues from Paris, July 2, 1778, aged 66 years. This nobleman has erected to his memory a very plain monument, in a grove of poplars, which constitutes part of his beautiful gardens. On the tomb are inscribed the following epitaphs:

Ici repose
L'Homme de la Nature
Et de la Verité!

Vitam impendere Vero *.
Hic jacent Ossa J. J. Rousseau.

* His motto.

ROUSSELART, a town of France, in the department of the North, 10 miles N.E. of Ypres, and 20 S.E. of Ostend. Lon. 3. 0 E. Lat. 50. 58 N.

ROUSILLON, a late province of France, 50 miles long and 25 broad; bounded on the E. by the Mediterranean, on the W. by Cerdagna, on the N. by Lower Languedoc, and on the S. by Catalonia, from which it is separated by the Pyrenees. See PYRENEES, EASTERN.

ROUT. *s.* (*rot*, Dutch.) 1. A clamorous multitude; a rabble; a tumultuous crowd (*Roscommon*). 2. (*route*, Fr.) Confusion of an army defeated, or dispersed (*Daniel*).

To ROUT. *v. a.* To dissipate and put into confusion by defeat (*Clarendon*).

To ROUT. *v. n.* To assemble in clamorous and tumultuous crowds (*Bacon*).

ROUTE. *s.* (*route*, Fr.) Road; way (*Gay*).

ROW. *s.* (*reih*, German.) A rank or file; a number of things ranged in a line (*Spenser*).

To ROW. *v. n.* (ropan, Saxon.) To impel a vessel in the water by oars (*Gay*).

To ROW. *v. a.* To drive or help forward by oars (*Milton*).

ROWE (Nicholas), an English poet, born

at Little Beckford, Bedfordshire, 1673. From Highgate school he went to Westminster, and at 16 removed to the Inner Temple. Though his abilities might have raised him to eminence in the law, he preferred literature, and at the age of 25 produced his first tragedy, The Ambitious Stepmother, received with universal applause. Tamerlane—the Fair Penitent—Ulysses—the Royal Convert—Jane Shore—and Lady Jane Grey, succeeded with equal approbation; but the poet was inadequate to the ease and sprightliness of comedy, and his Biter was so little popular, that it is not even inserted in his works. His fame made him known to the great: the duke of Queensberry made him his public secretary of state, and on the Hanoverian succession he was appointed poet laureat, and land surveyor of the customs of the port of London, &c. He died 6th December 1718, aged 45. He translated into verse Lucan's Pharsalia, and Quillet's Callipædia, and edited Shakspeare's plays. Rowe is still a popular poet on the stage, and his Jane Shore, as Johnson says, is always seen and heard with pity. Though he does not often excite terror, yet he elevates the sentiments; and though he seldom pierces the breast, he always delights the ear, and often improves the understanding.

Rowe (Elizabeth), a lady eminent for her writings, was the eldest daughter of Mr. Walter Singer, and was born at Ilchester, in Somersetshire, the 11th of September 1674. She was well educated, and had in her infancy a good taste in painting, poetry, and music. She began to write verses at twelve years of age, and was but twenty-two in 1696, when she published a collection of her poems. She had no other tutor for the French and Italian than the honourable Mr. Thynne, son to lord viscount Weymouth; and she improved so fast under his lessons, that in a few months she was able to read Tasso's Jerusalem with great ease. Her shining merit, and the charms of her person, procured her many admirers; but Mr. Thomas Rowe, an ingenious and learned gentleman, distinguished by the liveliness of his disposition, married her in 1710; but he died the 13th of May, 1715. She wrote a very tender elegy on his death, and continued till the last moments of her life to express the highest veneration and affection for his memory; and after that melancholy event, generally resided at Frome, in Somersetshire, where the greatest part of her estate lay, and where she lived in retirement, and devoted herself to study, to the exercises of religion, and charity. She seldom quitted her retreat, and when she did, it was in complaisance to some illustrious ladies, and particularly the countess of Hertford, between whom and herself there subsisted a tender friendship. Though she had all the personal graces and mental endowments that could be desired, she would never consent to a second marriage, and died suddenly at Frome, the 20th of February, 1737. A pious book was found lying open by her, and in her cabinet were found letters to several of her friends, which she had ordered to be delivered to those to whom they were directed, immediately after her decease. She wrote, 1. The History of Joseph, an heroic poem. 2. Friendship in Death, and Letters moral and entertaining. 3. Devout Exercises of the Heart, which the reverend Dr. Isaac Watts, according to her request, revised and published. 4. Miscellaneous Works, two volumes. This excellent lady, who was admired as much for her piety and many virtues, as her other accomplishments, was favoured with the esteem and acquaintance of many persons of the first distinction.

ROWEL. The small sharp-pointed star, moving upon a pivot at the heel of the spur, and which the horse, in breaking, is taught to obey.

Rowel, a kind of rude seton, of which the following judicious account is given by Mr. Clark, of Edinburgh.

"Rowels, for horses, answer the same purposes as issues in the human body. The method of introducing them is by making an incision through the skin, about three-eighths of an inch long, and then separating the skin from the flesh with the finger, or with a blunt horn, all round the orifice, as far as the finger will easily reach, then introducing a piece of leather, very thin, shaped round, about the size of a crown piece, having a large round hole in the middle of it. Previous to introducing the leather, it should be covered with lint or tow, and dipped in some digestive ointment; a pledget of tow, dipped in the same ointment, should likewise be put in the orifice, in order to keep out the external air. The parts around it soon swell, and this is followed with a plentiful discharge from the orifice, of yellowish serum or lymph; and in two or three days at most there discharges a thick gross white matter: the rowel is then said to suppurate.

"These artificial vents act by *revulsion* or *derivation*; and hence they become of great use in many cases, as they empty the surrounding vessels by a regular slow discharge of their contents, and are even of great service when there is a redundancy or fulness of humours in general, which may require a gradual discharge, in preference to greater evacuations by purging medicines, &c. Rowels should be placed (especially in some particular cases) as near the affected part as possible; and, at all times, they ought to have a depending orifice, in order to admit of a free discharge of the matter that may be contained in them.

"The parts in which they may be most conveniently inserted, and where they are found to answer the purpose best, are the belly, inside of the thighs, the breast, and outside of the shoulders and hips. They are sometimes, but very injudiciously, put in between the jaw-bones under the root of the tongue, where they never come to a proper suppuration, on account of the constant motion of the parts in eating, &c. neither do they answer any good purpose from being placed in that situation. In some disorders it is found necessary to put in several of them at once, in order to make a sudden determination from the parts affected;

but this should be regulated by the horse's age and strength, and by the circumstances that require their use.

"But, though rowels are found very beneficial in some cases, yet, like a number of other operations common to horses, they sometimes, by the improper use of them, become hurtful to the constitution, and, in some diseases, they frequently, instead of suppurating, become gangrenous. Hence, the cure proves worse than the disease they were intended to remove. Thus, in violent fevers, where they are frequently very injudiciously applied, they never suppurate properly. Whether this proceeds from the quickness of the pulse, together with the violent rapidity with which the fluids in general are then carried through the vessels, or from the violent agitation in which the whole system is thrown, it is difficult to determine; but experience confirms the fact. In such cases, the surrounding parts, where the rowel is placed, seldom or never swell (as in the ordinary course, when they suppurate properly), but appear dry, or much in the same state as when they were first put in; there is little or no discharge from the orifice, and the little that does come is thin, ichorous, and bloody. In such cases, they ought to be taken out immediately, and the parts well fomented with a strong infusion of chamomile, or an emollient poultice applied, if it can be properly fixed, and frequently repeated; and, provided there be no fever at the time, two or three ounces of Peruvian bark may be given through the day, either made into balls or given in a liquid; and this course should be continued till the threatening symptoms are removed."

To ROWEL. *v. a.* To pierce through the skin, and keep the wound open by a rowel (*Mortimer*).

RO'WEN. *s.* A field kept up till after Michaelmas, that the corn left on the ground may sprout into green (*Tusser*).

RO'WER. *s.* (from *row.*) One that manages an oar (*Addison*).

ROWLEY, a monk who is said to have flourished at Bristol in the 15th century, and to have been an author voluminous and elegant. Of the poems attributed to him, and published some time ago, various opinions have been entertained, which we have noticed elsewhere. They seem now to be almost forgotten. See CHATTERTON.

ROWLEY (William), who stands in the third class of dramatic writers, lived in the reign of king Charles I. and received his education at the university of Cambridge; but whether he took any degree there, is not evident; there being but few particulars preserved in regard to him, more than his close intimacy and connection with all the principal wits and poetical geniuses of that age, by whom he was well beloved, and with some of whom he joined in their writings. Wood styles him "the ornament, for wit and ingenuity, of Pembroke-hall, in Cambridge." In a word, he was a very great benefactor to the English stage, having, exclusive of his aid lent to Middleton, Day, Heywood, Webster, &c. left us five plays of his own composing, and one in which even Shakspeare afforded him some important assistance.

ROWLEY-RAG, in oryctology, a species of basalt, or of porphyry. See BASALTES and PORPHYRIUS.

ROXANA, the daughter of a Persian satrap, taken prisoner by Alexander. The conqueror became enamoured of her, and married her. She behaved with great cruelty after Alexander's death, and was at last put to death herself by Cassander's order.

ROXBURGH, a town and castle of Scotland, which gives name to a county. It is situate near the Tiviot, 19 miles S.W. of Berwick, and 32 S.E. of Edinburgh. Lon. 2. 47 W. Lat. 55. 46 N.

ROXBURGHSHIRE, a county of Scotland, sometimes called Teviotdale; bounded on the N. by Berwickshire, on the E. and S. by Northumberland and Cumberland, and on the W. by the shires of Dumfries and Selkirk. From N. to S. it extends 30 miles, and nearly the same from E. to W. The principal rivers are the Tweed, Tiviot, and Liddel. The face of the country exhibits a rough, irregular appearance of mosses, hills, and mountains, interspersed with narrow valleys, well watered, and fertile in corn. The hills feed great numbers of sheep and cattle.

ROXBURGHIA, in botany, a genus of the class octandria, order monogynia. Calyx inferior, four-leaved; corol four-petalled; nectary four subulate leaflets, inserted into the keel of the petals and connivent; anthers sessile, lodged in the groove formed by the keel of the petals; capsule one-celled, two-valved, many-seeded; seeds inserted into a spungy receptable. One species; a twining shrub of the East Indies.

ROY (Julian le), of Tours, was born at Tours in 1686, came to Paris at the age of 18, and so excelled in his profession, that his watches acquired the same celebrity in France, as those of Graham in England. He died at Paris, 1759, aged 74, leaving four sons. Peter, the eldest, was watchmaker to the king, and published Memoirs for the Clock-makers of Paris, 4to.—Etrennes Chronometriques—Treatise on the Labours of Harrison and le Roy, for the Discovery of Longitude at Sea, 4to.—Letter to M. de Marivetz. He died 1785. Julian David, another son, was member of the national institute, and professor of architecture. He travelled over Greece and other countries, and published Ruins of the finest Monuments of Greece, folio, a work of merit—History of the Construction of Christian Temples, 8vo.—Observations on the Edifices of the Ancients—on the Marine, Ships, Sails, &c. of the Ancients. He died of an apoplexy, 1803, aged 75.

It is well known that the English, on account of their numerous discoveries in this art, had enjoyed such a reputation for the excellence of their clocks and watches, that they universally found a market in preference to

any others, in all parts of the known world; and that the French themselves were obliged to purchase theirs in England. Julien le Roy had the honour of removing part of this pre-eminence, and of transferring it to the French artists. We must refer to the account itself given of him for the various means which he employed to effect this, as they would be superfluous here; and it will be sufficient to mention, in a few words, the principal discoveries which he made. His repeating clocks and watches; his improved second and horizontal clocks; his universal compass card with a sight; an extremely useful and simple contrivance for drawing a meridian line, and finding the declination of the needle; his clocks and watches of three parts, and his new universal horizontal dial. It is to him also that watch-makers are indebted for the method of compensating for the effects of heat and cold in the balances of chronometers, by the unequal expansion of different metals; a discovery of the greatest importance, which has been brought by our English artists to a state of perfection hardly credible, although it had been condemned and thrown aside by the inventor's son, M. Pierre Le Roy. See vol. xxvi. p. 200, of the Philosophical Magazine.

Such a number of things so happily invented, and executed, procured him the reputation of the first artist in his profession. The celebrated Graham once paid him the following compliment before several persons, when a repeater of Le Roy's was shown him by lord Hamilton. After having examined it for some time, he said, "I could wish I were younger, that I might work from this model." Which justice done to his merit by the first watch-maker in Europe at that time, was afterwards universaliy rendered him by all artists who had arrived to any degree of excellence in the art.

ROYAL, *regal*, something relating to a king.

The word is French, formed from the Latin *regalis*, of *rex*, king.

In this sense we say, the royal family, the royal blood, royal line, &c.

In England, the prince and princess of Wales, the king's brothers, &c. are addressed under the title of royal highness. The duchess of Savoy is called madame royale.

ROYALS, in artillery, are a kind of small mortars, which carry a shell, whose diameter is five inches and a half. See MORTAR.

ROYAL, in sea language, is a name given to the highest sail which is extended in any ship. It is spread immediately above the top-gallant-sail, to whose yard-arms the lower corners of it are attached. This sail is never used but in light and favourable breezes.

ROYAL EXCHANGE. The term royal, applied to the Exchange of London, originated with queen Elizabeth, a princess who, though tinctured with the arbitrary prejudices of her time, deserves the grateful remembrance of her countrymen for many wise and extremely beneficial acts, equally contributing to increase the political and commercial prosperity of England.

The word Exchange is certainly improperly applied to a building in which the act of exchanging or bartering takes place; but we are not the only people who thus misuse the appellation, as many towns on the continent have their Places de Change. We know nothing more of the Bourse (synonimous with Exchange) frequented by the merchants of London before the reign of Elizabeth, except that it was situated in Lombard-street. It is, however, reasonable to suppose, that it was too inconsiderable in its extent, or had become ruinous by that period, as sir Thomas Gresham then entertained thoughts of exerting his influence to render his fellow-citizens an essential service, and at the same time improve his own property.

It is singular, that a people celebrated for their commercial enterprize from the very foundation of their metropolis, should have proceeded through many centuries, contented with transacting their business at casual and uncertain meetings, when it seems so obvious to their posterity that a rallying point is absolutely necessary where a trader may, at a fixed and certain hour, see and converse with those connected with him in commerce, and meet with purchasers for his commodities.

There cannot exist a doubt, that numbers of the citizens of London felt the necessity for an established and convenient Exchange, which may be supposed from the faint attempt made in Lombard-street, and which might have suggested the plan afterwards executed by Gresham, whose very extensive concerns made him more particularly sensible of the deficiencies of London in this instance. The circumstances attending the founding of the original Exchange on the present scite, has contributed to convey all the honour of the undertaking to sir Thomas, when, in truth, he was only an active partner in that honour; as it is an indisputable fact, that the Corporation of London purchased, at the expense of the city, not less than eighty houses, and the ground on which they stood, for the sum of four thousand pounds: these they ordered to be taken down, and the earth prepared for building a magnificent structure.

It will be perceived from this statement, that the collective body of the citizens was by no means deficient in their wishes to second the views of Gresham, who engaged to erect the Exchange at his own expense, and the parties were mutually to enter into conveyances of the ground and building to each other, that their descendants and successors might for ever possess a joint and equal property in the subsequent profits of the concern. This covenant was faithfully complied with by the Corporation, but sir Thomas neglected to execute his part of it. Hence it must be admitted, that the latter has no claim to the exclusive gratitude of the natives of London; on the contrary, it is very evident, the patriotism of the act should be divided between the then

Lord Mayor, Aldermen, and Council, and Gresham; with this admission in his favour, that it is more than probable the Corporation would never of themselves have conferred an Exchange on the city they governed.

Sir Thomas laid the first stone of the edifice on the seventh day of June, 1566, which was completed with brick, and so contrived as to render the reimbursement of his expenses as certain as human foresight would permit. This he supposed might be accomplished by the fines and rents accruing from a very considerable number of vaults, and shops which inclosed the area intended for the ostensible purposes of the building. The novelty of this arrangement operated greatly in his favour, and the shops let rapidly; but the vaults, as our ancient writers term them, being partly under ground, and consequently equally dark and damp, were but partially occupied. Sensible of his mistake, and determined to retrieve it if possible, he resolved that his future tenants should take the vaults with the shops at eight marks per annum; and they proceeded thus for some time, till at length it was fully ascertained the public would not be compelled to descend to purchase commodities in the dark. The tenants, therefore, unanimously resolved to offer him four pounds per annum for the shop only, resigning all claims to the vaults. This the knight immediately accepted, and let them to merchants for the reception of packages, and large quantities of pepper, which article is still deposited in those of the present building.

While the projector of the Exchange employed every engine to increase his profits on its erection, neither himself nor his colleagues were inattentive to its original purpose; and they considered, that though it was impossible the merchants and traders of the city, and the foreigners who visited it, should not perceive the advantages it offered them, in the expediting their business, yet that they might be more firmly impressed on their minds, he had recourse to a stratagem which it was amply in his power to apply.

During the reigns of Edward VI. and queen Mary, this enterprizing merchant had been employed as their agent in procuring loans on the Continent, and had conducted himself with so much prudence and success, that queen Elizabeth entrusted him with similar commissions, particularly at Antwerp, where he procured her large sums. This method of proceeding did not, however, accord with the patriotic views of our great trader, who contrived to prevail upon the sovereign to apply to her own subjects for assistance, which he more than once afforded her himself with much profitable advice on financial matters. The stratagem alluded to was the prevailing on the queen to go in solemn procession to the new Exchange, and there proclaim it such, under the additional sanction of her royal protection and recommendation. Had this monarch been less attached to splendid exhibitions of regal state, the claims of sir Thomas on her gratitude were sufficiently powerful to demand a still greater favour. It is not, therefore, to be wondered at, that she readily consented to perform her part, particularly as it was intimately connected with the future welfare of her good city of London. Accordingly, after due preparation, her Majesty departed from Somerset-house, in the Strand, on the twenty-third of January, 1570, attended by the officers of her court and a train of nobility, to the magnificent residence of sir Thomas, who, at a very great expense, provided a most superb entertainment for his royal guest, her attendants, and the principal citizens; after which the whole party went to the new edifice, where every possible display of rich goods was made in the shops, the occupiers of which, delighted with the condescension of their queen, endeavoured to exceed each other in gratifying her curiosity, and expressing their loyalty and gratitude. The moment, at length, arrived for the accomplishment of this well-concerted plan; and sir Thomas and the citizens had the satisfaction of hearing a herald proclaim the place a Royal Exchange by the sound of trumpet, at the express command of her majesty.

It appeared sufficiently plain after the decease of sir Thomas Gresham, that he had not erred in his calculations on the probable profits of the Exchange, as it was known that his lady received 751*l.* 5*s.* per annum in rents from it. And this result is precisely what a generous citizen would wish, that public advantage should be attended with private benefit to the successors of a public benefactor. The difficulty attending procuring the perusal of the archives of the different institutions of London has hitherto prevented the historian from giving a sketch of the existing connection between the estate of sir Thomas Gresham held by the Company of Mercers and the City of London; but it is certain that, after the year 1596, all the affairs of sir Thomas Gresham's trust were managed by a committee of four aldermen and eight commoners on the part of the Corporation; and by the master, wardens, and eight of the court of assistants of the Mercers' Company.

The dreadful calamity of 1666 destroyed the old Royal Exchange, when only 234*l.* 8*s.* 2*d* belonging to the Gresham trust remained in the coffers of the Company; and yet the persons composing it contrived to employ labourers to remove the ruins within six months after the conflagration occurred, in order to prepare the ground for the present structure; and on the twenty-fifth of February the king was petitioned for a supply of Portland stone. In September, 1667, the committee appointed to superintend the rebuilding of the Exchange submitted their plans and elevations to the inspection of Charles II., at the same time re-requesting permission to project the south portico into Cornhill. They had soon the satisfaction of hearing that the first were highly approved of, and that their request was granted. On the twenty-third of October, in the above

year, the monarch went to the scite, and placed the base of the pillar on the west side of the north entrance, after which he accepted of a handsome entertainment provided at the joint expense of the City and Company of Mercers, and served under a temporary building erected on the Scotch walk. In return for this hospitality, the king knighted the sheriffs Ganden and Davis, and gave 20*l.* in gold to the workmen. James, duke of York, laid the first stone of the eastern pillar, on the thirty-first of October; and on the eighteenth of the following month prince Rupert placed that on the east side of the south entrance, each being entertained in a sumptuous manner.

The Committee, inspecting the plan made by Mr. Jerman, for rebuilding the Exchange, on the 9th of December, 1667, resolved "that porticos should be built on the north and south sides, according as his majesty desires, and as are described in the aforesaid draft; and that houses shall be built on the heads of the said porticos, and shops underneath." Mr. Malcolm has collected many particulars relating to this noble edifice, in his Londinium Redivivum, and amongst others, the following extract from a book produced to a Committee of the House of Commons, 1747. "The said book begins the 27th of October, 1666, and ends July 12, 1676; and it thereby appears that the total expense of rebuilding the Royal Exchange amounted unto 58,962*l.*; the Company's moiety whereof was the sum of 29,481*l.* To defray which expense, it appeared the Company were obliged to borrow money upon their seal, insomuch that in the year 1682, they had taken up money on their bonds, on account of the trust of sir Thomas Gresham, to the amount of 45,795*l.*" It appeared, on this occasion, from the evidence of a Mr. Crumpe, "that the company had hitherto contributed equally with the city in the repairing of the Royal Exchange, and paying sir Thomas Gresham's lectures and charities; and that, in or about the year 1729, one of the lecturers of sir Thomas Gresham filed a bill, in Chancery, against the City of London, and the Mercer's Company; to answer which, it became necessary to draw out and state an account between the Mercers' Company and sir Thomas Gresham's trust estates, as also between the City and Company and the said estate; and accordingly, such accounts were drawn up: and thereby it appears, that there was due to the Mercers' Company, for their moiety of the expense of building the Royal Exchange, and other payments up to that time, the sum of 100,659*l.* 18*s.* 10*d.*" Mr. Cawne, the then clerk of the company of Mercers, produced a continuation of this account to the Committee above-mentioned, down to 1745, when the principal and interest amounted to the enormous sum of 142, 885*l.* 7*s.* 1*d.*

In the year 1767, it was represented to the Legislature that essential repairs were required in different parts of the Royal Exchange, which procured a grant of 10,000*l.*, and these were completed under the direction of Mr. Robinson, surveyor, who thought proper to rebuild the west side.

During the time occupied in rebuilding the present structure, the merchants of London transacted their business at Gresham college; and the new building was opened for that purpose, September 28, 1669: in 1703, the following notice appeared in the public papers: "An act of the Lord Mayor and Court of Aldermen is affixed at the Exchange, and other places in this city, by which all persons are prohibited coming upon the Royal Exchange to do business before the hours of twelve o'clock, and after the hour of two, till evening change. Wherein it is further enacted, that for a quarter of an hour before twelve the Exchange bell shall ring, as a signal of change time; and shall also begin to ring a quarter of an hour before two, at which time the change shall end: and all persons shall quit it, upon pain of being prosecuted to the utmost according to law. That the gates shall then be shut up, and continue so till evening change time; which shall be from the hours of six to eight from Lady-day till Michaelmas, and from Michaelmas to Lady-day from the hours of four to six; before and after which hours the bell shall ring as above said. And it is further enacted, that no persons shall assemble in companies, as stock-jobbers, &c. either in Exchange-alley, or places adjacent, to stop up and hinder the passage from and to the respective houses thereabouts, under pain of being immediately carried before the lord-mayor or other justice of the peace, and prosecuted."

There are at present numerous shops encircling the Royal Exchange, but they are confined to the ground floor, under the arches or piazza; many years past the upper rooms were used for this purpose, and it has been said to the amount of two hundred. Lloyd's coffee-house and an assurance office now occupy part of the upper story.

The architectural decorations render the exterior and interior fronts of the Royal Exchange an ornament to the vast metropolis of England. The form is square, and the area the same; there are four gates which face the cardinal points, but the principal is in Cornhill. Mr. Malcolm informs us that the statues of George I. and George II. are by Rysbrack; his present majesty's by Wilton, which was erected in March, 1764; and that most of the kings previously to Charles II. were sculptured by Cibber; that of the latter king, which originally stood in the area, is the work of Grinlin Gibbons, the unrivalled carver in wood; those of Charles I. and II., on the principal front, are by Bushnell. The statue of Charles II., in the area, was a few years since replaced by another in a Roman habit, the performance of Mr. Spiller. We shall conclude this slight sketch of the history of the Royal Exchange, with a brief description by the author just mentioned. The grand gateway is in the centre intercolumniation of four Corinthian pillars, which are the whole height of the front,

and have a complete entablature, the great arch reaching to the architrave. In the attic, directly over the gate, are the royal arms, and this forms the base of the steeple, on which there are three gradations, or stories, each bounded by pilasters and pillars, with entablatures and balustrades, and busts in place of vases, the usual ornaments of this sort of magnificent edifices; except the third, which has pediments on each side, with a cupola arising from the centre. On this is a globe and gilt grasshopper.

Over each side intercolumniation of the front are circular pediments, above them are attics and balustrades, with the Mercers crest and the City supporters. The lesser entrances have divided pediments, and over them Corinthian niches, and pediments containing statues of kings Charles the First and Second. The wings of the front are five arches in length, on each side of the gates, three of these form a piazza; the two remaining retire into the main building. The basement in which they are turned is rustic, and the story above them Corinthian, with four pillars, an entablature, and balustrade. The three windows of the projection, and those of the building, are exactly attic in their borders, though placed in Corinthian intercolumniations. The four sides of the quadrangle are magnificent, and richly decorated with the basement arches of the walks, the cornices over them, the niches, statues, pillars, circular windows, entablatures, and balustrade, all in correct proportion and arrangement.

ROYAL OAK, a fair spreading tree at Boscobel, in the parish of Donnington, in Staffordshire, the boughs whereof were once covered with ivy; in the thick of which king Charles II. sat in the day-time with colonel Careless, and in the night lodged in Boscobel-house: so that they are mistaken who speak of it as an old hollow oak; it being then a gay flourishing tree, surrounded with many more. The poor remains thereof are now fenced in with a handsome wall, with this inscription in gold letters: *Felicissimam arborem quam in asylum potentissimi regis Caroli II. Deus op. max. per quam reges regnant, hic crescere voluit*, &c.

ROYAL OAK, *Robur Carolinum*, in astronomy, one of the new southern constellations, the stars of which, according to Sharp's catalogue, annexed to the Britannic, are 12. viz. 0, 1, 2, 7, 2, 0, arranged according to their magnitudes.

ROYAL SOCIETY OF ENGLAND, is an academy or body of persons, supposed to be eminent for their learning, instituted by king Charles II., for promoting natural knowledge.

This learned and scientific body originated from an assembly of ingenious men, residing in London, who, being inquisitive into natural knowledge, and the new and experimental philosophy, agreed, about the year 1645, to meet weekly on a certain day, to discourse upon such subjects. These meetings, it is said, were suggested by Mr. Theodore Haak, a native of the palatinate in Germany; and they were held sometimes at Dr. Goddard's lodgings in Wood-street, sometimes at a convenient place in Cheapside, and sometimes in or near Gresham college. This assembly seems to be that mentioned under the title of the *Invisible, or Philosophical College*, by Mr. Boyle, in some letters written in 1646 and 1647. About the years 1648 and 1649, the company which formed these meetings began to be divided, some of the gentlemen removing to Oxford, as Dr. Wallis, and Dr. Goddard, where, in conjunction with other gentlemen, they held meetings also, and brought the study of natural and experimental philosophy into fashion there; meeting first in Dr. Petty's lodgings, afterwards at Dr. Wilkins's apartments in Wadham college, and, upon his removal, in the lodgings of Mr. Robert Boyle; while those gentlemen who remained in London continued their meetings as before. The greater part of the Oxford society coming to London about the year 1659, they met once or twice a week in term-time at Gresham college, till they were dispersed by the public distractions of that year, and the place of their meeting was made a quarter for soldiers. Upon the restoration, in 1660, their meetings were revived, and attended by many gentlemen, eminent for their character and learning.

They were at length noticed by the government, and the king granted them a charter, first the 15th of July 1662, then a more ample one the 22d of April 1663, and thirdly the 8th of April 1669; by which they were erected into a corporation, consisting of a president, council, and fellows, for promoting natural knowledge, and endued with various privileges and authorities.

Their manner of electing members is by balloting; and two-thirds of the members present are necessary to carry the election in favour of the candidate. The council consists of twenty-one members, including the president, vice-president, treasurer, and two secretaries; ten of which go out annually, and ten new members are elected instead of them, all chosen on St. Andrew's day. They had formerly also two curators, whose business it was to perform experiments before the society.

Each member, at his admission, subscribes an engagement, that he will endeavour to promote the good of the society; from which he may be freed at any time, by signifying to the president that he desires to withdraw.

The charges are five guineas paid to the treasurer at admission; and one shilling per week, or 52 *s.* per year, as long as the person continues a member; or, in lieu of the annual subscription, a composition of 25 guineas in one payment.

The ordinary meetings of the society are once a week, from November till the end of Trinity term the next summer. At first, the meeting was from three o'clock till six afternoon. Afterwards, their meeting was from

six till seven in the evening, to allow more time for dinner, which continued for a long series of years, till the hour of meeting was removed, by the present president, to between eight and nine at night, that gentlemen of fashion, as was alleged, might have the opportunity of coming to attend the meetings after dinner.

Their design is to "make faithful records of all the works of nature or art, which come within their reach; so that the present, as well as after ages, may be enabled to put a mark on errors which have been strengthened by long prescription; to restore truths that have been long neglected; to push those already known to more various uses; to make the way more passable to what remains unrevealed, &c."

To this purpose they have made a great number of experiments and observations on most of the works of nature; as eclipses, comets, planets, meteors, mines, plants, earthquakes, inundations, springs, damps, fires, tides, currents, the magnet, &c.: their motto being *Nullius in Verba*. They have registered experiments, histories, relations, observations, &c., and reduced them into one common stock. They have, from time to time, published some of the most useful of these, under the title of Philosophical Transactions, &c. usually one volume each year, which were, till lately, very respectable, both for the extent or magnitude of them, and for the excellent quality of their contents. The rest, that are not printed, they lay up in their registers.

They have a good library of books, which has been formed, and continually augmenting, by numerous donations. They had also a museum of curiosities in nature, kept in one of the rooms of their own house in Crane-court, Fleet-street, where they held their meetings, with the greatest reputation, for many years, keeping registers of the weather, and making other experiments; for all which purposes those apartments were well adapted. But, disposing of these apartments, in order to remove into those allotted them in Somerset-place, where having neither room nor convenience for such purposes, the museum was obliged to be disposed of, and their useful meteorological registers discontinued for many years, though they have lately been resumed.

Sir Godfrey Copley, bart. left five guineas to be given annually to the person who should write the best paper in the year, under the head of experimental philosophy: this reward, which is now changed to a gold medal, is the highest honour the society can bestow; and it is conferred on St. Andrew's day.

A History of the Royal Society has lately been published by Dr. Thomson, in one volume quarto.

ROYAL SOCIETY OF EDINBURGH. See SOCIETY.

RO'YALIST. *s.* (from *royal.*) Adherent to a king (*South*).

To RO'YALIZE. *v. a.* (from *royal.*) To ake royal (*Shakspeare*).

RO'YALLY. *ad.* (from *royal.*) In a kingly manner; regally; as becomes a king (*Dryden*).

RO'YALTY. *s.* (*roialté*, French.) 1. Kingship; character or office of a king (*Locke*). 2. State of a king (*Prior*). 3. Emblems of royalty (*Milton*).

ROYAN, once a large town of France, in the department of Lower Charente, famous for a siege maintained by the Huguenots against Lewis XIII. in 1622. It is now almost in ruins, and is seated at the mouth of the Garonne, 30 miles S. of Rochelle. Lon. 0. 57 W. Lat. 45. 38 N.

ROYENA. Bladder-nut. In botany, a genus of the class decandria, order digynia. Calyx cup-shaped; corol one-petalled, with a revolute border; capsule one-celled, four-valved. Seven species; herbs of the Cape; four of which are cultivated in the green-houses of our own country.

ROYES, a strong town of France, in the department of Somme. Some mineral waters were discovered here a few years ago. It is 12 miles N.W. of Noyon, and 60 N. by E. of Paris. Lon. 2. 51 E. Lat. 49. 46 N.

To ROYNE. *v. a.* (*rogner*, French.) To gnaw; to bite (*Spenser*).

RO'YNISH. *a.* (*rogneux*, French.) Paltry; sorry; mean; rude (*Shakspeare*).

ROYSTON, a town in Herts (part of which is in Cambridgeshire) with a market on Wednesday. Under the market-place is an ancient subterranean chapel, supposed to be of Saxon construction. Royston has given its name to a species of crow, called also the Hooded or Gray crow, which is a bird of passage in this neighbourhood, and also on the whole eastern coast. It is 15 miles S. by E. of Huntingdon, and 37 N. of London. Lon. 0. 1 E. Lat. 52. 6 N.

RO'YTELET. *s.* (French.) A little or petty king (*Heylin*).

ROZÉE (Mademoiselle), an extraordinary female painter, was born at Leyden, in 1632. It is said that she neither used oil nor water-colours in her performances, but only worked on the rough side of the pannel with a preparation of silk floss, disposed in different boxes, according to the different degrees of the bright and dark tints, out of which she applied whatever colour was requisite for her work, and blended, softened, and united the tints with such art and judgment, that she imitated the warmth of flesh as well as could be done with oil. Her pictures were exquisitely beautiful, and curious, some being historical subjects, others landscapes, and some portraits. She died in 1682.

To RUB. *v. a.* (*rhubio*, Welsh; *rieben*, German, to wipe.) 1. To clean or smooth any thing by passing something over it; to scour; to wipe; to perfricate. 2. To touch so as to leave something of that which touches behind (*Addison*). 3. To move one body upon another (*Arbuthnot*). 4. To obstruct by collision (*Shakspeare*). 5. To polish; to retouch (*South*). 6. To remove by friction

(*Collier*). 7. To touch hard (*Sidney*). 8. *To* RUB *down*. To clean or curry a horse (*Dryden*). 9. *To* RUB *up*. To excite; to awaken (*South*). 10. *To* RUB *up*. To polish; to refresh.

To RUB. *v. n.* 1. To fret; to make a friction (*Dryden*). 2. To get through difficulties (*L'Estrange*).

RUB. *s.* (from the verb.) 1. Friction; act of rubbing. 2. Inequality of ground, that hinders the motion of a bowl (*Shakspeare*). 3. Collision; hinderance; obstruction (*Dryden*). 4. Difficulty; cause of uneasiness (*Shakspeare*).

RUB-STONE. *s.* (*rub* and *stone*.) A stone to scour or sharpen (*Tusser*).

RU'BBER. *s.* (from *rub*.) 1. One that rubs. 2. The instrument with which one rubs (*Swift*). 3. A coarse file (*Moxon*). 4. A game; a contest; two games out of three (*Collier*). 5. A whetstone (*Ainsworth*).

RUBBER (Indian.) See CAOUTCHOUC.

RU'BBISH. RU'BBAGE. *s.* (from *rub*: as perhaps meaning, at first, dust made by rubbing. *Rubbage* is not used.) 1. Ruins of a building; fragments of matter used in building (*Shakspeare. Wotton*). 2. Confusion; mingled mass (*Arbuthnot*). 3. Any thing vile and worthless.

RUBE'DO, in medicine, a diffused, but not spotted, redness in any part of the skin; such as that which arises from blushing.

RUBEFACIENTS. (*rubefacientia*; from *rubefacio*, to make red.) Those substances which, when applied a certain time to the skin, induce a redness without blistering.

RUBENS (Sir Peter Paul), a famous painter, born at Cologne, in 1757. He studied first at Antwerp, and then went to Venice, where, in the school of Titian, he greatly improved himself. He afterwards went to Rome, where he contemplated the antiques and the paintings of Raphael. His reputation soon spread over Europe, when queen Mary of Medicis, wife of Henry IV. of France, invited him to Paris, and there he painted the Luxemburg galleries. The duke of Buckingham recommended him to the infanta Isabella, who sent him in 1630 ambassador to England, to negociate a peace with Charles I. He concluded this treaty, and painted the banqueting-house, for which the king paid him largely, and knighted him. He continued in the dissimilar functions of statesman and painter many years, by which he amassed vast wealth; and died in 1640.

Rubens's genius qualified him to excel equally in every thing that can enter into the composition of a picture. His invention was so fertile, that, if he had occasion to paint the same subject several times, his imagination always supplied him with something striking and new. The attitudes of his figures are natural and varied, the carriage of the head is peculiarly graceful, and his expression noble and animated. He is by all allowed to have carried the art of colouring to its highest pitch; he understood so thoroughly the true principles of the chiaro-scuro, that he gave to his figures the utmost harmony, and a prominence resembling real life. His pencil is mellowed, his strokes bold and easy, his carnation glows with life, and his drapery is simple, but grand, broad, and hung with much skill. The great excellence of Rubens appears in his grand compositions; for, as they are to be viewed at a distance, he laid on a proper body of colours with uncommon boldness, and fixed all his tints in their proper places; so that he never impaired their lustre by breaking or torturing them; but touched them in such a manner as to give them a lasting force, beauty, and harmony.

It is generally allowed that Rubens wanted correctness in drawing and designing; some of his figures being heavy and too short, and the limbs in some parts not being justly sketched in the outline. Though he had spent seven years in Italy in studying those antiques by which other celebrated artists had modelled their taste; though he had examined them with such minute attention as not only to perceive their beauties, but to be qualified to describe them in a dissertation which he wrote on that subject; yet he seems never to have divested himself of that heavy stile of painting, which, being peculiar to his native country, he had insensibly acquired. The astonishing rapidity too with which he painted made him fall into inaccuracies, from which those works that he finished with care are entirely exempted.

Among his finished pieces may be mentioned the Crucifixion of Jesus Christ between the two Thieves, which was very lately to be seen at Antwerp; but of all his works the paintings in the palace of Luxemburg best display his genius and his style.

It is the observation of Algarotti, that he was more moderate in his movements than Tintoretto, and more soft in his chiaro-scuro than Carravaggio; but not so rich in his compositions, nor so light in his touches, as Paolo Veronese; in his carnations less true than Titian, and less delicate than Vandyck. Yet he contrived to give his colours the utmost transparency and harmony, notwithstanding the extraordinary deepness of them; and he had a strength and grandeur of style entirely his own.

RUBE'OLA. (*rubeola*, from *ruber*, red; from *rubio*, to become red.) Morbili. The measles. A genus of diseases in the class pyrexiæ and order exanthemata of Cullen; known by synocha, hoarseness, dry cough, sneezing, drowsiness; about the fourth day, eruption of small red points, discernible by the touch, which after three days end in mealy desquamation. The blood after venæsection exhibits an inflammatory crust. In addition to the symptoms already related, it is remarkable, that the eyes and eye-lids always shew the presence of this disease, being somewhat inflamed and suffused with tears. The synocha continues during the whole progress of the disease.

RUBIA. Madder. In botany, a genus of the class tetrandia, order monogynia. Corol one-petalled, campanulate, superior; berries two, one-seeded. Seven species, scattered over the globe; one, R. peregrina, common to the hedges of our own country.

The only cultivated species is R. tinctorum, Dyer's madder. Root perennial; stalk annual, prickly, square, prominent, jointed; leaves annual in fours, lanceolate, pointed, rough, fringed; flowers yellow, in four segments, resembling stars. They appear in June, and are sometimes succeeded by seeds that seldom ripen in England. It derives its specific name from its great utility in dyeing. See the articles DYEING and CALICO PRINTING.

The roots of the plant have a bitterish somewhat austere taste, and a slight smell, rather disagreeable. These roots were formerly considered as deobstruent, detergent, and diuretic; but they are now seldom used in medicine. The bones of animals that feed upon the root become tinged with the red colour of the root; yet neither the fleshy nor the cartilaginous parts of the animal frame are in the least affected by the colour. The soil proper for madder should be deep and light, and should be deeply and thoroughly ploughed in autumn, as soon as the crop is off, with a four-coultered plough. In about three months afterwards, let the ground be ploughed a second time, with the same plough, and a third time about the end of March; then about the end of April, or in May, let the young shoots from the sides of the root be taken off from the mother-plant, with as much root as possible, and planted with an iron dibble, in rows at a foot distance from one another. When one row is planted, the line is to be removed a foot and a half, and another row planted. The sets in this not being placed opposite to those in the other, but just over-against the middle of the spaces between: the line is then to be removed to the distance of five feet, and drawn straight over the ground, as before, and a row of the sets are to be planted there: thus there will be a third row at five feet distance from the second, and at six and a half from the first; the line is then to be moved again one foot and an half; and another, being a fourth row, is to be planted opposite the middle distances of the last; and in this manner the whole ground is to be planted out. If the season should prove dry after planting, the sets must be watered, and after the plants appear, let them be carefully weeded, and the growth of their roots promoted.

There are different ways of managing the root when taken up, and different forms in which it is brought to market. It may be dried in a hop-kiln, with a little fire.

RUBICAN colour of a horse; a bay, sorrel, or black, with a light grey or white upon the flanks, but so that the grey or white be not predominate in those parts.

RUBICON, a small river of Italy, which it separates from Cisalpine Gaul. It rises in the Apennine mountains, and falls into the Adriatic sea. By crossing it, then the boundaries of his province, J. Cæsar began the civil wars against the senate and Pompey.

RU'BICUND. *a.* (*rubiconde*, Fr. *rubicundus*, Latin.) Inclining to redness.

RU'BIED. *a.* (from *ruby*.) Red as a ruby (*Milton*).

RUBI'FIC. *a.* (*ruber* and *facio*, Latin.) Making red (*Grew*).

RU'BIFORM. *a.* (*ruber*, Latin, and *form*.) Having the form of red (*Newton*).

To RU'BIFY. *v. a.* To make red (*Brown*).

RUBIGO, a goddess at Rome, particularly worshipped by husbandmen, as she presided over corn. Her festivals, called Robigalia, were celebrated on the 25th of April, and incense was offered to her, as also the entrails of a sheep, and of a dog. She was intreated to preserve the corn from blights.

RUBIGO, in botany, the rust or red mildew, frequently seen on the stems and leaves of plants. It consists of yellow or brown stains, which when touched give out a powder of the same colour, and equally soiling. Microscopical observation has shown that this rust-like matter proceeds from small fungi called æcidium, the seeds of which constitute it. We find it peculiarly frequent in the leaves and stems of euphorbia cyparissias; barberis vulgaris; rhamnus catharticus, and in the spikes or culms of wheats, oats, and other grain. See ÆCIDIUM.

RUBIGO FERRI. Chalybis rubigo præparata. Rust of iron. This is a yellow oxyd of iron, and therefore termed oxydum ferri luteum in the chemical nomenclature. It possesses corroborant and stimulating properties, and is exhibited with success in leucorrhæa, ataxia, asthenia, chlorosis, pyrosis, dyspepsia, rachitis, &c.

RU'BIOUS. *a.* (*rubeus*, Latin.) Ruddy; red: not used (*Shakspeare*).

RU'BRICATED. *a.* (from *rubrica*, Latin.) Smeared with red.

RU'BRIC. *s.* (*rubrique*, Fr. *rubrica*, Lat.) Directions printed in books of law and in prayer books; so termed, because they were originally distinguished by being in red ink (*Stillingfleet*).

RU'BRIC. *a.* Red (*Newton*).

To RU'BRIC. *v. a.* (from the noun.) To adorn with red.

RUBUS. Bramble. In botany, a genus of the class icosandria, order polygynia. Calyx five-cleft; petals five; berries superior, composed of several single-seeded granulations. Thirty-two species: chiefly natives of Europe and America; seven common to the woods, hedges, or mountains of our own country. Of these some are shrubby, others herbaceous. The following are cultivated.

1. R. idæus. Raspberry. A well-known shrub; peduncles hispid; flowers in panicles; fruit red, grateful to the smell and taste, bristly. Numerous varieties: found wild in our own hedges.

2. R. occidentalis. Virginian raspberry. Higher than the preceding; stalks purplish; flower ornamental; fruit a dark black when

ripe, little flavour. It varies with a red fruit more acid and pleasant than the European raspberry.

3. R. odoratus. Flowering raspberry. Perennial creeping root; six or seven feet high; petals largish, light purple; fruit rarely produced here, but the common raspberry of North America; not so pleasant as the European.

4. R. fruticosus. Common bramble. Blackberry. Well known to every one: the cultivated variety is the double-flowering, or double blossomed bramble, which is highly ornamental in our gardens.

5. R. trispidus. Bristly bramble: stem and petioles very rough, with stiff lanceolate bristles. A native of Canada.

6. R. cœsius. Dewberry. Fruit black, with a bright blue tinge or bloom, composed of few large grains: flavour agreeably acid, without the faint taste of R. fruticosus. A native of our own woods.

7. R. arcticus. Dwarf crimson bramble. Stems from a hand to a span in height, upright, simple, angular: flowers solitary, peduncled, terminal, deep-rose-coloured: fruit purple, sweet, fragrant: found on the stony hills of our own country.

8. R. chamœmorus. Cloud-berry; mountain bramble. Elegant; with a creeping root; simple stem, hardly a foot high, upright; mallow-like leaves; flowers terminal, peduncled, white; berry of a tawny or dull orange colour; a native of our own mountains.

The two last are best propagated by seeds; the rest by cuttings, suckers, layers, and division of the roots. The first is chiefly cultivated. The new plants should be placed two feet asunder, and set in rows, which should be five feet distant from one another. The soil they thrive in best is a fresh sandy loam, which should neither be too moist nor over dry. The time for dressing them is October, when all the old wood which produced fruit the preceding summer should be cut down to the ground, and the young shoots shortened to about two feet in length. The spaces between the rows should then be dug up, and some rotten dung buried in them. In the summer they must be kept clean from weeds, and once in three or four years there should be new beds made, and the old ones destroyed, for they seldom bear well after that time.

RUBY, in mineralogy, a species of silicious earth. See GEMMA. Ruby denotes, 1. Redness (*Shakspeare*). 2. Any thing red (*Milton*). 3. A blain; a blotch; a carbuncle (*Jones*).

RUBY. *a.* (from the noun.) Of a red colour (*Shakspeare*).

RUCTA'TION. *s.* (*ructo*, Latin.) A belching arising from wind and indigestion.

RUCTUS, in medicine, ructation, eructation.

RUD, in ichthyology. See CYPRINUS.

RUDAW, a town of Prussia, remarkable for the victory obtained by the knights of the Teutonic Order in 1370, over Kinstud, great duke of Lithuania; in memory of which a stone pillar was erected, which is still remaining. It is 12 miles N.N.W. of Konigsberg.

RUDBECHIA, in botany, a genus of the class syngenesia, order polygamia frustranea. Receptacle chaffy, conic; seeds crowned with a four-toothed margin; calyx a double row of scales. Nine species, American plants, five or six of which are cultivated, and afford ornament and variety in the borders and clumps of our gardens.

RUDDER, in navigation, a piece of timber turning on hinges in the stern of a ship; and which opposing sometimes one side to the water, and sometimes another, turns or directs the vessel this way or that.

The rudder becomes gradually broader, in proportion to its distance from the top, or to its depth under water. The back, or inner part of it, which joins to the stern-post, is diminished into the form of a wedge through its whole length, so as that the rudder may be the more easily turned from one side to the other, where it makes an obtuse angle with the keel. The hinges, which are bolted round the stern-post to the after extremity of the ship, are called googings, and are furnished with a large hole on the after-part of the stern-post. The other parts of the hinges, which are bolted to the back of the rudder, are called pintles, being strong cylindrical pins, which enter into the googings, and rest upon them. The length and thickness of the rudder are nearly equal to those of the stern-post. The rudder is turned upon its hinges, by means of a long bar of timber, called the tiller, the operation of which is directed by the tiller-rope, which in large vessels is wound about a wheel. The power of the rudder is reducible to that of the lever, and the oblique action of the water upon it is to be determined by the resolution of forces. As to the most advantageous angle made by the helm, with the line prolonged from the keel, geometricians have fixed it at 54° 44′. But it has been said, that, in determining this angle, they have presumed that the ship is as narrow at her floating line, or at the line described by the surface of the water round her bottom, as at the keel; whereas all vessels increase in breadth from the keel upward to the extreme breadth, where the floating line, or the highest water-line, is terminated; and, therefore, the angle above stated is too large. For the rudder is impressed by the water, at the height of the floating line, more directly than at the keel, because the fluid exactly follows the horizontal outlines of the bottom; so that a particular position of the helm might be supposed necessary for each different incidence which it encounters from the keel upwards. But as a middle position may be taken between all these points, it will be sufficient to consider the angle formed by the sides of the ship, and her axis, or the middle line of her length, at the surface of the water, in order to determine afterwards the mean point, and the mean angle of incidence. The angle 54° 44′, it is said, is too open, and very unfavourable to the ship's head-way, because the water acts

upon the rudder there with too great a sine of incidence, as being equal to that of the angle which it makes with the line prolonged from the keel below; but above, the shock of the water is almost perpendicular to the rudder, because of the breadth of the bottom. If then the rudder is only opposed to the fluid, by making an angle of 45° with the line prolonged from the keel, the impression, by becoming weaker, will be less opposed to the ship's headway, and the direction of the absolute effort of the water upon the helm drawing nearer to the lateral perpendicular, will be placed more advantageously. To which it is added, that experience daily testifies, that a ship steers well, when the rudder makes the angle of 35°. L. Euler recommends an obliquity somewhat less than 54° 44′, for the greatest action of the rudder, and says, if we wish to know this angle more exactly, we have only to find an angle $n=\frac{1}{3}$ cos. k, (k being the angle between the direction of the keel and that of the water), and then make the required angle $q=90-\frac{1}{2}(n+k)$. Moreover, he remarks, since the leeway ϕ seldom surpasses 20 degrees, by taking $k=\frac{1}{2}\phi$, this expression will not deviate considerably from the truth: therefore, since k does not surpass 10 degrees; it is obvious that there could not result any sensible error whenever this angle should be taken a few degrees greater or less. Thus, by taking $k=10°$, we find $n=70°\ 50'$, and $q=49°\ 35'$. The force of the water upon the rudder moving with the velocity c, will be denoted by $\frac{c^2 \cos.^2 k}{4g} f^2.\sin.^2(q+k)$

f^2 denoting the surface of the rudder, and g as usual $16\frac{1}{12}$ feet. Bouguer Traite de la Manœuvre des Vaisseaux. Falconer's Marine Dict. article Helm; and Euler's Complete Theory of the Construction and Properties of Vessels, translated by colonel Watson, 1776, book ii chap. vii. viii. ix.

A narrow rudder is best for a ship's sailing, provided she can feel it, that is, be guided and turned by it; for a broad rudder will hold much water when the helm is put over to any side; but if a ship have a fat quarter, so that the water cannot come quick and strong to her rudder, she will require a broad rudder.

Captain Bolton has taken out a patent for an improved rudder, the description of which is given in the 16th vol. of the first series of the Repertory of Arts, &c. The invention consists in fixing the rudder, so that when the vessel touches the ground, &c. it will rise of itself, or may be lifted at will by any of the ordinary mechanical powers.

RUDDIMAN (Thomas), a learned Scotchman, born in 1684. He was near fifty years keeper of the advocates library in Edinburgh; and published several works of profound erudition. In 1737 he was employed to complete the Diplomata et Numismata Scotiæ, the preface to which is deemed a master-piece of the kind. He died in 1767.

RU'DDINESS. *s.* (from *ruddy*.) The quality of approaching to redness (*Wiseman*).

RU'DDLE. *s.* (*rudul*, Islandick.) Red earth (*Woodward*).

RU'DDOCK. *s.* (*rebecula*, Latin.) A bird; the redbreast. See MOTACILLA.

RU'DDY. *a.* (ꝛuꝺu, Saxon.) 1. Approaching to redness; pale red (*Otway*). 2. Yellow (*Dryden*).

RUDE. *a.* (ꝛeꝺe, Saxon; *rudis*, Latin.) 1. Untaught; barbarous; savage (*Wilkins*). 2. Rough; coarse of manners; uncivil; brutal (*Shakspeare*). 3. Violent; tumultuous; boisterous; turbulent (*Boyle*). 4. Harsh; inclement (*Waller*). 5. Ignorant; raw; untaught (*Wotton*). 6. (*rude*, Fr.) Rugged; uneven; shapeless; unformed (*Chapman*). 7. Artless; inelegant (*Spenser*). 8. Such as may be done with strength without art (*Dryden*).

RUDELSTADT, a town of Upper Saxony, in the landgravate of Thuringia, and county of Schwartzburg, with a castle, near the river Sala.

RU'DELY. *ad.* 1. In a rude manner; fiercely (*Shakspeare*). 2. Without exactness; without nicety; coarsely (*Shakspeare*). 3. Unskilfully (*Dryden*). 4. Violently; boisterously (*Spenser*).

RU'DENESS. *s.* (*rudesse*, French; from *rude*.) 1. Coarseness of manners; incivility (*Swift*). 2. Ignorance; unskilfulness (*Hayward*). 3. Artlessness; inelegance; coarseness (*Spenser*). 4. Violence; boisterousness (*Shakspeare*). 5. Storminess; rigour (*Evelyn*).

RU'DENTURE. *s.* (French.) In architecture, the figure of a rope or staff, wherewith the flutings of columns are frequently filled up (*Bailey*).

RU'DERARY. *a.* (*rudera*, Latin.) Belonging to rubbish.

RUDERA'TION. *s.* In architecture, the laying of a pavement with pebbles or little stones (*Bailey*).

RU'DESBY. *s.* (from *rude*.) An uncivil turbulent fellow. A low word (*Shakspeare*).

RU'DIMENT. *s.* (*rudimentum*, Latin.) 1. The first principles; the first elements of a science (*Milton*). 2. The first part of education (*Wotton*). 3. The first, inaccurate, unshapen beginning or original of any thing (*Philips*).

RUDIME'NTAL. *a.* (from *rudiment*.) Initial; relating to first principles (*Spectator*).

RUDOLFWERD, a strong town of Germany, in Carniola, with an abbey. It is seated on the Gurck, in a country fertile in good wine, 45 miles S.E. of Laubach. Lon. 15. 20 E. Lat. 46. 8 N.

RUDOLPHIA, in botany, a genus of the class diadelphia, order decandria. Calyx two-lipped; corol with a long lanceolate banner; legume flat, many-seeded. Two species; twining shrubs of St. Domingo.

RUE (Goats). See GALIGA.

RUE (Common). See RUTA.

RUE (Meadow). See THALYCTRUM.

To RUE. *v. a.* (ꝛeoꝛꝛian, Saxon.) To grieve for; to regret; to lament (*Donne*).

RUE'FUL. *a.* (*rue* and *full*.) Mournful; woful; sorrowful (*Dryden*).

Ruellia Formosa.
Splendid Ruellia.

Smilacina Umbellata.
Umbelled Smilacina.

London, Published by Sherwood & Co. Paternoster Row, Feb.y 1.st 1812.

RUE'FULLY. *ad.* (from *rueful.*) Mournfully; sorrowfully (*More*).

RUE'FULNESS. *s.* (from *rueful.*) Sorrowfulness; mournfulness.

RU'ELLE. *s.* (French.) A circle; an assembly at a private house: not used (*Dryden*).

RUELLIA, in botany, a genus of the class didynamia, order angiospermia. Calyx five-parted; corol somewhat campanulate; stamens approaching each other in pairs; capsule bursting by elastic teeth. Forty-six species; shrubs of Asia, Africa, or America. See Nat. Hist. Pl. CXLII.

RUFF. *s.* (See RUFFLE.) 1. A puckered linen ornament, formerly worn about the neck (*Dryden*). 2. Any thing collected into puckers or corrugations (*Pope*). 3. A state of roughness: obsolete (*Chapman*). 4. New state: not used (*L'Estrange*).

RUFF, in ichthyology. See PERCA.

RUFF and REEVE, in ornithology. See TRINGA.

RUFFAC, a town of France, in the department of Upper Rhine, seated on the Rotbach, seven miles S. of Colmar, and 17 N.W. of Basle. Lon. 7. 27 E. Lat. 47. 58 N.

RUFFEC, a town of France, in the department of Charente, seated on the Anche, 24 miles N of Angoulême.

RU'FFIAN. *s.* (*ruffiano*, Italian.) A brutal, boisterous, mischievous fellow; a cutthroat; a robber; a murderer (*Hayward*).

RU'FFIAN. *a.* Brutal; savagely boisterous (*Pope*).

To RU'FFIAN. *v. n.* (from the noun.) To rage; to raise tumults; to play the ruffian: not in use (*Shakspeare*).

To RU'FFLE. *v. a.* (*ruyffelen*, Dutch, to wrinkle.) 1. To disorder; to put out of form; to make less smooth (*Boyle*). 2. To discompose; to disturb; to put out of temper (*Granville*). 3. To put out of order; to surprise (*Hudibras*). 4. To throw disorderly together (*Chapman*). 5. To contract into plaits (*Addison*).

To RU'FFLE. *v. n.* 1. To grow rough or turbulent (*Shakspeare*). 2. To be in loose motion; to flutter (*Dryden*). 3. To be rough; to jar; to be in contention: out of use (*Shaks.*).

RU'FFLE. *s.* (from the verb.) 1. Plaited linen used as an ornament (*Addison*). 2. Disturbance; contention; tumult (*Watts*).

RU'FFLERHOOD. *s.* In falconry, a hood to be worn by a hawk when she is first drawn (*Bailey*).

RUG. *s.* (*rugget*, rough, Swedish.) 1. A coarse nappy woollen cloth (*Peacham*). 2. A coarse nappy coverlet, used for mean beds (*Swift*). 3. A rough woolly dog: not used (*Shakspeare*).

RUGBY, a town in Warwickshire, with a market on Saturday, and a famous free-school. It is 11 miles S.E. of Coventry, and 85 N.N.W. of London. Lon. 1. 12 W. Lat. 52. 24 N.

RUGEN, an island of the Baltic, on the coast of Swedish Pomerania, opposite Stralsund, 23 miles long and 15 broad. It is strong both by art and nature, and abounds in corn and cattle. The chief town is Bergen.

RUGENWALD, a town of Prussian Pomerania, the chief place of the duchy of Wenden, with a castle, seated on the Wipper, eight miles from the Baltic, and 35 N.E. of Colberg. Lon. 16. 27 E, lat. 54. 35 N.

RU'GGED. *a.* (*rugget*, Swedish.) 1. Rough; full of unevenness and asperity (*Bentley*). 2. Not neat; not regular; uneven (*Shakspeare*). 3. Savage of temper; brutal; rough (*South*). 4. Stormy; rude; tumultuous; turbulent; tempestuous (*Shakspeare*). 5. Rough or harsh to the ear (*Dryden*). 6. Sour; surly; discomposed (*Shakspeare*). 7. Violent; rude; boisterous (*Hudibras*). 8. Rough; shaggy (*Fairfax*).

RUGGED, or SCABROUS, in botany. Scaber. Rough with tubercles, or prominent stiffish points. Applied to the leaf and stem: also to the calyx of the oak.

RU'GGEDLY. *ad.* (from *rugged.*) In a rugged manner.

RU'GGEDNESS. *s.* (from *rugged.*) 1. The state or quality of being rugged. 2. Roughness; asperity (*Ray*).

RU'GIN. *s.* A nappy cloth (*Wiseman*).

RU'GINE. *s.* (*rugine*, Fr.) A chirurgeon's rasp (*Sharp*).

RUGLEY, a town in Staffordshire, with a market on Tuesday, seated on the Trent, 10 miles S.E. of Stafford, and 126 N.W. of London. Lon. 1. 48 W. Lat. 52. 57 N.

RU'GOSE, or RU'GOUS. *a.* (*rugosus*, Lat.) Full of wrinkles.

RUHNKENIUS (David), of Stolp in Pomerania, became professor of belles lettres and history, and librarian in Leyden university. He died in 1798, aged seventy-five. He wrote Epistolæ criticæ in Hesiodi et Homeri hymnos —de vitâ et Scriptis Longini—Timæi sophistæ lexicon—Historia critica Oratorum Græcorum, 2 vols. 8vo.—editions of V. Paterculus, Rutilius Lupus, &c. His life has been published by Wyttenbach, and pretty copious memoirs are inserted in the Monthly Magazine for 1804, pp. 148—154.

RU'IN. *s.* (*ruine*, French; *ruina*, Latin.) 1. The fall or destruction of cities or edifices (*Beaumont*). 2. The remains of a building demolished (*Swift*). 3. Destruction; loss of happiness or fortune; overthrow (*Dryden*). 4. Mischief; bane (*Milton*).

To RU'IN. *v. a.* (*ruiner*, French.) 1. To subvert; to demolish (*Dryden*). 2. To destroy; to deprive of felicity or fortune (*Wake.*). 3. To empoverish (*Addison*).

To RU'IN. *v. n.* 1. To fall in ruins (*Milt.*). 2. To run to ruin; to dilapidate (*Sandys*). 3. To be brought to poverty or misery (*Locke*).

To RU'INATE. *v. a.* (from *ruin.*) Obsolete. 1. To subvert; to demolish (*Shaks.*). 2. To bring to meanness or misery irrecoverable (*Bacon*).

RUINATION. *s.* (from *ruinate.*) Subversion; demolition: obsolete (*Camden*).

RU'INER. *s.* (from *ruin.*) One that ruins (*Chapman*).

RU'INOUS. *a.* (*ruinosus*, Lat. *ruineaux*, Fr.) 1. Fallen to ruin; dilapidated; demolished (*Hayward*). 2. Mischievous; pernicious; baneful; destructive (*Swift*).

RU'INOUSLY. *ad.* 1. In a ruinous manner. 2. Mischievously; destructively (*Decay of Piety*).

RUIZIA, in botany, a genus of the class monadelphia, order polyandria. Calyx double, the outermost three-leaved; styles ten; capsules ten, one-celled, two-seeded, closely cohering. Three species; natives of the isle of Bourbon. In all the species the leaves are downy underneath, and the flowers in axillary, peduncled, bifid corymbs.

RULE. *s.* (*regula*, Latin.) 1. Government; empire; sway; supreme command (*Philips*). 2. An instrument by which lines are drawn (*South*). 3. Canon; precept by which the thoughts or actions are directed (*Tillotson*). 4. Regularity; propriety of behaviour: not in use (*Shakspeare*).

To RULE. *v. a.* (from the noun.) 1. To govern; to control; to manage with power and authority (*Dryden*). 2. To manage; to conduct (*Mac.*). 3. To settle as by a rule (*Atterbury*).

To RULE. *v. n.* To have power or command (*Locke*).

RULE, in a monastic sense, a system of laws or regulations, whereby religious houses are governed, and which the religious make a vow at their entrance to observe. Such are the rules of the Augustins, Benedictins, Carthusians, Franciscans, &c. See AUGUSTINS, &c.

RULES OF COURT, in law, are certain orders made from time to time in the courts of law, which attorneys are bound to observe, in order to avoid confusion; and both the plaintiff and defendant are at their peril also bound to pay obedience to rules made in court relating to the cause depending between them. It is to be observed, that no court will make a rule for any thing that may be done in the ordinary course; and that if a rule be made, grounded upon an affidavit, the other side may move the court against it, in order to vacate the same, and thereupon shall bring into court a copy of the affidavit and rule. On the breach and contempt of a rule of court an attachment lies; but it is not granted for disobedience to a rule, when the party has not been personally served: nor for disobeying a rule made by a judge in his chamber, which is not of force to ground a motion upon, unless the same be entered. A rule of court is granted every day the courts at Westminster sit, to prisoners of the King's-bench or Fleet prisons, to go at large about their private affairs.

RULE OF THREE. See ARITHMETIC and PROPORTION.

RULE, or RULER, an instrument of wood or metal, with several lines delineated on it, of great use in practical mensuration. When a ruler has the lines of chords, tangents, sines, &c. it is called a plane scale.

The carpenter's joint-rule is an instrument usually of box, &c. twenty-four inches long, and one and a half broad; each inch being subdivided into eight parts. On the same side with these divisions is usually added Gunter's line of numbers. On the other side are the lines of timber and board measure; the first beginning at 32, and continued to 36, near the other end; the latter is numbered from 7 to 36, 4 inches from the other end. We shall point out some of the uses of this rule

The application of the inches, in measuring lengths, breadths, &c. is obvious. That of the Gunter's line, see under the article GUNTER'S LINE.

The use of the other side is that with which we are now concerned. 1. The breadth of any surface, as board, glass, &c. being given, to find how much in length makes a square foot. Find the number of inches the surface is broad, in the line of board measure, and right against it is the number of inches required. Thus, if the surface were eight inches broad, eighteen inches will be found to make a superficial foot. Or more readily thus: apply the rule to the breadth of the board, or glass, that end, marked 36, being equal with the edge, the other edge of the surface will show the inches, and quarters of inches, which go to a square foot. 2. Use of the table at the end of the board-measure. If a surface be one inch broad, how many inches long will make a superficial foot? look in the upper row of figures for one inch, and under it in the second row is twelve inches, the answer to the question. 3. Use of the line of timber-measure. This resembles the former; for having learned how much the piece is square, look for that number on the line of the timber-measure; the space thence to the end of the rule is the length which, at that breadth, makes a foot of timber. Thus, if the piece be nine inches square, the length necessary to make a solid foot of timber is $21\frac{1}{3}$ inches. If the timber be small, and under nine inches square, seek the square in the upper rank of the table, and immediately under it is the feet and inches that make a solid foot. If the piece be not exactly square, but broader at one end than the other, the method is to add the two together, and take half the sum for the side of the square. For round timber the method is to girt it round with a string, and to allow the fourth part for the side of the square; but this method is erroneous, for hereby you lose nearly one fifth of the true solidity; though this is the method at present practised in buying and selling timber.

RULE (Coggeshall's sliding), is chiefly used for measuring the superficies and solidity of timber, &c. It consists of two rulers, each a foot long, one of which slides in a groove made along the middle of the other.

On the sliding side of the rule are four lines of numbers, three whereof are double; that is, are lines to two radiuses; and one, a single broken line of numbers: the three first, marked A, B, C, are figured 1, 2, 3, &c. to 9; then

1, 2, 3, &c. to 10. The single line, called the girt-line, and marked D, whose radius is equal to the two radiuses of any of the other lines, is broke for the easier measurement of timber, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, &c. From 4 to 5 it is divided into ten parts, and each tenth subdivided into 2, and so on, from 5 to 6, &c. On the backside of the rule are, 1. A line of inch-measure, from 1 to 12; each inch being divided and subdivided. 2. A line of foot measure, consisting of one foot, divided into 100 equal parts, and figured 10, 20, 30, &c. The back part of the sliding piece is divided into inches, halves, &c. and figured from 12 to 24; so that when drawn wholly out, there may be a measure of two feet.

There is a great variety of sliding-rules of other constructions, and serving to perform computations in arithmetic, trigonometry, mensuration, gauging, &c., but which it is not necessary to describe minutely here.

RULE (Gilbert), M. D. born at Elgin, in 1628. He took his degrees in King's college, Aberdeen, where he was appointed professor of philosophy. In 1661 he was ejected from his college for refusing to comply with the act of uniformity. He went to Leyden to study physic, which, on his return home, he practised until the revolution, when the magistrates of Edinburgh appointed him principal of their University. He died at Edinburgh in 1705.

RULED-PAPER. Paper on which the staves are ruled for receiving the written notes of any musical composition. Formerly this paper was wholly ruled by hand by common quill pens, the tedious operation of which was afterwards superseded by the invention of five-pointed pens, made of brass. At present, however, the still more expeditious method of ruling the paper with a machine is generally adopted.

RU'LER. *s.* (from *rule.*) 1. Governour; one that has the supreme command (*Raleigh*). 2. An instrument, by the direction of which lines are drawn (*Moxon*).

RUM, a name given by the native Americans, to a peculiar spirit distilled from melasses, and which has hence become current in our own language, as well as many others of Europe.

As we shall treat of this material in connection with various others of a similar kind, as brandy, geneva, and other corn-spirits, alkohol, &c. under the article SPIRITS, DISTILLED, we shall here only observe that rum is prepared by the distillation of a fermented liquor made from melasses and other coarse saccharine matter, procured during the manufacture of raw sugars in the West Indies. The common Jamaica process is as follows. The usual materials for the fermentation are molasses or melasses; in other words the treacle which drains from the sugar, scummings of the hot-cane juice, and sometimes raw cane-liquor, lees, or *dunder*, as it is called, and water. The dunder answers the purpose of yeast, and is usually prepared by a separate fermentation of cane-sweets and water. The materials being mixed in due proportion (which are about equal parts of scummings, dunder and water), the fermentation begins very soon, and in twenty-four hours the liquor is fit for the first charge of melasses, which is added in the proportion of three gallons for every hundred gallons of the liquor. Another charge is added a day or two afterwards. The heat in fermentation should not exceed 90° or 94°, so that in the West Indies it is necessary to keep the fermenting tubs as cool as possible. The fermentation falls in six or eight days, when the liquor grows fine and fit for distillation. In about two hours after lighting the fire the spirit begins to run, (in a still of 1200 gallons) and it is collected as long as it remains inflammable.

The first spirit is called in the country *low wines*, and it is rectified in a smaller still to the Jamaica proof, which is that in which oil olive will sink. About 220 gallons of proof rum are obtained from 530 gallons of low wines. See SPIRITS, DISTILLED, WINE, FERMENTATION, and RECTIFICATION.

To RU'MBLE. *v. n.* (*rommelen*, Dutch.) To make a hoarse, low, continued noise (*Roscommon*).

RU'MBLER. *s.* (from *rumble.*) The person or thing that rumbles.

RUMEN, the paunch or first stomach of such animals as chew the cud; thence called *ruminant* animals.

RUMEX. Dock. In botany, a genus of the class hexandria, order trigynia. Calyx three-leaved; petals three, connivent; seed one, superior, three-sided, naked; stigma many-cleft. Thirty-seven species, scattered over the globe; ten, common to the meadows, marshes, mountains, and woods, of our own country. The following are cultivated.

1. R. acetosa. Common sorrel. Well known; the whole herb acid, and pleasantly astringent: yielding a juice which of late years has been crystallized, and affords an admirable substitute for the juice of lemons. There is a variety with broad leaves, named great mountain sorrel.

2. R. sentatus. French sorrel. Stem from a foot to eighteen inches high; flowers hermaphrodite; leaves heart-halbert shaped, glaucous, fleshy. Germany.

3. R. acetosella. Sheep's sorrel. Flowers diœcous; valves without grains; leaves lanceolate, arrow-shaped. Found in our own pastures.

4. R. patientia. Patience dock, or rhubarb. Root large; bark brown; leaves ovate-lanceolate; flowers hermaphrodite. Italy.

5. R. sanguineus. Bloody-veined dock, or blood-wort. Flowers hermaphrodite; valves very entire, one of them bearing grain; leaves heart-lanceolate. There is a variety with green veins. A native of our own woods.

6. R. lunaria. Tree sorrel. Stalk woody, ten or twelve feet high; flowers hermaphrodite; valves toothed, naked; pedicels flat, reflected, thickened; flowers in threes. A native of Italy.

RUMFORD, a town in Essex, with a market for hogs on Tuesday, and for corn on Wednesday, 12 miles E.N.E. of London. Lon. 0. 13 E. Lat. 51. 36 N.

RUMILLY, a town of Savoy, seated on an elevated plain, at the confluence of the Seram and Nepha, five miles from Annecy. Lon. 6. 10 E. Lat. 45. 56 N.

RU'MINANT. *a.* (*ruminans*, Lat.) Having the property of chewing the cud (*Ray*).

To RU'MINATE. *v. n.* (*rumino*, Latin.) 1. To chew the cud (*Arbuthnot*). 2. To muse; to think again and again (*Fairfax*).

To RU'MINATE. *v. a.* 1. To chew over again. 2. To muse on; to meditate over and over again (*Shakspeare*).

RUMINA'TION. *s.* (*ruminatio*, Latin.) 1. The property or act of chewing the cud (*Arbuthnot*). 2. Meditation; reflection (*Thomson*).

To RU'MMAGE. *v. a.* (*ranmen*, German; *rimari*, Latin.) To search; to plunder; to evacuate (*Dryden*).

To RU'MMAGE. *v. n.* To search places (*Swift*).

RU'MMER. *s.* (*roemer*, Dutch.) A glass; a drinking cup (*Philips*).

RUMNEY, or RHYNEY, a river which rises in Brecknockshire, and separating the counties of Glamorgan and Monmouth, enters the Bristol channel to the S.E. of Cardiff.

RU'MOUR. *s.* (*rumeur*, French; *rumor*, Latin.) Flying or popular report; bruit; fame (*Dryden*).

To RU'MOUR. *v. a.* (from the noun.) To report abroad; to bruit (*Dryden*).

RU'MOURER. *s.* (from *rumour*.) Reporter; spreader of news (*Shakspeare*).

RUMP. *s.* (*rumpff*, German.) 1. The end of the back bone (*Swift*). 2. The buttocks (*Shakspeare*).

RUMPHIA, in botany, a genus of the class triandria, order monogynia. Calyx three-cleft; petals three; drupe three-celled. One species; an Indian tree, with cinereous bark, and axillary racemes.

To RU'MPLE. *v. a.* (*rompelen*, Dutch.) To crush or contract into equalities and corrugations; to crush together out of shape (*Black.*).

RU'MPLE. *s.* (hpeỳmpelle, Sax.) Pucker; rude plait (*Dryden*).

RUMSEY, a corporate town in Hampshire, with a market on Saturday. It is governed by a mayor, has a manufacture of shaloons, and several paper and corn mills. It is eight miles N.N.W. of Southampton, and 74 W. by S. of London. Lon. 1. 31 W. Lat. 51. 2 N.

To RUN. *v. n.* pret. *ran.* (ỳnnan, Saxon; *rennen*, Dutch.) 1. To move swiftly; to ply the legs in such a manner as that both feet are at every step off the ground at the same time; to make haste; to pass with very quick pace (*Swift*). 2. To use the legs in motion (*Locke*). 3. To move in a hurry (*Ben Jonson*). 4. To pass on the surface, not through the air (*Exodus*). 5. To rush violently (*Burnet*). 6. To take a course at sea (*Acts*). 7. To contend in a race (*Swift*). 8. To flee; not to stand (*Bacon*). 9. To go away by stealth (*Shakspeare*). 10. To emit or let flow any liquid (*Shakspeare*). 11. To stream; to flow, to have a current; not to stagnate (*Addison*). 12. To be liquid; to be fluid (*Bacon*). 13. To be fusible; to melt (*Dryden*). 14. To fuse; to melt (*Moxon*). 15. To pass; to proceed (*Locke*). 16. To flow as periods or metre; to have a cadence: as, *the lines* run *smoothly*. 17. To go away; to vanish (*Addison*). 18. To have a legal course; to be practised (*Child*). 19. To have a course in any direction (*Addison*). 20. To pass in thought or speech (*Felton*). 21. To be mentioned cursorily, or in few words (*Arbuthnot*). 22. To have a continual tenour of any kind (*Sanderson*). 23. To be busied upon (*Swift*). 24. To be popularly known (*Temple*). 25. To have reception, success, or continuance: as *seditious papers always* run. 26. To go on by succession of parts (*Pope*). 27. To proceed in a train of conduct (*Shakspeare*). 28. To pass into some change (*Tillotson*). 29. To proceed in a certain order (*Dryden*). 30. To be in force (*Bacon*). 31. To be generally received (*Knolles*). 32. To be carried on in any manner (*Ayliffe*). 33. To have a track or course (*Boyle*). 34. To pass irregularly (*Cheyne*). 35. To make a gradual progress (*Pope*). 36. To be predominant (*Woodward*). 37. To tend in growth (*Bacon*). 38. To grow exuberantly (*Mortimer*). 39. To excern puss or matter (*Leviticus*). 40. To become irregular; to change to something wild (*Granville*). 41. To go by artifice or fraud (*Hudibras*). 42. To fall by haste, passion, or folly, into fault or misfortune (*Knolles*). 43. To fall; to make transition (*Watts*). 44. To have a general tendency (*Swift*). 45. To proceed as on a ground or principle (*Atterbury*). 46. To go on with violence (*Swift*). 47. *To* RUN *after*. To search for; to endeavour at, though out of the way (*Locke*). 48. *To* RUN *away with*. To hurry without deliberation (*Locke*). 49. *To* RUN *in with*. To close; to comply (*Baker*). 50. *To* RUN *on*. To be continued (*Hooker*). 51. *To* RUN *on*. To continue the same course (*Drayton*). 52. *To* RUN *over*. To be so full as to overflow (*Dryden*). 53. *To* RUN *over*. To be so much as to overflow (*Dryden*). 54. *To* RUN *over*. To recount cursorily (*Ray*). 55. *To* RUN *over*. To consider cursorily (*Wotton*). 56. *To* RUN *out*. To be at an end (*Swift*). 57. *To* RUN *out*. To spread exuberantly (*Taylor*). 58. *To* RUN *out*. To expatiate (*Broome*). 59. *To* RUN *out*. To be wasted or exhausted (*Ben Jonson*). 60. *To* RUN *out*. To grow poor by expence disproportionate to income (*Swift*).

To RUN. *v. a.* 1. To pierce; to stab (*Shakspeare*). 2. To force; to drive (*Locke*). 3. To force into any way or form (*Felton*). 4. To drive with violence (*Knolles*). 5. To melt; to fuse (*Felton*). 6. To incur; to fall into (*Calamy*). 7. To venture; to hazard (*Clarendon*). 8. To import or export without duty (*Swift*). 9. To prosecute in thought (*Collier*). 10. To push (*Addison*). 11. *To* RUN *down*. To chase to weariness (*L'Estrange*). 12. *To* RUN *down*. To crush; to overbear (*South*).

RUN. *s.* (from the verb.) 1. Act of running (*L'Estrange*). 2. Course; motion (*Bacon*). 3. Flow; cadence (*Broome*). 4. Course; process. 5. Way; will; uncontrolled course (*Arbuthnot*). 6. Long reception; continued success (*Addison*). 7. Modish clamour (*Swift*). 8. *At the long* RUN. In fine; in conclusion; at the end (*Wiseman*).

RU'NAGATE. *s.* (*renegat*, French.) A fugitive; rebel; apostate (*Raleigh*).

RU'NAWAY. *s.* (*run* and *away*.) One that flies from danger; one who departs by stealth; a fugitive (*Shakspeare*).

RUNCINATE LEAF, in botany. (*Runcina*, a large saw.) Pinnatifidum, ita ut lobi antice convexi, postice sint transversi. A sort of pinnatifid leaf, with the lobes convex before and straight behind, like the teeth of the large double saw used in sawing timber. Exemplified in common dandelion. This term does not occur in Philosophia Botanica, and was not originally distinguished by Linnéus from his pinnatifid leaf, of which it is only a variety.—Runcina seems rather to be a plane.

RU'NDLE. *s.* (of *round*.) 1. A round; a step of a ladder (*Duppa*). 2. A peritrochium; something put round an axis (*Wilkins*).

RU'NDLET. *s.* A small barrel (*Bacon*).

RUNG. The pret. and part. pass. of *ring*.

RUNGS, in a ship, the same with the floor or ground timbers, being the timbers which constitute her floor, and are bolted to the keel, whose ends are rung-heads.

RUNG-HEADS, in a ship, are made a little bending, to direct the sweep or mould of the futtocks, and naval timbers; for here the lines, which make the compass and bearing of a ship, do begin.

RUNIC, a term applied to the language and letters of the ancient Goths, Danes, and other northern nations.

The word *rune*, according to Mallet, is derived from a word in the ancient Gothic language, signifying to cut: but Wormius, with greater probability, derives *rune* from either *ryn*, a furrow, or *ren*, a gutter or channel. As these characters were first cut in wood or stone, the resemblance to a furrow, or channel, would easily suggest the appellation.

Some have been of opinion, that Gulphilas, or Ulphilas, a Gothic bishop, about the year 370, was the first inventor of the Runic character: but Olaus Wormius shews at large, that Ulphilas could only be the first who taught it to foreigners; for that the runæ, or characters themselves, were older than he.

In reality, Ulphilas, according to other authors, was so far even from teaching the character, that he invented an alphabet of his own, on purpose to put the Runic characters, which had been made subservient to the superstitions of heathenism, out of use.

Many learned writers have adopted the opinion, first suggested by Dr. Hickes, that the Runic character was borrowed from the Roman: and they farther maintain, that it was not known in the north before the introduction of Christianity. If it were allowed, that the Runic characters are borrowed from the Roman alphabet, it by no means follows that the Scandinavians had waited for the secret till the introduction of Christianity among them: but it is justly observed, by Wormius, that they are as easily reducible to the Greek and Hebrew alphabets as to the Roman. An evident proof that the Runic were not derived from the Roman letters, results, not only from their form, which has scarce any resemblance to these, but from their number (being but 16), and their order and names, which have nothing in common with the Roman, Greek, or Gothic characters of Ulphilas. A comparative view of the Runic and Gothic, in these respects, may be seen in the English translation of Mallet's Northern Antiquities, vol. i. p. 370. M. Mallet has sufficiently shewn, that all the old chronicles and poems of the North universally agree in assigning to the Runic characters a very remote antiquity, and in attributing the invention of them to Odin himself, whom their poets expressly call the inventor of the Runes.

RUNIC STAFFS were a kind of calendars or compendious almanacs, used in the North, marked out by lines upon short pieces of board, or smooth sticks, some of which bear the appearance of great antiquity. They were called, in the North, rim-stocks and prim-staffs; and exhibited, by different lines or marks, the fasts and festivals, the golden number, dominical letter, epact, &c. Dr. Plot in his History of Staffordshire, p. 418, &c. describes one of these instruments under the name of a clog, and illustrates the construction of it by a figure.—He observes, that this kind of almanac is a remain of the Danish government, and that it was still in use amongst the meaner sort of people. Those which he met with in Staffordshire had only the prime and the immoveable feasts upon them; whereas others of a more perfect kind, preserved in the cabinets of the curious, have likewise the dominical letters. And of those imperfect ones there were two kinds: some public, of a larger size, which were commonly hung at one end of the mantle-tree of the chimney, for the use of the whole family, as Wormius informs us they disposed of them in Denmark; and others private, of a smaller size, which they carried in their pockets. This chronological instrument is sometimes, by an evident corruption, called runstock.

RU'NNEL. *s.* (from *run*.) A rivulet; a small brook (*Fairfax*).

RU'NNER. *s.* (from *run*.) 1. One that runs. 2. A racer (*Dryden*). 3. A messenger (*Swift*). 4. One of the stones of a mill (*Mort.*).

RUNNER, in the sea language, a rope belonging to the garnet, and to the two bolt tackles. It is reeved in a single block, joined to the end of a pennant, and has at one end a hook to hitch into any thing, and at the other end a double block, into which is reeved the fall of the tackle, or the garnet, by which means it purchases more than the tackle would without it.

RUNNER, in botany. Reptans flagellum. A shoot producing roots and leaves at the end only, and thus propagating the plant: as in strawberry. See SARMENTOSE.

RUNNET. See RENNET.

RUNNING THRUSH. See THRUSH.

RU'NNING. *a.* Kept for the race (*Law*).

RU'NNION. *s.* (*rognant*, French, scrubbing.) A paltry scurvy wretch (*Shakspeare*).

RUNT. *s.* (*runte*, in the Teutonic dialects, signifies a bull or cow.) Any animal small below the natural growth of the kind (*Cleaveland*).

RUPALA, in botany, a genus of the class tetrandria, order monogynia. Calyxless, petals four, cohering at the base; stamens inserted on the middle of the petals; pericarp one-celled, one-seeded. Two species; natives of Cayenne.

RUPEE, ROUPIA, or ROUPIAS, a coin very current in the territories of the Great Mogul, and in several other parts of the East Indies. See COIN.

Rupees are struck both of gold and silver, and both the one and the other have their diminutions, as half-rupees, quarter-rupees, &c.

The gold rupee is worth 1s. 6d. sterling. The silver rupee is struck in the Mogul's mints, with an inscription of his name and titles, the year of his reign, and the place it was struck at. It weighs from 7dwt. 10½gr. to 7dwt. 11gr. and has from 1 to 2 parts in 100 allay. 100,000 is one lack, 100 lacks are one crore, and 100 crores are one anib.

The value of the silver rupee is various, according to its quality, and the place where it is coined.

RUPERT, a river of New Britain, which issues from the lake Mistassin, and flows W. into the S.E. part of James bay. In its course it forms several small lakes; and at its mouth is the remain of Fort Rupert, formerly a settlement of the Hudson Bay company. Lon. 76. 58 W. Lat. 51. 3 N.

RUPERT'S DROPS, an elegant glass toy, simply formed by pouring a small solid lump of green bottle glass, when red-hot, into water, by which means the rounded lump assumes gradually a lengthened form, terminating with a fine and nearly capillary tail, at the extremity. This solid lump will bear very considerable violence on the massy end without injury, and is altogether extremely tough; but whenever the smallest portion of the thinner end is broken off, the whole bursts with a smart snap, and instantly crumbles into innumerable fragments as small as fine sand; which, from their very minuteness, and the imperfection of their crystallization, do no other injury to the hand that holds the drop, than that of producing a slight sting from the sudden concussion.

This curious and extraordinary fragility is obviously owing to some permanent and very strong inequality of pressure; for when the Rupert's drops are heated so red as to be soft, and are let to cool gradually of themselves, and, consequently, to become better annealed, this property of bursting is entirely lost, and, at the same time, the specific gravity of the drop is increased.

These drops are also called, on the continent, *Larmes Bataviques*, or *Batavian Tears*.

All glass, not regularly annealed, or, in other words, cooled suddenly instead of progressively, has a tendency towards the same frangibility. Thus, in common window glass, if it be properly annealed, the diamond cuts it with moderate ease, making an uniform smooth furrow, at first dark, but gradually opening, and appearing like a bright silver thread: but when the glass is badly annealed, the diamond works with much more difficulty, the cut opens very slowly, and often flies into a different direction, or the glass entirely breaks.

There is another equally curious glass toy, formed upon the same principle, and evincing the same effect, called the *Bologna phial*. This is simply a phial, of any shape whatever, made of any kind of glass, but much thicker at the bottom than at top, and cooled immediately, without annealing. These being pretty stout, from their thickness will bear a smart blow from a wooden mallet, or any blunt instrument, or the concussion of a leaden bullet dropped into it from a considerable height, without injury: but if any sharp body, however small, such as a large grain of sand, or, which is still better, the shiver of a gun-flint, be dropped in from only a few inches height, the bottom cracks all around, just above the thickest part, and drops off. The same effect takes place if the bottom be slightly scratched with any hard body. When very brittle, if a hard angular substance, as a cut diamond, be dropt in, it will sometimes pass through the bottom, though very thick, with apparently as little resistance as through a spider's web. These glasses, when they have received the first injury, do not always crack immediately, but remain whole, sometimes for a few minutes, sometimes for hours, and then suddenly give way.

RUPPIA, in botany, a genus of the class tetrandria, order tetragynia. Calyxless; corolless; seeds four, pedicelled. One species only, found wild in our salt water ditches.

RUPPIN, a town of Brandenburg, in the Middle mark, capital of a circle of the same name, which was formerly a county. It stands on the W. side of a lake, formed by the river Rhin; and on the opposite side of the lake is Old Ruppin, with an ancient castle, the residence of its former counts, whose burial-place is at New Ruppin. This town was entirely consumed by fire, in 1787, but is rebuilt in a handsome manner, and greatly augmented. It has a considerable trade, a manufacture of cloth, and noted breweries. It is 32 miles N.N.W. of Berlin. Lon. 13. 0 E. Lat. 52. 56 N.

RU'PTION. *s.* (*ruptus*, Latin.) Breach; solution of continuity (*Wiseman*).

RU'PTURE. *s.* (*rupture*, French; from *ruptus*, Latin.) 1. The act of breaking; state of being broken; solution of continuity (*Arbuthnot*). 2. A breach of peace; open hostility.

RUPTURE. See HERNIA.

To RU'PTURE. *v. a.* (from the noun.) To break; to burst; to suffer disruption (*Sharp*).

RU'PTUREWORT. *s.* (*herniaria.*) A plant.

RU'RAL. *a.* (*rural*, French; *ruralis*, Latin.) Country; existing in the country, not in cities; suiting the country; resembling the country (*Thomson*).

RURA'LITY. RU'RALNESS. *s.* (from *rural.*) The quality of being rural.

RUREMONDE, or ROERMONDE, a strong town of France, in the department of Roer, lately of Austrian Gelderland, and a bishop's see. It has been taken several times; particularly in 1792, by the French, who were obliged to evacuate it soon after, but took it again the next year. It is seated at the conflux of the Roer with the Meuse, 12 miles S. of Velno, and 28 N.N.E. of Maestricht. Lon. 6. 4 E. Lat. 51. 11 N.

RURI'COLIST. *s.* (*ruricola*, Latin.) An inhabitant of the country.

RURI'GENOUS. *a.* (*ruro* and *gigno*, Lat.) Born in the country.

RUSCUS. Butcher's broom; Knee-holly. In botany, a genus of the class dioecia, order triandria. Calyx six-leaved; corolless. Male: nectary ovate; tubular, bearing the stamens within. Female: stamenless; style one; berry superior, three-celled; seeds in pairs. Five species, as follow:

1. R. aculeatus. Prickly butcher's broom. Stem suffruticose, tough, stiff, from eighteen inches to three feet high; leaves with pungent points, bearing the flowers above, naked: flowers small, yellowish green or purplish. Female flower succeeded by berries, red, larger than those of the asparagus, and almost as large as some cherries, of a sweetish taste, with two large orange-coloured seeds in each.

The seeds of this plant generally lie a year in the ground before they vegetate, and the plants so raised are long before they attain size enough to make any figure; whence it is much better to transplant the roots. Groves of England.

2. R. hypophyllum. Broad-leaved butcher's broom. Leaves broader than in the last, bearing the flowers underneath, naked. Italy.

3. R. hypoglossum. Double-leaved butcher's broom. Leaves floriferous underneath, beneath the leaflet: flowers of a pale yellow; berries like those of the first sort. Italy.

4. R. racemosus. Alexandrian laurel. Stalks slender, about four feet high, sending out side-branches; racemes terminal, hermaphrodite; flowers of an herbaceous yellow colour; berries like R. aculeatus. Portugal.

5. R. androgynus. Climbing butcher's broom. Stalks pliant, seven or eight feet high; leaves bearing the flowers at the edge; flowers white; berries yellowish red. Canaries.

All these are cultivated in our gardens, and appear ornamental on the verges of shrubberies, as being evergreens. They are easily propagable by seeds or suckers. The last is the tenderest of the tribe, and will rarely flourish without the aid of a green-house.

RUSE. *s.* (French.) Cunning; artifice; little stratagem; trick (*Ray*).

RUSH. *s.* (ɹyꝛc, Saxon.) See JUNCUS.

RUSH (Flowering), in botany. See BUTOMUS.

RUSH (Sweet), in botany. See ACORUS.

RUSH CANDLE. Rushlight. See CANDLE.

To RUSH. *v. n.* (hꝛeoꝛan, Saxon.) To move with violence; to go on with tumultuous rapidity (*Sprat*).

RUSH. *s.* (from the verb.) Violent course (*Crashaw*).

RUSH-NUT. The root of the cyperus esculentus of Linnéus, a native of Italy, where it is collected and eaten, being more delicately and pleasantly tasted than our chesnuts. See CYPERUS.

RUSHWORTH (John), born in Northumberland, about 1607. He was a student of Oxford, and became a barrister of Lincoln's-inn. He took down, in short hand, the debates in parliament, and speeches from the king's mouth, or those delivered in the exchequer and star chambers, as well as at the council table. Sir Thomas Fairfax, his near relation, when appointed general of the parliament forces, made him his secretary. In 1658 he was chosen one of the burgesses for Berwick-upon-Tweed, to serve in the protector Richard's parliament; and was again chosen for the same place in 1660. He died in the king's-bench prison, in 1690. His historical collections of state papers are very valuable, though not always to be relied on.

RUSSEL (lord William), third son of William, first duke of Bedford, was born about 1641. His lordship soon obtained a seat in the house of commons, where he sided with the whig party, and set himself with great zeal against the duke of York's succession. He afterwards entered into various schemes for excluding that prince, and for which he was tried at the Old Bailey, by a venal court and a packed jury, who found him guilty, and he was beheaded in Lincoln's-inn-fields, July 31st, 1683: though in 1689 the house of lords passed an act to reverse his attainder. He married Rachel, second daughter of Wriothesly, earl of Southampton, widow of lord Vaughan, a woman of great talents and piety. When she heard of his condemnation, she threw herself at the king's feet, but Charles was inexorable, and she immediately went to the Tower, and employed all the powers of affection and eloquence in exhorting her husband to die with heroic resolution. She parted from him on the day of his execution, and he, turning from her, exclaimed, "the bitterness of death is now passed." She continued a widow till her death, 1723, at the age of 87. The letters which passed between her and her husband display, in the strongest features, the characters of a man of uprightness and integrity, and of a woman of the most generous heart, and the most affectionate sentiments.

RUSSELIA, in botany, a genus of the class didynamia, order angiospermia. Calyx five-leaved; corol two-lipped, elongated; stigma globular; capsule pointed, one-celled, two-

valved, many-seeded. One species; a climbing shrub of Havannah, with red flowers.

RUSSELSHEIM, a town of Germany, in the principality of Hesse-Darmstadt, situate on the Maine, six miles E. of Mentz, and 13 N.W. of Darmstadt.

RU'SSET. *a.* (*rousset*, Fr. *russus*, Latin.) 1. Reddishly brown (*Dryden*). 2. *Newton* seems to use it for gray. 3. Coarse; homespun; rustic (*Shakspeare*).

RU'SSET. *s.* Country dress (*Dryden*).

RU'SSET. RU'SSETING. *s.* A name given to several sorts of pears or apples from their colour (*Mortimer*).

RUSSIA, a vast empire, partly in Asia, and partly in Europe; bounded on the N. by the Frozen ocean, E. by the Pacific ocean, S. by Great Tartary, the Caspian sea, Persia, Turkey in Asia, and the Black sea, and W. by Turkey in Europe, Poland, the Baltic sea, and Sweden. There were three countries that had the name of Russia; namely, Red Russia, which formed the S. part of Poland; White Russia, which comprehended the E. part of Lithuania; and Black Russia, which included the governments of Kaluga, Moscow, Tula, Rezan, Volodimir, and Yaroslaf; and hence his imperial majesty takes the title of emperor of all the Russias. This empire, exclusive of the late acquisitions from the Turks and from Poland (see POLAND) forms a square, whose sides are 2000 miles each. A country of such vast extent must lie in different climates; and the soil and products must be as different; but not one third of the country is sufficiently peopled, or properly cultivated.

The population of European Russia, was estimated in 1799 at 33 millions: since that period it has gradually increased, and is now about 36 millions.

In the middle and northern parts of the empire, the cold is very severe, and the days extremely short in winter; but the summers are warm and delightful; and even in the shortest nights the twilight is very luminous. At the winter solstice, when the day is at the shortest, the sun rises and sets on the horizon of some of the principal cities in the Russian empire according to the following table:

	H.	M.		H.	M.
At Astrachan sun rises	7	48	sun sets	4	12
Kiev - -	8	7		3	53
Moscow - -	8	37		3	23
Riga - -	8	47		3	13
Tobolsk - -	8	56		3	4
Petersburg -	9	15		2	45
Archangel -	10	24		1	36

At the summer solstice, when the day is at its greatest length, this order is reversed. The most fertile part is near the frontiers of Poland; insomuch that the inhabitants are able to supply their neighbours with corn: the N. part is not only more cold, but very marshy, and overrun with forests, inhabited chiefly by wild beasts. The whole country is well watered by lakes and numerous rivers, which abound with fish; the principal rivers are the Dnieper, Volga, Don, Dwina, and Oby. Medicinal and saline springs are not uncommon; and there are mines of fine silver, copper, iron, and other minerals. The red and black juchte, or Russia leather, for colour, smell, and softness, cannot be equalled in any other part of the world; and there are likewise flourishing manufactures of linen, woollen stuffs, velvet, and silk: also brass, iron, steel, and tin are wrought; and great guns, arms, wire, cordage, canvas, paper, parchment, candles, saltpetre, gunpowder, glass, &c. are made in Russia. This country affords a variety of commodities, which are of great use to foreigners, and as its exports greatly exceed the imports, there is a considerable annual balance of trade in its favour. The home commodities are sables, black furs, the skins of black and white foxes, ermines, hyenas, lynxes, bears, panthers, wolves, martins, white hares, &c. likewise Russia leather and linen, copper, iron, talc, tallow, wax, honey, corn, potash, tar, linseed and train-oil, castor, isinglass, hemp, flax, thread, Siberian musk, soap, feathers, timber, &c. To these commodities may be added almost all the merchandise of China, India, Persia, Turkey, and some European countries. This extensive empire was divided by Catharine II. into 41 governments; namely Petersburg, Olonetz, Wiburg, Revel, Riga, Pskof, Novogorod, Tver, Smolensk, Polotsk, Mohilef, Orel, Kaluga, Moscow, Tula, Rezan, Volodimir, Jaroslaul, Vologda, Archangel, Kostroma, Niznei Novogorod, Kasan, Simbirsk, Penza, Tambof, Voronetz, Kursk, Novogorod Severskoi, Tchernigof, Kiof, Kharkof, Catharinenslaf, Caucasia, Saratof, Viatka, Perm, Tobolsk, Ufa, Kolivan, and Irkutsh; all which see, and Siberia. The church is governed by a patriarch, under whom are the archbishops and bishops. The established religion is that of the Greek church, which was first embraced by the great duchess Olga, in the year 955, and afterward by her grandson, the great duke Wladimir, in 988, whose example was followed by his subjects. But a considerable number of Russians profess the Mahometan religion, and a greater number are still pagans. The inhabitants of the provinces conquered from Sweden are Lutherans; and the protestants, of whom there are great numbers among the Russians, as also the papists, enjoy full liberty of conscience, and the public exercise of their religion; but the latter are not suffered to hang up bells in their churches. There are many convents for both sexes in the empire; but Peter I. prudently ordered, that no man should enter on a monastic life before he is thirty years of age, and that no woman should take the veil under fifty, and then not without the licence of the holy synod. Formerly the Russians were wholly employed in agriculture, feeding of cattle, hunting, and fishing; and he was thought a learned man who could read and write: but Peter the great undertook to introduce the arts and sciences; and, in 1724, he founded the first university that ever was in Russia, and an academy of sciences, at Peters-

burg, supplied with some of the best professors in Europe; and he also invited and established great numbers of excellent artificers. The Russians, in general, are robust, well-shaped, and of pretty good complexion. They are great eaters, and very fond of brandy. They use bathing, but smoke no tobacco, lest the smoke should dishonour the images of the saints, which they hold in great veneration; however, they take a great deal of snuff, made of the tobacco brought from the Ukraine. With respect to dress, a long beard is in high estimation among the fair nymphs of Russia. The commonalty have still a great veneration for this fringe of human hair, notwithstanding the efforts of their monarchs to root it out; and it is only those depending upon government, in the army and navy, who have yet complied with the custom and the wish of the court. Those who retain their beards retain likewise the ancient dress, the long swaddling coat, either of skins, or of coarse cloth lined with skins, in winter; and in summer, of cloth only. About their middle they have a sash of any colour; but what they mostly affect, is green or yellow. They wear trowsers instead of breeches and stockings; their limbs are, besides, wrapped in many folds of woollen stuffs to keep them warm, and over all they wear boots. Their shirts are without collars; and their necks exposed to the cold, which are hard and impenetrable from this practice. Government continues to exert every nerve to compel the subjects to adopt the German dress. The clergy alone excepted, none can procure any place, or favour from court, upon other condition than banishing the Asiatic sheepskin robes. The worn-out veteran retires with a pension, upon the express terms of never again assuming the habit of his fathers. But so zealously attached are the multitude to former manners, and so honourably do they esteem them, that a Russian dressed in his beard and gown, tells you by his looks that he has not prostituted the memory of his ancestors. The dress of the women is the reverse of the men, both in fashion and colour; every part of it being as short and tight as decency will allow, and very gaudy. It is the same with that of the Highland women in Scotland; both have the short jacket, the striped petticoat, and the tartan plaid; and both too, in general, have a napkin rolled about their head. The Russian women are, however, far more elegant and rich in their attire; nor is gold lace and paint wanting, to set off their charms. The young generation are modernizing these antic vestments; the stiff embroidered napkin is supplanted by one of flowing silk; the jacket and petticoat are of muslin, or other fine stuffs; and the plaid is exchanged for a silk or satin cloak, in the cold season, lined with fur. The better class of females wear velvet boots. The dress of the higher ranks is after the French and English fashion; and all wear a covering of fur six months of the year. Persons of both sexes wear a cross on their breasts, which is put on when they are baptized, and never laid aside while they live: the peasants crosses are of lead, but those worn by the better sort are of gold or silver. The sovereign of Russia is absolute. He was formerly called grand duke, which is now the title of the heir apparent; he afterward assumed the title of czar, which the natives pronounce tzar, or zaar, a corruption of Cesar, emperor; from some fancied relation to the Roman emperors; on account of which they also bear the eagle as a symbol of their empire. The first who bore the title of czar was Basil, son of Basilides, who freed his country from its subjection to the Tartars, about the year 1470. The title of emperor was first assumed by Peter I. who, by his actions, justly acquired the surname of Great, and finished his glorious course in the year 1725. Perhaps no country ever exhibited, in so short a time, the wonders that may be effected by the genius and exertions of one man. Peter the great, at his accession to the throne, found his subjects of all ranks involved in the grossest ignorance and barbarism; his numerous armies ferocious and undisciplined; and he had neither merchant ships nor men of war; which, added to the remoteness of her situation, rendered the influence of Russia in the politics of Europe of little consideration. Peter civilized his barbarous subjects, disciplined his armies, built cities and fortresses, and created a navy. These national improvements have been continued since his time, and Russia now holds a rank among the nations of the world, of which human foresight, at the commencement of the eighteenth century, could have formed no conception. Petersburg is the capital of the whole empire.

For more important information respecting Russia, we beg to refer to Dr. Clarke's Travels in Russia, and to Mr. Myers's Geography, recently published.

RUSSIA ASHES. The impure potash, as imported from Russia.

RUSSIA COMPANY. See COMPANY.

RUST, the oxyd of a metal. Iron, for instance, when exposed to the air, soon becomes tarnished, and gradually changed into a brown or yellow powder, well known by the name of rust. This change is occasioned by the gradual combination of the iron with the oxygen of the atmosphere, and, according to the new chemistry, it is now denominated the oxyd of iron.

To RUST. *v. n.* (from the noun.) 1. To gather rust; to have the surface tarnished or corroded (*Dryden*). 2. To degenerate in idleness (*Dryden*).

To RUST. *v. a.* 1. To make rusty (*Shakspeare*). 2. To impair by time or inactivity.

RU'STIC. *a.* (*rusticus*, Lat. *rustique*, Fr.) 1. Rural; country (*Sidney*). 2. Rude; untaught; inelegant (*Watts*). 3. Brutal; savage (*Pope*). 4. Artless; honest; simple. 5. Plain; unadorned (*Milton*).

RU'STIC. *s.* A clown; a swain; an inhabitant of the country (*South*).

RUSTIC, in architecture, implies a manner of building in imitation of nature, rather than

according to the rules of art. See ARCHITECTURE.

RUSTIC GODS, *dii rustici*, in antiquity, were the gods of the country, or those who presided over agriculture, &c. Varro invokes the 12 *dii consentes*, as the principal among the rustic gods; viz. Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Good Luck. Besides these 12 arch rustic gods, there were an infinity of lesser ones; as Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus. Struvius adds the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the empire over all the rustic gods to Pan.

RUSTIC ORDER, that decorated with rustic quoins, rustic work, &c.

RUSTIC WORK, is where the stones in the face, &c. of a building, instead of being smooth, are hatched, or picked with a point of a hammer.

RU'STICAL. *a.* (*rusticus*, Lat.) Rough; savage; boisterous; brutal; rude (*Brown*).

RU'STICALLY. *ad.* (from *rustical.*) Savagely; rudely; inelegantly (*Dryden*).

RU'STICALNESS. *s.* (from *rustical.*) The quality of being rustical; rudeness; savageness.

To RU'STICATE. *v. n.* (*rusticor*, Latin.) To reside in the country (*Pope*).

To RU'STICATE. *v. a.* To banish into the country (*Spectator*).

RUSTI'CITY. *s.* (*rusticité*, Fr. *rusticitas*, Latin.) 1. Qualities of one that lives in the country; simplicity; artlessness; rudeness; savageness (*Woodward*). 2. Rural appearance.

RU'STINESS. *s.* (from *rusty.*) The state of being rusty.

To RU'STLE. *v. n.* (hpirtlan, Sax.) To make a low continued rattle; to make a quick succession of small noises (*Shakspeare*).

RU'STY. *a.* (from *rust.*) 1. Covered with rust; infected with rust (*Dryden*). 2. Impaired by inactivity (*Shakspeare*).

To RUT. *v. n.* (*ruit*, Fr.) To desire to come together. Used of deer.

RUT. *s.* (*ruit*, French.) 1. Copulation of deer (*Bacon*). 2. The track of a cart wheel (*Chapman*).

RUTA. Rue. In botany, a genus of the class decandria, order monogynia. Calyx five-parted; petals concave; receptacle surrounded with ten melliferous dots; capsule lobed. In some species a fifth part of the fructification or number of dots is wanting. Seven species; natives of the south of Europe, and of Palestine. The following four are cultivated.

1. R. graveoleus. Common rue. Root woody, branched; stems frutescent, covered with a rugged gray striated bark, more than eighteen inches high; leaves more than decompound; leaflets oblong, with an obovate terminal one; petals entire. It has several varieties, as broad-leaved, narrow-leaved, variegated-leaved. Rue has a strong and grateful smell, and a bitter, hot, penetrating taste; the leaves are so acrid, that by much handling they have been known to irritate and inflame the skin; and the plant, in its natural or uncultivated state, is said to possess these sensible qualities still more powerfully. The imaginary quality of the rue, in resisting and expelling contagion, is now laid aside. It is doubtless a powerful stimulant, and is considered, like other medicines of the fetid kind, as possessing attenuating, deobstruent, antispasmodic powers. In the London pharmacopœia it is directed in the form of an extract; and it is also an ingredient in the pulvis e myrrha comp.

2. R. montana. Mountain rue. Leaves more than decompound; all the leaflets linear; petals entire.

3. R. chalepensis. African rue. Very like the first; petals ciliate-toothed.

4. R. patavina. Three-leaved rue. Stalk rises singly from the root, herbaceous, about a foot high; leaves ternate, sessile, linear; flowers yellow. A native of Padua.

They may be all propagated by seeds, slips, or cuttings.

RUTA MURARIA. The plant to which this name is given in the pharmacopœias, is the asplenium ruta muraria of Linnéus. It is supposed by some to possess specific virtues in the cure of ulcers of the lungs, and is exhibited in the form of decoction.

RUTH. *s.* (from *rue.*) 1. Mercy; pity; tenderness (*Fairfax*). 2. Misery; sorrow (*Spenser*).

RUTH (Book of), a canonical book of the Old Testament, being a kind of appendix to the book of Judges, and an introduction to those of Samuel; and having its title from the person whose interesting story is here principally related. In this story are observable the ancient rights of kindred and redemption; and the manner of buying the inheritance of the deceased, with other particulars of great note and antiquity. The canonicalness of this book was never disputed; but the learned are not agreed about the epocha of the history it relates. Ruth the Moabitess is found in the genealogy of our Saviour. Matth. i. 5.

RUTHERFORTH (Thomas, D.D.), an ingenious English philosopher, was the son of the Rev. Thomas Rutherforth, rector of Papworth Everard, in the county of Cambridge, who had made large collections for the history of that county.

Our author was born the 13th of October 1712. He studied at Cambridge, and became fellow of St. John's college, and regius professor of divinity, in that university; afterwards rector of Shenfield in Essex, and of Barley in Hertfordshire, and archdeacon of Essex. He died the 5th of October 1771, at 59 years of age.

Dr. Rutherforth, besides a number of theological writings, published, at Cambridge,

1. Ordo Institutionum Physicarum, 1743, in 4to.

2. A System of Natural Philosophy, in 2 vols. 4to, 1748. A work which has been much esteemed.

3. He communicated also to the Gentleman's Society at Spalding, a curious correction of Plutarch's description of the instrument used to renew the vestal fire, as relating to the triangle with which the instrument was formed. It was nothing else, it seems, but a concave speculum, whose principal focus, which collected the rays, is not in the centre of concavity, but at the distance of half a diameter from its surface. But some of the ancients thought otherwise, as appears from prop. 31 of Euclid's Catoptrics.

The writer of his epitaph says, "He was eminent no less for his piety and integrity, than his extensive learning; and filled every public station in which he was placed with general approbation. In private life, his behaviour was truly amiable. He was esteemed, beloved, and honoured by his family and friends; and his death was sincerely lamented by all who had ever heard of his well deserved character."

RU'THFUL. *a.* (*ruth* and *full.*) Rueful; woful; sorrowful (*Carew*).

RU'THFULLY. *ad.* 1. Wofully; sadly (*Knolles*). 2. Sorrowfully; mournfully (*Spenser*).

RUTHILE, in mineralogy, a species of TITANIUM, which see.

RUTHIN, a town in Denbighshire, with a market on Monday. It is seated in a vale, on the river Clwyd, and had a strong castle, now in ruins. It is 15 miles S.W. of Holywell, and 206 N.W. of London. Lon. 3. 30 W. Lat. 53. 7 N.

RU'THLESS. *a.* (from *ruth.*) Cruel; pitiless; uncompassionate; barbarous (*Sandys*).

RU'THLESSNESS. *s.* (from *ruthless.*) Want of pity.

RU'THLESSLY. *ad.* (from *ruthless.*) Without pity; cruelly; barbarously.

RUTIDOSIS, in medicine, a corrugation and subsiding of the cornea of the eye. The species are, 1. Rutidosis, from a wound or puncture penetrating the cornea. 2. Rutidosis, from a fistula penetrating the cornea. 3. Rutidosis, from a deficiency of the aqueous humour, which happens from old age, fevers, great and continued evacuations, and in extreme dryness of the air. 4. Rutidosis of dead persons, when the aqueous humour exhales through the cornea, and no fresh humour is secreted; so that the cornea becomes obscure and collapsed: this is a most certain sign of death.

RUTLAM, a town of Hindustan Proper, in the province of Malwa, 48 miles W. of Ougein, and 136 E. of Amedabad. Lon. 74. 58 E. Lat. 23. 25 N.

RUTLANDSHIRE, the smallest county of England, being only 15 miles long and 11 broad. It is supposed to have received its name from the red colour of the soil, which, in some parts, is a sort of ruddle. It is bounded on the W. and N.W. by Leicestershire, on the N. and N.E. by Lincolnshire, and on the S. and S.E. by Northamptonshire. It lies in the diocese of Peterborough, contains 48 parishes and two market-towns, and sends two members to parliament. The air is very good, and the soil rich. The principal rivers are the Welland and the Guash, or Wash. Oakham is the county-town. In 1801 this county contained 16,356, and in 1811, 16,380 inhabitants. See POPULATION.

RU'TTIER. *s.* (*routiere*, Fr.) A direction of the road or course at sea.

RUTTING TIME. The period of sexual orgasm among deer and other quadrupeds. It commences the latter end of August, and continues to the first and second week in October; during which both the stag and buck assume a degree of boldness in approaching man, that they never display at any other time of the year. At this season their necks swell; they range from one place to another incessantly, in seeming search of some object to attack; the voice of the stag is loud and alarming, to those who have not been accustomed to hear it. When opposed, they are so exceedingly strong and ferocious, that no common force can stand against them: they attack an individual in rutting time with a certainty of success. Some few years since, the locksmith who inspected the gate locks of Windsor Great Park weekly, was pursued by a stag, and when within a few yards of him, most luckily escaped by climbing a small tree, where he was kept in jeopardy near twenty-four hours, till the next day the stag made a retreat upon an accidental approach of the keepers. A short time after which, a girl, about fourteen years of age, passing through Hackwood Park, near Basingstoke, in Hampshire (and having on a red cloak), was attacked by a stag that not only perforated her body with his antlers in almost every part, but furiously tore her coloured cloak to pieces, so that the spot was covered with its rags; the whole corpse so maimed and disfigured, as to retain but little of the appearance of a human frame.

RU'TTISH. *a.* (from *rut.*) Wanton; libidinous; salacious; lustful; lecherous (*Shakspeare*).

RUTTUNPOUR, a city of the peninsula of Hindustan, in Orissa, and the capital of one of the western Mahratta chiefs. Lon. 82. 36 E. Lat. 22. 16 N.

RUYSCH (Frederic), an anatomist, of the Hague. He studied at Leyden and Franeker, and settled at the Hague, which he left to be anatomical professor at Amsterdam. He made a valuable collection of natural curiosities, which he was prevailed upon to present, for 30,000 florins, to the Czar Peter, when he visited Amsterdam. His anatomical works are very valuable, in 4 vols. 4to. He died 1731, aged 93. His son Henry, who died before him, published Theatrum universale omnium animalum, 2 vols. folio.

RUYSCHIANA, in botany, a genus of the class pentandria, order monogynia. Calyx five-leaved; corol of five reflected petals; styleless; berry undecided, many-seeded. Two species, parasitical shrubs of Martinique and Guiana.

RUYSCHIANA TUNICA. In anatomy, the internal surface of the choroid membrane of the human eye, which this celebrated anatomist imagined was a distinct lamina from the external surface.

RUVO, a populous town of Naples, in Terra di Bari, with a bishop's see, 16 miles W. of Bari. Lon. 16. 44 E. Lat. 41. 26 N.

RUZA, a town of Russia, in the government of Moscow, 48 miles W.N.W. of Moscow. Lon. 36. 2 E. Lat. 55. 46 N.

RYACOTTA, a town of Hindustan, in the Mysore country, 75 miles S. of Seringapatam, and 85 W.S.W. of Arcot. Lon. 76. 45 E. Lat. 30. 15 N.

RYAN (Loch), a lake in the N.W. angle of Wigtonshire. The sea flows into it through a narrow pass; and it was formerly crowded, in the season, with shoals of herrings.

RYANIA, in botany, a genus of the class polyandria, order monogynia. Calyx five-leaved, permanent, coloured; corolless; stigmas four; berry corky, one-celled, many-seeded. One species; a tree of Trinity Island, with alternate leaves, and one-flowered axillary peduncle.

RYDAL-WATER, a lake in Westmorland, a little to the W. of Ambleside. It is one mile in length, spotted with little islands, and communicates, by a narrow channel, with Grasmere-water to the W. and, by the river Rothay, with Windermere water to the S.

RYDROOG, a town and fortress of Hindustan, in the Mysore country, 128 miles N. of Seringapatam. Lon. 76. 52 E. Lat. 14. 40 N.

RYE, a borough in Sussex, with a market on Wednesday and Saturday. It is an appendage to the cinque ports, governed by a mayor and jurats, and sends two members to parliament. Its port is so choaked up with sand, that it can admit small vessels only. It exports corn, malt, hops, and other products of the country: and its fishermen send considerable supplies to the London market. It is 28 miles S.S.E. of Maidstone, and 63 S.E. of London. Lon. 0. 45 E. Lat. 51. 0 N.

RYE, in botany. See SECALE.

RYE-GRASS. See HUSBANDRY.

RYEGATE, a borough in Surry, with a market on Tuesday. It had a castle, some ruins of which are still to be seen; particularly a long vault, with a room at the end, large enough to hold 500 persons, where (according to tradition) the barons, who took up arms against king John, held their private meetings. It is seated in a valley, called Holmesdale, 16 miles E. of Guildford, and 21 S.W. of London. Lon. 0. 15 W. Lat. 51. 16 N.

RYER (Peter du), a dramatic writer, of Paris. He was in 1626 secretary to Lewis XIII. but in consequence of an imprudent marriage sold the place. He was afterwards secretary to the duke of Vendome. He wrote 19 dramatic pieces, and translated 13, which, according to Voltaire, were popular on the stage. He died 1658, aged 53.

RYMER (Thomas), an English antiquary and critic, was educated at the grammar-schoo of Northallerton, in Yorkshire, whence he was removed to Cambridge. He succeeded Mr. Shadwell as historiographer to king William III. His valuable collection of the Fœdra, continued after his death by Mr. Sanderson, extends to 20 vols. He was the author of A View of the Tragedies of the last Age, which shewed more spleen than judgment, and his remarks on Shakspeare are considered as very unreasonable. However, he was a good antiquary, and died in 1713.

RYNCHOPS. Skimmer. In zoology, a genus of the class aves, order grallæ. Bill straight, the upper mandible much shorter; the lower, truncate at the tip. One species only, rynchops nigra, black skimmer. Blackish, beneath white; bill red at the base; front and chin white; wings with a transverse white band; two middle tail-feathers black, the next edged with white; legs red.

Another variety, tawny, with black bill.

Inhabits America and Asia; twenty inches long: is perpetually flying about and skimming over water, out of which it scoops small fishes with its lower mandible; in stormy seasons frequents shores in search of shell-fishes.

RYSBRAECK (Peter), an eminent landscape painter of Antwerp, was born in 1657. His figures and trees are well designed, and he painted expeditiously, and with great spirit.

RYSWICK, a village in Holland, seated between Hague and Delft, where the prince of Orange has a palace. It is remarkable for a treaty concluded here in 1697, between England, Germany, Holland, France, and Spain.

RYTHMICAL. An epithet applied to the property, or quality, in the ancient melopœia and modern melody, by which the cadences, accents, and quantities, are regulated and determined.

RYTHMUS, in medicine, the number and rate of the pulse.

RYVES (Sir Thomas), born in the latter end of the 16th century, and educated at Winchester school, from whence he was sent to Oxford. He became a celebrated civilian in doctor's commons, and the court of admiralty. At the accession of Charles I. he was made king's advocate, and knighted. He died in 1651. He wrote several works, as The Vicar's Plea,—Historia Navalis Antiqua,—Historia Navalis Media, &c.

RYVES (Bruno), an English divine, and relation of sir Thomas. At the restoration of Charles II. he had the deanry of Windsor conferred on him, and was made secretary to the Garter. He died in 1677. He wrote Mercurius Rusticus, or the country's complaint, and several other works.

RZECZICA, a town of Lithuania, capital of a territory of the same name. It is seated at the confluence of the Wyedszwck and Dnieper, 125 miles N. of Kiof. Lon. 31. 5 E. Lat. 50. 32 N.

S.

S, A consonant, and the eighteenth letter of the alphabet, the sound of which is formed by driving the breath through a narrow passage between the palate and the tongue elevated near it, together with a motion of the lower jaw and teeth towards the upper; the lips being a little way open, with such a configuration of every part of the mouth and larynx, as renders the voice somewhat hissing.

S is, therefore, accounted one of the three hissing consonants; the other two being *z* and *j*. It is also held a semi-vowel, as forming a kind of imperfect sound, without the assistance of any of the vowels.

It is the peculiar quality of *s*, that it may be sounded before all consonants, except *x* and *z*, in which *s* is comprised, *x* being only *ks*, and *z* a hard or gross *s*. This *s* is, therefore, termed by grammarians *sucæ potestatis litera*. In the beginning of words it has invariably its natural and genuine sound; in the middle it is sometimes uttered with a stronger appulse of the tongue to the palate, like *z*, as *rose, busy*, &c. and sometimes it keeps its natural sound, as *loose, designation*, &c. In the end of monosyllables, it is sometimes *s*, as *this;* and sometimes *z*, as *as*, and generally in verbs where *es* stands for *eth*, as *gives*. A single *s* seldom ends any word, except the third person of verbs, as *loves*, the plural of nouns, as *trees*, the pronouns *this, his, ours, yours, us*, the adverb *thus*, and words derived from the Latin, as *rebus:* the close being always either in *se*, as *house*, or *ss*, as *grass*. It sounds like *z* before *ion*, if a vowel goes before, as *intrusion;* and like *s*, if it follows a consonant, as *conversion*. It sounds like *z* before *e* mute, as *refuse*, and before *y* final, as *rosy*. Johnson.

Some of the ancients avoided all use of the *s* very studiously; particularly Pindar, who has whole poems without once mentioning it. And hence also in Plautus, and some others of the Latin poets, we find it cut abruptly off, as in *dignu'*, *omnibu'*, &c. Others, on the contrary, affected the use of it every where, inserting it where it was not wanted; as *Casmenæ* for *Camenæ*, *dusmosæ* for *dumosæ*, *cæsna* for *cæna*, &c.

Of all other letters, the *s* is nearest akin to the *r;* whence it was frequently changed, on account of its disagreeable sound, into *r*. Thus the *Valerii*, *Furii*, &c. were at first called *Valesii*, *Fusii*, &c. and what we now call *ara, arena, carmen, feriæ, lares*, &c. were anciently wrote *asa, asena, casmen, fesiæ, lases*, &c. Add to this, that the Latin nouns now terminated in *or*, as *arbor, labor*, &c. all anciently ended in *s*; as *arbos, labos*, &c.

In the inflections of nouns, *s* is variously changed; sometimes into *r*, as *flos, floris*; sometimes into *n*, as *sanguis, sanguinis*; sometimes into *d*, as *pes, pedis*; sometimes into *t*, as *nepos, nepotis*. On the contrary, in verbs, it is frequently put for other letters; for *b*, as in *jubeo, jussi*; for *e*, as in *parco, parsi*; for *d*, as in *ludo, lusi*; for *g*, as in *spargo, sparsi*, &c.

The Latins also frequently changed the Greek *s* into *l*, as Ἀννίβας, *Annibal*; into *d*, as μέσον, *medium*, &c. The double *s* was frequently changed into *x*, as πίσσα, *pix*; and sometimes even the single one, as Αἴας, *Ajax*.

The old and the new orthography of the French differ chiefly in the use of the *s*; the latter omitting it in writing, where it is not heard in the pronunciation, and the former retaining it: thus the followers of the one, particularly the Academy in their dictionary, write *tempeste, huistre, fluste*; those of the other, *tempête, huître, flûte*, &c.

S was a numerical letter among the ancients, signifying seven: according to the verse,

S *vera septenos numeratos significabit.*

Among the Greeks, ϡ signified 200, and ϡ denoted 200,000; the *sigma* joined to *tau*, i. e. ϛ, denoted 6. The *samech* of the Hebrew ס denoted 50, and with two points above ס, it signified 50,000.

In abbreviations, S. stands for *societas*, or *socius*; as, R. S. S. for *Regiæ Societatis Socius*, i. e. *fellow of the Royal Society*. In medicinal precriptions, S. A. signifies *secundum artem*, i. e. *according to the rules of art*; and *ss* immediately following any quantity, imports *semis*, half. In the notes of the ancients, S. stands for *sextus, servius*, or *sanctus*; S. S. *sanctissimus*; S. P. for *spurius*; S. C. for *senatus consultum*; S. D. for *salutem dicit*; S. P. D. for *salutem plurimam dicit*; S. P. Q. R. for *senatus populusque Romanus*; S. S. S. for *stratum super stratum*, i. e. *one layer above another alternately*; S. V. B. E. E. Q. V. for *si vales bene est ego quoque valeo*, a form used in Cicero's time, in the beginning of letters. Upon the French coins, S distinguished those that were struck at Rheims.

S, in books of navigation, &c. signifies south; S. E. south-east; S. W. south-west; S. S. E. south-south-east, &c. See COMPASS.

S, in the Italian music, stands for SOLO.

SAAVEDRA (Michael de Cervantes), a celebrated Spanish writer, and the inimitable author of Don Quixote, was born at Madrid in 1549. From Spain he went to Italy, and served cardinal Aquaviva at Rome as chamberlain. Fighting under the banners of the victorious Marc Antonio Colonna, he lost his left hand in 1571. He was taken by the Moors, and suffered a captivity of five years and a half. On his return to Spain, he applied himself to writing for the stage, by which he acquired great fame. The first part of his Don Quixote was printed at Madrid in 1605. Notwithstanding the vast applause his book every where received, he suffered many difficulties from poverty. In 1615 he published a second part. He was the author of several other works, and died of a dropsy in 1616. His sickness was of such a nature, that he himself was able to be, and actually was, his own historian. At the end of the preface to the Troubles of Persiles and Sigismunda, he represents himself on horseback upon the road, and a student who had overtaken him, engaged in conversation with him: "And happening to talk of my illness (says he), the student soon let me know my doom, by saying it was a dropsy I had got; the thirst attending which, all the water of the ocean, though it were not salt, would not suffice to quench. Therefore, senor Cervantes, (says he), you must drink nothing at all, but do not forget to eat; for this alone will recover you without any other physic. I have been told the same by others, answered I; but I can no more forbear tippling, than if I were born to do nothing else. My life is drawing to an end; and from the daily journal of my pulse, I shall have finished my course by next Sunday at the furthest.—But adieu, my merry friends all; for I am going to die; and I hope to see you ere long in the other world, as happy as heart can wish." His dropsy increased, and at last proved fatal to him; yet he continued to say and write bons mots.

SAADAH, a strong and populous town of Arabia Felix, where much Turkey leather is made. It is 140 miles W.N.W. of Sanaa. Lon. 44. 55 E. Lat. 17. 50 N.

SAALEFELD, a town of Upper Saxony, in the principality of Altenburg. Here are manufactures of cloth and silk stuffs: it is likewise the mint-town for the circle of Upper Saxony. It stands on the Saal, 20 miles N.N.E. of Coburg, and 46 S.W. of Altenburg. Lon. 11. 22 E. Lat. 50. 31 N.

SAATZ, or ZATEC, a town of Bohemia, which gives name to a circle. It is situate on the Eger, 25 miles S.W. of Leutmeritz, and 44 S. of Dresden. Lon. 14. 15 E. Lat. 50. 16 N.

SABADILLA. See CAVADILLA.

SABÆANS, SABÆI, or SABIANS, the adherents to Sabaism; a sect of idolaters, much ancienter than Moses, and the Jewish law.

Hottinger sets aside the common derivation of Sabæan from צבא, militia, host; and will not have it the name of a sect of religion, but of a people in Arabia Felix, the descendants of Saba, grandson of Cham. But the critics, to a man, conspire against this opinion.

The word is sometimes also written Sabians, Sabaites, Zabæans, Zabians, Zabaites, Tsabæans, Tsabians, and Tsabaists.

The Sabæans were very numerous throughout the East: in later times they have mixed something of Christianity with their superstition. They set a great value on the baptism of St. John; whence they have also been denominated Christians of St. John.

Some, indeed, doubt whether the Sabæans be the same with the Christians of St. John; but father Angelo de St. Joseph, a Carmelite missionary, and Maracci, in his notes on the Alcoran, assert it expressly. Be this as it will, Mahomet, in his Koran, and the Arabian authors since him, make frequent mention of them. Beidavius, in his comment on the Koran, represents them as a kind of mean between the Christians and the Magusians, who are the followers of the Magi, among the Persians: he adds, that they pretend to be of the religion of Noah. Kessæus notes, that they pretend to be in possession of the books of Seth and Enoch; though they own none of the books of Scripture, except the book of Psalms.

Some charge them with worshipping the stars; and others, the angels or demons. Maimonides attributes both to them.

Abu Joseph Ascheus and Kessæus place the Sabæans about Charran, or Charræ, and Ghezira in Mesopotamia; which opinion is confirmed by this, that all their books are in the Chaldee tongue, though in a character very different from the Chaldee.

Sale, in his preliminary discourse to the Koran, p. 14, &c., has given the following brief account of the tenets and worship of this sect. They believe in the existence of one God, though they also pay an adoration to the stars, or the angels and intelligences which they suppose reside in them, and govern the world under the supreme Deity. They endeavour to perfect themselves in the four intellectual virtues, and believe the souls of wicked men will be punished for nine thousand ages, but will afterwards be received to mercy. They are obliged to pray three times a day, before sunrise, before noon, and before sun-set; and in praying they turn their faces, as some say to the north; according to others, to the south, to Mecca, or to the star to which they pay their devotion. They have three fasts in the year; the first lasts thirty days, the second nine days, and the last seven. They offer many sacrifices, of which they eat no part, but wholly burn them. They abstain from beans, garlic, and some other pulse and vegetables. They go on pilgrimage to a place near the city of Harran, or Charran, in Mesopotamia, where great numbers of them dwell; and they have also a great respect for the temple of Mecca, and the pyramids of Egypt; fancying these last to be the sepulchres of Seth, and of Enoch and Sabi, his two sons, whom they consider as the first propagators of their religion; and at these structures they sacrifice a cock and black calf, and offer up incense. This is one of the religions, the practice of which Mahomet tolerated (on

paying tribute), and the professors of it are often included in that expression of the Koran, "those to whom the Scriptures have been given," or literally, "people of the Book."

SABAISM, an ancient kind of idolatry; the first that ever entered into the world. See the preceding article.

SABA'OTH. (Heb.) Armies; hosts.

SABBATARIANS, a sect of Christians, chiefly Baptists, who observe the Jewish or Saturday Sabbath, from a persuasion that, it being one of the ten commandments, which they contend are all in their nature moral, was never abrogated by the New Testament. They say that Saturday must at least be deemed of equal validity for public worship with any day never particularly set apart by Jesus Christ and his Apostles. Those of this sect who are what are denominated Particular Baptists, hold, in common with most other christians of the present day, all the other doctrines of grace, as they are usually called, viz. the Trinity, Atonement, Divinity of Jesus Christ, &c. &c.

In our own country, this sect is by no means numerous. They have only two congregations in London; the one of General Baptists, and the other of Particular, or Calvinistic Baptists. In America, however, as we are informed by Morse and Winterbotham, there are many christians of this persuasion, particularly in Rhode Island, New Jersey, and at Ephrate in Pennsylvania.

SABBATH, in the Hebrew language, signifies rest. The seventh day was denominated the sabbath, or day of rest, because that in it God had rested from all his works which he created and made. From that time the seventh day seems to have been set apart for religious services; and, in consequence of a particular injunction, was afterwards observed by the Hebrews as a holy day. They were commanded to set it apart for sacred purposes in honour of the creation, and likewise in memorial of their own redemption from Egyptian bondage.

The importance of the institution may be gathered from the different laws respecting it. When the ten commandments were published from Mount Sinai in tremendous pomp, the law of the sabbath held a place in what is commonly called the first table, and by subsequent statutes the violation of it was to be punished with death. Six days were allowed for the use and service of man; but the seventh day God reserved to himself, and appointed it to be observed as a stated time for holy offices, and to be spent in the duties of piety and devotion. On this day, the ministers of the temple entered upon their week; and those who had attended on the temple service the preceding week went out at the same time. New loaves of shew bread were placed upon the golden table, and the old ones taken away. Two lambs for a burnt offering, with a certain proportion of fine flour, mingled with oil, for a bread-offering, and wine for a libation, were offered. The sabbath, as all other festivals, was celebrated from evening to evening. It began at six in the evening on Friday, and ended at the same time the next day.

Concerning the time at which the sabbath was first instituted, different opinions have been held. Some have maintained, that the sanctification of the seventh day, mentioned in Gen. ii. is only there spoken of διὰ προλήψιν or by anticipation; and is to be understood of the sabbath afterwards enjoined the children of Israel at the commencement of the Mosaic dispensation. But without entering into a particular examination of all the arguments adduced to support this opinion, a few observations, it is presumed, will be sufficient to show that it rests on no solid foundation.

It cannot easily be supposed that the inspired penman would have mentioned the sanctification of the seventh day amongst the primeval transactions, if such sanctification had not taken place until 2500 years afterwards. Writers, ambitious of that artificial elegance which the rules of criticism have established, often bring together in their narratives events which were themselves far distant, for the sake of giving form to their discourse; but Moses appears to have despised all such flimsy refinements, and to have constructed his narrative in great conformity to the series of events.

From the accounts we have of the religious service practised in the patriarchal age, it appears that, immediately after the Fall, when Adam was restored to favour through a Mediator, a stated form of public worship was instituted, which man was required to observe in testimony, not only of his dependence on the Creator, but also of his faith and hope in the promise made to our first parents, and seen afar off. Of an institution then so grand and important, no circumstance would be omitted that is necessary to preserve it, or that contributes to render the observance of it regular and solemn.

That determined times are necessary for the due celebration of divine service, cannot be denied. Such is the constitution of man, that he must have particular times set apart for particular services. He is doomed to toil and labour; to earn his bread in the sweat of his face; and is capable of performing religious duties only in such a manner as is consistent with his situation in the world. If stated times for religious solemnities had not been enjoined, the consequence would have been, that such solemnities would have been altogether neglected; for experience shows, that if mankind were left at liberty when and how often they should perform religious offices, these offices would not be performed at all. It is the observation of holy times that preserves the practice of holy services; and without the frequent and regular returns of hallowed days, man would quickly forget the duty which he owes to God, and in a short time no vestige of religion would be found in the world.

Among the ordinances which God vouchsafed his ancient people, we find that the pious observation of holydays was particularly insisted upon; and the sabbath was enjoined to be kept holy, in the most solemn manner, and under the severest penalties. Can it then be supposed that he would suffer mankind, from the creation of the world to the Mosaic era, to re-

main without an institution so expedient in itself, and as well fitted to answer the end proposed by it, under the one dispensation as ever it could be under the other? No; we have every imaginable reason to conclude, that when religious services were enjoined, religious times were appointed also; for the one necessariiy implies the other.

It is no objection to the early institution of the sabbath, that there is no mention of it in the history of the patriarchal age. It would have swelled the Bible to a most enormous size had the sacred historian given a particular account of all the transactions of those times; besides, it would have answered no end. When Moses wrote the book of Genesis, it was unnecessary to relate minutely transactions and institutions already well known by tradition: accordingly we see, that his narrative is everywhere very concise, and calculated only to preserve the memory of the most important facts. However, if we take a view of the church-service of the patriarchal age, we shall find, that what is called the legal dispensation, at least the liturgic part of it, was no new system, but a collection of institutions observed from the beginning, and republished and formed by Moses. The Scriptures inform us that Cain and Abel offered sacrifices; and the account which is given of the acceptance of the one, and the rejection of the other, evidently shows that stated laws respecting the service had then taken place. "In process of time," at the end of the days, "Abel brought an offering." Here was priest, altar, matter of sacrifice, appointed time, motive to sacrifice, atonement made, and accepted. The distinction of animals into clean and unclean before the Flood, and Noah's sacrifice immediately after his deliverance, without any new direction, is an unanswerable proof of the same truth. It is testified of Abraham, by God himself, that he kept his charge, his commandments, his statutes, and his laws. These expressions comprehend the various branches into which the law given at Sinai was divided. They contain the moral precepts, affirmative and negative, the matter of religious service, a body of laws to direct obedience, and to which man was to conform his conduct in every part of duty. Agreeably to this, we find that sacrifices were offered, altars and places of worship consecrated, and the sabbath also mentioned as a well known solemnity, before the promulgation of the law. It is expressly taken notice of at the fall of manna; and the incidental manner in which it is then mentioned, is a convincing proof that the Israelites were no strangers to the institution: for, had it been a new one, it must have been enjoined in a positive and particular manner, and the nature of it must have been laid open and explained, otherwise the term would have conveyed no meaning.

The division of time into weeks, or periods of seven days, which obtained so early and almost universally, is a strong indication that one day in seven was always distinguished in a particular manner. Week, and seven days, are in scripture language synonimous terms. God commanded Noah, seven days before he entered the ark, to introduce into it all sorts of living creatures. When the waters of the flood began to abate, Noah sent forth a dove, which, finding no rest for the sole of her foot, returned to him. After seven days he sent forth the dove a second time, and again she returned to the ark. At the expiration of other seven days, he let go the dove a third time: and a week is spoken of (Gen. xxix.) as a well known space of time.

This septenary division of time has been, from the earliest ages, uniformly observed over all the eastern world. The Israelites, Assyrians, Egyptians, Indians, Arabians, and Persians, have always made use of a week, consisting of seven days. Many vain attempts have been made to account for this uniformity; but a practice so general and prevalent could never have taken place, had not the septenary distribution of time been instituted from the beginning, and handed down by tradition.

From the same source also must the ancient heathens have derived their notions of the sacredness of the seventh day. That they had such notions of it is evident from several passages of the Greek poets, quoted by Aristobulus, a learned Jew, by Clement of Alexandria, and Eusebius.

——— εβδομη, ιερον ημαρ. Hesiod.
The seventh, the sacred day.

Εβδοματη δ' επειτα κατηλυθεν, ιερον ημαρ. Homer.
Afterwards came the seventh, the sacred day.

Again:

Εβδομον ημαρ ην, και τω τετελεστο παντα.
On the seventh day, all things were completed.

Εβδοματη δηοι τετελησμενα παντα τετυκται. Linus.
All things were made perfect on the seventh day.

That they likewise held the number seven in high estimation has been shown by a learned, though sometimes fanciful, author, with such evidence as to enforce conviction. The Pythagoreans call it the venerable number, σεβασμου αξιος, worthy of veneration, and held it to be perfect, and most proper to religion. They denominated it fortune, and also styled it voice, sound, muse, because, no doubt, seven distinct notes comprehend the whole scale of music, beyond which neither voice nor instrument can go, but must return from the seventh, and begin again anew. They likewise designed it τελεσφορος, leading to the end. Seven, in the Hebrew language, is expressed by a word that primarily signifies fulness, completion, sufficiency, and is applied to a week, or seven days, because that was the full time employed in the work of creation; to the sabbath, because on it all things were completed; and to an oath, because it is sufficient to put an end to all strife. This opening of the Hebrew root will enable us to come at the meaning of those expressions of the heathens, and also let us see whence they derived their ideas and modes of speaking, and that the knowledge of the transactions at the creation, though much perverted, was never entirely lost by them.

As the seventh day was observed by the Jew-

ish church, in memory of the rest of God after the works of creation, and their own deliverance from Pharoah's tyranny; so the first day of the week has always been observed by the christian church in memory of the resurrection of Jesus Christ, by which he completed the work of man's redemption on earth, and rescued him from the dominion of him who has the power of death.

This day was denominated by the primitive Christians the Lord's day. It was also sometimes called Sunday; which was the name given to it by the heathens, who dedicated it to the sun. And, indeed, although it was originally called Sunday by the heathens, yet it may very properly retain that name among Christians, because it is dedicated to the honour of "The true light, which lighteth every man that cometh into the world," of Him who is styled by the prophet "The Sun of righteousness," and who on this day arose from the dead. But although it was, in the primitive times, indifferently called the Lord's day or Sunday, yet it was never denominated the sabbath; a name constantly appropriated to Saturday, or the seventh day, both by sacred and ecclesiastical writers.

Of the change from the seventh to the first day of the week, or even of the institution of the Lord's day festival, there is no account in the New Testament. However, it may be fairly inferred from it, that the first day of the week was, in the apostolic age, a stated time for public worship. On this day the apostles were assembled, when the Holy Ghost came down so visibly upon them to qualify them for the conversion of the world. On this day we find St. Paul preaching at Troas, when the disciples came to break bread: and the directions which the same apostle gives to the Corinthians concerning their contributions for the relief of their suffering brethren, plainly allude to their religious assemblies on the first day of the week.

Thus it would appear from several passages in the New Testament, that the religious observation of the first day of the week is of apostolical appointment; and may, indeed, be very reasonably supposed to be among those directions and instructions which our blessed Lord himself gave to his disciples, during the 40 days between his resurrection and ascension, wherein he conversed with them, and spoke of the things pertaining to the kingdom of God. Still, however, it must be owned that those passages, although the plainest that occur, are not sufficient to prove the apostolical institution of the Lord's day, or even the actual observation of it. In order, therefore, to place the matter beyond all controversy, recourse must be had to ecclesiastical testimony.

From the consentient evidence and uniform practice of the primitive church, and also from the attestation of Pliny, a heathen of no mean figure both in learning and power, we find that the first day of the week was observed in the earliest ages as a holiday or festival, in honour of the resurrection of Christ. Now there are but two sources whence the custom could possibly have arisen. It must have been instituted either by human or divine authority: by human authority it was not instituted; for there was no general council in those early times, and without the decree of a general council it was impossible that any ecclesiastical institution could have been universally established at once. It remains, therefore, that it must have been instituted by divine authority: and that it really was so, will further appear from the following considerations. It is certain that the apostles travelled over the greatest part of the world, and planted churches in the remotest parts of it. It is certain, also, that they were all led by the same spirit; and their desire was, that unity and uniformity should be observed in all the churches which they had founded. It is not therefore surprising that, in the primitive times, the same doctrine, the same worship, the same rites and customs, should prevail all over the Christian world; nay, it would have been unaccountable had the case been otherwise. For this reason we may conclude that every custom, universally observed in the early ages of the Christian church, and not instituted by a general council, was of original appointment.

As the Lord's day is sanctified, that is, set apart to Christians for the worship and service of God, their Creator, Redeemer, and Sanctifier, a little consideration will easily discover how it ought to be observed. Although a day separated from worldly business, yet it is in no sense a day of idleness, but a season appropriated to the works of salvation and labours of charity.

In the primitive times this holy day was observed in the most solemn manner. From the monuments of those early ages we learn, that it was spent in a due and constant attendance on all the offices of divine worship. On it they held their religious assemblies, in which the writings of the apostles and prophets were read to the people, and the doctrines of Christianity further pressed upon them by the exhortations of the clergy. Solemn prayers and praises were offered up to God, and hymns sung in honour of Christ; the Lord's supper was constantly celebrated; and collections were made for the maintenance of the clergy and the relief of the poor. On this day they abstained, as much as they could, from bodily labour. They looked upon it as a day of joy and gladness; and, therefore, all fasting on it was prohibited, even during the season of Lent, their great annual fast.—Such was the zeal of those times, that nothing, no not the severest persecutions, hindered them from celebrating holy offices on this day. They were often beset and betrayed, and as often slaughtered in consequence of cruel edicts from emperors, those very emperors for whose happiness and prosperity they always offered up their fervent prayers. For this cause, when they could not meet in the day-time, they assembled in the morning before it was light; and when sick, in exile, or in prison, nothing troubled them

more than that they could not attend the service of the church. No trivial pretences were then admitted for any one's absence from public worship; for severe censures were passed upon all who were absent without some urgent necessity. When the empire became Christian, Constantine and his successors made laws for the more solemn observation of the Lord's day. They prohibited all prosecutions and pleadings and other juridical matters to be transacted on it, and also all unnecessary labour: not that it was looked upon as a Jewish sabbath, but because these things were considered as inconsistent with the duties of the festival.

But although the primitive Christians did not indulge themselves in the practice of unnecessary labour or trifling amusements, yet they did not wholly abstain from working, if great necessity required it. The council of Laodicea enjoined that men should abstain from work on the Lord's day if possible; but if any were found to judaize, they were to be censured as great transgressors. So circumspect were the primitive Christians about their conduct on this festival, that on the one hand they avoided all things which tended to profane it, whilst, on the other, they censured all those who insisted it should be observed with Pharisaical rigour.

The primary duty of the Lord's day is public worship. The nature and design of the Christian religion sufficiently shows the necessity and importance of assembling for the duties of devotion. The whole scope of Christianity is to bring us to an union with God, which cannot be obtained or preserved without frequent communications with him; and the reasons which show religious intercourse to be the indispensable duty of Christians in a private capacity, will bind it with equal or more force on them, considered as a community.

The advantages of public worship, when duly performed, are many and great. There are two, however, which deserve to be considered in a particular manner. It gives Christians an opportunity of openly professing their faith, and testifying their obedience to their Redeemer in the wisest and best manner; and in an age when atheism has arisen to an alarming height, when the Son of God is crucified afresh, and put to open shame, every man, who has any regard for religion, will cheerfully embrace all opportunities of declaring his abhorrence of the vicious courses pursued by those degenerate apostates. He will with pleasure lay hold on every occasion to testify that he is neither afraid nor ashamed to confess the truth; and will think it his indispensable duty openly to disavow the sins of others, that he may not incur the guilt of partaking of them.

Public worship preserves in the minds of men a sense of religion, without which society could not exist. Nothing can keep a body of men together and unite them in promoting the public good, but such principles of action as may reach and govern the heart. But these can be derived only from a sense of religious duties, which can never be so strongly impressed upon the mind as by a constant attendance upon public worship. Nothing can be more weak than to neglect the public worship of God, under the pretence that we can employ ourselves as acceptably to our Maker at home in our closets. Both kinds of worship are indeed necessary; but one debt cannot be paid by the discharge of another. By public worship every man professes his belief in that God whom he adores, and appeals to Him for his sincerity, of which his neighbour cannot judge. By this appeal he endears himself more or less to others. It creates confidence; it roots in the heart benevolence, and all other Christian virtues, which produce, in common life, the fruits of mutual love and general peace.
